5. Sedum Tórreyi Don. Torrey's Stonecrop. (I. F. f. 1814.) Annual, low, tufted, glabrous, $5-8 \mathrm{~cm}$. high. Leaves alternate, linear-oblong, teretish, sessile, entire, $4-8 \mathrm{~mm}$. long; cyme $2-5$-forked, its branches $\mathbf{I}-5 \mathrm{~cm}$. long; flowers sessile or very short-pedicelled, about 7 mm . broad; petals yellow, lanceolate, acute; follicles divergent, tipped with the short subulate style. In dry, open places, Mo., Kans. and Ark. to Tex. May.
6. Sedum stenopétalum Pursh. Narrow-petaled Stonecrop. (I. F. f. 1815.) Perennial, tufted, glabrous; flowering branches $8-18 \mathrm{~cm}$. high. Leaves alternate, crowded but scarcely imbricated, except on the sterile shoots, sessile, linear, $6-16 \mathrm{~mm}$. long, entire ; cyme $3-7$-forked, compact ; flowers mostly shortpedicelled, 8 -10 mm . broad; petals narrowly lanceolate, very acute, yellow ; follicles about 4 mm . long, the subulate style-tip at length somewhat divergent. In dry, rocky places, Neb. and Colo. to Dak., the N. W. Terr., Utah, Ore. and Br. Col. May-June.
7. Sedum refléxum L. Crooked Yellow or Reflexed Stonecrop. Dwarf Houseleek. (I. F. f. 1816.) Perennial by a creeping stem producing numerous short barren shoots ; flowering branches erect; leaves alternate, sessile, imbricated on the sterile shoots, terete, somewhat spurred at the base, $6-18 \mathrm{~mm}$. long; cyme $4-8$-forked, its branches recurved in flower ; flowers $8-12 \mathrm{~mm}$. broad; petals linear, yellow, two to three times as long as the short ovate sepals; follicles about 3 mm . long, tipped with a slender somewhat divergent style. E. Mass. and W. N. Y., escaped from gardens. Native of Europe. Summer.
8. Sedum pulchéllum Michx. Widow's Cross. (I. F. f. 1817.) Glabrous, ascending or trailing, branched, $\mathrm{I}-3 \mathrm{dm}$. long. Leaves crowded, terete or linear, sessile, obtuse, slightly auriculate at the base, $6-25 \mathrm{~mm}$. long, about 2 mm . wide; cyme $4-7$-forked, its branches spreading or recurved in flower; flowers sessile, close together, $8-12 \mathrm{~mm}$. broad; petals linear-lanceolate, acute, about twice the length of the lanceolate obtusish sepals ; follicles $4-6 \mathrm{~mm}$. long, tipped with a slender style. On rocks, Va. to Ga., Ind., Kans. and Tex. May-July.
9. Sedum ternàtum Michx. Wild Stonecrop. (I. F. f. I8I8.) Perennial,
glabrous, tufted ; stems creeping, flowering branches, $0.7-2 \mathrm{dm}$. high. Lower leaves and those of sterile shoots flat, obovate, entire, $1-2.5 \mathrm{~cm}$. long, sometimes 2 cm . wide, rounded at the apex, cuneate at the base or narrowed into a petiole, verticillate in 3 's; upper leaves oblanceolate or oblong, alternate, sessile; cyme 2-4-forked, its branches spreading or recurved in flower; flowers rather distant, often leafy-bracted, about 1 cm . broad; petals linear-lanceolate, acute, nearly twice the length of the oblong obtuse sepals; follicles 5 mm . long, tipped with the slender style. On rocks, N. Y. and N. J. to Ga., Ind. and Tenn. Also escaped from gardens to roadsides in the Middle and Eastern States. April-June.
10. Sedum Nèvii A. Gray. Nevius' Stonecror. (I. F. f. 1819.) Tufted, glabrous; stems spreading or decumbent, flowering branches ascending, $8-13 \mathrm{~cm}$. high. Leaves of the sterile shoots densely imbricated, spatulate or obovate, narrowed or cuneate at the base, mostly sessile, rounded at the apex, entire, $6-12 \mathrm{~mm}$. long; leaves of the flowering branches spatulate or linear-oblong, alternate; cyme about 3 -forked; flowers close together, $6-8 \mathrm{~mm}$. broad; petals linear, acuminate, longer than the sepals; follicles about 4 mm . long, divergent, tipped with the short style. On rocks, Va. to Ala. May-June.

## 3. SEMPERVIVUM L.

Perennial herbs, the succulent leaves imbricated on the short sterile shoots and scattered on the erect flowering stems, with compound cymes of showy flowers. Flowers 6-20-parted. Petals distinct, oblong or lanceolate, acute or acuminate. Stamens twice as many as the petals. Styles filiform; ovules $\infty$. Follicles manyseeded. [Latin, always living.] About 40 species, natives of the Old World.

1. Sempervivum tectòrum L. Houseleek. (I. F. f. 1820.) Flowering stems about 3 dm . high, the barren shuots forming lateral nearly globular tufts. Leaves oval or ovate, the lower $2.5-4 \mathrm{~cm}$. long, thick, short-pointed, bordered by a line of stiff short hairs; cyme large, dense; flowers sometimes 2.5 cm . broad, pink, sessile along its branches; petals lanceolate, acute, 2 to 3 times as long as the obtuse ciliate sepals. Essex Co., Mass. ; Somerset Co., N. J. Native of continental Europe. Summer.

## Family 3. PENTHORACEAE Rydb.

Erect perennial scarcely succulent herbs, with alternate sessile serrate thin leaves, and greenish perfect flowers in forked secund cymes. Calyx 5 -parted. Petals usually wanting, if present 5. Stamens io, hypogynous; filaments filiform. Carpels 5 , united to the middle, ovules $\infty$. Capsule depressed, 5-lobed, 5-beaked, the lobes tipped with divergent styles, many-seeded. Only the following genus.

## 1. PENTHORUM L.

[Greek, five, from the symmetrical flower.] About 3 species, natives of eastern N. Am., Japan and China.
I. Penthorum sedoides L. Ditch or Virginia Stonecrop. (I. F. f. i821.) Glabrous, erect; stem I.5-6 dm. high. Leaves lanceolate or narrowly elliptic, acuminate at each end, finely serrate, $5-10 \mathrm{~cm}$. long; cymes $2-3$-forked; flowers short-pedicelled, about 4 mm . broad; sepals triangular-ovate, acute, shorter than the flattish capsule; petals often or generally wanting. In ditches and swamps, N. B. to Fla., Minn., Neb. and Tex. July-Sept.

## Family 4. PARNASSIACEAE Dumort. <br> Grass-of-Parnassus Family.

Glabrous bog herbs with a rosette of basal leaves and generally one or a few alternate stem-leaves, and solitary terminal flowers. Flowers perfect. Calyx generally 5-lobed to near the base, free from or adnate to the ovary. Petals 5. Fertile stamens 5 ; staminodia (imperfect stamens) in clusters at the base of each petal. Ovary r-celled with + parietal
placentae; style one; stigmas 4. Seeds numerous. Seed-coat winged. Only the following genus.

## r. PARNÀSSIA L.

[From the Greek mount ; the plant called Grass.of-Parnassus by Dioscorides.] About 12 species, natives of the north temperate and arctic zones. Besides the following, another occurs in northwestern America.

Petals sessile; leaves ovate, oval, orbicular or cordate.
Staminodia 3-5 at the base of each petal
Flower $2-4 \mathrm{~cm}$. broad; petals much exceeding the calyx-lobes.

Staminodia not longer than the stamens, stout. Staminodia longer than the stamens, slender.
Flower 8 -10 mm . broad; petals equalling the calyx-lobes.
Staminodia 5-15 at the base of each petal, slender.
Flower 8 -10 mm. broad; leaves narrowed at base.
Flower 25 mm . broad; leaves cordate at base.
Petals clawed; leaves reniform; staminodia 3 at each petal.

1. F. Carolimana.
2. P. grandifolia.
3. P. Kotzebuei.
4. P. parviflora.
5. P. palustris.
6. P. asarifolia.
7. Parnassia Caroliniàna Michx. Carolina Grass of Parnassus. (I. F. f. 1852.) Scape 2-3 dm. high, with a nearly sessile ovate clasping leaf below the middle. Basal leaves long-petioled, ovate, oval or orbicular, obtuse, rounded or sometimes cordate at the base, or decurrent into the petiole, $2-5 \mathrm{~cm}$. long; calyxlobes ovate-oblong, obtuse; petals broadly oval, white, greenish-veined; staminodia generally 3 in each set; capsule 8 -10 mm. long. In swamps and low meadows, N. B. to Manitoba, N. Car. and Iowa. June-Sept.
8. Parnassia grandiròlia DC. Large-Leaved Grass-of-Parnassus. (I. F. f. 1853.) Similar to the preceding, the scape bearing an ovate clasping leaf at the middle or below. Basal leaves often larger and narrowed at the base; petals white; staminodia 3-5 in each set, slender or almost filiform, exceeding the antherbearing stamens. In moist soil, Va. to Fla., Mo. and La. July-Sept.
9. Parnassia Kotzebuei C. \& S. Kotzebue's Grass-of-Parnassus. (I. F. f. 1854.) Scape slender, $7-15 \mathrm{~cm}$. high, leafless, or sometimes with a single sessile oval leaf near the base. Basal leaves short-petioled, membranous, ovate or oval, narrowed or sometimes cordate at the base, $6-24 \mathrm{~mm}$. long; calyx-lobes oblong; petals white, $3-5$-veined, sessile; staminodia $3-5$ at the base of each petal. Quebec, Lab., arctic Am. to Alaska and in the Canadian Rocky Mts. Summer.
10. Parnassia parvifìra DC. Small-flowered Grass-of-Parnassus. (I. F. f. 1856.) Scape 1-3 dm. high, slender, usually bearing a clasping oval leaf at the middle. Basal leaves petioled, oval or ovate, narrowed at the base, not cordate, $12-25 \mathrm{~mm}$. long; sepals equalling or somewhat shorter than the elliptic sessile petals; staminodia 5-7 at the base of each petal. In wet places, Quebec to Lab. and the Pacific Coast, south to Mich. and Utah. July-Sept.
11. Parnassia palustris L. Marsh or Northern Grass-of-Parnassus. (I. F. f. I855.) Scape slender, I-3 dm. high, bearing a clasping ovate leaf below the middle, or rarely leafless. Basal leaves slender-petioled, ovate, obtuse at the apex, usually cordate at the base, $18-35 \mathrm{~mm}$. long; calyx $\frac{1}{4}-\frac{1}{2}$ shorter than the elliptic few-veined sessile petals; staminodia $9-15$ at the base of each petal. In wet places, Newt. and Lab. to Alaska, Mich. and Wyo. Also in Europe and Asia. July-Sept.
12. Parnassia asarifòlia Vent. Kidney-leaved Grass of-Parnassus. (I. F. f. 1857.) Scape 2.5-5 dm. high, bearing a clasping nearly orbicular leaf at about the middle. Basal leaves long-petioled, rounded, kidney-shaped, often $5-8 \mathrm{~cm}$. wide; flower $25-35 \mathrm{~mm}$. broad; calyx-lobes oval, much shorter than the strongly veined elliptic petals; staminodia 3 in each set, slender, about the length of the stamens. In wet places, mountains of Va., Tenn., Ga., and N. Car. July-Oct.

## Family 5. SAXIFRAGACEAE Dumort.* Saxifrage Family.

Herbs. Flowers perfect or polygamo-diœcious. Calyx 5-lobed or 5-parted (rarel 12 -lobed or parted), free, or adnate to the ovary,

[^27]usually persistent. Petals usually 4 or 5 , rarely none. Stamens equal in number to or twice as many as the petals, in apetalous species as many or twice as many as the calyx-lobes, perigynous or epigynous; filaments distinct. Disk generally present. Carpels usually 2, distinct or united, but upper portion free, mostly fewer than the stamens. Seeds commonly numerous; endosperm generally copious, fleshy; embryo small, terete. About 70 genera and 600 species, of wide geographic distribution.

Large herbs; leaves 3 -ternate; flowers polygamous.
Leaves simple, cleft, lobed or 3 -foliolate; flowers perfect.
Placentae axial.
Ovary superior or nearly so; stamens io.
Ovary more or less adnate to the calyx-tube.
Stamens 5, in our species.
Petals deciduous.
Petals persistent.
Stamens io.
Placentae almost basal.
Placentae parietal.
Petals present (in our species); terrestrial plants. Petals entire. Petals lobed or pinnatifid.
Petals none; small aquatic plants.

1. Astalbe.
2. Saxifraga.
3. Therofon.
4. Sullivantia.
5. Saxifraga.
6. Tiarella
7. Heuchera.
8. Mitella.
9. Chrysosplenium.

## 1. ASTÍLBE Hamilt.

Erect perennial herbs, with small spicate flowers in terminal panicles. Calyx campanulate, $4-5$-lobed. Petals 4 or 5 (in our species), linear-spatulate, inserted at the base of the calyx. Stamens 8-10; filaments elongated. Ovary superior or nearly so, $2-3$-celled, deeply $2-3$-lobed at the apex; styles $2-3$; ovules $\infty$. Capsule $2-3$-lobed, separating into 2 or 3 follicle-like carpels, each usually few-seeded. Seeds small, the testa loose, tapering at each end. [Greek without brightness.] About 7 species, natives of eastern N. Am., eastern Asia and the Himalayas.
I. Astilbe biternàta (Vent.) Britton. False Goat's Beard. Astilbe. (I. F. f. 1822.) Erect, 1-2 m. high, more or less pubescent. Leaves petioled, often 6 dm . broad; leaflets thin, stalked, ovate, the lateral ones usually oblique, acuminate, sharply serrate or incised, $5-\mathbf{1 2} \mathrm{cm}$. long; panicles often 3 dm . long; flowers sessile or nearly so, about 4 mm . broad, yellowish white; petals of the staminate flowers spatulate, those of the perfect ones much smaller or none; stamens 10; follicles 2, acute, glabrous, about 3 mm . long. In woods, mountains of Va. to Ga. and Tenn. Plant with the aspect of Aruncus. June.

## 2. SAXÍFRAGA L.

Perennial herbs, with entire toothed or pinnatifid leaves, and perfect flowers. Calyx-tube free, or adnate to the base of the ovary, 5 -lobed. Petals 5 , perigynous. Stamens Io, inserted with the petals; anthers didymous. Ovary superior or partly inferior, usually 2 -celled, 2 -lobed at the summit; styles short; ovules $\infty$, on axial placentae. Capsule 2-beaked, many-seeded. Seeds small, the testa smooth or roughened. [Greek, stone-breaking, from reputed medicinal qualities.] About 210 species, nearly all natives of the north temperate zone. Besides the following, about 50 others occur in western N . Am.

> * Stems prostrate; leaves rounded, opposite; petals purple.
> I. S. oppositifolia.

* Stems erect or ascending; leaves alternate; petals white or yellow.

Flowers yellow; leaves entire.
Stems several-flowered; leaves linear. 2. S. autumnalis.
Stems I-flowered; leaves oblong.
Flowers white: leaves $3-7$-lobed, mostly wider than long.
Stems $10-25 \mathrm{~cm}$. tall; flower commonly solitary, nodding. 4. S. cernua.
Stems weak, $5-12 \mathrm{~cm}$. long; flowers $\mathrm{I}-5$, erect. 5. S. rviularis.

*     *         * Stems scapose, naked or bracted, the leaves clustered at the base.
+ Leaves stiff, oblong or oblanceolate; petals yellow or yellowish.

Leaves sharply 3 -toothed at the apex.
Leaves with white denticulate margins.
++ Leaves deeply $3-5$-cleft ; petals white.
$\dagger \dagger+$ Leaves soft, obovate or oval with narrowed or spatulace base.

Flowers regular; petals all nearly alike.
Plants large, 3 -ro dm. tall, growing in wet places.
Leaves merely denticulate or repand; follicles ovoid. 9. S. Pennsylvanica.
Leaves coarsely and sharply dentate; follicles lanceolate.
10. S. micranthrdifolia.

Plants low, 5-45 cm. tall, growing in dry or rocky places.
Petals sessile, not clawed.
Flowers in cymose or at length panicled clusters. 11. S. Virginiensis.
Flowers capitate; arctic and alpine species.
12. S. nivalis.

Petals narrowed into a claw.
Flowers few, most or all of them replaced by tufts of leaves.
13. S. comosa.

Inflorescence loose, cymose-paniculate.
Follicles erect, united to near their summits; styles short.
14. S. stellaris.

Follicles divergent, united only at base; styles filiform.
15. S. Grayana.
16. S. Michauxiz.

Flowers irregular, 3 petals large, 2 smaller.
$\dagger \dagger \dagger \dagger$ Leaves soft, orbicular, cordate, dentate all around.
17. S. Geum.

1. Saxifraga oppositifòlia L. Purple or Mountain Saxifrage, (I. F. f. 1823.) Tufted, stems densely leafy, $5-25 \mathrm{~cm}$. long. Leaves sessile, persistent, keeled, fleshy, obtuse, punctate with $1-3$ pores, $2-5 \mathrm{~mm}$. long, the margins ciliate; flowers solitary, peduncled or nearly sessile, $8-12 \mathrm{~mm}$. broad; calyx-lobes obtuse, much shorter than the obovate purple petals; calyx free from the ovary and capsule; follicles abruptly short-pointed; seeds rugose. On wet rocks, Vt., Anticosti, and Newf. to Alaska, south in the Rocky Mts. to Wyo. and Ore. Also in Europe and Asia. Summer.
2. Saxifraga autumnàlis L. Yellow Mountain Saxifrage. (I. F. f. 1824.) Tufted, glabrous; stems $5-15 \mathrm{~cm}$. high. Leaves linear, fleshy, mucronatetipped, sessile, $8-18 \mathrm{~mm}$. long, $2-5 \mathrm{~mm}$. wide, the margins often sparingly ciliate; flowers corymbose, $8-14 \mathrm{~mm}$. broad; petals oblong, sometimes spotted with orange, exceeding the ovate-oblong calyx-lobes; carpels abruptly acuminate; base of the capsule adnate to the calyx; seeds minutely rugose. On wet rocks, Newf. and Lab. to Vt., western N. Y., arctic Am. and Mich. Also in alpine and arctic Europe and Asia. Summer. [S. aizoides L.]
3. Saxifraga Hírculus L. Yellow Marsh Saxifrage. (I. F. f. I825.) Erect, $10-25 \mathrm{~cm}$. high. Leaves $1-4 \mathrm{~cm}$. long, the lower petioled, the upper sessile; flower terminal, with scarlet spots; calyx-lobes obtuse, reflexed; petals obovate or oblong, about 3 times as long as the calyx-lobes; capsule free from the calyx or nearly so, about 8 mm . long, its beaks at length diverging. In bogs, Lab. and arctic America. Also in northern and alpine Europe and Asia. Summer,
4. Saxifraga cérnua L. Nodding or Drooping Bulbous Saxifrage. (I. F. f. 1826.) Stem weak, ascending, pubescent but scarcely glutinous, I-3 dm. long. Basal and lower leaves petioled, broadly reniform, palmately 5-7-lobed, usually less than 25 mm . wide; upper leaves smaller, sessile, 3 -lobed or entire and bract-like, often bearing bulblets in their axils; flowers $\mathrm{I}-3$, terminal, $8-10 \mathrm{~mm}$. broad; petals obovate, 3-4 times as long as the ovate calyx-lobes. Newf., Lab. and arctic America to Alaska. Also in arctic and alpine Europe and Asia. Summer.
5. Saxifraga rivulàris L. Alpine Brook Saxifrage. (I. F. f. 1827.) Tufted, matted, $2-7 \mathrm{~cm}$. high. Basal and lower leaves slender-petioled, reniform, $3-5$-lobed, seldom more than 6 mm . wide; petioles dilated at the base; upper leaves lanceolate or ovate, sessile; flowers 1-5, terminal, white, $6-10 \mathrm{~mm}$. broad; calyxlobes ovate, obtuse, slightly shorter than the ovate-oblong petals; base of the capsule adnate to the calyx. White Mts., Lab., arctic Am. and south in the Rocky Mts. to Colo. Also in arctic and alpine Europe and Asia. Summer.
6. Saxifraga tricuspidata Retz. Three-toothed Saxifrage. (I. F. f. 1828.) Tufted; flowering stems $5-20 \mathrm{~cm}$. high, the leaves oblong or oblong-
spatulate, parchment-like, $8-14 \mathrm{~mm}$. long, narrowed at the base, sessile, the margins ciliate; flowers corymbose, $8-10 \mathrm{~mm}$. broad; sepals ovate, coriaceous, much shorter than the petals; lower part of capsule adnate to the calyx. In rocky places, Newf. and Lab. to Alaska, south to Lake Superior and in the Canadian Rocky Mts. Also in arctic Europe. Summer.
7. Saxifraga Aizòon Jacq. Livelong Saxifrage. (I. F. f. I829.) Leaves in a rosette; plant spreading by offsets. Leaves $8-24 \mathrm{~mm}$. long, spatulate, thick, obtuse; scape viscid-pubescent, $\mathbf{1}-2.5 \mathrm{dm}$. high; flowers corymbose, about 6 mm . broad; calyx-lobes ovate-oblong, obtuse, viscid, shorter than the obovate, often spotted petals; base of capsule adnate to the calyx. On dry rocks, Vt.; Quebec to Lab., Lake Superior and Manitoba. Also in Europe. Summer.
8. Saxifraga caespitòsa L. Tufted Saxifrage. (I. F. f. i830.) Tufted; leaves spatulate or fan-shaped, $6-18 \mathrm{~mm}$. long, glabrous; flowering stem $5-20 \mathrm{~cm}$. high, viscid-pubescent, at least above, linear-bracted or with several 3 -lobed leaves; flowers I-8, corymbose, $8-14 \mathrm{~mm}$. broad; calyx-lobes ovate-oblong, obtuse or obtusish, much shorter than the petals; base of the capsule adnate to the calyx. On rocks, Quebec, Lab. and Newf. to Alaska, Ore. and Colo. Also in Europe and Siberia. Summer.
9. Saxifraga Pennsylvánica L. Pennsylvania or Swamp Saxifrage. (I. F. f. I83I.) Scape stout, terete, viscid-pubescent. Leaves oval to oblanceolate, $10-25 \mathrm{~cm}$. long, $3-7 \mathrm{~cm}$. wide, obtuse at the apex, narrowed at the base into a broad petiole; cymes in an elongated panicle; flowers greenish, regular, $3-5 \mathrm{~mm}$. broad; calyx-tube nearly free from the ovary, its lobes ovate, obtusish, reflexed, one-half shorter than the linear-lanceolate petals; filaments subulate or filiform. In swamps and on wet banks, Me. to Ont., Minn., Va., Iowa and Mo. May.
10. Saxifraga micranthidifòlia (Haw.) B. S. P. Lettuce Saxifrage. (I. F. f. 1832.) Scape slender, viscid. Leaves oblanceolate or oval, sometimes 3 dm . long, obtuse, tapering downward into a long margined petiole; panicle loose, elongated; flowers white, regular, 4-6 mm . broad; calyx-lobes reflexed, slightly shorter than the oval or oblong obtuse petals; calyx-tube free from the ovary; filaments club-shaped. In cold brooks, Penn. to N. Car. May-June.
II. Saxifraga Virginiénsis Michx. Early Saxifrage. (I. F. f. 1833.) Scape viscid-pubescent, $1-3 \mathrm{dm}$. high. Leaves obovate or oval, narrowed into a margined petiole, dentate or crenate, $2-7 \mathrm{~cm}$. long or longer; flowers white, regular, 4-6 mm . broad; calyx-lobes erect, triangular-ovate, much shorter than the obtuse petals; ovary nearly free from the calyx; carpels nearly separate. In dry or rocky woodlands, N. B. to Minn., Ga. and Tenn. March-May.
11. Saxifraga nivàlis L. Clustered Alpine Saxifrage. (I. F. f. 1834.) Resembling the preceding, but seldom over 15 cm . high. Scape viscid, naked, or bracted at the base of the capitate inflorescence; leaves ovate or oval, narrowed into a margined petiole, thicker; flowers white, 6 -10 mm. broad; calyx-lobes ovate or oblong, obtuse, about one-half the length of the petals; ovary half-inferior; follicles deep purple, divergent. Lab. and arctic Am., south in the Rocky Mts. to Ariz. Also in Europe and Siberia. Summer.
12. Saxifraga comòsa (Poir.) Britton. Foliose Saxifrage (I. F. f. I835.) Scape slightly viscid, $5-15 \mathrm{~cm}$. high. Leaves oblanceolate, cuneate, dentate and mostly obtuse, $8-18 \mathrm{~mm}$. long; flowers white, regular; calyx nearly free from the ovary, its lobes reflexed, much shorter than the sagittate petals. Me.; Lab. and arctic America; Mt. Evans, Colo. Also in Asia and Europe. Summer.
13. Saxifraga stellàris L. Star or Starry Saxifracie. (I. F. f. is $3^{\circ}$.) Scape bracted at the inflorescence, $\mathbf{r}-3 \mathrm{dm}$. high. Leaves oblong, oblanceolate or obovate, sharply dentate, tapering into a broad petiole, $\mathbf{I}-5 \mathrm{~cm}$. long; flowers ahout 1 cm . broad; petals white, yellow-spotted at the base; calyx nearly free from the ovary, its lobes reflexed, lanceolate, obtusish, about one-half the length of the oblong petals ; capsule $4-6 \mathrm{~mm}$. long. In rocky places, reported from Lab. and Greenland. Also in Europe and Asia. Summer.
14. Saxifraga Grayàna Britton. Gray's Saxifrage. (I. F. f. 1837.) (ilan-dular-pilose, scapose from a corm-like rootstock; scape 1.5-4.5 dm. tall. Basal leaves oblong to nearly orbicular, $2-12 \mathrm{~cm}$. long, crenate-dentate, narrowed into margined petioles, mostly shorter than the blade : flowers white, $\mathcal{S}-10 \mathrm{~mm}$. broad; calyx-tube adnate to the ovary, its segments ovate-oblong, reflexed, obtuse; petals
ovate, obtuse, 2 -spotted; filaments club-shaped; follicles oblong, 4-6 mm. long. In rocky situations, mountains of Va. and N. Car. June-July.
15. Saxifraga Michaùxii Britton. Michaux's Saxifrage. (I. F. f. 1838.) Erect, viscid-pubescent, ${ }^{15-50 ~ c m}$. high. Basal leaves oblanceolate or oblong, $7-17 \mathrm{~cm}$. long, narrowed into a margined petiole, coarsely dentate; scape leafybracted above; inflorescence paniculate; flowers $4-6 \mathrm{~mm}$. broad, irregular; petals clawed, white, the 3 larger ones sagittate or truncate and usually with a pair of yellowish spots at the base, the other 2 spatulate and unspotted; calyx-tube free from the ovary, its lobes reflexed; follicles lanceolate, about 5 mm . long. In dry rocky places, Va. and W. Va. to Ga. May-Sept.

I7. Saxifraga Gèum L. Kidney-Leaved Saxifrage. (I. F. f. 1839.) Glandular-pubescent, scapose ; scape $7-25 \mathrm{~cm}$. high. Leaves clustered at the base, $1-2.5 \mathrm{~cm}$. wide; petioles stout, densely pubescent, $2-6 \mathrm{~cm}$. long; inflorescence paniculate ; bracts small, linear; flowers $4-6 \mathrm{~mm}$. broad; petals white, oblong or ovate-oblong, with a yellow spot at the base and several smaller purplish spots at the middle; calyx-lobes lanceolate or reflexed; capsule oblong. Newf. and in Europe. June-July.

## 3. THÉROFON Raf.

Glandular-pubescent perennial herbs, with alternate petioled orbicular or reniform leaves, and small white perfect flowers in panicles. Calyx-tube topshaped or subglobose, adnate to the ovary, its limb 5-lobed. Petals 5, deciduous, inserted on the calyx-tube. Filaments short. Ovary 2-celled (rarely 3-celled); styles 2, rarely 3. Capsule 2-celled, the beaks of the carpels divergent. Seeds numerous, the testa shining, minutely punctate. [Greek, beast-killing; an old name of aconite.] About 5 species, natives of N. Am.
I. Therofon aconitifolium (Nutt.) Millsp. Aconite Saxifrage. (I. F. f. 1840.) Stem 3-6 dm. high. Lower and basal leaves long-petioled, reni-form-orbicular, cordate or truncate at the base, palmately 5-7-lobed, sharply in-cised-serrate; upper leaves short-petioled; cymes panicled; pedicels and calyx viscid; flowers white, about 4 mm . broad; calyx-lobes lanceolate, erect; petals oblanceolate; capsule adnate to the calyx-tube, only its divergent beaks free. In woods, southwestern Va. to N. Car., Tenn. and Ga. July.

## 4. SULLIVÁNTIA T. \& G.

Slender perennial herbs, with mainly basal long-petioled reniform-orbicular crenate or slightly lobed leaves, and small white cymose-paniculate flowers. Calyxtube campanulate, adnate to the base of the ovary, its limb 5 -lobed, the lobes erect. Petals 5, spatulate, marcescent. Stamens 5, inserted at the base of the calyx-lobes. Filaments short. Ovary 2-celled, 2-beaked, ripening into a 2 -beaked capsule. Styles 2. Ovules $\infty$. Seeds winged. [In honor of William Starling Sullivant, 1803-1873, American botanist.]. Three known species, of North America.
I. Sullivantia Sullivántii (T. \& G.) Britton. Sullivantia. (I. F. f. 1841.) Stem scapose, nearly leafless, reclined, slightly glandular-pubescent, 15 35 cm . long. Leaves long-petioled, $2-7 \mathrm{~cm}$. wide, reniform, sparingly pubescent or glabrous; panicle ample, sometimes leafy-bracted, glandular; pedicels recurved in fruit; flowers about 4 mm . broad; calyx-lobes ovate, acutish; petals entire, exceeding the stamens. On cliffs, Ohio to Minn. and Iowa. June.

## 5. tiarélla l.

Perennial erect herbs, with the leaves mainly basal, long-petioled, lobed or 3foliolate, small stipules adnate to the petiole, and white pedicelled racemose or paniculate flowers. Calyx-tube campanulate, nearly or quite free from the base of the ovary, its limb 5 -lobed. Petals 5 , clawed. Stamens 10 ; filaments elongated. Ovary 1-celled; styles 2 ; ovules $\infty$. Capsule membranous, $\mathbf{1}$-celled, 2-valved, the valves usually unequal. Seeds usually few, smooth, not winged. [Diminutive of tiara, from the form of capsule.] About 6 species, natives of N. Am., Japan and the Himalayas. Besides the following, 3 others occur in western N. Am.

I Tiarella cordifòlia L. Coolwort. False Mitrewort. (I. F. f. I842.) Scape $15-30 \mathrm{~cm}$. high, slender, pubescent; plant producing runners later in the
season. Leaves long-petioled, broadly cordate, 3-7-lobed, obtuse or acutish at the apex, $5-10 \mathrm{~cm}$. long, crenate or dentate all around, pubescent with scattered hairs above, glabrate or downy along the veins beneath; inflorescence racemose, glandu-lar-puberulent; flowers white, about 6 mm . broad; petals oblong, entire or slightly dentate, clawed, somewhat exceeding the white calyx-lobes; capsule reflexed, about 6 mm . long, its valves very unequal. In rich, moist woods, N. S. to Ont. and Minn., south to Ga. and Ind. April-May.

## 6. HEÙCHERA L.

Erect or ascending perennial herbs, with mainly basal long-petioled ovate or orbicular leaves, and small, paniculate or racemose, white green or purple flowers, on naked or leafy-bracted scapes. Calyx-tube campanulate, often oblique, adnate to the base of the ovary, 5 -lobed. Petals small, spatulate, often shorter than the calyx-lobes, entire, inserted on the throat of the calyx. Stamens 5, inserted with the petals. Ovary 1-celled; styles 2, slender. Ovules $\infty$. Capsule 2-valved, 2beaked. Seeds minutely hispid or muricate. [Named for Johann Heinrich von Heucher, 1677-1747, a German botantist.] About 34 species, natives of N. Am. and Mex. Besides the following, about 20 others occur in western and southern N. Am.

Stem with $1-3$ leaves (seldom 4 or 5).
Stamens slightly if at all exceeding the petals; calyx in flower $5-8 \mathrm{~mm}$. long, decidedly turbinate at the base.

1. H. pubescens.

Stamens about twice as long as the petals; calyx in flower campanulate or slightly turbinate.

Stem and petioles glabrous or puberulent.
Calyx 5-7 mm. long, cylindric-campanulate. 2. H. roseola.
Calyx 3-4 mm. long, open-campanulate.
3. H. Curtisii.

Stem and petioles villous; calyx in flower about 2 mm .
5. H. crinita.

Stem strictly scapose.
Flowers small ; calyx in flower $2-5 \mathrm{~mm}$. long, only slightly oblique.
Petioles and scape hirsute or villous, seldom glabrate.
Lobing of the leaves rather deep; lobes acute; calyx in flower about 2 mm .
Leaves cordate; lobes and teeth triangular. 4. H. villosa.
Leaves mostly reniform; lobes broadly ovate; teeth rounded, mucronate. 5. H. crinita. Lobing of the leaves shallow; lobes obtuse ; teeth rounded, mucronate. Calyx in flower about 2 mm . long, petals white. 6. H. parviflora. Calyx in flower $4-5 \mathrm{~mm}$.; petals greenish or purplish.
7. H. hirsuticaulis.

Petioles glabrous or puberulent ; scape rarely slightly hirsute.
Petals spatulate, scarcely exceeding the calyx-lobes. 8. H. Americana. Petals oblanceolate, twice as long as the calyx-lobes. 9. H. lancipetala.
Flowers large; calyx in flower 6 -1o mm . long, decidedly oblique.
Leaves sinuately lobed, crenate with very shallow and broad mucronate teeth.

> 1o. H. longiffora.

Leaves more deeply lobed; teeth broadly ovate.
11. H. hispida.
I. Heuchera pubéscens Pursh. Downy Heuchera. (I. F. f. I846.) Stems rather stout, 3-9 dm. high, densely glandular-pubescent, at least above. Basal leaves slender-petioled, broadly cordate, $5-10 \mathrm{~cm}$. wide, 5-7 lobed, the lobes rounded or acute, crenate or dentate; panicle loose; calyx minutely glandular, its lobes usually unequal ; petals broadly spatulate, purplish, slightly exceeding the calyx-lobes. In rich woods, mountains of Penn, to Ky. and N. Car. May-June.
2. Heuchera roseòla Rydb. Pink Heuchera. Stem 5-6 dm. high, gland-ular-puberulent, or glabrate below. Basal leaves round-cordate. 4-6 cm. wide. 5-7-lobed with rounded lobes, crenate with mucronate teeth, minutely hispid above. hirsute on the veins beneath and ciliate on the margin; stem-leaves small, broadly ovate, with sharp acuminate teeth; panicle loose, simple ; calyx glandular puberulent, its lobes oblong, obtuse, slightly unegual; petals light pink, oblanceolate. about $\frac{1}{4}$ longer than the calyx-lobes. In woods, York Furnace, Penn. May.
3. Heuchera Cúrtisii T. \& G. Curtis Hevcheka. Stem 5-10 dm. high. glabrous below, puberulent above. Basal leaves round-cordate or reniform, $3^{-8}$
cm . broad, rounded-lobed and crenate, glabrous or slightly hispidulous above, ciliate on the margins ; stem-leaves orbicular or broadly ovate, sharply toothed with acuminate teeth; panicle lax, open, with divergent branches; calyx puberulent, its lobes oblong, obtuse ; petals purple, puberulent, spatulate, scarcely exceeding the calyx-lobes. Rich woods of Va. and N. Car. June.

Heuchera Curtisii crenàta Rydb. Stem more leafy, with 3-5 rounded cordate or orbicular, crenate leaves; panicle narrower and petals minute. Va. to N. Car. Type from Peaks of Otter, Va,
4. Heuchera villòsa Michx. Hairy Heuchera. (I. F. f. I844.) Stem erect, 2-6 dm. high, leafless, or bearing a few small bracts, generally villous-pubescent with brownish hairs, as are also the long petioles and the veins on the lower surfaces of the leaves. Basal leaves $7-12 \mathrm{~cm}$. wide, orbicular or sometimes longer than broad; flowering calyx campanulate, regular; petals linear-spatulate, white or nearly so, about twice as long as the calyx-lobes; stamens much exserted. In rocky places, Va. and W. Va. to Ga. and Tenn. June-Sept. Called also American Sanicle.
5. Heuchera crinita Rydb. Large Hairy Heuchera. Stem 5-7 dm. high, stout, bearing some bracts or often $\mathbf{I}-3$ leaves, villous, as well as the petioles, with brownish hairs. Basal leaves rounded, reniform, $10-22 \mathrm{~cm}$. in diameter, glabrous or slightly hispidulous above, more or less hairy beneath, esperially on the veins; flowering calyx campanulate, almost regular, strigose-villous; petals spatulate, pinkish, slightly longer than the calyx-lobes; stamens about twice as long. In the form of the leaves it is intermediate between the preceding and the next, but it is much larger than either. In rocky places, from Ky. and Ill. to Va. Type from Ky.
6. Heuchera parviflòra Bartl. Rugel's Heuchera. (I. F. f. 1843.) Stems slender, $1.5^{-6} \mathrm{dm}$. long, weak, glandular-hirsute or villous, leafless, often bearing a few bracts. Basal leaves with long slender glandular-villous petioles, broadly reniform, $5-13 \mathrm{~cm}$. wide, with 7-9 broad lobes; inflorescence very loosely paniculate; flowerıng calyx regular, campanulate; petals linear-spatulate, $2-3$ times as long as the calyx-lobes; stamens somewhat exserted. Shaded cliffs, Mo. and Ill. to western N. Car. July-Sept. The name $H$. Rugelii Shuttlw., of 1847, must give place to the older $H$. parviflora Bartl., of 1839.
7. Heuchera hirsuticaùlis (Wheelock) Rydb. Hirsute Heuchera. Stem stout, 5-6 dm. high, leaflets long-hirsute. Leaves reniform, 5-10 cm. broad, glabrate or sometimes hirsute above, hirsute on the veins beneath; flowering calyx campanulate, glandular-puberulent, somewhat oblique; petals spatulate, greenish or purplish, generally shorter than the oblong obtuse calyx-segments; stamens fully twice as long. Rocky banks, Mo., Ill. and Ind. May-June. [H. hispida hirsuticaulis Wheelock.]
8. Heuchera Americana L. Alum-Root. (I. F. f. I845.) Stem 6-9 dm. high, leafless, more or less glandular-hirsute. Basal leaves long-petioled, 7-10 cm . wide, with 7-9 rounded crenate-dentate lobes, the older ones glabrous, or with scattered hairs on the upper surface; flowering calyx broadly campanulate, nearly regular, $3-5 \mathrm{~mm}$. long ; petals small, greenish; stamens much exserted; anthers orange. In dry or rocky woods, Ont. to Conn., Minn., Ala. and La. May-Aug.
9. Heuchera lancipétala Rydb. Long-petaled Alum-root. Stern stout, about 6 dm . high, naked, sparingly glandular-hirsute. Leaves round-reniform, resembling those of the preceding, rather firm, glabrous except the ciliate margins and the veins beneath; panicle narrower and more simple than in the preceding; flowering calyx open campanulate, but decidedly turbinate at the base, nearly regular; petals whitish or pinkish; stamens about twice as long. Type from Ky.
10. Heuchera longifiòra Rydb. Long-flowered Heuchera. Stem about 5 dm. high, glandular-puberulent above, naked or with a few small bracts. Leaves firm, glabrous, except the ciliate margins, reniform, $5-8 \mathrm{~cm}$. in diameter; flowering calyx deeply campanulate, oblique, gibbous at the base on the shorter side, glandular-puberulent, its lobes oblong, very obtuse; petals spatulate with a slender claw, yellow at the base, purple-tipped, about equalling the calyx-segments; stamens and style included. Hills bordering Mudlick Bath, Ky. May.
11. Heuchera híspida Pursh. Rough Heuchera. (I. F. f. 1847.) Stem 6-12 dm. tall, hirsutely-pubescent, glandular-puberulent, usually leafless. Leaves $4-7 \mathrm{~cm}$. wide, with long petioles, broadly ovate-orbicular. 5-9 lobed; panicle narrow; flowering calyx deeply campanulate, very oblique, its lobes unequal; petals spatulate, slightly exceeding the calyx-lobes; stamens slightly exserted. In woods, Va. to W. Ont., Kans. and the N. W. Terr. May-June.

Heuchera hispida Richardsònii (R. Br.) Rydb. Very sparingly hairy ; leaves smaller, about 4 cm . in diameter; flowering calyx longer, fully 10 mm . long; stamens scarcely at all exserted. Manitoba, N. W. Terr. and Br. Col.

## 7. Mitella L.

Erect perennial herbs, with long petioled ovate to reniform basal leaves, naked or 2-leaved scapes, and small white or greenish flowers in elongated spiciform racemes. Calyx-tube adnate to the base of the ovary, its limb 5 -lobed. Petals 5, 3-cleft or pinnatifid. Stamens 10 (sometimes 5); filaments short. Ovary globose, I-celled; styles 2, short; ovules $\infty$. Capsule I-celled, 2-valved at the apex, many-seeded. Seeds smooth, shining. [Diminutive of mitra, a cap, from the form of the young pod.] About 12 species, natives of N. Am. and E. Asia. Besides the following, about 7 others occur on the Pacific Coast.
Basal leaves ovate, cordate ; scape with 2 opposite leaves.
Basal leaves reniform; scape naked or 1 -leaved near the base.

1. M. diphylla.
2. M. nuda.
3. Mitella diphylla L. Two-leaved Bishop's Cap, or Mitrewort. (I. F. f. 1848.) Scape $2.5-4.5 \mathrm{dm}$. high, pubescent, bearing a pair of opposite leaves near its middle. Basal leaves acute or acuminate, 3-5-lobed, dentate, scabrous and with scattered hairs on both sides, $2.5-5 \mathrm{~cm}$. long; leaves of the scape similar, usually smaller; raceme o.7-2 dm. long; calyx-lobes and petals white; capsule flattish, broad, dehiscent above. In rich woods, Quebec to Minn., N. H., N. Car. and Mo. April-May.
4. Mitella nùda L. Stoloniferous or Naked Bishop's Cap or MrTREWORT. (I. F. f. 1849.) Usually stoloniferous; scape erect, slender, pubescent, $7-15 \mathrm{~cm}$. high. Basal leaves crenate or doubly crenate, $2-4 \mathrm{~cm}$. wide, pubescent with scattered hairs; stem-leaves usually none; flowers pedicelled, greenish, about 4 mm . broad. In cold woods and peat-bogs, Newf. and Lab. to the Pacific coast, N. Eng., Penn., Mich. and Mont. Also in Asia. April-June.

## 8 CHRYSOSPLÉNIUM L.

Low somewhat succulent mainly semi aquatic herbs, with petioled crenate leaves with no stipules. Flowers minute, greenish, perfect. Calyx-tube urn-shaped or obconic, adnate to the ovary, its limb 4-5-lobed. Petals none. Stamens 8-10 (rarely 4 or 5), inserted on the margin of a disk; filaments short. Ovary 1-celled, flattish, 2-lobed; styles 2, short, recurved; ovules $\infty$. Capsule membranous, short, inversely cordate or 2 -lobed, 2-valved above. Seed-coat muricate or pilose. [Greek, golden spleen, from some reputed medicinal quality.] About 15 species, natives of the north temperate zone and southern S. Am. Besides the following, 2 others occur in northwestern America.

Lower leaves opposite; flowers mostly solitary.
Leaves all alternate; flowers corymbose.

1. C. Americanum.
2. C. Towensis.
3. Crysosplenium Americànum Schwein. Golden Saxifrage. Water Carpet. (I. F. f. 1850.) Stems decumbent, forked above, glabrous or very nearly so, $7-20 \mathrm{~cm}$. long. Lower leaves opposite, the upper often alternate, broadly ovate, orbicular or somewhat reniform, obtuse or trut:cate at the base, rounded at the apex, 4-20 mm. wide; flowers sessile, axillary, about 2 mm . broad; calyxlobes commonly 4 , yellowish, or purplish within; stamens commonly \&; anthers orange-red. In wet, shaded places, N. S. to the Sask. region, south to (ia.., and to Ohio and Minn. March-June.
4. Chrysosplenium Iowénsis Rydb. Iowa Goiden Saxifrage. (I. F. f. 1851.) Flowering stems, $1-7 \mathrm{~cm}$. high, branched above. Leaves reniform, thin, shining above, pale beneath, 4-10 mm. wide, or crenate with 5-7 rather broad lobes; upper stem-leaves larger than the lower; calyx-lobes commonly

4, orange-yellow within; stamens usually 8, rarely 4-6. Decorah, Iowa. MayJune. It has been confused with C. alternifolium L . with dull punctate leaves with truncate lobes and C. tetrandrum Fries, with thick 3 - 5 -lobed leaves and 4 stamens.

## Family 6. HYDRANGEACEAE Dumort. <br> Hydrangea Family.

Shrubs or trees with simple opposite leaves and no stipules. Flowers perfect or the exterior ones of the clusters sterile and conspicuous. Petals and sepals generally 5. Stamens twice as many or numerous, epigynous. Carpels $2-10$, wholly united or the apex free, the lower half at least enclosed by and adnate to the calyx. Seeds numerous ; endosperm generally copious ; embryo small. About 16 genera and 80 species, of temperate and tropical regions.

Stamens 8-10; exterior flowers of the corymb usually neutral.
Stamens 2040 ; all flowers perfect.
Vines; style I; petals small.
Shrubs ; styles 3-5; petals large.

1. Hydrangea.
2. Decumaria.
3. Philadelphus.

## 1. HYDRÁNGEA L.

Shrubs, or some Asiatic species small trees, with opposite simple petioled leaves and terminal corymbose flowers. Exterior flowers of the corymb often apetalous, slender-pedicelled, sterile, but with enlarged and very conspicuous calyx-lobes; fertile flowers small. Calyx-tube hemispheric or obconic, $4-5$-lobed. Petals 4 or 5 . Stamens inserted on the disk. Filaments filiform. Ovary 2- (seldom 3-4-) celled; styles 2-4, distinct, or united at the base; ovules $\infty$. Capsule membranous, usually 2 -celled, ribbed, many-seeded, dehiscent at the bases of the styles. [Greek, watervessel, from the shape of the capsule.] About 35 species, natives of eastern N. Am., Asia and S. Am. Besides the following, 2 others occur in the southeastern States.

Leaves glabrous or somewhat pubescent beneath.
Leaves grayish-tomentose beneath.
r. H. arborscens.
2. H. cinerea.

1. Hydrangea arboréscens L. Wild Hydrangea. (I. F. f. 1858.) A shrub, $\mathbf{I}-3 \mathrm{~m}$. high. Petioles $3-10 \mathrm{~cm}$. long; leaves ovate, thin, $7-15 \mathrm{~cm}$. long, acute or often acuminate at the apex, rounded, cordate or rarely broadly cuneate at the base, sharply dentate, green both sides, sometimes pubescent beneath; cymes $5-13 \mathrm{~cm}$. broad; marginal sterile flowers usually few or none, but sometimes numerous. On rocky stream or river banks, southern N. Y. and N. J. to Iowa, Fla. and Mo. June-July.

Hydrangea arboréscens Kanawhàna Millsp. Leaves pale or somewhat glaucous beneath. W. Va.
2. Hydrangea cinérea Small. Gray Hydrangea. ((I. F. f. 1859.) A shrub 2-3 m. high. Leaves slender-petioled, ovate, rounded or cordate at the base, acute or acuminate at the apex, $7-15 \mathrm{~cm}$. long, green and nearly glabrous above; marginal flowers, or at least some of them, sterile and conspicuous. Has been confused with $H$. radiata. Mo. to Tenn. and Ga. June-July.

## 2. DECUMÀRIA L.

Woody climbing vines, with opposite petioled leaves, and terminal corymbose flowers. Stipules none. Calyx-tube top-shaped, adnate to the ovary, its limb 7-ro-toothed. Petals 7-10, narrow. Stamens inserted on the disk; filaments subulate. Ovary 5-10-celled, 10-15-ribbed, its apex conic; style thick; stigma capitate, 5 -10-lobed; ovules $\infty$. Capsule fragile, ribbed, opening between the ribs. Seeds numerous, the testa membranous, reticulated, produced into a clubshaped appendage. [Latin, decem, ten; the parts being often in ro's.] A monotypic genus of southeastern N. Am.
I. Decumaria bàrbara L. Decumaria. (I. F. f. i860.) Climbing by aerial rootlets. Petioles $1-3 \mathrm{~cm}$. long; leaves ovate, $5-10 \mathrm{~cm}$. long, entire or
repand-denticulate, glabrous and shining above : corymbs $5-8 \mathrm{~cm}$. broad; flowers white, fragrant, $6-8 \mathrm{~mm}$. broad; calyx-teeth deciduous; capsule top-shaped, 4-6 mm . high, tipped with the conic persistent style. In swamps, Va. to Fla. and La. May-June.

## 3. PHILADÉLPHUS L.

Shrubs, with petioled simple deciduous leaves. Flowers large, terminal or axillary, corymbose, racemose or solitary, white or cream-colored. Calyx-tube top-shaped, adnate to the ovary, 4-5-lobed. Petals 4 or 5, convolute, rounded or obovate. Stamens inserted on the disk. Ovary 3-5-celled; styles filiform, distinct, or united at the base; ovules $\infty$. Capsule top-shaped, 3-5-celled, at length loculicidally dehiscent by $3-5$ valves, many-seeded. Seeds oblong, the testa membranous, produced at each end. [Named after King Ptolemy Philadelphus.] About 15 species, natives of N. Am., Mex., Asia and Europe., Besides the following, about 5 others occur in southern and western N. Am.

Flowers inodorous, solitary or few.

Calyx-lobes about equalling the tube, acute.
Calyx-lobes about twice as long as the tube, acuminate.
Flowers racemose, numerous, fragrant.

1. $P$. inodorus.
2. P. grandiflorus.
3. $P$. coronarius.
I. Philadelphus inodòrus L. Scentless Syringa. (I. F. f. 186i.) A shrub, $2-3 \mathrm{~m}$. high, glabrous or very nearly so. Leaves ovate or oval, acute or acuminate at the apex, rounded or sometimes narrowed at the base, $5 \mathbf{- 1 2} \mathrm{~cm}$. long, strongly 3 -nerved, serrate with small distant teeth, or entire; flowers about 3 cm . broad. In thickets, Va. to Ala. and Ga. Escaped from cultivation in Penn. May.
4. Philadelphus grandifiòrus Willd. Large-flowered Syringa. (I. F.f. 1862.) A shrub, $2-3 \mathrm{~m}$. high, resembling the preceding. Leaves broadly ovate or oval, more or less pubescent, especially beneath, $7-12 \mathrm{~cm}$. long, acuminate at the apex, rounded or narrowed at the base, sharply dentate, 3-nerved; flowers 45 cm . broad. In low grounds, Va. to Tenn. and Fla. April-May.
5. Philadelphus coronàrius L. Garden Syringa. Mock Orange. (I. F. f. 1863.) A shrub o.5-3 m. high. Leaves short-petioled, oval, elliptic or ovateelliptic, $5-10 \mathrm{~cm}$. long, glabrous above, pubescent beneath, acute or acuminate at the apex, denticulate with distant teeth, 3 -nerved; flowers $2.5-4 \mathrm{~cm}$. broad, creamy white; calyx-lobes ovate, acute, longer than the tube. Escaped from gardens in Va. and Ohio, and sparingly in the Middle and Eastern States. Native of Europe. May-June

## Family 7. ITEACEAE Agardh. <br> Virginia Willow Family.

Shrubs or small trees with simple alternate leaves, no stipules and racemose flowers. Calyx 5-lobed, adnate to the base of the ovary. Petals 5. Stamens 5, inserted on the disk. Carpels 2, united to or near the apex. Capsule membranaceous, 2-celled, mostly superior, only the base enclosed in the calyx. Seeds several with a copious endosperm.

## r. ÌteA L.

Shrubs or small trees, with petioled decidunus leaves, and small white flowers. Calyx-tube obconic or campanulate. Petals linear, their apices inflexed. Stigma 2-grooved in our species; ovules few or numerous. Capsule oblong or narrowly conic, 2 -valved. Seeds narrow, flattish, the testa produced at each end. [Greek for willow, which its leaves resemble.] About 5 species, natives of the eastern U. S. and Asia. The following is the only one known to occur in N. Am.
I. Itea Virgínica L. Itea. Virginia Willow. (I. F. f. IS64.) A shrub 10-25 $\mathbf{c m}$. high, the twigs and inflorescence finally pubescent. Leaves short-petioled, narrowly oval, oblanceolate or rarely obovate, 3-7 cm. long, acute or acuminate at the apex, narrowed at the base, sharply serrulate, glabrous, or with a few hairs along the veins beneath; racemes terminal, dense, $5-15 \mathrm{~cm}$ long; flowers
short-pedicelled; petals linear, erect or slightly spreading, about 5 mm . Iong; capsule $4-6 \mathrm{~mm}$. long, pubescent, narrow. In wet places, pine barrens of N. J., and eastern Penn. to Fla., western N. Car. and La. May-June.

## Family 8. GROSSULARIÀCEAE Dumort.

Gooseberry Family.
Shrubs, with often fascicled usually lobed petioled leaves, and racemose or subsolitary axillary or lateral flowers, the pedicels bracteolate. Calyx-tube adnate to the ovary, the limb 4-5-lobed, often colored. Petals 4 or 5 , inserted on the throat of the calyx, small, scale-like, often included. Stamens 4 or 5, inserted with the petals. Ovary i-celled; styles 2, distinct or united. Berry globose or ovoid, pulpy, the calyx persistent on its summit. Seeds obscurely angled, their outer coat gelatinous, the inner crustaceous. Only the following genus, having the characters of the family.

## 1. RİBES L.

About 60 species, natives of the north temperate zone and the Andes of S. Am. besides the following some 40 others occur in western N. Am.

Leaves plicate in vernation.
Racemes $\mathrm{I}-4$-flowered; stems generally with subaxillary spines (Gooseberries).
Calyx-lobes oblong, shorter than the tube; berry often spiny or bristly; stamens not exserted.

Calyx-tube ovoid-campanulate, green; berry spiny. 1. R. Cvnosbati.
Calyx-tube tubular; berry bristly or glabrous.
Flowers purplish; spines slender; plant very hairy.
2. R. Huronense.

Flowers whitish; spines stout; plant slightly pubescent. 3. $R$. setosum.

Calyx-lobes equalling or exceeding the tube; berry glabrous.
Calyx-lobes shorter than the tube and ovary; peduncles short.
Stamens scarcely exceeding the oblong calyx-lobes.
Spines stout, usually 3 together; raceme usually r-flowered.
4. R. Uva-crispa.

Spines small, slender or none; raceme 2 -flowered.
5. R. oxyacanthoides.

Stamens somewhat exceeding the linear calyx-lobes.
6. $R$. rotundifolium.

Calyx-lobes much longer than the tube and ovary; peduncle slender; stamens long-exserted.

Spines slender; bark purplish. 7. R. gracile.
Spines stout; bark light gray. $\quad$ 8. R. Missouriensis.
Racemes many-flowered; stem with spines and bristles, calyx saucer-shaped, glan-dular-bristly.
9. R. lacustre.

Racemes many-flowered; stem unarmed; calyx campanulate to tubular. (Currants.) Calyx-tube campanulate.

Berry glandular-bristly, red. 1o. R. prostratum.
Berry glabrous.
Calyx-tube open-campanulate.
Raceme erect or ascending; berry black. 11. R. Hudsonianum.
Raceme pendulous; berry red. 12. . rubrum.
Calyx-tube cylindric-campanulate; berry black. 13. R. floridum.
Calyx-tube tubular, glandular; berry red, more or less glandular.
14. $R$. cereum.

Leaves convolute in bud; stem unarmed; calyx-tube tubular, bright yellow.
15. R. aureum.
r. Ribes Cynósbati L. Wild Gooseberry. Dogberry. (I. F. f. 1865.) Infra-axillary spines slender, solitary or sometimes 2-3 together, erect or spreading, $6-10 \mathrm{~mm}$. long, or often wanting. Prickles few and weak or none; petioles $12-35 \mathrm{~mm}$. long, slender, generally pubescent; leaf-blade nearly orbicular, $3-5 \mathrm{~cm}$. broad, somewhat pubescent, at least when young, truncate or cordate at the base, deeply 3-5-lobed, the lobes crenate-dentate or incised; peduncles and pedicels
slender; berry $8-\mathbf{1 2} \mathrm{mm}$. in diameter, with subulate prickles. In rocky woods, N. B., south to N. Car., west to Manitoba and Mo. April-June.
2. Ribes Huronénse Rydb. Lake Huron Gooseberry. Infra-stipular spines slender, solitary, $8-10 \mathrm{~mm}$. long, ascending; prickles few and weak; stem finely pubescent; petioles slender, $\mathbf{I} \mathbf{- 2} \mathrm{cm}$. long, very pubescent; leaf-blade rounded, obtuse at the base, deeply 5 -lobed, incised, densely and rather coarsely pubescent; peduncles slender but short, about 15 mm . long, generally 3 -flowered; calyx very pubescent; petals broadly cuneate, white; styles distinct to the middle; berry bristly or weakly spiny. Intermediate between the preceding and the following, but more pubescent than either. Type from Lake Huron [R. Cynosbati $y$ Hook].
3. Ribes setòsum Lindl. Bristly Gooseberry. (I. F. f. 1866.) Infraaxillary spines 1-3 together, slender or rather stout, 5-10 mm . long, spreading. Bristles usually numerous and stout; leaves slender-petioled, more or less finely pubescent, at least when young, $1-3 \mathrm{~cm}$. in width, broadly ovate or orbicular, 3-5lobed, the lobes incised-dentate; flowers 1-4, $6-10 \mathrm{~mm}$. long; fruit sparingly bristly, or often glabrous, dark blue, very sour. On lake shores and in thickets, Manitoba to Mont., Neb. and Wyo. May.
4. Ribes Ùva-críspa L. Garden Gooseberry. (I. F. f. 1870.) Spines stout, spreading or reflexed, usually 3 together. Prickles scattered or none; leaves short-petioled, orbicular or broader, pubescent, at least when young, seldom over 2.5 cm . wide, 3-5-lobed, the lobes obtuse and crenate-dentate; peduncles short, 1-2-flowered, usually pubescent; flowers green, about 6 mm . long. Along roadsides in N. J. and N. Y., escaped from gardens. Native of Europe and Asia. May.
5. Ribes oxyacanthoìdes L. Hawthorn or Northern Gooseberry. (I. F. f. 1868.) Spines generally solitary, light colored, 4-10 mm. long, often short. Prickles commonly wanting; leaves petioled; petioles and lower leafsurfaces commonly pubescent; flowers greenish-purple or white, $6-8 \mathrm{~mm}$. long; berry $8-12 \mathrm{~mm}$. in diameter, reddish purple when ripe. In wet woods and low grounds, Lab. and Newf. to the N. W. Terr., N. J. and Neb. May-July.
6. Ribes rotundifòlium Michx. Eastern Wild Gooseberry. (I. F.f. L869.) Closely resembling the preceding, the spines commonly shorter, or often altogether wanting, and the prickles none. Leaves similar, but more shining beneath when young; flowers greenish-purple, $6-8 \mathrm{~mm}$. long; stamens exserted for about $\frac{1}{4}$ their length; berry usually not more than 8 mm . in diameter. In rocky woods, Mass. and N. Y. to N. Car. May-July.
7. Ribes grácile Michx. Slender Gooseberry. (I. F. f. 1867.) Branches slender and generally purplish. Spines slender, solitary, or 2 or 3 together, purplish, 6-10 mm. long or more. Prickles none; leaves slender-petioled, somewhat pubescent when young, orbicular, $2-30.5 \mathrm{~cm}$. wide, truncate or obtuse at the base, $3-5$-lobed, the lobes rather blunt, dentate ; pedicels very slender, $\mathbf{I}-2 \mathrm{~cm}$ : long; flowers white, drooping, $10-12 \mathrm{~mm}$. long: calyx-tube narrow, very short; berry reddish purple, $8-10 \mathrm{~mm}$. in diameter. In dry or rocky soil, Ill. and Kans. to La. and Tex. May.
8. Ribes Missouriénsis Nutt. Missouri Gooseberry. Branches stout, gray or whitish with shreddy bark; spines usually 3 together, stout, $8-15 \mathrm{~mm}$. long; bristles numerous on the young shoots, rather stout. usually none on the older stems and their branches; leaves with stouter petioles, pubescent especially when young, $2-6 \mathrm{~cm}$. in diameter; flowers white, $10-15 \mathrm{~mm}$. long; fruit purple, $10-15 \mathrm{~mm}$. in diameter. It has been confused with the preceding. River banks and plain thickets, from Ill. and Penn. to Minn., Black Hills of S. Iak., and Kans. March-May.
9. Ribes lacústre (Pers.) Poir. Swamp Gooseberry. (I. F. f. IS71.) Spines slender, weak, generally clustered. Branches usually densely bristly; petioles slender, pubescent ; leaves nearly orbicular, thin, pubescent along the veins beneath, deeply $5-7$-lobed, $3-5 \mathrm{~cm}$. wide, the lobes acutish, incised-dentate; flowers green; pedicels slender, bracted at the base, about 4 mm . long; calyx-lobes short, broad, spreading; stamens very short, not exserted; berry about 4 mm . in diameter, reddish, covered with weak bristles. In swamps and wet woods. Newf. to Mass., Penn., Mich., Br. Col. and Wash. May-June.
10. Ribes prostràtum L'Her. Fetid Currant. (I. F. f. 1872.) Branches decumbent or spreading. Petioles slender, $3-7 \mathrm{~cm}$. long, the dilated base sometimes ciliate; leaves nearly orbicular, sharply and deeply $5-7$-lobed, $3-7 \mathrm{~cm}$. wide, usually somewhat pubescent along the veins beneath, the lobes acute or acutish, dentate-serrate ; flowers racemose, about 5 mm . broad ; pedicels $4-5 \mathrm{~mm}$. long, glandular, bracted at the base; stamens short, not exserted. In cold wet places, Lab. to the N. W. Terr. and Br. Col., south to N. Car., Mich. and Colo. Plant with a disagreeable odor. May-June.
II. Ribes Hudsoniànum Richards. Northern Black Currant. (I. F. f. I873.) Branches erect. Petioles slender, $3-10 \mathrm{~cm}$. long; leaves broader than long, $3-10 \mathrm{~cm}$. wide, more or less pubescent and resinous-dotted beneath, 3-5lobed, the lobes obtuse or acutish, coarsely dentate; pedicels 4 mm . long or less; flowers white, $4^{-6} \mathrm{~mm}$. broad; calyx-lobes oval, obtuse; stamens short, not exserted; bracts setaceous, deciduous; fruit black, glabrous, 4-6 mm. in diameter. Hudson Bay and western Ont. to N. W. Terr. May-June.

Ribes nigrum L., the Black Currant of the gardens, with similar leaves, but loosely flowered drooping racemes, is beginning to escape from cultivation.
12. Ribes rùbrum L. Red Currant. (I. F. f. 1875.) Petioles slender, glabrous or sparingly pubescent, $3-8 \mathrm{~cm}$. long; leaves pubescent beneath, at least when young, orbicular or broader, cordate at the base, 3-5-lobed, the lobes acutish, sharply dentate; pedicels longer than the ovate bractlets; flowers greenish or purplish, about 4 mm . broad; calyx flat-campanulate; stamens short; fruit 4-8 mm. in diameter. In cold woods, Lab. to Alaska, northern N. Eng, N. J., Ind. and Minn., and escaped from cultivation in the Middle and Eastern States. Also in Europe and Asia. May-June.
13. Ribes fóridum L'Her. Wild Black Currant. (I. F. f. I874.) Branches erect. Petioles slender; leaves nearly orbicular, glabrous above, somewhat pubescent and resinous-dotted beneath, $3-8 \mathrm{~cm}$. wide, sharply 3 - 5 -lobed, the lobes dentate-serrate, acutish; bractlets linear, much exceeding the pedicels, or shorter; flowers greenish-white, 8 -10 mm . long; calyx-lobes short, broad, obtuse; stamens not exserted; fruit globose-ovoid, about 6 mm . in diameter. In woods, N. S. to Va., Manitoba, and Neb. April-May.
14. Ribes cèreum Dougl. White-flowered Currant. Squaw Currant. (I. F. f. 1876.) Petioles more or less glandular-pubescent, $6-20 \mathrm{~mm}$. long; leaves reni-form-orbicular, cordate at the base, $1-4 \mathrm{~cm}$. wide, sparingly glandular-pubescent, or glabrate on both sides, $3-5$-lobed, the lobes obtuse, crenate or crenulate: racemes short, pubescent, pendulous; bractlets persistent; flowers sessile or short-pedicelled, pink or greenish-white; petals minute, nearly orbicular; stamens short; fruit insipid, about 6 mm . in diameter. Dry hills, from S. Dak. and Neb., to Br. Col., Ariz. and Cal. May-June.
15. Ribes aùreum Pursh. Golden, Buffalo or Missouri Currant. (I. F. f. I877.) Petioles slender, pubescent, at least when young; leaves pubescent and ciliate, or at length glabrous and shining, often broader than long, thick, 3lobed or sometimes 5 -lobed, broadly cuneate or truncate at the base, the lobes obtuse; racemes leafy-bracted, few-flowered; flowers spicy-scented, $\mathbf{I} 2-25 \mathrm{~mm}$. long; calyx-tube cylindric, glabrous, 3-4 times as long as the oval spreading lobes; stamens slightly exserted; fruit black, glabrous, 6-10 mm. in diameter. Along streams, Minn. to Mo., Tex., Cal., Ore. and the N. W. Terr. April-May.

Ribes aùreum chrysocòccum Rydb. Fruit yellow when mature, more acid. Western Neb, to Mont.

Family 9. HAMAMELIDÀCEAE Lindl.
Witch Hazel Family.
Trees or shrubs, with alternate petioled simple leaves, and perfect or polygamous flowers, variously clustered. Perianth often imperfect, or sometimes none. Calyx-tube, when present, more or less adnate to the ovary, its limb truncate or 5 -lobed. Petals, when present, $4^{-\infty}$, perigy-
nous. Stamens $4-\infty$, perigynous; filaments distinct. Disk circular or none. Ovary compound, of 2 carpels united below, 2 -celled; styles 2, subulate, erect or recurved; ovules 1- $\infty$. Fruit a 2 -celled 2 -beaked woody or cartilaginous capsule, dehiscent at the summit. Seeds 1 -several, anatropous; embryo large; endosperm scanty. About 15 genera and 35 species, natives of N. Am., Asia and South Africa.
Ovules I in each cavity; flowers perfect or polygamous; shrubs or small trees; fruit not spiny.

Flowers white, in catkin-like spikes; petals none. 1. Fothergilla.
Flowers yellow, in axillary clusters; petals long. 2. Hamamelis.
Ovules several in each cavity; flowers monœecious; large trees ; fruit globular, spiny.
3. Liquidambar.

## r. FOTHERGÍLLA Murr.

Shrubs, the foliage somewhat stellate-pubescent. Leaves alternate, obovate. Flowers in catkin-like bracted terminal spikes, appearing a little before the leaves. Calyx campanulate, slightly 5-7-lobed. Petals none. Stamens about 24, inserted on the edge of the calyx; anthers subglobose. Ovary 2 -celled; styles slender. Capsule cartilaginous, 2-celled, 2 -seeded. Seeds bony, pendulous. [Named for Dr. John Fothergill, 1712-1780, an English naturalist.] Two or three species of eastern N. Am.
r. Fothergilla Carolìna (L.) Britton. Fothergilla. (I. F. f. 1878.) A shrub, $6-15 \mathrm{dm}$. high, the young twigs densely stellate-pubescent. Leaves shortpetioled, $5-8 \mathrm{~cm}$. long, obovate or broadly oval, obtuse or short-pointed at the apex, usually inequilateral, coarsely dentate-crenate above the middle, or entire; spikes erect, $3-5 \mathrm{~cm}$. long; bracts densely pubescent, the lower ones sometimes lobed; stamens white or pinkish, $4-8 \mathrm{~mm}$. long; capsule very pubescent. In wet grounds, Va. to Ga. April.

## 2. HAMAMELLIS L.

Shrubs, with alternate leaves, and clustered lateral yellow bracted flowers, appearing in late summer or autumn. Calyx 4 -parted, persistent, adnate to the lower part of the ovary. Petals 4, elongated, linear, persistent, or in the staminate flowers sometimes wanting. Stamens 4 , alternating with 4 scale-like staminodia; filaments very short; anthers dehiscent by a valve. Ovary 2-celled; styles 2, short; ovules I in each cell, pendulous. Capsule woody, at length 2 -valved at the summit. Seed oblong, its testa shining. [Greek, with the apple, flower and fruit being borne together.] Three known species, one native of eastern N. Am., the others of Japan.
I. Hamamelis Virginiàna L. Witch-Hazel (I. F. f. 1879.) A shrub, or rarely a small tree. Leaves short-petioled, obovate or broadly oval, somewhat cordate and inequilateral at the base, stellate-pubescent, at least when young, 5-12 cm . long, thick, repand-dentate; flowers in axillary clusters, nearly sessile; petals about I mm. wide, $\mathbf{1 2 - 1 8} \mathrm{mm}$. long; capsule maturing the next season, $6-8 \mathrm{~mm}$. high, at length bursting elastically; seeds large, bony. In low woods, N. B. and N. S. to Minn., Mo., Fla. and Tex. Aug.-Dec.

## 3. LIQUIDÁMBAR L.

Large trees with resinous sap, simple alternate lobed petioled leaves, and small monoccious flowers in heads, the staminate clusters racemose, the pistillate ones usually solitary. Calyx and corolla of the staminate flowers none; stamens numerous; filaments short; anthers longitudinally dehiscent. Calyces of the pistillate flowers confluent; petals none; anthers rudimentary, borne on the edge of the calyx; ovary partly inferior, 2 -celled; ovules several or numerous; styles 2. Capsule's 2beaked, 2 -valved at the summit, dry, hard, forming a dense spinose globular head. [Name Latin-Arabic referring to the fragrant sap.]

1. Liquidambar Styracíflua L. Sweet Gum. Star-leated or Red Gum. Bilsted. Alligator-tree. (I. F.f. 1880.) A forest tree, maximum height about 45 m . ; bark very rough, branches usually winged with corky ridges. Leaves broader than long, $7-20 \mathrm{~cm}$. wide, subcordate at base, deeply $3-7$-lobed,
often pubescent in the axils of the veins beneath, the lobes triangular-ovate, acute, sharply and finely serrate; sterile flower-clusters erect, of numerous small heads, greenish; fertile heads long-peduncled, at length drooping, borne near the base of the sterile; head of fruit about $3-4 \mathrm{~cm}$. in diameter, the fertile seeds few, with numerous minute sterile ones. In low woods, Conn. and southern N. Y. to Fla., Ill., Mo. and Mex. April-May.

## Family 10. PLATANÀCEAE Lindl.

## Plane-tree Family.

Large trees, with alternate petioled palmately lobed and veined leaves, the hollowed petiole bases enclosing the buds for the following season, and small green monœecious flowers in dense globular heads. Receptacle somewhat fleshy. Calyx of 3-8 externally pubescent minute sepals. Corolla of as many thin glabrous petals. Staminate flowers with stamens as many as the sepals and opposite them ; filaments short; anthers oblong or linear, longitudinally dehiscent. Pistillate flowers with $2-8$ distinct pistils; ovary linear, I-celled ; style elongated; stigma lateral. Ripened head of fruit composed of very numerous narrowly obpyramidal nutlets which are densely pubescent below with long nearly erect hairs. Seed pendulous; endosperm thin; cotyledons linear. Only the following genus, comprising some 7 species, natives of the north temperate zone.

## 1. PLÁtanUS L.

Characters of the family. [Name ancient.] Besides the following species, 2 others occur in the western U. S. and I or 2 in Mex.
r. Platanus occidentàlis L. Button-wood. Button-ball. Plane-tree. (I. F. f. 188I.) A large tree; maximum height about $40 \mathrm{~m} . ;$ outer bark freely peeling off in thin plates, uncovering the bright white inner layers. Leaves orbicular, or wider than long, $10-25 \mathrm{~cm}$. wide, cordate or truncate at the base, $3-5$-lobed, densely floccose pubescent with whitish branched hairs when young, becoming nearly glabrous when old, the lobes sharply serrate, or rarely entire ; stipules with broad spreading toothed borders, conspicuous on joung shoots; fruiting heads 2 cm . in diameter, usually solitary, hanging on a long peduncle, persistent through the winter. Along streams and in wet woods, Me. to Ont. and Minn., Fla., Kans. and Tex. May.

## Family 11. ROSÀCEAE* B. Juss. <br> Rose Family.

Herbs, shrubs, or trees, with alternate (in some exotic genera opposite) leaves, and regular perfect or rarely polygamo-dioecious flowers. Stipules commonly present, sometimes large. Calyx free from or adnate to the ovary, 5 -lobed (rarely 4-9-lobed), often bracteolate. Disk adnate to the base of the calyx. Petals equal in number to the calyx-lobes, distinct, or none. Stamens usually numerous, distinct; anthers small, 2-celled. Carpels $1-\infty$, distinct, or adnate to the calyx. Ovary i-celled or rarely imperfectly 2 -celled; style terminal or lateral. Ovules I, 2, or several, anatropous. Fruit mostly follicles or achenes ; endosperm none, or rarely copious. About 65 genera and 1200 species, of wide geographic distribution.
I. Fruit not enclosed in a hollow receptacle, the so-called calyx.

Pistils few, seldom more than 5 , ripening into $2-4$-seeded follicles. Follicles dehiscent along both sutures; seeds shining. 1. Opulaster. Follicles dehiscent along one suture; seeds dull.

Pistils alternate with the calyx-lobes.
Flowers perfect; leaves simple; shrubs.
Flowers diocious; leaves 2-3-pinnate; tall herbs. Spiraea. Flowers diæcious; leaves 2-3-pinnate; tall herbs. 3. Aruncus.

[^28]Pistils opposite the calyx-lobes; petals white.
Follicles united at the base ; petals obovate or oblong ; leaves pinnate.
4. Sorbaria.

Follicles free; petals strap-shaped; leaves trifoliolate.
5. Porteranthus.

Pistils numerous or rarely few, ripening into $1-2$-seeded drupelets or achenes.
Pistils ripening into drupelets crowded on the receptacle.

Drupelets very pulpy.
Drupelets nearly dry, enclosed by the calyx. Pistils ripening into achenes.

Style deciduous.
Style nearly basal; ovules ascending or nearly erect, orthotropous; leaves pinnate.
8. Drymocallis.

Style lateral; ovules ascending and amphitropous.
Achenes hairy ; low shrubs.
Leaves pinnate ; style club-shaped ; flowers yellow.
9. Dasiphora.

Leaves trifoliolate ; style filiform; flowers white.
10. Sibbaldiopsis.

Achenes glabrous; herbs.
Achenes 10-15; stamens 5; leaves trifoliolate.
11. Sibbaldia.

Achenes numerous; stamens about 20.
Receptacle much enlarged and red in fruit ; leaves trifoliolate.

Receptacle pulpy, edible; petals white.
12. Fragaria.

Receptacle not pulpy ; petals yellow.
13. Duchesnea.

Receptacle in fruit somewhat enlarged, spongy ; leaves pinnate; petals red.
14. Comarum.

Receptacle not enlarged in fruit; leaves interruptedly pinnate ; petals yellow. 15. Argentina.
Style terminal or nearly so.
Pistils numerous; ovules pendulous and anatropous.
16. Potentilla.

Pistils 2-6; ovules basal, erect.
17. Waldsteinia.

Style persistent on the achene.
Pistils numerous; herbs.
Calyx-lobes and petals 5 ; leaves interruptedly pinnate.
Style jointed above, the upper portion deciduous.
18. Geum.

Style not jointed. 19. Sieversia.
Calyx-lobes and petals 8 or 9 ; leaves simple; styles plumose
20. Dryas.

Pistil solitary; achene with a long plumose style; shrubs.
21. Cercocarpus.

Pistils 5-15; fruit resembling a follicle, but indehiscent and 1 -seeded ; style not plumose; herbs.
22. Ulmaria.
2. Fruit, r-4 achenes, enclosed in the persistent dry receptacle; herbs.

Calyx with 4 or 5 bractlets; petals none. 23. Alchemilla.
Calyx not bracteolate.
Calyx bearing hooked prickles; petals 5. 24. Agrimonia.
Calyx not prickly; petals none. 25. Sanguisorba.
3. Fruit, numerous achenes, enclosed in the fleshy receptacle; shrubs with pinnate leaves.
26. Rosa.

## 1. OPULÁSTER Medic.

Branching shrubs, with petioled simple palmately lobed leaves, and white flowers in terminal corymbs. Calyx campanulate, 5 -lobed. Petals 5 rounded, inserted in the throat of the calyx, Stamens 20-40, inserted with the petals. Pistils $\mathbf{I}-5$, short-stipitate, when 5 alternate with the calyx-lobes. Stigma terminal, capitate. Pods I-5, inflated, 2-4-seeded. Seeds oroid or globose, crustacoous, shining; endosperm copious. [Greek, a wild Opulus, or cranberry-tree.] Species about 8, 3 of eastern N. Am., 4 of the Rocky Mts. and Pacific Coast. I in Mantchuria.
Follicles mostly 5, glabrous.

1. O. opulifolius.

Follicles 2-4, finely pubescent.
2. O. intermedius.

1. Opulaster opulifolius (L.) Kuntze. Eastern Ninebark. (I. F. f. 1882.) A shrub, $\mathrm{P}-3 \mathrm{~m}$. high, with recurved branches, glabrous twigs and foliage, the bark peeling off in thin strips. Stipules caducous; leaves ovate-orbicular, generally acutely 3 -lobed, cordate, truncate or broadly cuneate at the base, $3-5 \mathrm{~cm}$. long, crenate-dentate; pedicels slender, $10-16 \mathrm{~mm}$. long; flowers white or purplish; calyx glabrous or nearly so; follicles 5 , glabrous, shining, $8-10 \mathrm{~mm}$. long, acute, obliquely subulate-tipped, twice as long as the calyx. River-banks and in rocky places, Quebec to Ky. and Ga. June.
2. Opulaster intermédius Rydb. Prairie Ninebark. Like the preceding, but generally lower, $\mathbf{I - I . 5} \mathrm{m}$. high; leaves orbicular in outline, with rounded lobes, $2-6 \mathrm{~cm}$. long, obtuse or subcordate at the base, crenate; pedicels and calyx finely pubescent; ovaries 3 or 4, rarely 2, pubescent, united below, follicles $6-7 \mathrm{~mm}$. long, rounded or obtuse at the apex, tipped with a subulate style. River banks from III. and Mo. to Colo. and S. Dak.

## 2. SPIRAEA L.

Shrubs. Flowers racemose, cymose, corymbose or paniculate, white or pink, perfect. Calyx persistent, its tube $4-5$-lobed. Petals $4-5$, inserted on the calyx, short-clawed. Stamens 20-60, distinct, inserted on the calyx; filaments filiform. Disk adnate to the calyx-tube. Pistils commonly 5 (rarely I-8), superior, alternate with the calyx-lobes. Stigmas capitate or discoid; ovules $2-\infty$. Follicles usually 5, not inflated. Seeds linear, pendulous, the testa dull. [Greek, twisting, the pods twisted in some species.] About 60 species, natives of the north temperate zone. Besides the following, about 5 others occur in western N. Am.
Flowers in dense terminal panicles.

$$
\text { Glabrous or nearly so throughout. } \quad \text { I. S. salicifolia. }
$$

Twigs and lower surfaces of the leaves woolly-pubescent.
2. S. tomentosa. Flowers in terminal corymbs.

Leaves broadly oval or ovate, thick, serrate. 3. S. corymbosa.
Leaves oblong, thin, nearly entire.
4. S. Virginiana.
r. Spiraea salicifòlia L. Willow-leaved or American Meadow-sweet. Quaker Lady. (I. F. f. 1883.) An erect shrub, 6-12 dm. high. Leaves petioled, oblanceolate, obovate, lanceolate or oval, sharply serrate, especially above the middle, $3-5 \mathrm{~cm}$. long, $8-24 \mathrm{~mm}$. wide, or on young shoots much larger, mainly cuneate at the base, pale beneath; flowers white or pinkish-tinged, $4-6 \mathrm{~mm}$. broad; follicles glabrous. In swamps or moist ground, Newf. to the Rocky Mts., Ga. and Mo. Also in northern Europe and Asia. June-Aug.
2. Spiraea tomentòsa L. Hardhack. Steeple-bush. (I. F. f. 1884.) Erect, shrubby, usually simple, the stems floccose-pubescent. Leaves shortpetioled, ovate or oval, $3-5 \mathrm{~cm}$. long, $\mathbf{1 2 - 2 5} \mathrm{mm}$. wide, unequally serrate, glabrous and dark-green above, woolly-pubescent with whitish hairs beneath; flowers pink or purple, rarely white, about 4 mm . broad; follicles pubescent. In swamps and low grounds, N. S. to Manitoba, Ga. and Kans. July-Sept.
3. Spiraea corymbòsa Raf. Corymbed Spiraea. (I. F. f. 1885.) A shrub, 3-ro dm. high, nearly glabrous throughout. Leaves petioled, rounded or slightly cordate at the base, serrate, especially above the middle, green above, paler and sometimes minutely pubescent beneath, $4-7 \mathrm{~cm}$. long, $3-5 \mathrm{~cm}$. wide; flowers white, about 4 mm . broad; follicles glabrous. On banks or in rocky places, mountains of Ga. to N. J., Ky. May-June.
4. Spiraea Virginiàna Britton. Virginia Spiraea. (I. F. f. 1886.) A glabrous much-branched shrub, the branches forming wands $3-12 \mathrm{dm}$. long. Leaves petioled, cuneate or rounded at the base, $4-5 \mathrm{~cm}$. long, $10-16 \mathrm{~mm}$. wide, green above, pale or slightly glaucous beneath, entire, or with a few low teeth above the middle; flowers white, about 6 mm . wide; pedicels and calyx glaucous; follicles glabrous. On rocks, W. Va., to the mountains of N. Car. and Tenn. June.

Spiraea Japónica L. f., with oblong-lanceolate acuminate cut-toothed leaves, the branches and corymbose inflorescence finely pubescent, occurs as an escape from cultivation in E. Penn.

## 3. ARÚNCUS Adans.

Tall perennial herbs, with large 2-3-pinnate leaves, stipules minute or wanting, and very numerous white diœcious flowers in panicled spikes. Calyx mostly

5-lobed. Petals as many as the calyx-lobes. Stamens numerous, inserted on the calyx; filaments filiform. Pistils usually 3, alternate with the calyx-lobes. Follicles glabrous, at length reflexed, usually 2 -seeded. Seeds minute, not shining. Two known species, the following of the north temperate zone, the other Japanese.
I. Aruncus Arúncus (L.) Karst. Goat's-beard. (I. F. f. 1887.) Glabrous throughout, stem erect, somewhat branched, $\mathbf{1} \mathbf{- 2} \mathbf{~ m}$. high. Leaves long-petioled, the lower 3 dm . long or more; leaflets ovate, lanceolate or oval, thin, acuminate or acute at the apex, rounded or slightly cordate, sharply doubly serrate or incised, 3-7 cm. long; inflorescence compound, branches spike-like, elongated; flowers 2-4 mm. wide; follicles short. In rich woods, Penn. to Iowa, Ga. and Mo. Also from Ore. to Alaska, and in northern Europe and Asia. May-July.

## 4. SORBARIA A. Br.

Shrubs with stipules, odd-pinnate leaves and white flowers in terminal panicles. Calyx openly campanulate, 5 -lobed. Petals 5, obovate or oblong. Stamens 2040; pistils mostly 5 , united at the base. Carpels not inflated. Seeds several, pendulous, with endosperm. About 4 Asiatic closely related species.
r. Sorbaria sorbifolia (L.) A. Br. Mountain-ash Spiraea. Large shrub, pubescent when young, glabrate in age. Leaflets 13-2I, lanceolate, acuminate, sharply and doubly serrate, dark green. Native of Siberia, often cultivated for ornament and escaped in the Middle States. June-Sept.

## 5. PORTERÁNTHUS Britton.

Erect perennial herbs, with nearly sessile stipulate 3-foliolate or 3-parted leaves, and white or pinkish perfect flowers in loose terminal panicles. Calyx cylindric, persistent, narrowed at the throat, Io-nerved, 5 -toothed, the teeth imbricated, slightly glandular. Petals 5, linear-lanceolate, spreading, convolute in the bud, somewhat unequal, inserted on the calyx. Stamens 10-20, included; filaments short; anthers large. Carpels 5, villous-pubescent, opposite the calyxlobes. Ovules ascending; style filiform. Follicles 5, 2-4-seeded. Seeds with endosperm. [In honor of Thomas Conrad Porter, Professor in Lafayette College.] Only the following species.
Leaflets serrate; stipules subulate, mainly entire.

1. P. trifoliatus.
Leaflets incised; stipules broad, foliaceous, incised.
2. P. stipulatus.
I. Porteranthus trifoliàtus (L.) Britton. Indian Physic. Bowman'sroot. (I. F. f. I888.) Herbaceous from a perennial root, erect, branching, 6-12 dm. high, glabrous or somewhat pubescent ; leaflets short-stalked, oval, ovate, lanceolate or slightly obovate, acuminate at the apex, narrowed at the base, $5-7 \mathrm{~cm}$. long, irregularly serrate; upper leaves often 3 -lobed, or sometimes merely serrate; pedicels slender ; petals white or pinkish, $10-12 \mathrm{~mm}$. long; pods pubescent, subu-late-tipped, little exceeding the calyx. Woodlands, N. Y. to Mich., Ga. and Mo. May-July.
3. Porteranthus stipulatus (Muhl.) Britton. American Ipecac. (I. F. f. 1889.) Resembling the preceding species, but generally more pubescent. Stipules foliaceous, broad, ovate, acuminate or acute, $8-25 \mathrm{~mm}$. long, sharply incised-serrate; leaflets commonly narrower than those of the preceding, incised-serrate, or those of the lower leaves deeply pinnatifid; pods less pubescent or sometimes quite glabrous. In woods, western N. Y. to Ind. and Kans., south to Ala., La. and the Ind. Terr. June-July.

## 6. RÙBUS L.

Perennial herbs, shrubs or trailing vines, often prickly, with alternate simple lobed or 3-7-foliolate leaves, the stipules adnate to the petiole. Flowers terminal or axillary, solitary, racemose or panicled, white, pink or purple, perfect or sometimes diocious. Calyx persistent, not bracted, deeply 5 -parted, its tube short and broad. Petals 5, deciduous. Stamens $\infty$. usually numerous, inserted on the calyx, distinct. Carpels $\infty$, rarely few. inserted on a convex or clongated receptacle, ripening into drupelets and forming an aggregate fruit. ()vules 2 , one abortive. Style nearly terminal, slender. Seed pendulous. [The ancient name of the
bramble, from ruber, red.] About 250 species, of wide geographic distribution, most abundant in the north temperate zone. Besides the following, some 10 others occur in N. Am. beyond our area. The stems of many species are biennial.

## A. Leaves simple, crenate or palmately lobed.

Shrubby, ${ }^{6-15} \mathrm{dm}$. high, branched; flowers corymbose.
Flowers numerous, red-purple.
Lobes of the leaves broadly triangular, dentate. I. R. odoratus.
Lobes of the leaves lanceolate, incised-dentate.
2. R. Columbianus.

Flowers few, white; western.
3. $R$. parviflorus.
4. R. Chamaemorus.

## B. Leaves $3-7-$ foliolate.

## 1. Fruit falling away from the dry receptacle. Raspberries.

Herbaceous, usually unarmed, 1-3-flowered; leaves not white beneath.

Petals pink, spreading.
5. $R$. arcticus.

Petals white, erect.
Shrubby; many-flowered; leaves white-pubescent beneath.
Stems bristly, not glaucous; fruit light red.
Stems prickly, slightly glaucous; fruit dark red.
Stems prickly, very glaucous; fruit purple-black.
2. Fruit persistent on the fleshy receptacle.

Blackberries and Dewberries.

* Erect, recurved or ascending ; fruit black.

Leaflets laciniate or deeply incised.
10. R. laciniatus.

Leaflets serrate or slightly incised.
Leaves white-woolly beneath.
11. R. cuncifolius.

Leaves not white-woolly beneath.
Inflorescence distinctly glandular.
Fruit broadly oval or nearly spherical, very pulpy.
Fruit narrowly oblong or thimble-shaped.
12. R. nigrobaccus.
13. R. Allegheniensis.

Inflorescence and leaves decidedly villous, scarcely glandular.
Terminal leaflet one-half longer than the lateral ones, oblong or oblongovate.
14. R. ostryifolius.

Terminal leaflet slightly larger than the lateral ones, obovate or rhombicobovate.
15. R. frondosus.

Inflorescence slightly villous.
Plant low, almost herbaceous, weakly prickly.
Plants tall and shrubby.
Plant strongly prickly.
16. R. Randii.

Plant unarmed or with a few weak prickles.
17. R. argutus.
18. R. Canadensi

* Trailing or decumbent.
+ Stem prickly (no. 19 also bristly) ; fruit black.
Leaves thick, coriaceous, persistent.
Flowers corymbose; stem very bristly; leaves, except those of the flowering branchlets, 5 -foliolate.

19. R. rubrisetus.

Flowers I-3; stem scarcely bristly; leaves mostly 3 -foliolate.
20. R. trivialis.

Leaves thin, deciduous.
Inflorescence usually many-flowered.
Flowers generally over 3 cm . in diameter; inflorescence generally glandular; terminal leaflet of sterile shoots rounded or cordate at the base. Leaflets simply serrate.
21. R. invisus.

Leaflets sharply doubly serrate.
22. R. roribaccus.

Flowers generally less than 3 cm . in diamleter; inflorescence not glandular; terminal leaflet of the sterile shoots cuneate or obtuse at the base.
Terminal leaflet one-half longer than the lateral ones, oblong or oblong-ovate, acute. 14. R. ostryifolius.
Terminal leaflet only slightly longer than the lateral ones, ovate, acuminate.
23. R. procumbens.

Inflorescence usually 1-2-flowered.
Leaflets cuneate at the base; glabrous.
Leaflets sharply serrate with triangular teeth.
24. $R$. subuniflorus.

Leaflets crenate serrate with ovate teeth. 25. R. Ensleni.
Leaflets rounded or cordate at the base, pubescent beneath.
26. R. Baileyanus,
$\dagger+$ Stem bristly or weakly prickly; fruit red or, when ripe, almost black.
Leaflets thick; inflorescence stout, strongly bristly or weakly prickly.
27. R. nigricans.

Leaflets thin; inflorescence sparingly and weakly bristly.
Some of the leaves quinate; leaflets of the flowering shoots oblanceolate or narrowly cuneate.
28. R. setosus.

All leaves ternate; leaflets of the flowering shoots broadly obovate.
29. R. hispidus.
$\dagger \dagger+$ Stem unarmed; fruit red.
6. R. Americanus.
I. Rubus odoràtus L. Purple-flowering Raspberry. (I. F. f. i8go.) Erect, branched, shrubby; glandular-pubescent and somewhat bristly, not prickly, I-I. 5 m . high. Stipules small, lanceolate, acuminate ; leaves simple, petioled, sometimes nearly 3 dm . broad, $3-5$-lobed, cordate at the base, pubescent, the lobes acuminate, finely serrate; flowers $3-5 \mathrm{~cm}$. broad; bracts membranous; calyx-lobes tipped with a slender appendage; fruit red when ripe, depressed-hemispheric, scarcely edible. In rocky woods, N. S. to Ont., Mich., Ga. and Tenn. A form with white flowers has been found at Pine Hill, Ulster Co., N. Y. June-Aug.
2. Rubus Columbiànus (Millsp.) Rydb. Maple-Leaved Raspberry. Erect, shrubby, glandular-pubescent, rarely bristly. Leaves simple, slender-petioled, 5-7-lobed to near the middle, cordate at the base; lobes lanceolate, acuminate, doubly and sharply dentate; flowers smaller than in the preceding, $2-3 \mathrm{~cm}$. broad; calyx-lobes ovate, with almost subulate tips; fruit red, small, depressed, of a very musky taste. Mountains of W. Va. July. [R. odoratus var. Columbianus Millsp.]
3. Rubus parviflòrus Nutt. Salmon-berry. White-flowering Raspberry. (I. F. f. i891.) Similar to $R$. odoratus but usually less glandular and scarcely bristly. Leaves petioled, simple, cordate at the base, $3-5$-lobed, the lobes acute or obtusish, rarely acuminate, coarsely and unequally serrate; flowers few, corymbose, white, terminal, $3-5 \mathrm{~cm}$. broad; calyx-lobes tipped with a long, slender appendage ; fruit depressed-hemispheric, scarcely edible, red when ripe. In woods, Mich., Minn. and western Ont. to Alaska, Cal., Utah and Colo. MayJuly.
4. Rubus Chamaemòrus L. Cloudberry. Knotberry. Mountain Bramble. Mountain Raspberry. (I. F. f. 1892.) Herbaceous; rootstock creeping; branches erect, $4-25 \mathrm{~cm}$. high, finely pubescent or nearly glabrous, scaly below; leaves orbicular or broader, $5-9$-lobed, cordate or reniform at the base, pubescent or glabrous, 3-7 cm. broad, the lobes usually short, broad, dentate; flowers diœcious, solitary, terminal, white, $\mathbf{1 2 - 2 5} \mathrm{mm}$. broad: sepals ovate, shorter than the petals, sometimes toothed toward the apex; fruit red at first, yellow when ripe, composed of few drupelets, edible and pleasant. In peat-bogs and swamps, Me. and N. H. to Arctic Am., Alaska and Br. Col. Also in northern Europe and Asia. June-July.
5. Rubus árcticus L. Arctic Raspberry or Bramble. (I. F. f. I893.) Stems erect, herbaceous, $7-25 \mathrm{~cm}$. high, unarmed, finely pubescent, sometimes leafless below. Leaves 3 -foliolate (rarely 5 -foliolate); leaflets sessile or shortstalked, rhombic-ovate or obovate, coarsely and unequally serrate or slightly lobed. 18-25 mm. long; flowers solitary, or occasionally 2 , slender-peduncled, pink. $\mathbf{1 2 - 2 5} \mathrm{mm}$. broad, sometimes diœecious; sepals acute, equalling or shorter than the obovate petals; fruit light red, of several or numerous drupelets, edible, fragrant. In peat-bogs and damp woods, Quebec to Manitoba and Br. Col.. and throughout Arctic Am. Also in Europe and Asia. Summer.
6. Rubus Americànus (Pers.) Britton. Dwarf Raspberry. (I. F. f. 1897.) Stem trailing or ascending, unarmed, anmual, herbaceous or slightly woody, $15-45 \mathrm{~cm}$. long, somewhat pubescent. Leaves petioled. 3 -foliolate, rarely 5 -foliolate; leaflets rhombic-ovate, glabrous or nearly so, acute, the lateral ones mostly rounded, the terminal one cuneate at the base, all sharply serrate; peduncles slender, $\mathbf{I}-3$ flowered, glandular-pubescent; flowers $\$ 12 \mathrm{~mm}$. hroad; oetals 5-7, white, spatulate-oblong, erect, rather longer than the acuminate reflexed sepals; fruit red-purple, about 12 mm . long. In swamps, Newf. to Manitoba, N. J. and Neb. Intermediate between Blackberries and Raspberries. May-July.
7. Rubus strigòsus Michx. Wild Red Raspberry. (I. F. f. 1894.) Stems shrubby, biennial, branched, 5-20 dm. high, usually densely clothed with weak glandular bristles, or the older stems with small hooked prickles. Leaves pinnately $3-5$-foliolate; leaflets ovate or ovate-oblong, acuminate, sharply and irregularly serrate or slightly lobed, rounded at the base, $3-7 \mathrm{~cm}$. long; inflorescence racemose or paniculate, loose; pedicels slender, curving in fruit; flowers $8-12 \mathrm{~mm}$. broad; petals white, ascending, about equalling the spreading acuminate sepals; fruit eiongated-hemispheric, light red, white in a cultivated form. In dry or rocky situations, Newf. and Lab. to Manitoba, Br. Col., N. Car., and N. Mex. May-July.
8. Rubus negléctus Peck. Purple Wild Raspberry. (I. F. f. 1895.) Intermediate between the preceding species and the next. Stems recurved and rooting at the tip, glaucous, sparingly bristly and prickly; leaflets ovate, sharply and irregularly incised-serrate, $2-8 \mathrm{~cm}$. long; inflorescence corymbose, rather compact; pedicels erect or ascending even in fruit; flowers $8-10 \mathrm{~mm}$. broad; petals white, erect; fruit nearly hemispheric, dark-red or purple (yellowish in a cultivated form). In dry or rocky soil, N. Eng. to Penn. June-July. Fruit ripe July-Aug.
9. Rubus occidentàlis L. Black Raspberry. Thimble-berry. BlackCAP. (I. F. f. I896.) Very glaucous; stems cane-like, recurved, often rooting at the tip, sometimes $3-4 \mathrm{~m}$. long, sparingly armed with hooked prickles, rarely slightly glandular-bristly above. Leaves pinnately 3 -foliolate (rarely 5 -foliolate); leaflets ovate, acuminate, coarsely incised-serrate; flowers as in the preceding species; inflorescence corymbose, compact, usually only terminal; pedicels short, ascending or erect in fruit; fruit purple-black, depressed-hemispheric. Quebec and Ont., to Ga. and Kans. May-June.
10. Rubus laciniàtus Willd. Cut-leaved Blackberry. Stem ascending, $2-3 \mathrm{~m}$. high, pale green or purplish, angled, with stout flat recurved prickles; the young shoots villous. Leaves pedately $3-5$-foliolate; leaflets often again pinnately $3-5$-foliolate, laciniate or deeply incised and serrate, villous beneath; inflorescence cymose-paniculate; flowers $2-3 \mathrm{~cm}$. wide ; petals white, obovate-cuneate, often lobed at the apex; sepals more or less foliaceous and lobed; fruit large, black, hemispheric. Escaped from cultivation in S. N. Y. and Penn.; also in Ore. and Wash. Supposed to be a native of Europe. June-Aug.
ir. Rubus cuneifolius Pursh. Sand Blackberry. Knee-high Blackberry. (I. F. f. igoi.) Shrubby, $3-10 \mathrm{dm}$. high, much branched, armed with stout straight or recurved prickles. Leaves $3-5$-foliolate; leaflets thick, rugose above, $2-5 \mathrm{~cm}$. long, obovate or rarely oval, obtuse, dentate, especially above the middle, the terminal one cuneate; peduncles mainly terminal, 2-5-flowered; flowers white or pinkish, nearly 2.5 cm . broad; petals exceeding the sepals: fruit brownish-black, often 2.5 cm . long, delicious. In sandy soil, Conn. to Fla., Mo. and La. May-July.
12. Rubus nigrobáccus Bailey. High Bush Blackberry. (I. F. f. 1898.) Shrubby, branched, glandular-pubescent ; stems erect or recurved, I-3 m. long, armed with stout recurved prickles. Leaves $3-5$-foliolate; leaflets ovate or ovateoblong, acute or acuminate, coarsely and unequally serrate, pubescent beneath, the terminal one stalked; inflorescence mainly terminal, racemose-paniculate; bracts small; flowers $18-25 \mathrm{~mm}$. broad; petals white, obovate, much exceeding the sepals; fruit black, pulpy, 12-25 mm. long. In dry soil, N. Eng. to Fla. and Ark., mostly at low altitudes. May-June. Fruit ripe July-Aug. A form with small white fruit occurs in Michigan. [R. villosus Gray and of Ill. Fl.; not Ait.]
R. nigrobaccus sativus Bailey is a form with short flower clusters and fewer and larger drupelets.

I3. Rubus Allegheniénsis Porter. Mountain Blackberry. (I. F. f. 1899.) Glandular, resembling the preceding species. Stems rather more slender, red or purple, very prickly, erect or ascending, 6-25 dm. high. Leaflets usually narrower, ovate-lanceolate; fruit $16-28 \mathrm{~mm}$. long. $6-8 \mathrm{~mm}$. in diameter, much less pulpy and of a peculiar flavor; racemes sometimes very long, and pubescent; drupelets oblong when dry. In dry soil, Ont. and northern N. Y. to Penn. and Va., mostly at high altitudes. May-July.
14. Rubus ostryifòlius Rydb. Coast Blackberry. Ascending or depressed, 6-12 dm. high. Stems brownish purple; prickles stout, broad, flat at the base, recurved; younger parts finely villous; leaves 3 -foliolate; leaflets oblong or oblong-ovate, rather simply serrate, finely villous below, slightly pubescent or glabrate above ; corymb small, $\mathbf{I}-5$-flowered, villous-pubescent and somewhat prickly; flowers $\mathbf{I - 2} \mathrm{cm}$. in diameter; sepals ovate, with a short subulate tip; fruit hemispherical, black, rather dry, less than I cm. high. Near the seashore from N. J. to N. Car. Type from Atlantic Highlands, N. J. May-Aug. In habit intermediate between a blackberry and a dewberry.
15. Rubus frondòsus Bigel. Leafy-bracted Blackberry. Erect, about 1 m . high, decidedly villous, especially when young. Stems stout, angled, with rather stout, straight prickles; leaves mostly 3 -foliolate, especially on the flcwering branches, leaflets short-obovate, doubly and sharply serrate; terminal one generally short-petioled; inflorescence dense, generally leafy-bracted and subtended by unifoliolate leaves; flowers about 3 cm . broad; petals broadly obovate. N. Eng. to Ohio and Va. [R. villosus var. frondosus Torr.]
16. Rubus Rándii (Bailey) Rydb. Rand's Blackberry. Low and diffuse, almost glabrous, $3-5 \mathrm{dm}$. high, with very few and weak prickles, not rarely unarmed and only slightly shrubby. Leaves very thin, those of the sterile shoots 5 -foliolate, those of the flowering stems mostly 3 -foliolate, ovate or lance-ovate, longacuminate, sharply and doubly serrate, the terminal one slender-petioled; inflorescence elongated, many-flowered, bristly but not glandular; flowers $15-25 \mathrm{~mm}$. broad; fruit hemispheric, small, less than 1 cm . long. Me. to Lake Superior and Va. June-Aug. [ $R$. villosus var. Randii Bailey.]
17. Rubus argùtus Link. Tall Blackberry. Resembling the last, but stems tall, $\mathbf{I}-2 \mathrm{~m}$. high, stout, angled, purple, with strong and slightly recurved prickles; inflorescence corymbose, many-flowered, short; leaves of the flowering branches often small and the uppermost unifoliolate; flowers $2-3 \mathrm{~cm}$. broad; petals oval or narrowly obovate; fruit hemispheric, about 1 cm . high. It has been confused with $R$. frondosus, but is glabrate, its sterile shoots have larger, longacuminate leaflets, and the petals are narrower. Prince Edward Island to Ga., Ala. and Penn. May-July.
18. Rubus Canadénsis L. Millspaugh's Blackberry. (I. F. f. 1900.) Ascending, wand-like, entirely unarmed, or with a few weak prickles, glabrous or the younger shoots scurfy-pubescent; stems $15-35 \mathrm{dm}$. long. Leaves long-petioled, pedately 5 -foliolate, or some 3 -foliolate; leaflets oval, thin, glabrous on both sides, long-acuminate or acute, rounded or narrowed at the base, often 15 cm . long and 5 cm . wide, sharply but not very deeply serrate; stalk of the terminal leaflet 4-10 cm . long; inflorescence loosely racemose; pedicels slender, ascending; fruit black, very pulpy, $15-25 \mathrm{~mm}$. long. In thickets and rich woods, mountains of N. Eng., the Adirondacks, and in the higher southern Alleghanies. June-Aug. [R.Millspaughii Britt.]
19. Rubus rubrisétus Rydb. Red-bristled Dewberry. Stems 6-12 dm. long, trailing, weakly prickly and densely clothed with red or purplish bristles. Leaves 5 -foliolate, or some of the flowering branches 3 -foliolate, thick, evergreun, glabrous and shining; leaflets all petiolate, obovate or oval, acute or acuminate. dentate with broad teeth; inflorescence corymbose, 3-7-flowered, prickly and bristly; flowers 15-25 $^{2} \mathrm{~mm}$. wide; sepals ovate, with a short subulate tip. $\mathrm{I}_{1}$. the Mississippi Valley from Mo. to La. Feb. -June. Type from New Orleans.
20. Rubus triviàlis Michx. Southern Dewberry. (I. F.f. 1904.) Stem trailing or procumbent, $\mathbf{I} \mathrm{m}$. long or more, beset with stout hooked prickles, and sometimes slightly bristly. Branches erect. $3^{-15} \mathrm{~cm}$. high, prickly; leaves petioled, 3 -foliolate (rarely 5 -foliolate); leaflets oval or sometimes ovate lanceolate, coriaccous, evergreen, glabrous or very nearly so, acute or obtusish at the apex, serratedentate; peduncles terminal, prickly, $1-3$ flowered; flowers often 25 mm . broad, white; petals much exceeding the reflexed sepals; fruit black, often 25 mm . long, well flavored. In dry sandy soil, Va. to Fla., west to Tex. March-May.
21. Rubus invísus Bailey. Ithaca Dewberri. Stems stout and partly ascending, terete, armed with straight, slightly reflexed prickles. Leaves of the sterile shoots 5 -foliolate, those of the flowering shoots gencrally 3 -foliolate, glabrous or nearly so; leaflets broadly ovate, more or less acuminate, espectially those of the
sterile shoots; corymbs few-flowered, with rather elongated pedicels; sepals with long tips; fruit globular-oblong. N. Y. to Ala. and Kans. June-July. [R. Canadensis var. invisus Bailey.]
22. Rubus roribáccus (Bailey) Rydb. Lucretia Blackberry. Stem very stout, terete, with weak straight prickles. Young shoots and inflorescence decidedly villous-glandular; leaves as those of the preceding, but less acuminate, sharply doubly serrate, thinner and greener; inflorescence many-flowered, leafy-bracted; flowers large, $3-5 \mathrm{~cm}$. in diameter; petals generally broadly obovate; sepals nearly always foliaceous with a lanceolate base; fruit oblong-globose. Va., W. Va. and Penn. May-July. [R. Canadensis var. roribaccus Bailey.]
23. Rubus procúmbens Muhl. Low Ruvning Blackberry. Dewberry. (I. F. f. 1906.) Trailing, shrubby; stem armed with scattered prickles or nearly naked. Branches erect or ascending, I-3 dm. long, more or less pubescent, sometimes slightly glandular; leaves petioled, 3-7-foliolate; leaflets ovate, oval or thin, obovate, acute or sometimes obtusish at the apex, rounded or narrowed at the base, sharply dentate-serrate, usually sparingly pubescent; white, about 25 mm . broad; fruit black, delicious, often 25 mm . long. In dry soil, Newf. and Ont. to Lake Superior, Va., La. and the Ind. Terr. April-May. Fruit ripe June-July. [R.Canadensis T. \& G., not L.]
24. Rubus subunifiòrus Rydb. One-flowered Dewberry. Like the preceding, but soon glabrate throughout; branches very slender; flowers $3-4 \mathrm{~cm}$. broad, mostly solitary, on long axillary peduncles in fruit fully as long as the leaves; prickles very weak; fruit small, hemispheric, I cm. long or less, of few large grains. In habit intermediate between the preceding and the following, but the flowers larger than in either. Sandy or dry soil, near the coast from Me. to S. Car. May-July; fruit July-Sept. [R. villosus Ait. 1789 ; not Thunb. 1784.]
25. Rubus Énsleni Tratt. Enslen's Dewberry. Slender, trailing, glabrous throughout, sparingly armed with reflexed prickles. Leaves small, 2-4 cm. long, obovate-cuneate or the terminal one rhombic-cuneate, entire at the base, crenatedentate or crenate-serrate above, acute; flowers small, about 15 mm . broad; sepals narrowly ovate, mucronate: fruit small, of few drupelets. Woods in the South from Kans. (?) to Miss. and Ala. March-April.
26. Rubus Baileyànus Britton. Bailey's Blackberry. (I. F. f. 1905.) Stem trailing or ascending, sparingly prickly, I-2 m. long. Leaflets broadly ovate or oval, pubescent, at least on the lower surface, mostly rounded or cordate at the base, acute or obtuse, the uppermost leaves almost invariably unifoliolate; flowers few, rather large, $2-3 \mathrm{~cm}$. broad; fruit small. In dry woods and thickets, Me. to N. Y. and Va. May-June.
27. Rubus nígricans Rydb. Peck's Dewberry. (I. F. f. 1903.) Decumbent, with stout bristles. Shoots suberect, often 3 dm . high, the sterile ones very bristly, with stout reflexed bristles or slender prickles; leaves of the sterile shoots and the lower ones of the fertile 5 -foliolate: leaflets petioled or the lower subsessile, obovate or oval, acuminate, sharply serrate, dark green; inflorescence racemose, leafybracted; flowers about 15 mm . broad; sepals lanceolate; fruit hemispheric, about I cm., at first red, but nearly black when fully ripe. Open grounds, Newf. to Mich., south to Penn. [R. hispidus var. suberectus Peck; not R. suberectus Anders.; $R$. setosus of Ill. Fl., in part.]
28. Rubus setòsus Bigel. Bristly Blackberry. Similar to the next following species but stouter: stems ascending or decumbent, the older parts densely clothed with slender slightly reflexed bristles. Lower leaflets generally 5 , 3 in those of the flowering branches, oblanceolate, mostly acute or short-acuminate sometimes 5 cm . long, short-stalked or sessile; flowers $12-18 \mathrm{~mm}$. broad, race mose; fruit small, sour. E. Mass. July-Aug.
29. Rubus híspidus L. Hispid or Ruxing Swamp Blackberry. (I. F. f. 1902.) Stems slender, slightly woody, creeping, more or less densely beset with weak bristles. Branches erect or ascending, I-3 dm. long, naked; leaves petioled, 3 -foliolate; leaflets obovate, obtuse, thick, persistent, narrowed at the base, I-4 cm . long, sharply serrate above the middle; peduncles terminal or axillary, nearly or quite leafless; flowers corymbose, white, $10-14 \mathrm{~mm}$. broad; petals exceeding the sepals; fruit red, nearly black when ripe, sour, usually less than $\mathbf{I} \mathrm{cm}$. long,
composed of few drupelets. In swamps or low grounds, rarely in dry soil, N. S. to Ont., Minn., Ga. and Kans. June-July.

## 7. DALIBÀRDA L.

A low tufted perennial downy-pubescent herb, with simple long-petioled ovateorbicular cordate and crenate leaves, and scape-like peduncles bearing I or 2 white flowers. Calyx deeply 5-6-parted, its divisions somewhat unequal, the 3 larger ones commonly toothed. Petals 5, sessile, soon deciduous. Stamens numerous. Pistils 5-10; style terminal. Drupelets 5-10, nearly dry, enclosed at length in the connivent calyx-segments. [Named in honor of Thos. Fran. Dalibard, a French botanist of the eighteenth century.] A monotypic genus of northeastern North America.
I. Dalibarda rèpens L. Dalibarda. (I. F. f. 1907.) Plant commonly bearing cleistogamous flowers. Stems slender, unarmed, much tufted, several inches long; leaves pubescent on both sides, $2-5 \mathrm{~cm}$. in diameter, the crenations low, obtuse or sometimes mucronulate; stipules setaceous; flowers $8-10 \mathrm{~mm}$. broad; peduncles slender, $4-12 \mathrm{~cm}$. long; drupelets oblong, pointed, slightly curved, minutely roughened. In woods, N. S. to Minn., south to southern N. J., Ohio and Mich. June-Sept.

## 8. DRYMOCALLIS Fourr.

Perennial, more or less glandular or viscid, erect herbs with pinnate leaves. Flowers irregularly cymose; calyx 5 -bracteate; sepals 5; petals 5, obovate, elliptic or orbicular, not emarginate, yellow or white. Stamens 20-30, in five festoons on the much thickened margins of the pentagonal disk around the receptacle; anthers flattened. Receptacle hemispheric with numerous pistils; style nearly basal and generally thickened near the middle; seed attached near the base of the style, ascending, orthotropous. A genus of 18 or 20 species of the north temperate zone; of these 13 are found in America.

1. Drymocallis argùta (Pursh) Rydb. Tall, or Glandular CinqueFoIL. (I. F. f. 1913.) Erect, stout, glandular and villous-pubescent, 3-10 dm. high. Basal leaves pinnately 7-II-foliolate; leaflets ovate, oval or rhomboid, obtuse at the apex, the terminal one cuneate, the others rounded at the base and commonly oblique, all sharply incised-serrate ; stem-leaves short-petioled or sessile, with fewer leaflets; flowers white, densely cymose, $10-18 \mathrm{~mm}$. broad; calyx-lobes ovate, acute, shorter than the obovate petals; stamens 25-30. [Potentilla arguta Pursh.] On dry or rocky hills, N. B. to the Rocky Mts., south to Tenn. and Kans. June-July.

## 9. DASÍPHORA Raf.

Shrubs with scarious sheathing stipules and pinnate leaves. Flowers solitary or in small cymes; bractlets, sepals and petals 5. Petals orbicular, not emarginate, in ours yellow. Stamens about 25, in 5 festoons on a disk as in Drymocallis; style lateral, club-shaped, thick and glandular above; stigma four-lobed. Achenes numerous, densely covered with long straight hairs; seed ascending and amphitropous. A genus of 8 or 9 species, all Asiatic, but the following also natives of North America and Western Europe.
I. Dasiphora fruticòsa (L.) Rydb. Shrubby Cinquefoil. (I. F. f. 1932.) Shrubby, much branched; stems erect or ascending, very leafy, 1.5-12 dm. high, the bark shreddy. Leaflets 5-7, oblong, entire, acute or acutish at each end, $1-2 \mathrm{~cm}$. long, silky-pubescent, the margins revolute; flowers bright yellow, $1.5-3 \mathrm{~cm}$. broad; calyx-lobes ovate; bractlets oblong. [Polentilla fruticosa L.] In swamps or moist rocky places, Lab. and Greenland to Alaska, N. J., Ariz. and Cal. Also in Europe and Asia. June-Sept.

Dasiphora fruticosa tenuifolia (Willd.) Rydb. Leaflets linear-oblong, more revolute; shrub lower and more hairy. On high mountains among exposed rocks. Range of the species.
ro. SIBBALDIOPSIS Rydb.
A low undershrub, with trifoliolate subcoriaceous leaves and white cymose flowers. Bractlets and sepals 5. Petals 5, obovate or broadly oval, not emargi-
nate. Style lateral, filiform; achenes turgid, villous; seed ascending and amphitropous; otherwise as in Potentilla. A monotypic genus.
I. Sibbaldiopsis tridentàta (Soland.) Rydb. Three-toothed Cinqueforl. (I. F. f. 1933.) Caudex woody, creeping; branches of the year erect, $3-30 \mathrm{~cm}$. high, pubescent. Stipules lanceolate, entire; leaflets cuneate, 3 -toothed or sometimes $2-5$-toothed at the truncate apex, dark green and shining above, pale and minutely pubescent beneath; flowers I-6, in a terminal cyme, about I cm. broad; bractlets shorter and narrower than the ovate acute calyx-lobes; stamens about 20. [Potentilla tridentata Soland.] In rocky places, especially on mountains, Greenland to N. J., on the southern Alleghanies, shores of Lake Superior, and west to the Canadian Rocky Mts. June-Aug.

## ir. SIBBÀLDIA L.

Depressed alpine or arctic plants, with alternate mainly 3 -foliolate stipulate leaves, and cymose flowers. Calyx slightly concave, 5 -lobed, 5 -bracteolate, persistent. Petals 5, oblong or spatulate, much smaller than the calyx-lobes, yellow. Stamens 5, opposite the calyx-lobes, inserted on the margin of the villous-pubescent disk. Carpels $5-10$, on short pubescent stipes; style lateral, filiform. Achenes 5-10, glabrous. [Named in honor of Robt. Sibbald, a Scotch naturalist.] About 5 species, natives of the colder parts of the north temperate zone.

1. Sibbaldia procúmbens L. Sibbaldia. (I. F. f. 1938.) Densely tufted; stem decumbent or creeping, less than I dm. long. Stipules membranous, lanceolate or ovate-lanceolate, adnate; leaves 3 -foliolate; leaflets cuneate, $3-5$-toothed at the apex, pubescent with scattered hairs on both sides, resembling in outline those of Sibbaldiopsis tridentata; flowers yellow, $3-5 \mathrm{~mm}$. broad, numerous; petals spatulate, very small; calyx-lobes oblong-ovate, acute, longer and broader than the bractlets. White Mts.; Mt. Albert, Quebec; Lab., Greenland to Alaska, south in the Rocky Mts. to Utah and Colo. Also in Europe and Asia. Summer.

## 12. FRAGÀRIA L.

Perennial acaulescent herbs propagating by runners, with basal tufted petioled 3 -foliolate leaves, and sheathing membranous stipules. Flowers white, corymbose or racemose on erect scapes, polygamo-diœcious, the pedicels often recurved. Calyx persistent, its tube obconic or turbinate, 5 -bracteolate, deeply 5 -lobed. Petals 5, obovate, short-clawed. Stamens $\infty$; filaments slender. Carpels $\infty$, inserted on a glabrous convex or elongated receptacle, which becomes fleshy or pulpy in fruit; styles lateral. Achenes $\infty$, minute, dry, crustaceous. Seed ascending and amphitropous. [Latin, fragum, strawberry, signifying fragrance.] About 25 species, natives of the north temperate zone and the Andes of S. Am. Besides the following, 15 others occur in western N. Am.

Achenes imbedded in pits on the fruit.
Hairs of the scape and petioles mostly divaricate; leaflets generally petiolate.
Leaflets broadly oval or obovate; fruit globose or ovoid. I. F. Virginiana.
Leaflets oblong or narrowly obovate: fruit oblong-conic. 2. F. Canadensis.
Hairs of the scape and petioles appressed; leaflets subsessile. 3. F. Terrae-novae.
Achenes borne on the surface of the fruit; leaflets subsessile.
Stout ; leaflets thickish; plant naturalized; fruit ovoid to hemispheric.
4. F. vesca.

Slender ; leaflets thin; native plant; fruit ovoid to conic.
5. F. Americana.

1. Fragaria Virginiàna Duchesne. Virginia or Scarlet Strawberry. (I. F. f. I908.) Rather stout, tufted, dark green, villous-pubescent. Leaflets thick, obtuse, dentate-serrate, the terminal one generally cuneate, the lateral inequilateral at the base; scape equalling or shorter than the leaves; hairs of the pedicels mostly appressed; calyx-lobes, at least of the sterile flowers, erect at maturity. In dry soil, Prince Edward Island to Minn., Ind. Terr. and Ga. April-June.

Fragaria Virginiana Grayàna (Vilm.) Rydb. Plant coarse and hairy; hairs of pedicels divaricate. Ohio to Kans. [F. Virginiana Illinoensis Gray.]

Fragaria Virginiana australis Rydb. Smaller and more hairy, $3-8 \mathrm{~cm}$. high ; leaflets only $2-4 \mathrm{~cm}$, long, almost sessile ; sepals broad, acuminate. Va, to N, C. and La,
2. Fragaria Canadénsis Michx. Northern Wild Strawberry. (I. F.f. 1909.) Petioles slender, loosely villous. Leaves thin but firm; leaflets oblong or the middle one narrowly obovate, obtuse, rather few-toothed, $2-4 \mathrm{~cm}$. long, glabrous or nearly so above, even when young, more or less appressed-pubescent beneath; flowers few, slender-pedicelled, $\mathbf{1 0}-\mathbf{1 5} \mathrm{mm}$. broad; fruit $12-16 \mathrm{~mm}$. long. In fields and meadows, Newf. to Mich., south to the Catskills, May-July.
3. Fragaria Terrae-nòvae Rydb. Newfoundland Strawberry. Leaves thin, glabrate above, slightly silky beneath; leaflets $2-5 \mathrm{~cm}$. long, obovate, serrate, the lateral ones slightly oblique at the base; scape slender, silky strigose at first, glabrate in age, few flowered; flowers $1.5-\mathbf{2} \mathrm{cm}$. in diameter; petals often nearly twice as long as the sepals; fruit hemispheric, about $\mathbf{I} \mathrm{cm}$. broad. Newf. and Lab. to Me. and Ont.
4. Fragaria vésca L. European Wood Strawberry. (I. F. f. 1910.) Stout, tufted, dark green, silky. Leaflets ovate or broadly oval, obtuse, dentate, rather thin, the terminal one cuneate, the others inequilateral at the base; scape commonly exceeding the leaves so that the fruit is borne above them, sometimes 3 dm . high, its hairs mostly spreading; calyx-lobes remaining spreading or sometimes reflexed. In fields and along roadsides. Nat. from Europe in the Eastern and Middle States. April-June.
5. Fragaria Americàna (Porter) Britton. American Wood Strawberry. (I. F. f. I9II.) Slender, light green, silky-pubescent or glabrate, producing runners more freely than any of the preceding species. Leaflets very thin, ovate or oval, sharply incised-dentate, the terminal one commonly cuneate, the others inequilateral at the base, pubescent with silvery appressed hairs beneath; calyx-lobes reflexed in fruit; fruit often with a short neck. In rocky woods, Newf. to Va. and N. Mex. May-June.

## 13. DUCHESNEA J. E. Smith.

Perennial herbs, with leafy runners, 3 -foliolate long-petioled leaves and axillary slender-peduncled yellow perfect flowers. Calyx 5-parted, 5-bracteolate, the bractlets larger than the calyx-segments and alternating with them, dentate or incised. Petals 5, obovate. Stamens numerous. Pistils numerous, borne on a hemispheric receptacle which greatly enlarges but does not become pulpy in fruit. Achenes superficial on the receptacle. [In honor of A. N. Duchesne, French botanist.] Two species, natives of southern Asia.
I. Duchesnea Índica (Andr.) Focke. Yellow or Indian Strawberry. (I. F. f. 1912.) Silky-pubescent, tufted and forming leafy runners, dark green. Leaflets rhombic obovate, rather thin, crenate or dentate, obtuse at the apex: peduncles equalling or longer than the leaves; flowers $1.5-2 \mathrm{~cm}$. broad; bractlets of the calyx dentate or incised, exceeding the ovate or lanceolate acuminate spreading calyx-lobes. In waste places, southern N. Y. and Penn. to Fla. and Ga. Naturalized or adventive from India. April-July.

## 14. CÓMARUM L.

A stout dark green nearly glabrous herb, with alternate pinnate large-stipuled leaves, the large purple flowers cymose or solitary, terminal or also axillary. Calyx deeply 5-lobed, 5-bracteolate, the bractlets narrow. Petals shorter than the calyx-lobes, acute, purple. Stamens numerous, inserted on the large pubescent disk. Pistils numerous, inserted on the pubescent receptacle which becomes spongy in fruit. Style lateral. Achenes glabrous, I-seeded. Seed pendulous. [Greek name of the Arbutus, from the similar fruits.] A monotypic genus of the north temperate zone.
I. Comarum palústre L. Purple or Marsh Cinquefoli. Purple Marshlocks. Cowberry. (I. F. f. 1937.) Decumbent at the base. Leaves pinnate, the lower long-petioled, 5-7-foliolate; leaflets oblong or oblanceolate, sharply serrate, obtuse or acutish at the apex, narrowed at the hase. $3-8 \mathrm{~cm}$. long; stipules membranous, sometimes adnate to the petiole for half its length: upper leaves nearly sessile, 3-5-foliolate; flowers showy. I cm . broad, in fruit 2 cm .; calyx-lobes purple within, ovate, acuminate, much exceeding the ovate-
lanceolate petals; bractlets much shorter than the calyx-lobes. In swamps and peat-bogs, Greenland to Alaska, N. J., Mont., northern Cal. and Iowa. Also in northern Europe and Asia. June-Aug.

## 15. ARGENTİNA Lam.

Perennial herbs, with interruptedly pinnate leaves and long runners. Flowers yellow, solitary on long pedicels from the axils of the basal leaves; petals broadly oval or almost orbicular, not emarginate; stamens 20-25; style filiform, lateral, tardily deciduous; mature achenes with a thick, corky pericarp; seed ascending, amphitropous; otherwise as in Potentilla. A genus consisting of three species, one from New Zealand and the following.

Achenes thick, generally grooved at the upper end; leaves 1-2 dm. long; leaflets sharply serrate.

1. A. Anserina.

Achenes lenticular; leaves $3-5 \mathrm{~cm}$. long; leaflets with rounded teeth.

> 2. A. Egedī.

1. Argentina Anserìna (L.) Rydb. Silver-weed. Wild or Goosetansy. (I. F. f. 1934.) Herbaceous; runners 3-10 dm. long. Stipules membranous; leaflets $\mathbf{I}-3 \mathrm{~cm}$. long, oblong, oblanceolate or obovate, obtuse, the lower generally smaller, nearly glabrous above, white and silky-pubescent beneath; peduncles about equalling the leaves; flower yellow, $10-25 \mathrm{~mm}$. broad; petals exceeding the ovate acute calyx-lobes and oval bractlets; receptacle villous; achenes glabrous [Potentilla Anserina L.]. On shores and salt meadows, N. J. to Greenland, west to Cal. and Alaska, south in the Rocky Mts. to N. Mex. Also in Europe and Asia. May-Sept.

Argentina Anserìna grándis (Torr. \& Gray) Rydb. Leaves often 3-4 dm. long, erect; leaflets oblong, $4-7 \mathrm{~cm}$. long. In grassy places, from Greenland and Newf. to Alaska, south to Mont. and Cal.
2. Argentina Egèdii (Wormsk.) Rydb. Egedi's Silver-weed. Much smaller than the preceding: leaflets $5-15$, glabrous above, sometimes white-tomentose beneath, but never silky, broadly obovate or suborbicular, 5-10 mm. long; pedicels 1-3 cm. long. [Potentilla Egedii (Wormsk.) T. \& G.] Greenland to Alaska, south to Mass. and Ore., along the coast. Also in Iceland.

## 16. POTENTÍLLA L.

Herbs or shrubs, with alternate stipulate digitately or pinnately compound leaves, and cymose or solitary, yellow white or purple perfect flowers. Calyx persistent, its tube concave or hemispheric, 5 -bracteolate (rarely 4 -bracteolate), 5 -lobed (rarely 4-lobed). Petals 5 or rarely 4, mostly obovate or orbicular, usually emarginate. Stamens $20-30$, seldom 5 or 10; filaments slender ; anthers small. Carpels usually in 3 series, numerous, inserted on a dry, usually pubescent receptacle; style terminal, deciduous. Seed pendulous and anatropous. [Diminutive of potens, powerful, from the medicinal properties of some species.] About 150 species, nearly all natives of the north temperate zone. Besides the following about 30 others occur in western N. Am. All species of our range have yellow flowers and glabrous achenes.

1. Flowers cymose ; erect or ascending herbs.

Leaves digitately $3-7$-foliolate; leaflets dentate or incised.
Leaflets 5-7.
Leaves white-pubescent beneath. I. P. argentea. Leaves green beneath.

Plant $7-20 \mathrm{~cm}$. high; leaflets obovate, $12-16 \mathrm{~mm}$. long; arctic.
2. P. maculata.

Plants $3-8 \mathrm{dm}$. high; leaflets $2-8 \mathrm{~cm}$. long; introduced species.
Leaflets obovate : flowers $6-8 \mathrm{~mm}$. broad. 3. P. intermedia.
Leaflets oblanceolate; flowers $12-20 \mathrm{~mm}$. broad. 4. $P$. sulphurea.
Leaflets 3 (or apparently 5 in no. ir).
Styles filiform; plants arctic or alpine.
Leaves white-pubescent beneath.
5. P. nivea.

Leaves green beneath, often villous.
Flowers $10-14 \mathrm{~mm}$. broad.

Teeth of the leaflets acute; bractlets oblong.
6. P. emarginata.

Teeth of the leaflets obtuse; bractlets oval. 7. P. nana. Flowers only 6 mm . broad.
8. P. Robbinsiana.

Styles glandular-thickened below.
Plants stout, erect, rough-pubescent.
Stamens about 20.
Stamens 5-8; prairie species.
Plant slender, often diffuse, villous or glabrate.
9. P. Monspeliensis.
10. P. pentandra.
ii. P. leucocarpa.

Leaves pinnately 3 -II-foliolate.
Leaves villous, or softly pubescent, rarely glabrate.
All the leaves 7 -11-foliolate; inflorescence cymose. 12. P. paradoxa.
Upper leaves 3 -foliolate; inflorescence falsely racemose.
13. P. Nicolletii.

Leaves white-tomentose on both sides
Leaves mostly regularly pinnate; pubescence silky and tomentose.
14. P. Hippiana.

Leaves mostly interruptedly pinnate; pubescence simply tomentose.
15. P. effusa.

Leaves green above, white-tomentose beneath; leaflets pinnatifid.
Styles thickened at the base.
Pubescence silvery-white.
16. P. bipinnatifida.

Pubescence not silvery-white.
Plants erect; leaves $7-15$-foliolate.
Plant dark green; leaves scarcely paler beneath.
17. P. atrovirens.

Plant not dark green; leaves decidedly paler beneath.
18. P. Pennsylvanica.

Plant ascending or decumbent; leaves 5-7-foliolate; leaflets approximate or almost digitate. 19. $P$. litoralis.
Styles not thickened; plant low, spreading; leaves 5-9-foliolate.
20. P. multifida.
2. Flowers solitary, axillary; creeping or ascending plants.

Leaflets 5 , rarely 3 ; petals and sepals 5 .
Stem long-assurgent; first flower from the axil of the second stem-leaf or some subsequent leaf.
Plant low, less than_I dm. high; first flower from the axil of the first stem-leaf. 22. $P$. pumila.

Leaflets 3 , rarely 5 ; petals and sepals 4 , rarely 5 .
23. P. procumbens.

1. Potentilla argéntea L. Silvery or Hoary Cinquefoil. (I. F. f. 1914.) Stems ascending, tufted, branched, slightly woody at the base, $1-5 \mathrm{dm}$. long, white woolly-pubescent. Leaves all but the uppermost petioled, digitately 5 foliolate; leaflets oblanceolate or obovate, green and glabrous above, white-pubescent beneath, laciniate or incised and with revolute margins; flowers $4-8 \mathrm{~mm}$. broad; calyx-lobes ovate, acutish, a little shorter than the obovate retuse petals; stamens about 20; style filiform. In dry soil, N. S. and Ont. to Dak., south to D. C. and Kans. Also in Europe and Asia. May-Sept.

Potentilla collina Wibel, of Europe, collected at Winona, Minn., and Cambridge, Mass., differs in its more prostrate habit, broader, not revolute leaflets, and larger calyx.
2. Potentilla maculata Pourr. Northern Cinquefoil. (I. F. f. Igi5.) Rootstock prostrate; stems ascending, simple, pubescent, 7-20 dm. high. Basal leaves slender-petioled, digitately 5 -foliolate (rarely 3 -foliolate); leaflets obovate, glabrous above, pubescent along the margins and on the veins beneath, green both sides, deeply toothed; flowers few, terminal, loosely cymose; petals obovate, obcordate, cuneate, orange-spotted at the base, longer than the ovate acutish calyxlobes; stamens about 20; style filiform. Lab. and Greenland to James Bay. Also in Europe. Summer. [ $P$. rubens Rydb., not Vill.]
3. Potentilla intermèdia L. Downy Cinquefoil. (I. F. f. Io16.) Perennial; stem 3-8 dm. high, leafy, much branched, finely pubescent with long hairs. Leaves green and finely hirsute on both sides, somewhat tomentose beneath, all but the uppermost 5 -foliolate; leaflets obovate or oblong, the teeth rather obtuse: flowers numerous, cymose, leafy-bracted; petals obcordate, equalling the triangularovate acute sepals and oblong bractlets; stamens about 20; style short. Mass, N.
Y. and N. J. Adventive from Europe. Resembles $P$. Monspeliensis, differing in its 5 -foliolate leaves, and perennial root.

Potentilla inclinàta Vill, a European species, has been collected by J. Fowler in Ontario. It resembles the last, but the leaves are grayish and slightly silky beneath.
4. Potentilla sulphùrea Lam. Rough-fruited Cinquefoil. (I. F. f. 1917.) Erect, rather stout, branched above, villous-pubescent, 4-7 dm. high. Stipules ovate-lanceolate, the lower foliaceous and laciniate; leaves digitately 5-7-foliolate, all but the uppermost petioled; leaflets oblanceolate or oblonglanceolate, green both sides, sparingly pubescent, deeply toothed, with triangular divergent teeth; flowers light yellow, numerous, about 2 cm . broad; stamens about 20; style slender, terminal; carpels rugose. This has been confused with P. recta L., which is also cultivated and sometimes escapes from gardens. The latter has smaller, dark yellow petals. In waste places, Ont., N. Y., Va. and Mich. Adventive from Europe. June-Sept.
5. Potentilla nívea L. Snowy Cinquefoil. (I. F. f. 1918.) Stems I-2 dm. high, woody at the base, silky-villous; leaves 3 -foliolate (very rarely 5 -foliolate), the lower petioled; leaflets oblong or obovate, usually deeply crenate, densely white-pubescent beneath, green and loosely villous above, $2-3 \mathrm{~cm}$. long, the terminal one generally cuneate; flowers $\mathbf{I}-5, \mathbf{1 2} \mathbf{- 1 5} \mathrm{~mm}$. broad; sepals silky, lanceolate, acute, shorter than the broadly obovate emarginate petals, longer than the bractlets; stamens about 20. Lab., Greenland and arctic Am. to Br. Col., south in the Rocky Mts. to Utah and Colo. Also in Europe and Asia. Summer.
6. Potentilla emarginàta Pursh. Arctic Cinquefoil. (I. F. f. 1919.) Stems villous-pubescent, tufted, about I dm. high. Leaves 3 -foliolate; leaflets obovate, $4-12 \mathrm{~mm}$. long, coarsely serrate toward the apex with acute teeth, the terminal one of which is generally the largest, villous on both sides; flower solitary, rarely 2, 10-14 mm . broad; calyx-lobes ovate, obtuse, pilose, equalling the oblong bractlets, shorter than the obcordate petals; stamens about 20. Lab., Greenland and arctic Am. to Alaska. Also in Siberia and Spitzbergen. Summer.
7. Potentilla nàna Willd. Low Cinquefoil. (I. F. f. 1920.) Villouspubescent; stems $2-5 \mathrm{~cm}$. high, tufted, generally I-flowered. Leaves 3 -foliolate; leaflets broadly obovate or orbicular, toothed, the teeth short, rounded, the terminal one often the smallest; petals broadly obcordate, exceeding the ovate acute sepals and the oval obtuse bractlets. Lab., Hudson Bay and arctic Am. to Alaska, and the Canadian Rocky Mountains. Also in Siberia. Summer.
8. Potentilla Robbinsiàna Oakes. Robbins' Cinquefoil. (I. F. f. I92I.) Depressed, $2-4 \mathrm{~cm}$. high, tufted from a woody base, villous-pubescent. Basal leaves petioled, 3 -foliolate, those of the flowering stem sessile, small and 3-lobed; leaflets obovate, villous, $4-8 \mathrm{~mm}$. long, deeply 3-7-toothed above, cuneate or narrowed at the base, obtuse at the apex; flowers solitary, terminal, 5-6 mm. broad; sepals and bractlets nearly equal, obtuse, slightly shorter than the obcordate petals. White Mountains. Summer.
9. Potentilla Monspeliénsis L. Rough Cinquefoil. (I. F. f. 1922. ) Erect, annual or biennial, hirsutely rough-pubescent, 3-8 dm. high. Leaves 3foliolate, the lower and basal ones petioled, the upper sessile or nearly so; leaflets obovate, green both sides, obtuse, pubescent with spreading hairs, $3-5 \mathrm{~cm}$. long; flowers densely cymose and leafy-bracted, about $\mathbf{I} \mathrm{cm}$. broad; calyx-lobes ovate, acute, pubescent, slightly longer than the obovate retuse petals; stamens 15-20; style glandular-thickened below. In dry soil, Lab. to S. Car., Alaska, Kans. and Ariz. Also in Mexico and Asia. June-Sept.

Potentilla Monspeliénsis Norvégica (L.) Rydb., with oblong leaflets and fine pubescence, a native of Europe and Western Asia is introduced in the Eastern States.
ro. Potentilla pentándra Engelm. Five-stamened Cinquefoil. (I. F. f. 1923.) Similar to the preceding, erect, hirsute, 3-7 dm. high, much branched above. Basal and lower leaves slender-petioled, 3 -foliolate, with the lower pair of leaflets parted nearly to the base, so as to appear 5 -foliolate; leaflets oblanceolate or oblong, obtuse, incised-dentate, more or less pubescent, $3-5 \mathrm{~cm}$. long; flowers in a more or less flat-topped cyme, pale yellow, less than 5 mm . broad; calyx-lobes ovate, acute, much exceeding the small spatulate petals; stamens $5-8$; style thickened below. Prairies, Manitoba to Kans., Mo. and Ark. June-Sept.
11. Potentilla leucocàrpa Rydb. Diffuse Cinquefoil. (I. F. f. 1924.) Decumbent or ascending, annual, usually diffusely branched, 4-8 dm. high, softly villous-pubescent, or glabrate. Leaves all but the uppermost petioled, 3 -foliolate; leaflets oblong, cuneate, thin, flaccid, pubescent, deeply serrate, $2-4 \mathrm{~cm}$. long; flowers loosely cymose, $3-4 \mathrm{~mm}$. broad; calyx-lobes ovate, acute, exceeding the obovate petals; stamens about IO; style slightly thickened below. In damp soil, Ill. to Minn., N. Mex., Cal. and Wash. May-Sept.

Potentilla rivalis Nutt., a western species which may reach our limits, is distinguished from this by its usually pinnately 5 -foliolate lower leaves, viscid pubescence, stricter erect habit, and more numerous stamens. It has been collected at the stockyards of Chicago.
12. Potentilla paradóxa Nutt. Bushy Cinquefoil. (I. F. f. 1925.) Softly pubescent, annual or biennial, rather stout, bushy, 3-8 dm. high. Leaves all but the uppermost petioled, pinnately 7-II-foliolate; leaflets obovate or oval, obtuse, $15-25 \mathrm{~mm}$. long, sparingly pubescent, crenate, the upper ones commonly confluent or decurrent on the rachis; flowers terminal, loosely cymose, leafybracted, 7 mm . broad; petals obovate, cuneate, about equalling the ovate calyxlobes; stamens about 20; style terminal, thickened below. Shores and river banks, N. Y. and Ont. to Ore. and N. Mex. Also in Mex. and Mantchuria. June-Sept.
13. Potentilla Nicollétii (S. Wats.) Sheldon. Nicollet's Cinqueforl. (I. F. f. 1926.) Similar to P. paradoxa, but more spreading and more branched; lower ieaves only pinnate, with few leaflets; upper leaves 3 -foliolate; teeth of the leaflets acute; inflorescence elongated, falsely racemose; stamens 10-15. N. Dak., Iowa and Mo.
14. Potentilla Hippiàna Lehm. Woolly Cinquefoil. (I. F. f. 1927.) Perennial, 3-5 dm. high, densely floccose as well as silky. Lower and basal leaves petioled, pinnately 5-II-foliolate; leaflets oblanceolate or oblong, obtuse, $2-5 \mathrm{~cm}$. long, deeply toothed, very white beneath, the lower ones smaller than the upper; flowers loosely cymose, $7-10 \mathrm{~mm}$. broad; petals obovate, retuse, a little exceeding the lanceolate acute calyx-lobes; stamens about 20. Dry soil, Minn, and Assin. to Br. Col., Neb. and N. Mex. June-Aug.
15. Potentilla effùsa Dougl. Branched Cinquefoil. (I. F. f. 1928.) Closely related to P. Hippiana. Plant 2-4 dm high, diffusely branched above ; leaves sometimes interruptedly pinnate, tomentose-canescent, but not silky; leaflets 5-II, cuneate-oblong, obtuse; flowers $6-8 \mathrm{~mm}$. broad, loosely cymose; bractlets shorter than the lanceolate acute calyx-lobes; petals obovate, emarginate, exceeding the calyx-lobes; stamens about 20. Prairies, Minn. (according to Upham) to Mont. and Colo. Summer.
i6. Potentilla bipinnatífida Dougl. Cut-leaved Cinquefoil. Stems erect or ascending, simple, white silky-villous, 3-5 dm. high. Basal leaves pinnately $7-9$-foliolate; stem-leaves subsessile and often subdigitate; leaflets approximate, obovate in outline, pectinately divided into linear obtuse segments, silvery white; flowers densely cymose; sepals ovate, longer than the lanceolate bractlets and about equalling the obovate-cuneate, truncate petals. Prairies, Hudson Bay to Sask., Alb. and Colo. [P. Pennsylvanica bipinnatifida T. \& G.]
17. Potentilla atróvirens Rydb. Dark-green Cinquefoil. Stem stout, 2-3 dm. high, branched, with erect branches, dark green, densely pilose. Leaves similar to those of P. Pennsylvanica, but dark green, densely pilose and strongly veined; cyme many-flowered, narrow, with erect branches; bractlets and sepals ovate, subequal, exceeding the cuneate-obovate bright yellow petals. Prairies. Minn., S. Dak. and Wyo.
18. Potentilla Pennsylvanica L. Prairie Cinquefoil. (I. F. f. 1029.) Stem 4-8 dm. high, tomentose. Leaves pinnately $5^{-15}$-foliolate. grayish-tomentose beneath, glabrous above ; leaflets oblong or oblanceolate, cleft halfway to the midrib into oblong lobes, margins scarcely revolute; cymes dense: petals yellow. obovate, truncate or slightly emarginate, about equalling the ovate triangular acute sepals and the lanceolate bractlets; style thickened helow. On prairies, Hudson Bay to the Canadian Rocky Mountains, south to N. Mex. Summer.

Potentilla Pennsylvánica strigòsa Pursh. Stem usually lower; pubescent with long villous hairs; leaflets with deep narrow divisions, margins revolute. Manitoba and the N. W. Terr. to Kans. and N. Mex. Also in Siberia.
19. Potentilla littoràlis Rydb. Coast Cinquefoil. (I. F. f. 1930.) Per ennial, tufted; stems ascending or decumbent, 2-4 dm. high, appressed-silky or glabrate. Leaflets oblanceolate or obovate, incised-pinnatifid into oblong obtuse segments, grayish-pubescent beneath, green and glabrate above, $1-6 \mathrm{~cm}$. long ; flowers yellow, cymose, $8-10 \mathrm{~mm}$. broad; petals obovate, equalling or slightly exceeding the ovate acute veined sepals and the lanceolate bractlets; stamens 20-25; style thickened below. Coast of Newf. and Lab. to Quebec and N. H. June-July.
20. Potentilla multífida L. Cut-leaved Cinquefoil. (I. F. f. 1931.) Perennial ; stems several or many from the caudex, low, ascending or spreading, appressed-silky. Leaves pinnately 5-9-foliolate, grayish-tomentose beneath, glabrate above; leaflets finely divided to near the midrib into linear acute segments, with more or less revolute margins; petals a little exceeding the ovatelanceolate acute sepals; style short, not thickened at the base. Hudson Bay and the N. W. Terr. Also in Europe and Asia. Summer.
21. Potentilla Canadénsis L. Five-finger. (I. F. f. 1935.) Stem slender, at first erect, later decumbent or prostrate, $4-6 \mathrm{dm}$. long, silky-villous; leaves petioled, digitately 5 -foliolate (rarely 3 -4-foliolate); leaflets oblanceolate or oblong, $2-4 \mathrm{~cm}$. long, incisely serrate, at least above; flowers $10-12 \mathrm{~mm}$. broad; petals 5 , broadly oval, slightly longer than the acute calyx-lobes and linear-lanceolate bractlets. In dry soil, Me. and Quebec to Ga., Minn. and the Ind. Terr. AprilAug. Called also Wild Strawberry.

Potentilla Canadénsis símplex (Michx.) T. \& G. Stem elongated, 5-10 dm. long, the pubescence more appressed; leaves larger, more glabrate and green; leaflets often 5-6 cm. long.

Potentilla réptans L., a European species, collected on ballast at Camden, N. J., differs in its more closely creeping habit, smaller leaves, and very broad elliptic bractlets.
22. Potentilla pùmila Poir. Dwarf Five-finger. (I. F. f. 1935a.) Low perennial herb, seldom more than a few inches high; flowering stems at first very short and upright, later in the season producing some slender prostrate runners; whole plant densely silky-strigose; basal leaves digitately 5 -foliolate, on slender petioles; stem-leaves few and often only 3 -foliolate; leaflets obovate, sharply serrate, usually about 2 cm . long; otherwise as the preceding. In poor soil, N. Eng. to Penn.
23. Potentilla procúmbens Sibth. Wood Cinquefoil. (I. F. f. 1936.) Diffusely branched, trailing or ascending, very slender, somewhat pubescent, I-6 dm . long. Leaflets oblanceolate or obovate, sharply dentate above; peduncles usually much exceeding the leaves; flowers $6-8 \mathrm{~mm}$. broad; petals obovate, emarginate, or rounded, exceeding the acute calyx-lobes and bractlets. Lab. (according to Hooker). Common in Europe. Summer. [P. nemoralis Nestl.]

## 17. WALDSTEİNIA Willd.

Perennial herbs with the aspect of Strawberries, with alternate mainly basal long-petioled 3 -5-foliolate or lobed leaves, membranous stipules, and yellow corymbose flowers on bracted scapes. Calyx persistent, the tube topshaped, minutely 5-bracteolate or bractless at the summit, 5 -lobed. Petals 5 . Stamens $\infty$, inserted on the throat of the calyx; filaments rigid, persistent. Carpels 2-6, inserted on a short villous receptacle; style nearly terminal, deciduous, filiform. Achenes 2-6, obliquely obovoid, pubescent. Seed erect. [Named in honor of Franz Adam von Waldstein-Wartenburg, 1759-1823, a German botanist.] Five known species, natives of the north temperate zone. Besides the following, another occurs in Ga.

> Petals obovate, longer than the sepals. I. fragarioides. Petals linear-oblong or narrowly elliptic, shorter than the sepals. 2. W. parviflora.

1. Waldsteinia fragarioìdes (Michx.) Tratt. Barren or Dry Straylverry. (I. F. f. 1939.) Pubescent, or nearly glabrous; rootstock creeping, rather stout. Leaves tufted, long-petioled, 3 -foliolate (rarely 5 -foliolate); leaflets obovate, obtuse at the apex, broadly cuneate at the base, dentate or crenate and sometimes
incised, 3-5 cm. long; flowers yellow. 6-10 mm. broad; calyx-lobes ovatelanceolate, acute. Woods and shaded hillsides, N. Eng. and Ont. to Minn., Mich., Ind., and along the Alleghanies to Ga. May-June.
2. Waldsteinia parviflòra Small. Southern Dry Strawberry. (I. F. f. 1939 a.) Villous-hirsute, or glabrous in age. Leaflets cuneate-obovate or broadly rhomboidal, $4-7 \mathrm{~cm}$. long, coarsely and irregularly crenate or lobed; tube of the calyx broadly turbinate, the segments triangular-lanceolate, or lanceolate-acuminate. In woods and shaded soil, Va. to N. Car., Tenn. and Ga. March-May.

## 18. GÈUM L.

Perennial herbs, with odd-pinnate, or deeply pinnatifid, stipulate leaves. Flowers cymose-corymbose or solitary. Calyx persistent, its tube obconic or hemispheric, usually 5 -bracteolate, 5 -lobed. Petals 5, orbicular, oblong or obovate, obtuse or emarginate. Stamens $\infty$, inserted on a disk at the base of the calyx; filaments filiform. Carpels $\infty$, aggregated on a short receptacle. Style filiform, terminal, jointed, the lower portion persistent, sometimes plumose in fruit. Seed erect, its testa membranous. [The ancient Latin name.] About 40 species, most abundant in the north temperate zone. Besides the following about 3 others occur in southern and western N. Am.

Calyx-lobes strongly reflexed; style not plumose, sometimes hispid at the base. Flowers yellow, 4 mm . broad; head of fruit stalked; calyx bractless.
I. G. vernum.

Flowers $6-20 \mathrm{~mm}$. broad; head of fruit sessile ; calyx bracteolate.
Petals white, or very nearly so, obovate.
Plant softly-pubescent or glabrate; receptacle bristly. 2. G. Canadense.
Plant rough-pubescent; receptacle glabrous or downy.
3. G. Virginianum.

Petals cream-yellow, narrowly oblong, scarcely exceeding the sepals.
4. G. flavum.

Petals yellow, broadly obovate or orbicular.
Segments or lobes of upper stem-leaves broadly rhombic-obovate; petals $4^{-6} \mathrm{~mm}$. long.
Basal leaves simple, or pinnately $3^{-7}$-foliolate; plant pubescent, divaricately branched; petals about equalling the sepals.
5. G. urbanum.

Basal leaves interruptedly pinnate; plant hispid; petals exceeding the sepals.
6. G. macrophyllum.

Segments or lobes of upper stem-leaves oblanceolate; petals $6-8 \mathrm{~mm}$. long.
7. G. strictum.

Calyx-lobes erect or spreading; style plumose below ; flowers purple, nodding.
8. G. rivale.
I. Geum vérnum (Raf.) T. \& G. Spring Avens. (I. F. f. 1943.) Erect or ascending, slender, simple or nearly so, 2-6 dm. high. Basal leaves tufted, petioled, with a single orbicular-reniform dentate $3-5$-lobed leaflet, or pinnate with 3-7 obovate or oval more or less dentate and lobed ones; stem-leaves few, sessile or short-petioled, pinnate or pinnatifid ; flowers few, erect; calyx-lobes ovate, acute, reflexed; petals spreading; style glabrous, about 4 mm . long ; receptacle glabrous. Shaded places, Ont. to W. Va., Tenn., Kans. and Tex. Nat. in N. J. and S. N. Y. April-June.
2. Geum Canadense Jacq. White Avens. (I. F. f. 1944.) Erect, branched above, $2-7 \mathrm{dm}$. high. Stipules small, dentate; basal leaves petioled. 3 -foliolate or pinnately divided, their segments $3-5$, the terminal one broadly ovate or obovate. the lateral ones narrower, all dentate and more or less lobed, sometimes with smaller ones borne on the petiole; stem-leaves short-petioled or sessile, 3 - 5 -lobed or divided; peduncles slender; petals obovate, equalling or shorter than the sepals; head of fruit $8-12 \mathrm{~mm}$. long; style $6-8 \mathrm{~mm}$. long. In shaded places. N. S. to Ga., Minn., Kans. and Mo. June-Aug.
3. Geum Virginiànum L. Rough Avens. (I. F. f. 1945.) Resembling the preceding species but much stouter, the stem and petioles bristly-pubescent, the stout short peduncles pubescent with reffexed hairs. Basal leaves becoming very large, the terminal leaflet sometimes 15 cm . wide; sepals exceeding the spreading revolute creamy-white petals; head of fruit very dense, $12-10 \mathrm{~mm}$. in diameter;
style $8-10 \mathrm{~mm}$. long. Low grounds, N. B. to Penn. and southward in the Alleghanies, west to Minn. and to Kans. Blooms earlier than G. Canadense. May-July.
4. Geum flàvum (Porter) Bicknell. Cream-colored Avens. (I. F. f. 1946.) Stem bristly-hairy below, erect, $4-$ IO dm. tall. Stipules large, often 2.5 cm . long, foliaceous, dentate or lobed. Basal leaves mostly pinnately divided, sometimes only lobed; lower stem-leaves usually also pinnately divided, the terminal segment often elongated; upper stem-leaves sometimes entire; peduncles slender; head of fruit about $\mathbf{I} \mathrm{cm}$. in diameter; receptacle bristly-villous; style $6-8 \mathrm{~mm}$. long. In woods, Conn. and N. Y. to Va, and E. Tenn. June-Aug.
5. Geum urbànum L. European Yellow Avens. Stem 3-6 dm. high, finely pubescent, divaricately branched. Basal leaves simple, reniform and 3 -lobed or pinnately $3-7$-foliolate, with rhomboid-cuneate leaflets, very rarely with smaller ones interposed; stem-leaves mostly 3 -foliolate, with rhombic leaflets or the uppermost -simple; head of fruit $\mathbf{1 2 - 1 5} \mathrm{mm}$. in diameter; receptacle pubescent; style 5-7 mm. long, purplish. Introduced from Europe and established at Cambridge, Mass.
6. Geum macrophýllum Willd. Large-leaved Avens. (I. F. f. 1947.) Stout, erect, bristly-pubescent, 3-10 dm. high. Stipules broad, foliaceous; basal leaves petioled, lyrate-pinnate, the terminal segment much the largest, reniform, orbicular or cordate, dentate, 3-7-lobed; lateral leaflets 3-6, oval or obovate, with smaller ones interspersed or borne on the petiole; stem-leaves short-petioled or sessile; flowers several, short-peduncled; receptacle nearly glabrous; style $6-8 \mathrm{~mm}$. long; upper internode pubescent below. In low grounds, N. S. to Alaska, Br. Col., N. Y. and Ore. May-July.
7. Geum stríctum Ait. Yellow Avens. (I. F. f. 1948.) Pubescent, branched above, $6-15 \mathrm{dm}$. high. Stipules broad, foliaceous; basal leaves lyratepinnate; leaflets $5-7$, obovate, cuneate, dentate or lobed, with a few smaller ones interspersed, the terminal one largest, broadly ovate or cuneate, or rarely orbicular or reniform ; stem-leaves sessile or short-petioled, with 3-5 ovate or oblong acute segments; receptacle dow ny-pubescent; style 6-10 mm. long, the upper internode hispid. In swamps or low grounds, Newf. to Br. Col., N. J., Penn., Mo. and Ariz. Also in Asia. June-Aug. A hybrid with G. Canadense has been found in eastern Penn.
8. Geum rivàle L. Purple or Water Avens. (I. F. f. 1940.) Erect, simple or nearly so, pubescent, 3-10 dm. high. Basal leaves lyrately and interruptedly pinnate, petioled, the later al segments generally few and small, the terminal $\mathbf{I}-3$, much larger, all sharply and irregularly lobed and dentate; stem-leaves distant, short-petioled or sessile, simple, or 3 -foliolate ; flowers few, $20-25 \mathrm{~mm}$. broad; petals obovate, emarginate, abruptly narrowed into a claw; head of fruit stalked in the calyx; style 6-8 mm. long. In swamps and low grounds, Newf. to Br. Col., N. J., Penn., Mo. and Colo. Also in Europe and Asia. May-July.
19. SIEVĖRSIA R. Br.

Generally low perennial herbs with odd-pinnate leaves, mostly clustered at the base. Flowers in cymes, or solitary, yellow or purplish. Calyx obconic or hemispheric, 5 -lobed and generally 5 -bracteolate. Petals 5. Stamens numerous; filaments filiform. Carpels many, on a short hemispheric receptacle. Style terminal, persistent, filiform, not jointed, pubescent or plumose, generally elongating in fruit. Seeds erect, basal. [Named in honor of Sievers]. About 15 species of temperate, alpine or arctic regions; besides the following five or six others occur in western and arctic North America.
Leaflets $1-9$; terminal one of the basal leaves orbicular-reniform; style plumose below; flowers yellow.
I. S. Peckii.

Leaflets numerous, cuneate ; style plumose throughout ; flowers light purple.
2. S. ciliata.
I. Sieversia Péckii (Pursh) Rydb. Yellow Mountain Avens. (I. F f. 1941.) Pubescent with spreading hairs, or glabrate ; stem I-6 dm. high, erect, simple, I-8-flowered at the summit. Basal leaves petioled, lyrately pinnate, the terminal segment very large, reniform-orbicular, sharply and irregularly dentate and slightly $3-5$-lobed, $7-15 \mathrm{~cm}$. broad; lateral leaflets small, few or none; flowers
yellow, 12-20 mm. broad; bractlets much shorter than the erect lanceolate calyxlobes; petals obovate or orbicular, often slightly emarginate, spreading; style plumose below, naked above, $12-16 \mathrm{~mm}$. long, not jointed. White Mountains of N. H.; Mt. Kineo, Me. July-Aug. [Geum Peckii Pursh.] S. radiàta (Michx.) Greene, of N. Car. and Tenn., with which this has been confused, is stouter and more hairy and has broadly and deeply obcordate petals.
2. Sieversia ciliàta (Pursh) Rydb. Long-plumed Purple Avens. (I. F. f. 1942.) Softly pubescent, scapose ; scape 1-4.5 dm. high, simple, 3-8 flowered at the summit. Basal leaves petioled, interruptedly pinnate with many small leaflets interspersed among the obovate or oval laciniate numerous larger ones; leaves of the scape 2 opposite small sessile pairs, the elongated peduncles commonly bearing another similar pair; flowers $12-18 \mathrm{~mm}$. broad ; style $3-5 \mathrm{~cm}$. long. In dry or rocky soil, Lab. and northern N. Eng. to N. Y., Br. Col., Mo. and Ariz. [Geum ciliatum Pursh.] May-July.

## 20. DRỲAS L.

Low tufted herbaceous shrubs, with simple petioled stipulate leaves, whitecanescent beneath, and white or yellow, perfect solitary flowers on slender scapes. Calyx persistent, not bracted, its tube concave, glandular-hirsute, 8-9-lobed. Petals 8 or 9 , obovate, larger than the calyx-lobes. Stamens $\infty$, inserted on the throat of the calyx; filaments subulate. Carpels $\infty$, sessile, inserted on the dry receptacle; style terminal, persistent, elongated and plumose in fruit. Seed ascending, its testa membranous. [Name Latin, a wood-nymph.] Three species, natives of the cold-temperate and arctic parts of the north temperate zone.

Flowers white; sepals linear-lanceolate.
Leaves oval or ovate, coarsely crenate, I. D. octopetala.
Leaves ovate, or ovate-lanceolate, subcordate, entire or nearly so.
2. D. integrifolia.

Flowers yellow; sepals ovate; leaves crenate.
3. D. Drummondii.
I. Dryas octopétala L. White Mountain Avens. (I. F. f. 1949.) Stems prostrate, branched, $7-15 \mathrm{~cm}$. long. Stipules linear, adnate to the petiole; leaves green and glabrous above, generally obtuse at each end, $\mathbf{I}-2.5 \mathrm{~cm}$. long ; scape terminal, erect, $3-12 \mathrm{~cm}$. long, pubescent; petals spreading; sepals glandular-pubescent, persistent; style about 2.5 cm . long, plumose and conspicuous in fruit. Lab., Greenland and arctic Am., south in the Rocky Mts. to Utah and Colo. Also in arctic and alpine Europe and Asia. June-Aug.
2. Dryas integrifòlia Vahl. Entire-Leaved Mountain Avens. (I. F. f. 1950.) Similar to the preceding, but the leaves are ovate or ovate-lanceolate, obtuse and often subcordate at the base, obtusish at the apex, entire or with I or 2 teeth near the base, the margins strongly revolute ; flowers generally slightly smaller. "White Hills of N. H.," according to Pursh; Anticosti, Lab., west through arctic Am. to Alaska, and in Greenland. June-Aug.
3. Dryas Drummóndii Richards. Drummond's Mountain Avens. (I. F. f. 1951.) Similar to $D$. octopetala, the leaves crenate-dentate, but generally narrowed at the base. Scape floccose-pubescent, often taller; petals generally erect; sepals ovate, acutish, black glandular-pubescent. On gravel, Gaspé, Quebec; Anticosti and Lab., throughout arctic America and south to Nont. June-Aug.

## 2x. CERCOCARPUS H. B. K.

Shrubs or small trees, with alternate simple petioled coriaceous stipulate straight-veined leaves, and short-pedicelled or sessile, axillary or terminal, perfect flowers. Calyx narrowly tubular, persistent, contracted at the throat, 5-lobed. Petals none. Stamens $15-25$, inserted in 2 or 3 rows on the limb of the calyx: filaments very short. Ovary I, terete, slender. included in the calyx-tube, ripening into a villous achene; style filiform, villous, persistent, plumosic and elongated in fruit; stigma obtuse; ovule nearly erect. Seed linear, its testa membranous. [Greek, tailed-fruit.] About 6 species, natives of western N. Am. and Mexico.
I. Cercocarpus parvifolius H. \& A. Smali-lfater Cercocarpus. (I. F. f. 1952.) A low branching shrub. Leaves obovate or oval, coriaceous,
obtuse, short-petioled, dentate, silky-pubescent or canescent below, $1.5-3 \mathrm{~cm}$. long, $6-15 \mathrm{~mm}$. broad; flowers axillary, solitary or in pairs, short-peduncled, recurved, about 6 mm . broad; style becoming $5-10 \mathrm{~cm}$. long and very plumose in fruit. In dry or rocky soil, S. Dak. and W. Kans. to northern Mex., west to Cal. AprilJune.

## 22. ULMÀRIA Hill.

Tall perennial herbs, with alternate petioled pinnately divided stipulate leaves, and small perfect flowers in large cymose panicles. Calyx 5-lobed. Petals 5, clawed. Stamens numerous, inserted on the flat or slightly concave receptacle; filaments narrowed at the base. Pistils about $10(5-15)$, distinct; ovary 2 -ovuled. Ripe carpels resembling follicles but indehiscent, I-seeded. Seed pendulous. [Named from the fancied resemblance of the leaf-segments to those of Ulmus.] About 9 species, natives of the north temperate zone.
Lateral leaflets palmately 3-5-lobed; flowers pink or purple.

1. U. rubra.

Lateral leaflets merely serrate, or slightly lobed; flowers yellowish white. 2. U.Ulmaria.
I. Ulmaria rùbra Hill. Queen-of-the-Prairie. (I. F. f. 1953.) Glabrous; stem branched, $6-25 \mathrm{dm}$. tall. Leaves large, the lower sometimes $\mathbf{I} \mathrm{m}$. long, pinnately 3-7-foliolate, commonly with smaller leaf-segments interposed or borne on the petiole; the lobes acute, unequally serrate or incised; terminal leaflet larger, $7-9$-parted; flowers fragrant, about 8 mm . broad; fruit glabrous. In moist grounds and on prairies, Penn. to Ill., Mich., Ga., Ky. and Iowa. Escaped from gardens farther east. June-July.
2. Ulmaria Ulmària (L.) Barnhart. Meadow-sweet or Meadow-Queen. Honey-sweet. (I. F. f. 1954.) Stem 6-12 dm. tall. Leaves pinnately 3-9foliolate, densely and finely white-downy beneath, green above, or in some forms green on both sides; lateral leaflets sessile, opposite, ovate or ovate-lanceolate, acute or acuminate, the terminal one larger and deeply $3-5$-lobed, the lobes acute and serrate. Escaped from gardens, Quebec to Mass. Native of Europe and Asia. June-Aug.

## 23. ALCHEMÍLLA L.

Herbs, with alternate lobed or digitately compound leaves, adnate stipules, and small perfect greenish corymbose or capitate flowers. Calyx persistent, cup-shaped, contracted at the throat, 4-5-lobed, 4-5-bracteolate. Petals none. Stamens 1-4; filaments short. Carpels I-4; style basal or lateral, slender. Achenes I-4, enclosed in the calyx-tube. Seed ascending, its testa membranous. [Name from its fancied value in alchemy.] About 35 species, natives of the Old World and of western America from Br. Col. to Chile.

Annual ; flowers in sessile axillary clusters; leaves small.

1. A. arvensis.

Perennial; flowers in compound terminal corymbs; leaves large.
2. A. vulgaris.
r. Alchemilla arvénsis (L.) Scop. Parsley-Piert, or Field Lady's Mantle. Argentill. (I. F. f. 1955.) Annual, softly pubescent, the branches usually slender, ascending, $2-15 \mathrm{~cm}$. high. Stipules toothed or rarely entire; leaves very short-petioled, pubescent, fan-shaped, 4-10 mm. long, deeply 3 -parted, the lobes cuneate, $2-4$-cleft; flowers $2-3 \mathrm{~mm}$. broad, in sessile axillary clusters partly enclosed by the stipules. In dry fields, D. C., Va., Tenn., N. Car., and in N. S. Also on the Pacific coast. Nat. or adventive from Europe. April-Sept.
2. Alchemilla vulgàris L. Lady's Mantle. Dew-cup. (I. F. f. 1956.) Perennial from a woody rootstock. Stipules mostly toothed; leaves orbicularreniform, 5-9-lobed, pubescent, the lower slender-petioled, the upper sessile or nearly so; lobes broad, not deep, serrate; flowers about 4 mm . broad, very numerous in peduncled often leafy corymbs. In grassy places near the coast, N. S., Cape Breton, Lab. and Greenland. Nat. from Europe. May-Sept.

Alchemilla alpina L., reported by Pursh from the White and the Green Mountains, a native of alpine and northern Europe and Asia, is distinguished from the preceding by its 5 oblong silky entire leaflets,

Perennial erect herbs. Leaves alternate, petioled, odd-pinnate, with smaller leaf-segments interposed between the larger ones, and conspicuous stipules. Flowers small, regular, perfect, yellow, in narrow racemes. Calyx-tube often grooved, uncinate-bristly above, the 5 lobes connivent. Petals 5, small. Stamens 5-15, slender. Carpels 2, included; style terminal; stigma 2-lobed; ovules pendulous. Fruit dry, mostly reflexed ; achenes I-2, oblong. Seed suspended, its testa membranous. [Ancient Latin name.] About 15 species, natives of the north temperate zone and the Andes of S. Am. Besides the following, another occurs in the Southern States.

Racemes and leaves beneath with loose spreading hairs or glabrous.
Roots not tuberous; fruit large, turbinate, with numerous radiating bristles.

1. A. hirsuta.

Ronts tuberous; fruit very small, hemispheric, with few ascending or erect bristles.
2. A. striata.

Racemes and leaves beneath closely and softly pubescent.
Roots tuberous; stems pubescent; leaves not glandular-dotted beneath.
Small, often simple, with elongated terminal raceme; leaflets 3-5.
3. A. pumila.

Larger, paniculate-branched; leaflets $5-1 \mathrm{I}$. 4. A. mollis.
Roots not tuberous; stems hirsute; leaves glandular-dotted beneath.
Leaflets mostly $7-9$; fruit large, the bristles connivent.
5. A. Brittoniana.

Leaflets mostly ${ }^{11-17}$; fruit small, the bristles radiate.
6. A. parviflora.

1. Agrimonia hirsùta (Muhl.) Bicknell. Tall Hairy Agrimony. (I. F. f. 1957.) Tall, 3-18 dm. high, minutely glandular, villous. Leaflets thin, bright green, mostly 7, spreading, elliptic to broadly oblong, or the odd one obovate, acute, base often subcordate, coarsely serrate, the margins and nerves beneath ciliate, the lower surface rarely pubescent; flowers $8-12 \mathrm{~mm}$. broad, the buds ovoid, acute; fruit reflexed, 6 mm . long, short-turbinate. Woods and thickets, N. B. to Minn., N. Car., Kans. and Cal. June-Aug.
2. Agrimonia striàta Michx. Woodland Agrimony. (I. F. f. 1958.) Mostly about 6 dm . high, minutely glandular; racemes filiform, loosely flowered. Leaflets thin, commonly 5 , mostly oblong or obovate-oblong and obtuse, crenate or dentate, scarcely ciliate; flowers $4-5 \mathrm{~mm}$. broad, the buds subglobose, truncate or nearly so; fruit 4 mm . high or less, spreading or nodding, hemispheric, the furrows shallow or obsolete. In dry woods, Conn. to Va., Kans. and Mo. July-Sept.
3. Agrimonia pùmila Muhl. Small-fruited Agrimony. (I. F. f. 1959.) Small and slender, 3-6 dm. high, erect or assurgent, simple, or with a few branches above. Stem villous with spreading hairs below, appressed-pubescent above; leaves often crowded toward the base of the stem, frequently 3 -foliolate; leaflets small, elliptic to obovate or cuneate, obtuse or acute at the apex, often pale beneath; flowers small; fruit 4 mm . long or less, minutely glandular, hemispheric to turbinate; disk flat; bristles few, ascending or erect. In dry soil, Penn. and Md. to Fla., Ky. and La. Aug.
4. Agrimonia móllis (T. \& G.) Britton. Soft Agrimony. (I. F. f. ig60.) Virgately branched, 4-18 dm. tall. Stem pubescent, or villous below, finely pubescent above. Leaves thickish, dull green, veiny, pale and velvety-pubescent beneath; leaflets narrowly oblong to obovate, obtuse or acutish at the apex, crenate to dentate; flowers $6-8 \mathrm{~mm}$. broad, the buds subglobose, obtuse; fruit 4 mm . long or more, oblong to broadly turbinate, the ascending slender bristles nearly in: a single row. Dry woods and thickets, Conn. to Mich., N. Car. and Kans. July-()ct.
5. Agrimonia Brittoniana Bicknell. Britton's Agrimony: (I. F. f. 1001.) Robust, 6-12 dm. tall, virgately branched. Stem hirsute-pubescent with short spreading brownish hairs, sub-appressed above ; leaflets elliptic to rhomboid-lanceolate, deeply and closely serrate, dull green, thickish, rugose, their margins finely scabrous-ciliolate ; racemes long, erect or ascending ; flowers crowded, 0-10 mm. wide; fruit 6-8 mm. long, long-turbinate, deeply grooved; bristles often purplish, short, crowded, inflexed and comivent over the sepals. Along thickets and roadsides, Quebec to northern N. Y. and W. Va. Also in the Rocky Mts. June-Sept.
6. Agrimonia parvifiora Soland. Many-flowered Agrimony. (I. F. f. 1962.) Virgately branched, 6-12 dm. high, with long racemes. Stem densely hirsute with coarse brownish hairs, villous above; leaflets lanceolate or linear-lanceolate, acuminate, sharply serrate, rather thin, glabrous above, pubescent beneath, especially on the veins, very glandular ; flowers very numerous, $6-10 \mathrm{~mm}$. broad; the buds rounded-truncate; fruit small, glandular, dilated-turbinate; bristles reflexed, spreading and erect. In moist or dry soil, N. Y. to Mich., Kans., Ga. and Miss. July-Oct.

## 25. SANGUISÓRBA L.

Erect, mostly perennial herbs, sometimes decumbent at the base, with alternate odd-pinnate stipulate leaves and small perfect or polygamo-diocious flowers in dense terminal peduncled spikes or heads. Calyx-tube turbinate, constricted at the throat, persistent, 4 -lobed, the lobes petaloid, deciduous. Petals none. Stamens $4-\infty$, inserted on the throat of the calyx; filaments filiform, elongated, exserted ; anthers short; carpels $\mathbf{I}-3$, enclosed in the calyx-tube. Style filiform, terminal. Achene usually $\mathbf{I}$, enclosed in the dry angled calyx. Seed pendulous. [Latin, blood-staunching, from its supposed properties.] About 20 species, natives of the north temperate zone. In addition to the following, 2 or 3 others occur in the western parts of North America.

Flowers capitate, greenish; stamens numerous; leaflets $\mathbf{1 2 - 2 0} \mathbf{~ m m}$. long.

1. S. Sanguisorba.

Flowers spicate, white ; stamens 4 ; leaflets $25-75 \mathrm{~mm}$. long.
2. S. Canadensis.

1. Sanguisorba Sanguisórba (L.) Britton. Salad Burnet. (I. F. f. 1963.) Glabrous or pubescent, erect, slender, perennial, branched, $2.5-5 \mathrm{dm}$. high. Stipules usually small, laciniate; leaflets 7-19, ovate or broadly oval, deeply incised, short-stalked or sessile; flowers $6 \mathbf{- 1 2} \mathrm{~mm}$. long, the lower ones staminate, the upper perfect; stigma tufted, purple; calyx-lobes ovate, acute or acutish; fruit $2-4 \mathrm{~mm}$. long. In dry or rocky soil and in ballast, southern Ont., N. Y. and Penn. to Md. Naturalized from Europe and native also of Asia. Summer.
2. Sanguisorba Canadénsis L. American Great Burnet. [I. F. f. 1964.] Glabrous or slightly pubescent toward the base, erect, branched above, 3-18 dm. high, the branches erect. Stipules often foliaceous and dentate; basal leaves long-petioled, sometimes 6 dm . long; leaflets $7-15$, ovate, oblong or oval, serrate with acute teeth, stalked; flowers perfect, bracteolate at the base; filaments long-exserted, white ; achene enclosed in the 4 -angled calyx. In swamps and low meadows, Newf. to Mich., south to Ga. July-Oct.

## 26. RÒSA L.

Erect or climbing shrubs, generally with subterranean rootstocks. Stems commonly prickly. Leaves alternate, odd-pinnate. Stipules adnate to the petiole. Flowers corymbose or solitary, red, pink or white (in our species). Calyx-tube cup-shaped or urn-shaped, constricted at the throat, becoming fleshy in fruit, 5(rarely 4-) lobed, the lobes imbricated, spreading, deciduous or persistent. Petals 5 (rarely 4), spreading. Stamens $\infty$, inserted on the hollow annular disk. Carpels $\infty$, sessile at the bottom of the calyx; ovaries commonly pubescent; styles distinct or united. Achenes numerous, enclosed in the berry-like fruiting calyx-tube. Seed pendulous. [The ancient Latin name of the rose.]

A large genus, natives of the northern hemisphere. Besides the following, about 6 others occur in southern and western N. Am.
> * Styles cohering in a column : leaflets mostly 3; stem climbing. I. R. setigera. ** Styles all distinct ; leaflets 5-1I.

Sepals persistent, erect on the fruit, or spreading.
Infrastipular spines generally none.
Stems unarmed or nearly so; sepals erect on the fruit,
2. R. blanda.

# Leaflets $3-9$, often resinous, obtuse at base; flowers solitary; sepals erect. Fruit globose or nearly so, $12-15 \mathrm{~mm}$. in diameter. 3. R. Sayi. Fruit ellipsoid or obovoid, $8-10 \mathrm{~mm}$. broad and $15-18 \mathrm{~mm}$. long. 

4. R. Engelmanni.

Leaflets 7 -II, not resinous, narrowed at base ; flowers corymbed; sepals spreading.
5. R. Arkansana.
6. R. Woodsii.

Infrastipular spines commonly present; stems prickly.
7. R. Carolina. Sepals deciduous, spreading.

Leaflets finely serrate; spines stout, recurved.
Leaflets coarsely serrate.
Infrastipular spines nearly straight ; native bushy species.
Stems with scattered prickles or naked.
Leaflets $7-9$, shining above ; flowers corymbose; spines stout.
8. R. lucida.

Leaflets 5-7; flowers solitary or few ; spines slender. 9. R. humilis. Stems very densely prickly; flowers usually solitary. 1o. $R$. nitida. Infrastipular spines stout, hooked; introduced wand-like or climbing species. Leaflets somewhat pubescent beneath, serrate. II. R. canina. Leaflets very glandular beneath, doubly serrate. 12. R. rubiginosa.
I. Rosa setígera Michx. Prairie Rose. Climbing Rose. Michigan Rose. (I. F. f. I965.) Stems several meters long, armed with scattered curved prickles, not bristly. Petioles, twigs and peduncles often glandular-pubescent; stipules very narrow; leaflets mostly ovate, acute or obtusish at the apex, rounded at the base, $3-7 \mathrm{~cm}$. long, sharply serrate; flowers corymbose, about 6 cm . broad; sepals ovate, acute, at length reflexed and deciduous, glandular; petals rose-color or white; fruit globose, 8 -10 mm. in diameter, more or less glandular. In thickets and on prairies, Ont. to Wis., Kans., W. Va., Fla. and Tex. Escaped from cultivation in N. J. and Va. June-July.
2. Rosa blánda Ait. Smooth or Meadow Rose. (I. F. f. 1966.) Erect, 6-12 dm. high, entirely unarmed or with a few straight slender prickles. Leaflets 5-7, short-stalked, usually pale beneath, oval or obovate, commonly narrowed at the base, $2-4 \mathrm{~cm}$. long, simply and sharply serrate; flowers pink, sometimes 7 cm . broad, corymbose or solitary; sepals lanceolate, acuminate, entire, hispid-puhescent; fruit globose or pyriform, glabrous or nearly so, about 1 cm . in diameter. In moist, rocky places, Newf. to Vt., N. J., Ont. and Ill. June-July.
3. Rosa Sáyi Schwein. Prickly Rose. (I. F. f. 1967.) Bushy, 3-10 dm . high, the stems and often the branches densely armed with straight prickles. Stipules mostly broad; leaflets 5-9 (rarely 3), oval or oval-lanceolate, obtuse at the apex, rounded at the base, simply or doubly serrate, often more or less resinouspubescent, $3-5 \mathrm{~cm}$. long; flowers usually solitary, $6-7 \mathrm{~cm}$. broad; sepals lanceolate, acuminate or sometimes dilated above, entire or few toothed, hispid or glabrous. Anticosti to Minn., the N. W. Terr. and Colo. June-July.
4. Rosa Engelmánni Wats. Engelmann's Rose. Like the preceding but low, 2-5 dm. high, very slender and with few branches; leaflets very thin, pale beneath; fruit small, elongated, with an evident neck and more or less conical at the base. In open woods from Mich. to S. Dak., Colo. and Tex.
5. Rosa Arkansàna Porter. Arkansas Rose. (I. F. f. 1968.) Erect, 3-6 dm. high. Stems densely prickly with slender bristles; stipules rather narrow; leaflets 7-II, oval or obovate, sessile or nearly so, obtuse at the apex, narrowed at the base, seldom over 2.5 cm . long, simply and sharply serrate, glabrous, or finely puberulent beneath; flowers corymbose or rarely solitary, about 5 cm . broad; sepals lanceolate, acuminate, sparingly glandular-hispid or glabrous; fruit globose or nearly so, $10-12 \mathrm{~mm}$. in dianeter, glabrous. Prairies, Minn. and Iowa to Mont., Tex. and N. Mex. June-July.
6. Rosa Woòdsii Lindl. Woods' Rose. (I. F. f. 1969.) Low, bushy, 3-10 dm. high, armed with slender mostly straight spines, or unarmed above. Stipules rather broad, entire; leaflets 5-9, oval or obovate, short-stalked or sessile, obtusish at the apex, narrowed or cuneate at the base, $10-18 \mathrm{~mm}$. long, simply and sharply serrate, somewhat glaucous beneath; flowers $3-5 \mathrm{~cm}$. broad; sepals erect on the fruit; fruit globose or globose-ovoid, $8-10 \mathrm{~mm}$. in diameter, glabrous, sometimes glaucous. Prairies, Minn. to Mo., the N. W. Terr. and N. Mex. June-July.
7. Rosa Carolina L. Swame Rosf. (I. F. f. mō0.) Bushy, 3 - 25 dm. high,
with stout commonly recurved prickles or sometimes unarmed; leaflets 5-9 (usually 7), oval, oblong, ovate-lanceolate or even obovate, 3-7 cm. long, acute or acutish, pale or pubescent beneath; flowers corymbose or rarely solitary, $5-7 \mathrm{~cm}$. broad; calyx-lobes lanceolate, acuminate or dilated above, hispid-pubescent, spreading, deciduous; fruit globose or depressed-globose, about 8 mm . high, glandular-hispid. In swamps and low grounds, Quebec and Ont. to Minn., Fla. and Miss. June-Aug.
8. Rosa lùcida Ehrh. Glossy Rose. Like R. humilis but larger, $\mathbf{I}-2 \mathrm{~m}$. high; leaflets mostly $7,2-4 \mathrm{~cm}$. long, thick, shining above; stipules broad, often glandular-toothed; prickles rather stout and flat, straight or slightly curved; fruit about I dm. high. N. J. and Penn: to Ont. and Newf. [R. humilis lucida Best].
9. Rosa hùmilis Marsh. Low or Pasture Rose. (I. F. f. 1971.) Bushy, I-IO dm. high, usually armed with slender straight infrastipular spines, and more or less prickly. Stipules narrow, entire; leaflets usually 5 (sometimes 7), rather thin, ovate, oval or obovate, somewhat shining, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long, mostly acute at each end, short-stalked or sessile, glabrous or pubescent beneath; flowers usually few or solitary, $5-7 \mathrm{~cm}$. broad; pedicels and calyx usually glandular; sepals lanceolate, acuminate, or dilated above, commonly lobed; fruit globose or depressedglobose, glandular-hispid, about 8 mm . high. In dry or rocky soil, Me. and Ont. to Wis., Ga., Kans. and La. May-July.

Rosa hùmilis villòsa Best. Low, very prickly; leaflets thickish, villous-pubescent beneath. N. J. and N. Y.
10. Rosa nítida Willd. Northeastern Rose. (I. F. f. 1972.) Bushy, seldom over 6 dm . high, the stems and branches densely covered with slender straight prickles nearly as long as the slender infrastipular spines. Stipules usually broad; leaflets 5-9, oblong or oval, generally acute at each end, the terminal one sometimes slightly obovate and obtuse at the apex, all sharply serrate, shining above, glabrous or very nearly so, $\mathbf{1 2 - 3 0} \mathrm{mm}$. long; flowers $3-6 \mathrm{~cm}$. broad; sepals lanceolate, acuminate, entire, hispid or glandular; fruit glandular-hispid, globose, about 8 mm . high. In low grounds, Mass. to Newf. June-July.
if. Rosa canìna L. Dog Rose. Canker Rose. Wild Brier. (I. F. f. 1973.) Branches erect or straggling, sometimes 3.5 m . long, armed with short hooked spines, not bristly but sometimes glandular. Stipules broad, glandular; leaflets 5-7, ovate or oval, rather thick, generally obtuse at each end, usually simply and sharply serrate, $2-4 \mathrm{~cm}$. long; flowers solitary or few, pink varying to white; sepals much lobed, lanceolate, reflexed, deciduous; fruit long-ovoid, I-2 cm. long, usually glabrous. In waste places, N. S. to N. J., Va., Tenn. and Kans. Nat. from Europe. June-July.
12. Rosa rubiginòsa L. Sweetbrier. (I. F. f. 1974.) Slender, i-2 m. high, or forming longer wands, armed with stout recurved spines. Stipules rather broad; leaflets 5-7, similar to those of the preceding, but generally doubly serrate and densely glandular-pubescent and resinous beneath, very aromatic; flowers pink varying to white; sepals lanceolate, usually much lobed, spreading, deciduous, glandular-hispid; fruit oval or ovoid, 1-2 cm. long. In waste places, N. S. to Ont., Kans., Tenn. and Va. Nat. from Europe. June-July.

Rosa cinnamòmea L., the Cinnamon Rose, with small double reddish flowers, and leaves downy-pubescent beneath, is occasionally found along roadsides in the Middle and Eastern States.

## Family 12. POMÀCEAE L.

Apple Family.
Trees or shrubs, with alternate leaves, the small deciduous stipules free from the petiole. Flowers regular, perfect. Calyx superior, mostly 5 -toothed or 5 -lobed, its tube adnate to the ovary. Petals mostly 5 , usually clawed. Stamens numerous or rarely few, distinct; anthers small, 2-celled, the sacs longitudinally dehiscent. Ovary composed of 1-5 wholly or partly united carpels; ovules I-2 (rarely several) in each carpel, anatropous, ascending; styles $1-5$; stigma small. Fruit a more
or less fleshy pome, consisting of the thickened calyx-tube enclosing the bony papery or leathery carpels. Endosperm none; cotyledons fleshy. About 20 genera and 225 species, of wide geographic distribution.

| Ripe carpels papery or leathery. |  |
| :--- | :--- |
| Leaves pinnate. <br> Leaves simple, entire, toothed, or lobed. <br> Cavities of the ovary (carpels) as many as the styles. | 1. Sorbus. |

## I. SÓRBUS L.

Trees or shrubs, with pinnate leaves, serrate leaflets, deciduous stipules, and white flowers, in compound cymes. Calyx-tube urn-shaped, 5 -lobed, not bracteolate. Petals 5, spreading, short-clawed. Stamens $\infty$. Ovary inferior ; styles usually 3 , distinct; stigma truncate; ovules 2 in each cavity. Fruit a small red berry-like pome. [The ancient Latin name of the Pear or Service-tree.] About 7 species, natives of the north temperate zone. Besides the following, another occurs in western N. Am.

Leaflets glabrous above.
Leaflets long-acuminate; fruit $4^{-6} \mathrm{~mm}$. in diameter.
I. S. Americana.

Leaflets obtuse or short-pointed; fruit about 8 mm . in diameter.
2. S. sambucifolia.
3. S. Aucuparia.

Leaflets pubescent on both sides.
r. Sorbus Americàna Marsh. American Mountain Ash. Dogberry. (I. F. f. 1975.) A small tree, with smooth bark. Leaves petioled; leaflets II-I7, lanceolate, long-acuminate, glabrous, or slightly pubescent, bright green above, generally paler beneath, $3-10 \mathrm{~cm}$. long; cymes dense, $7-15 \mathrm{~cm}$. broad; flowers $4-6 \mathrm{~mm}$. broad. In moist ground, Newf., Manitoba, N. Car. and Mich. May-June.
2. Sorbus sambucifòlia (C. \& S.) Roem. Western Mountain Ash. (I. F. f. 1976.) Resembles the preceding. Leaflets 7-15, proportionately broader and shorter, oval or ovate-lanceolate, obtuse or short-pointed at the apex, glabrous and dark green above, pale and usually more or less pubescent beneath, especially along the veins, seldom over 7 cm . long; flowers $6-7 \mathrm{~mm}$. broad; calyx and pedicels generally pubescent; cymes $5-10 \mathrm{~cm}$. broad. In moist ground, Lab. tc Alaska, northern N. Eng., Penn., Mich., and in the Rocky Mts. to Colo. and Utah. Also in northeastern Asia. June-July.
3. Sorbus Aucupària L. European Mountain Ash. Leaves pubescent on both sides, especially when young, the calyx and pedicels usually woolly. Escaped from cultivation, N. S. to N. H. Native of Europe.

## 2. PỲRUS L.

Trees, or some species shrubs, with simple leaves. Flowers large, white or pink, in simple cymes. Calyx urn-shaped, 5 -lobed, the lobes acute. Petals 5, rounded, short-clawed. Stamens usually numerous; styles mostly 5 , distinct, or united only at the very basc; ovules 2 in each cavity; carpels cartilaginous or leathery. Fruit a pome, usually pear-shaped, its flesh abounding in grit-cells. [Latin name of the Pear.] About 12 species, zatives of the Old World.

1. Pyrus commùnis L. Peare Choke Pear. (I. F. £. 1977.) A tree, sometimes 20 m . high; branches usually thorny. leaves ovate. clliptic or obovate, finely serrulate or entire, petioled, $3-8 \mathrm{~cm}$. long, downy and ciliate when young, becoming glabrous or nearly so, the apex acute or acumiate: petioles sometimes as long as the blades or longer: cymes few-several-flowered, berne at the ends of short twigs of the preceding year; pedicels 1.55 cm . long: flowers white, $2-5 \mathrm{~cm}$. broad; calyx-lobes about as long as the tube; styles distinct to the
base. In thickets and woods, Me. to N. J. and Penn., escaped from cultivation. Native of Europe and Asia. April-May.

## 3. MALUS Hill.

Trees or shrubs, with toothed or lobed leaves, and pink or white flowers in simple terminal cymes. Calyx-tube urn-shaped or campanulate, 5 -lobed. Petals 5, rounded, clawed. Styles 2-5 (usually 5), united at the base; ovules 2 in each cavity ; carpels papery or leathery. Fruit a pome, usually depressed-globose, mostly hollowed at the base. [Greek, apple.] About 15 species, natives of the north temperate zone. Besides the following, another occurs in northwestern Am.
Leaves glabrous, at least when mature.
Leaves oblong, lanceolate or oval, narrowed at the base. I. M. angustifolia.
Leaves ovate, cordate or rounded at the base.
2. M. coronaria.

Leaves persistently pubescent or tomentose beneath.
Leaves mostly narrowed at the base; pome $2-4 \mathrm{~cm}$. in diameter. Pedicels slender, $2-4 \mathrm{~cm}$. long.
3. M. Ioensis.

Pedicels stout, $\mathrm{I}-2.5 \mathrm{~cm}$. long.
4. M. Soulardi.

Leaves rounded or subcordate at the base ; pome $5-10 \mathrm{~cm}$. in diameter.
5. M. Malus.
r. Malus angustifòlia (Ait.) Michx. Narrow-leaved Crab Apple. (I. F. f. 1978.) A small tree. Leaves oblong, oblong-lanceolate or oval, thick, shining and dark green above, sometimes pubescent beneath when young, dentate or often entire, $2-5 \mathrm{~cm}$. long; cymes tew-flowered; pedicels $2-4 \mathrm{~cm}$. long, slender; flowers pink, fragrant, mostly less than 2.5 cm . broad; pome about 2.5 cm . in diameter. In thickets, N. J. to Ill., Kans., Fla. and La. March-May.
2. Malus coronària (L.) Mill. American Crab Apple. (I. F. f. 1979.) A small tree. Leaves petioled, ovate to trangular-ovate, sparingly pubescent beneath when young, sharply serrate and often somewhat lobed, ovate, acute or acutish at the apex, $2-8 \mathrm{~cm}$. long; flowers rose-colored, very fragrant, $2-5 \mathrm{~cm}$. broad; pedicels I-4 cm. long, glabrous; calyx slightly pubescent; pome fleshy, globose or depressed, $2-4 \mathrm{~cm}$. in diameter, greenish-yellow, fragrant, acid. In thickets, Ont. to Mich. and S. Car. April-May. Fruit ripe Sept.
3. Malus Ioénsis (Wood) Britton. Western Crab Apple. (I. F. f. 1980.) A small tree, much resembling Malus coronaria. Leaves firm, white-pubescent beneath, at length glabrous above, obtuse at the apex, mostly narrowed at the base, ovate, oval or oblong, dentate, crenate or with a few rounded lobes, $2-5 \mathrm{~cm}$. long, or on young shoots much larger ; petioles, pedicels and calyx pubescent. Minn., Wis. and Ill. to Neb., Ky., La. and the Ind. Terr. April-May.
4. Malus Soulàrdi (Bailey) Britton. Soulard Crab Apple. (I. F. f. r98ı.) A small tree, resembling the two preceding. Leaves ovate, elliptic or obovate, mostly obtuse or truncate at the apex, rugose and densely tomentose beneath, irregularly crenate-dentate or sometimes few-lobed; petioles 2.5 cm . or less, tomentose; flowers smaller than those of $M$. coronaria, the cymes dense; pedicels stout, whitetomentose; pome $2.5-6 \mathrm{~cm}$. in diameter. Minn. to Mo. and Tex. April-May.
5. Malus Malus (L.) Britton. Apple. (I. F. f. 1982.) A large tree with spreading branches. Leaves ovate or oval, rounded or slightly cordate at the base, glabrous or nearly so above, pubescent and often woolly beneath ; pedicels generally tomentose, $2-5 \mathrm{~cm}$. long ; flowers pink, or white, $3-8 \mathrm{~cm}$. broad; calyx tomentose. In woods and thickets, Me. to N. Y., N. J., Penn. and Ga. Introduced from Europe and escaped from cultivation. April-May.

## 4. ARONIA Medic.

Low shrubs, with simple petioled finely serrate leaves, the upper side of the midrib glandular, the narrow stipules early deciduous. Flowers small, white or pink, in compound cymes. Calyx urn-shaped, 5-lobed. Petals 5, concave, spreading. Stamens numerous. Styles $3-5$, united at the base. Ovary woolly. Pome small, globose, oval, or somewhat top-shaped, its carpels rather leathery. [Name modified from Aria, the Beam-tree of Europe.] Only the following species: Cyme and lower surfaces of the leaves woolly.

Fruit short-pyriform, bright red.
Fruit oval to globose, purple-black.
Cymes and leaves glabrous or nearly so; fruit black or purplish.

[^29]I. Aronia arbutifòlia (L.) Medic. Red Choke-berry. (I. F. f. 1983.) Leaves oval, oblong or obovate, obtuse or short-pointed at the apex, narrowed or somewhat cuneate at the base, $2-8 \mathrm{~cm}$. long, glabrous above, densely tomentose beneath; flowers white or purplish-tinged, $8-\mathbf{1} 2 \mathrm{~mm}$. broad; calyx and pedicels tomentose; pome $4^{-6} \mathrm{~mm}$. in diameter, short-pyriform, and bright red when mature, long-persistent. In swamps and wet woods, N. Y. to Fla. March-May.
2. Aronia atropurpùrea Britton, $n$. s.p. Purple-fruited Chokeberry. A shrub, sometimes 4 m . high, usually taller than the other species. Calyx, pedicels and lower leaf-surfaces tomentose; flowers similar to those of the preceding ; fruit oval to globose, purple-black, $6-10 \mathrm{~mm}$. high. In wet soil, N. S. to Fla. April-June. Type from Arlington, Staten Island.
3. Aronia niggra (Willd.) Britton. Black Chokeberry. (I. F. f. 1984.) Leaves obovate or oval, short-petioled, crenulate, dark green above, paler beneath, glabrous or nearly so on both surfaces; calyx and pedicels nearly glabrous; fruit globose or oval, nearly black, 6-8 mm. in diameter, early deciduous. In swamps or low woods, or sometimes in drier soil, N. S. to Ont., Fla. and Mich. MarchJune.

## 5. AMELÁNCHIER Medic.

Shrubs or trees, with simple petioled leaves, unarmed branches, and racemose or rarely solitary white flowers. Calyx-tube campanulate, adnate to the ovary, 5 -lobed, the lobes narrow, reflexed, persistent. Petals 5. Stamens $\infty$, inserted on the throat of the calyx; filaments subulate; styles $2-5$, connate, pubescent at the base. Ovary inferior, its cavities becoming twice as many as the styles; ovule I in each cavity, erect. Pome small, berry-like, 4-10-celled. Testa of the seed cartilaginous. [The Savoy name of the Medlar.] About 12 species, natives of the north temperate zone. Besides the following, some 3 others occur in western N. Am. and $\mathbf{r}$ in Mex.

Flowers several or numerous in the racemes; pome globose.
Glabrous or pubescent trees and shrubs; leaves usually serrate nearly all around.
Leaves acute or acuminate at the apex; top of the ovary glabrous or nearly so.
Leaves ovate, oval or ovate-lanceolate, glabrous when mature; base cordate or rounded.

1. A. Canadensis.

Leaves oblong, oval, ovate or obovate, rarely subcordate at base, densely white-woolly beneath, at least when young. 2. A. Botryapium.
Leaves rounded, obtuse or subacute at the apex; top of the ovary woolly.
Low shrub of rocky places, $3^{-6} \mathrm{dm}$. high ; petals $4^{-8} \mathrm{~mm}$. long.

Tree or small shrub; petals $10-16 \mathrm{~mm}$. long.
Glabrous western shrub; leaves dentate above the middle only. Flowers only I-4 in the clusters; pome oblong or obovoid.
I. Amelanchier Canadénsis (L.) Medic. June-berry. Service-berry. May-cherry. (I. F. f. 1985.) A tree, sometimes reaching the height of 20 m . Leaves ovate or oval, sharply and finely serrate, soon entirely glabrous, $2-10 \mathrm{~cm}$. long; racemes spreading or drooping ; pedicels long, slender; bracts silky, purplish, deciduous ; petals linear, linear-spatulate, or linear-oblong, $\mathbf{I}-2 \mathrm{~cm}$. long, 3-4 times the length of the nearly or quite glabrous calyx; pome red or purple, sweet, about 6 mm . high. In dry woodlands, Newf. to Ont., Fla. and La. MarchMay. Fruit ripe June-July.
2. Amelanchier Botryàpium (L. f.) DC. Shad-bush. Swamp SugarPEAR. (I. F. f. 1986.) A shrub or small tree, sometimes 10 m . high, the foliage and inflorescence densely white-woolly when young, often nearly or quite glabrous when old. Leaves acute at the apex, finely and sharply serrate nearly all around; racemes short, rather dense; pedicels short, seldom over 2.5 cm . long; petals spatulate or linear-spatulate, $6-14 \mathrm{~mm}$. long, $2-3$ times as long as the calyx-lobes; calyx usually densely white-woolly; pome $6-8 \mathrm{~mm}$. in diameter. In swamps and moist soil, N. B. to Manitoba, Fla. and La. April-May.
3. Amelanchier spicata (Lam.) Dec. Low June-berry. (I. F. f. 1087.) Stems 3-6 dm. high from a long root creeping among rocks. Leaves elliptic or oval, $2-4 \mathrm{~cm}$. long, rounded at both ends, or sometimes subacute at the apex, sometimes subcordate at the base, serrulate or dentate-serrate, or sometimes entire below the middle, dark green and quite glabrous when mature, woolly when young ;
racemes 4 -10-flowered; pedicels $\mathbf{1 - 2 . 5} \mathrm{cm}$. long in fruit ; calyx-lobes nearly triangular ; pome about 6 mm . in diameter. N. Y., N. J. and Penn. May.
4. Amelanchier rotundifolia (Michx.) Ruem. Round-leated June-berry. (I. F. f. 1988.) A tall shrub or small tree. Leaves broadly oval, ovate or nearly orbicular, $2-8 \mathrm{~cm}$. long, obtuse or rounded at both ends, or rarely subacute, often cordate at the base, serrate with large teeth, or entire near the base, glabrous from the time of unfolding or more or less woolly when very young ; pedicels $2-4 \mathrm{~cm}$. long in fruit; calyx-lobes lanceolate; petals spatulate or oblanceolate, $\mathbf{I - 1 . 6} \mathrm{cm}$. long; pome $6-8 \mathrm{~mm}$. in diameter. In woods and thickets, N. B. to Minn., N. Y. and Mich. May.
5. Amelanchier alnifòlia Nutt. Northwestern June or Service-berry. (I. F. f. I989.) A shrub, tomentose-pubescent when young, at length glabrate and somewhat glaucous. Leaves thick, broadly elliptic or almost orbicular, very obtuse and often truncate at the apex, rounded or subcordate at the base, coarsely dentate above the middle, $\mathbf{I}-5 \mathrm{~cm}$. long; racemes short, rather dense; pedice.s short; petals oblanceolate, cuneate, $6-18 \mathrm{~mm}$. long, $2-4$ times the length of the calyx; pome purple, with a bloom, 6-8 mm. high, sweet. Dry soil, western Ont. to Br. Col., Mich., Neb., N. Mex. and Cal. April.
6. Amelanchier oligocàrpa (Michx.) Roem. Oblong-fruited June-berry. (I. F. f. 1990.) A shrub, glabrous or very nearly so, except the early deciduous bracts, which are sometimes tomentose. Leaves thin, narrowly oval or oblong, generally about 3 times as long as broad, narrowed at each end, finely and sharply serrate, $2-8 \mathrm{~cm}$. long; racemes 1-4-flowered; pedicels slender; petals obovate or oblanceolate, $6-8 \mathrm{~mm}$. long, about twice as long as the calyx; pome pear-shaped, purple, with a bloom, $6-8 \mathrm{~mm}$. long. In cold swamps or wet rocky places, Lab. to Ont., Penn. and Mich. May.

## 6. CRATAEGUS L.

Shrubs or small trees, usually spiny, with petioled leaves and white or pink corymbose flowers. Calyx-tube cup-shaped or campanulate, adnate to the carpels, its limb 5-lobed. Petals 5, rounded, inserted on the throat of the calyx. Stamens $\infty$, usually numerous; filaments filiform. Ovary inferior, or its summit free, $\mathbf{1}$-5-celled; styles I-5, separate; ovule $\mathbf{I}$ in each carpel, or if 2 , dissimilar. Pome rather small, drupe-like, containing $\mathbf{I}-5$ bony carpels, each I -seeded or rarely 2 -seeded. Seed erect, flattish. [Greek, strong, from the toughness of the wood.] About 75 species, natives of the north temperate zone, Mexico and the Andes. Besides the following, 8 or 10 others occur in southern and western N. Am.

## * Corymbs many-flowered.

I. Leaves obovate, spatulate, oblanceolate or flabellate. Foliage, pedicels and calyx glabrous.

Leaves obovate or oblanceolate, sharply serrate.
Spines long, slender; leaves shining. I. C. Crus-galli.
Spines short, stout; leaves dull. 2. C. brevispina.
Leaves obovate or spatulate, crenate.
Leaves narrowly spatulate; flowers 8 mm . wide. 3. C. spathulata.
Leaves obovate; flowers 15 mm . wide.
4. C. Browniz.

Lower leaf-surfaces, pedicels and calyx more or less pubescent, at least when young.
Leaves short-petioled; fruit smail.
Leaves oblanceolate, very obtuse. 5. C. berberifolia.
Leaves obovate-oval, acutish. 6. C. prunifolia.
Leaves obovate, acutish, dull. 7. C. collina.
Leaves slender-petioled; fruit large.
Leaves obovate, dull, irregularly serrate. 8. C. punctata.
Leaves flabellate, shining, incised-serrate.
9. C. fabellata.
2. Leaves ovate, oval, orbicular-obovate or nearly orbicular. $a$. Foliage, pedicels and calyx glabrous, or nearly so.

Leaves mainly truncate or cordate at the base.
Leaves lobed ; fruit 4-6 mm. high. io. C. cordata.
Leaves irregularly serrate; fruit $10-12 \mathrm{~mm}$. high, glaucous.
11. C. Eggerti.

Leaves narrowed or wedge-shaped at the base.
Leaves deeply cleft ; styles $\mathrm{I}-3$.
12. C. Oxyacantha.

Leaves serrate or incised; styles mostly 5 .
Fruit about 6 mm . in diameter.
13. C. viridis.

Fruit $10-12 \mathrm{~mm}$. in diameter, glaucous or pruinose.
Leaves firm, shining.
Fruit globose ; western. 14. C. nitida.
Fruit pyriform; eastern. 15. C. Porteri.
Leaves thin, dull.
16. C. pruinosa.
b. Lower surfaces or teeth of the leaves, pedicels and calyx pubescent or glandular.

Leaves deeply pinnately incised; fruit $4^{-6} \mathrm{~mm}$. long.
17. C. apiifolia.

Leaves serrate or lobed; fruit 6-25 mm. long.
Leaves glabrous, or nearly so.
Leaves, or, most of them, truncate or cordate at the base.
18. C. coccinea.

Leaves, or most of them, narrowed at the base.
Fruit 8-14 mm. in diameter.
Fruit globose to oval; leaves firm in texture.
Bractlets and calyx very glandular. 19. C. rotundifolia.
Bractlets and calyx pubescent. 20. C. occidentalis.
Fruit pyriform; leaves thin.
21. C. tenuifolia.
22. C. macracantha.

Fruit only $6-8 \mathrm{~mm}$. in diameter.
Leaves pubescent, especially along the veins beneath.
Leaves ovate-orbicular, mostly truncate or cordate at base. Fruit r.52.5 cm . in diameter; red. 23. C. mollis.

Leaves ovate to oval, mostly cuneate or narrowed at the base.
Fruit globose or depressed-globose.
Veins not prominent on the lower leaf-surfaces.
24. C. Biltmoreana.

Veins very straight and prominent. 25. C. campestris.
Fruit oval to oblong.
Fruit dull red, over 1 cm . long.
26. C. tomentosa.

Fruit bright red, 1 cm . long or less.
27. C. Chapmani.

Fruit pyriform.
28. C. pyriformis.
** Corymbs I-7-flowered.
Calyx-lobes not incised; petioles and leaf-serrations very glandular.
29. C. Alava.

Calyx-lobes deeply incised; petioles and leaf-serrations little or not at all glandular.

Leaves obovate or spatulate, obtuse.
Leaves oval, mostly acute at both ends.

1. Crataegus Crús-gálli L. Cockspur Thorn. Newcastle Thorn. (I. F. f. I99I.) A shrub or small tree, the branches spreading. Thorns numerous, slender, $5-10 \mathrm{~cm}$. long; leaves coriaceous, shining above, obovate or oblanceolate, obtuse or abruptly acuminate at the apex, cuneate at the base, $2-5 \mathrm{~cm}$. long, sharply serrate; flowers about 12 mm . broad; calyx-lobes linear-lanceolate; styles usually I-3; fruit globose or slightly pear-shaped, about 12 mm . long. In thickets, Quebec to Manitoba, N. H., Fla. and Tex. May-June.
2. Crataegus brevíspina (Dougl.) Farwell. Douglas Thorn. A small tree. Foliage glabrous or nearly so. Leaves obovate, unequally serrate or somewhat lobed, cuneate or narrowed at the base, $4-8 \mathrm{~cm}$. long, the petiole about one fourth the length of the blade; thorns $1.5-3 \mathrm{~cm}$. long; flowers about 2 cm . wide; calyx-lobes ovate, obtuse, rarely glandular; fruit globose, purple-black, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. in diameter. Mich. to Br. Col., Colo. and Ore. May-June. [C. Douglasii Lindl.]
3. Crataegus spathulàta Michx. Small-fruited HAw. (I. F. f. I992.) A shrub or small tree. Spines $2-5 \mathrm{~cm}$. long; leaves fascicled, coriaceous, shining above, rather dull beneath, spatulate, obtuse and crenate or with $2-3$ lobes at the summit, entire and cuneate at base, almost sessile, $2-4 \mathrm{~cm}$. long; flowers about $\delta$ mm . broad; calyx-lobes ovate ; styles commonly 5 ; fruit red, globose, $4-6 \mathrm{~mm}$. long. In thickets, Va. to Fla., Mo. and Tex. May-June.
4. Crataegus Bròwnii Britton. Addison Brown's Thorn. Glabrous throughout. Leaves obovate or oval-obovate, obtuse, or obtusish at the apex, cuneate-narrowed at the base, irregularly crenate, with distinctly rounded teeth. slender-petioled, $4-6 \mathrm{~cm}$. long : pedicels slender; bracts linear, very glandular; flowers about 1.5 cm . broad; calyx-segments linear-lanceolate. Va. and W. Va. May. Type from Buchanan, Va.
5. Crataegus berberifolia T. \& G. Barberrvi-leaten Thorn. similar to $C$. Crus-galli, but the young leaves, pedicels and calyx densely pubescont. Thorns slender, $2-5 \mathrm{~cm}$. long; mature leaves pubescent with scattered hairs, rather
dull, oblanceolate to broadly obovate, $4-8 \mathrm{~cm}$. long; fruit oval, about $\mathbf{I c m}$. long. Mo. to La. April-May.
6. Crataegus prunifolia (Marsh.) Pers. Plum-leaved Thorn. Similar to broad-leaved forms of C. Crus-galli, the leaves oval to obovate, acutish, serrate nearly to the base; $5-7 \mathrm{~cm}$. long, $3-5 \mathrm{~cm}$. wide, pubescent beneath, at least when young; pedicels and calyx pubescent; flowers and globose pome about $\mathbf{I} \mathrm{cm}$. broad. Mo. Perhaps not the original Mespilus prunifolia Marsh.
7. Crataegus collína Chapm. Round-fruited Thorn. A small tree, the young foliage and the inflorescence pubescent. Leaves ob̨ovate, mostly acute, finely serrate, tapering into the short petiole; flowers 8 - 10 mm . broad; styles 5 ; fruit hard, globular, about I cm. in diameter. Va. to Ga. and Mo. April-May.
8. Crataegus punctàta Jacq. Large-fruited Thorn. (I. F. f. 1993.) A shrub or small tree, with horizontal, thorny branches. Thorns $2-5 \mathrm{~cm}$. long, often branched; leaves slender-petioled, obovate, obtuse or short-pointed at the apex and irregularly serrate or serrulate, cuneate at the base, nearly glabrous above, pubescent or at length glabrous beneath, $5-8 \mathrm{~cm}$. long, rarely lobed, veins straight, conspicuous'; flowers $\mathbf{I - 2} \mathrm{cm}$. broad; calyx-lobes linear, entire ; styles mostly 3 ; fruit globose or oval, red or yellow, $1.5-2.5 \mathrm{~cm}$. in diameter. In thickets, Quebec and Ont. to N. H., Ga., west to Iowa. May.

Crataegus punctàta canéscens Britton. Lower leaf-surfaces, petioles, peduncles and pedicels densely whitish-tomentose. Vt. to Ont., Penn. and Ohio.

## 9. Crataegus flabellàta (Spach) Rydb. Fan-leaved Thorn. Leaves

 flabellate, broadest above the middle, cuneate at the base, thin and usually with a few scattered hairs beneath when young, sharply and irregularly incised-serrate, glabrous, firm and shining above when old, 6-10 cm . long, slender-petioled; thorns 5 cm . long or more; fruit globose, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. in diameter. Quebec to Me., R. I.', the N. W. Terr. and Mont.10. Crataegus cordàta (Mill.) Ait. Washington Thorn. (I. F. f. 1994.) A tree, $5-15 \mathrm{~m}$. high. Spines slender, $2-5 \mathrm{~cm}$. long; leaves slender-petioled, broadly ovate, generally sharply $3-7$-lobed and serrate, acute or acuminate at the apex, truncate or cordate at the base, $2-8 \mathrm{~cm}$. long; flowers $8-12 \mathrm{~mm}$. broad; styles 5 ; fruit bright red, depressed-globose, 4-6 mm. high. In woods and thickets, Va. to Ga., Ill. and Tenn.; escaped from cultivation in southern N. J. and Penn. March-May.
II. Crataegus Éggerti Britton. Eggert's Thorn. Foliage sparingly pubescent when young, glabrous when mature. Thorns $3-6 \mathrm{~cm}$. long; leaves ovateorbicular, dull green above, pale beneath, sharply and irregularly serrate, or somewhat lobed, mostly truncate or subcordate at the base, acute or acutish at the apex, slender-petioled, $5-\mathbf{1 2} \mathrm{cm}$. long, and about as wide; flowers $2-2.5 \mathrm{~cm}$. broad; bracts large, very glandular; fruit subglobose, large, sometimes nearly 2 cm . in diameter, glaucous. In dry soil, Iowa to Mo. and Kans. April-May.
11. Crataegus Oxyacántha L. Hawthorn. White or May Thorn. (I. F. f. 1995.) A shrub or tree. Thorns stout, numerous; leaves slender-petioled, glabrous on both sides or pubescent when young, sharply 3-7-lobed, broadly ovate or slightly obovate, broadly cuneate, at the base, $2-5 \mathrm{~cm}$. long; flowers $\mathbf{I}-1.5 \mathrm{~cm}$. broad, white or pink; calyx-lobes ovate; styles 1-3; fruit globose or globose-ovoid. about 6 mm . high. Along roadsides and in thickets, sparingly escaped from cultivation. May-June.
12. Crataegus víridis L. Southern Thorn. (I. F. f. 1996.) A small tree, often without spines. Leaves slender-petioled, ovate to lanceolate or somewhat obovate, glabrous, or pubescent in the axils of the veins beneath, sharply serrate and usually somewhat lobed, mostly acute at each end, $2-8 \mathrm{~cm}$. long; flowers $\mathbf{1} \mathbf{- 1 . 5} \mathrm{cm}$. broad; calyx-lobes lanceolate; styles commonly 5 ; fruit globose or oval, about 6 mm . high, persistent into the winter, 6-8-seeded. Mo. and Kans. to La., Tex., S. Car. and Fla. March-April.
13. Crataegus nítida Engelm. Shining Thorn. Similar to C. viridis, but often a larger tree, the leaves thicker, larger, ovate to oval, and more shining above. Flowers about 2 cm . broad; fruit globose, 1 cm . in diameter, or a little more, $4-5$-seeded, glaucous. Ill., Mo. and Ark. May. [C. viridis nitida Engelm.]
14. Crataegus Pórteri Britton. Porter's Thorn. A shrub, wholly gla-
brous. Leaves ovate to oval, dark green and shining above, paler beneath, 6-10 cm . long, $3-5 \mathrm{~cm}$. wide, sharply irregularly serrate and slightly lobed, the slender petiole about one-third the length of the blade; pedicels slender; fruit pyriform, about 1.4 cm . long and 1 cm . in diameter, pruinose. Calyx-lobes entire. Tannersville, Penn., July 4, 1896.
15. Crataegus pruinòsa (Wendl.) Beadle. Pruinose Thorn. A shrub or small tree. Spines long and slender. Leaves ovate, acute, incised-serrate and somewhat lobed, thin, slender-petioled, $6-8 \mathrm{~cm}$. long, glabrous or nearly so; fruit globose, pruinose, about 10 mm . in diameter. Va. to N. Car. and Mo. [Mespilus pruinosa Wendl.]
16. Crataegus apiifòlia (Marsh.) Michx. Parsley Haw. Parsley-leaved Thorn. (I. F. f. 1997.) A shrub or small tree. Spines stout, 2-5 cm. long; leaves slender-petioled, broadly ovate or nearly orbicular in outline, pubescent on both sides at least when young, truncate or slightly cordate at the base, $\mathrm{I}-3 \mathrm{~cm}$. long, thin, pinnately and deeply $5-7$-cleft, the lobes sharply serrate; flowers $8-12$ mm . broad ; calyx-lobes linear, glandular ; styles $\mathrm{I}-3$; fruit red, oval, $4-6 \mathrm{~mm}$. long. In thickets, Va. to Fla., Mo. and Tex. March-April.
17. Crataegus coccínea L. Scarlet Thorn or Haw. Red Haw. (I. F. f. 1998.) A shrub or sometimes a small tree. Spines stout, 3-5 cm. long; leaves slender-petioled, broadly ovate or orbicular, acute or acuminate at the apex. mostly truncate or subcordate at the base, thin, or becoming firm, sharply incised and serrate, the teeth glandular-tipped; pedicels, bractlets and calyx somewhat glandular-pubescent ; flowers $\mathbf{I} .5-3 \mathrm{~cm}$. broad; calyx-lobes lanceolate; styles 3-5; fruit red, globose or oval, $10-16 \mathrm{~mm}$. in diameter, rarely hairy. Thickets, Newf. to Manitoba, Fla. and Tex. April-May.
18. Crataegus rotundifolia (Ehrh.) Borck. Glandular Thorn. (I.F.f. 1999.) A shrub, similar to the preceding, the spines slender. Leaves mostly smaller, slender-petioled, glabrous or very nearly so, oval, ovate, obovate, or some of them nearly orbicular, incised-serrate with gland-tipped teeth, or sometimes lobed, acute, most of them narrowed or cuneate at the base; bractlets and calyxlobes very glandular; flowers $\mathbf{1 . 5 - 2 . 5} \mathrm{cm}$. broad; fruit globose to oval, red, $8-\mathbf{1} 6$ mm. long. Conn. to Ind., Fla. and Ala. April-June.
19. Crataegus occidentàlis Britton. River-bank Thorn. Pedicels, calyx and lower leaf-surfaces pubescent. Thorns stout, 3 cm . long or more. Leaves oval or slightly obovate, irregularly serrate and sometimes slightly lobed, mostly obtuse at the apex, and narrowed or subcuneate at the base, $4-7 \mathrm{~cm}$. long, 3 or 4 cm . wide, slender-petioled; flowers about 1.5 cm . wide; fruit oval-globose, about I cm. long. River banks, Neb., Colo., Wyo. and Mont.
20. Crataegus tenuifòlia Britton. Thin-leaved Thorn. A shrub, the thorns slender, slightly curved, $5-6 \mathrm{~cm}$. long. Leaves very thin, even when mature, ovate, acute or short-acuminate at the apex, narrowed, or some of them subtruncate at the base, incised-serrate and lobed, with short hairs on the upper surface, $6-10 \mathrm{~cm}$. long, the very slender petiole half the length of the blade or longer; pedicels slender; fruit pyriform, over I cm. long, $8-9 \mathrm{~mm}$. thick, the calyx-lobes glandular-serrate. S. W. Va. Type from South Fork of the Holston River, June 15, 1892.
21. Crataegus macracántha Lodd. Long-Spined Thorn. (I. F. f. 2000.) A shrub or small tree, the bright brown thorns $5 \mathbf{- 1 3} \mathrm{~cm}$. long. Leaves dull, 3-9 cm . long, usually with a few hairs on the prominent veins beneath, sharply and often doubly serrate with gland-tipped teeth, narrowed or cuneate at the base; pedicels often pubescent; calyx and bractlets glandular; flowers numerous, 12-16 mm . broad; fruit globose or oval, 6-8 mm. in diameter. Quebec to Dak., Va. and Mo. May-June.
22. Crataegus móllis (T. \& G.) Scheele. Red-fruited Thorn. (I. F. f. 2001.) A shrub or small tree. Leaves generally broadly ovate, truncate at the base, sometimes 13 cm . long, incised and sharply serrate with gland-tipped teeth, roughish above, pubescent beneath, especially when young ; twigs, petioles and calyx densely pubescent; calyx-lobes usually incised and glandular: flowers 1.5-2.5 cm . broad; fruit bright red, $2-3 \mathrm{~cm}$. in diameter, hairy. Thickets, Quebec to Mich., Neb., Kans., Penn., La. and Tex. April-May.
23. Crataegus Biltmoreàna Beadle. Bilmiore Thorn. Lower leaf-
surfaces, especially along the veins, calyx and pedicels pubescent. Leaves broadly ovate, or nearly orbicular, narrowed, or some of them somewhat truncate at the base, sharply and unequally serrate, subacute, $6-10 \mathrm{~cm}$. long; petioles $2-3 \mathrm{~cm}$. long, mostly a little shorter than the pedicels; young fruit very pubescent; mature fruit subglobose, green to yellow, I cm . or rather more in diameter, green. Pa. to N. Car., Ala. and Mo. May.
24. Crataegus campéstris Britton. Mature leaves firm, densely and finely pubescent and prominently straight-veined beneath, dull and with short scattered hairs above, $6-9 \mathrm{~cm}$. long and nearly as wide, sharply and somewhat irregularly serrate. Thorns stout, $4-6 \mathrm{~cm}$. long; pedicels slender, pubescent ; fruit globose, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. in diameter, pubescent when young. Mo. and Kans.
25. Crataegus tomentòsa L. Pear-thorn. Pear Haw. (I. F. f. 2002.) A shrub or small tree. Spines stout, $2-6 \mathrm{~cm}$. long; leaves petioled, broadly oval or ovate-oval, acute or acutish at the apex, narrowed or cuneate at the base, sharply dentate or somewhat lobed, not glandular, slightly scabrous above, pubescent, especially along the veins beneath, $5-\mathbf{I} 3 \mathrm{~cm}$. long; twigs, petioles and calyx tomentose-pubescent; flowers about $\mathbf{1 2} \mathbf{~ m m}$. broad; calyx-lobes lanceolate, usually incised; styles $3-5$; fruit dull red, oval to oval-pyriform, over 1 cm . long. In thickets, Ont. to N. J., Ga., Mich. and Mo. May-June.
26. Crataegus Chápmani (Beadle) Ashe. Chapman's Thorn. A small tree, similar to C. tomentosa, but the leaves smaller and thicker in texture; flowers about 1.5 cm . wide; fruit smaller, short-oval, 1 cm . high or less, bright red. Va. to Ga. and Mo. May-June.
27. Crataegus pyrifòrmis Britton. Pear-fruited Thorn. Twigs light gray. Leaves broadly oval or obovate-oval, dull, $6-8 \mathrm{~cm}$. long, when mature glabrous above, pubescent, especially on the veins beneath, rather finely serrate nearly all around, not lobed, the blade decurrent into the petiole; pedicels slender; fruit pyriform, about 1 cm . long. Monteer, Mo., B. F. Bush, 1899.
28. Crataegus flàva Ait. Summer or Yellow Haw. (I. F. f. 2003.) A tree, with maximum height of about 7 m ., usually very thorny. Leaves obovate, petioled, irregularly glandular-dentate at the apex, narrowed or cuneate and often entire at the base, $\mathrm{I}-4 \mathrm{~cm}$. long, pubescent on both sides or at length glabrate; pedicels and calyx pubescent; flowers $\mathbf{I}-2 \mathrm{~cm}$. broad; styles commonly 5 ; fruit globese or somewhat pyriform, $\mathbf{1}-\mathbf{1} .5 \mathrm{~cm}$. in diameter. In sandy thickets, Va. to Fla., Mo. and Tex. April-May.
29. Crataegus unifiòra Muench. Dwarf Thorn. (I. F. f. 2004.) A shrub, or sometimes a small tree. Spines numerous, slender, $2-5 \mathrm{~cm}$. long; leaves obovate, coriaceous, nearly sessile, obtuse and crenate at the apex, cuneate and entire at the base, $1-4 \mathrm{~cm}$. long, more or less pubescent, or glabrate and at length shining above; twigs, pedicels and calyx pubescent; flowers $8-10 \mathrm{~mm}$. broad; calyx-lobes lanceolate, deeply incised, glandular; styles commonly 5 ; fruit globose or pyriform. I-I. 6 cm . in diameter, yellow. In sandy soil, S. N. Y. to Fla., W. Va., Mo. and La. April-May.
30. Crataegus Vàiliae Britton. Vail's Haw. (I. F. f. 2005.) A shrub, the branches stout, light gray; thorns slender. Leaves oval, $2-8 \mathrm{~cm}$. long, shortpetioled, pubescent on both sides, but becoming glabrate and slightly shining above, sharply serrate, sometimes slightly 3-lobed; stipules narrow, glandular; corymbs 2-6-flowered; pedicels and calyx densely pubescent; calyx-lobes lanceolate, 812 mm . long, deeply incised, glandular, reflexed in fruit; pome globose, yellowish green, $8-10 \mathrm{~mm}$. in diameter. In thickets, Va. and N. Car. to Mo. May-June.

## 7. COTONEÁSTER Medic.

Shrubs, with stipulate coriaceous leaves, and small white cymose or rarely solitary flowers. Calyx-tube adnate to the ovary, the limb 5-lobed, persistent. Petals 5, scarcely clawed. Stamens numerous. Ovary 2-5-celled or of 2-5 carpels, separate at the summit; styles $2-5$; ovules 2 in each cavity or carpel, alike, erect. Pome ovoid, globose or top-shaped, the carpels bony when mature. [Name neoLatin, Quince-star or Star-quince.] About 20 species, natives of the Old World.
I. Cotoneaster Pyracántha (L.) Spach. Evergreen or Fire Thorn. Pyracanth. (I. F. f. 2006.). A shrub. Spines slender, $\mathbf{I}-2.5 \mathrm{~cm}$. long; leaves evergreen, glabrous, oval or slightly oblanceolate, crenulate, obtuse at the apex,
usually narrowed at the base, $2-5 \mathrm{~cm}$. long, short-petioled; cymes many-flowered; pedicels and calyx pubescent; calyx-lobes ovate; flowers about 6 mm . broad; styles 5; fruit scarlet, depressed-globose, about 4 mm . high, bitter. In thickets, escaped from cultivation, S. Penn. to Ala. and Tenn. Native of Europe and Asia. May.

## Family 13. DRUPACEAE DC. <br> Plum Family.

Trees or shrubs, the bark exuding gum, the foliage, bark and seeds containing prussic acid, bitter. Leaves alternate, petioled, serrate, the small stipules early deciduous, the teeth and petiole often glandular. Flowers regular, mostly perfect. Calyx inferior, deciduous, free from the ovary, 5 -lobed. Disk annular. Calyx-lobes imbricated in the bud. Petals 5, inserted on the calyx. Stamens numerous, inserted with the petals. Pistil I in our genera; ovary i-celled, 2 -ovuled; style simple; stigma mostly small and capitate. Fruit a drupe. Seed I, suspended; endosperm none ; cotyledons fleshy. About 6 genera and 1 Io species, widely distributed, most abundant in the north temperate zone.

Drupe glabrous.
Drupe velvety.

1. Prunus.
2. Amygdalus.

## 1. PRŨNUS L.

Shrubs or trees, mostly with edible fruits, the white or pink flowers variously clustered, the leaves conduplicate or convolute in vernation. Petals spreading. Stamens 15-20, distinct ; filaments filiform. Style terminal ; stigma peltate or truncate. Exocarp of the drupe fleshy, the endocarp bony, smooth or a little roughened, globose or oval, or oblong and compressed. [Ancient Latin name of the Plum-tree.] About 90 species, natives of the north temperate zone, tropical America and Asia. Besides the following, some 12 others occur in southern and western N. A.

* Flowers in lateral scaly umbels or fascicles, expanding with or before the leaves.
$\dagger$ Inflorescence umbellate, the clusters sessile or nearly so.
Leaves convolute in vernation; fruit mostly large; pit more or less flattened.
Umbels several-flowered.
Leaves abruptly acuminate : drupe red or yellow.
Calyx-lobes entire, pubescent within; fruit globose. I. P. Americana.
Calyx-lobes glandular-serrate; fruit subglobose or oval.
Calyx-lobes glabrous within; leaves oval or obovate.

2. P. nigra.

Calyx-lobes pubescent on both sides; leaves ovate-lanceolate.
3. $P$. hortulana.

Leaves acute, gradually acuminate, or obtusish; drupe red or purple.
Leaves glabrous when mature.
Fruit red, with little bloom or none.
Leaves lanceolate; drupe thin-skinned. 4. P. angustifolia.
Leaves ovate-lanceolate or oblong; drupe thick-skinned ; western shrub. 5. P. Watsoni.

Fruit dark purple, with a bloom; leaves ovate. 6. P. Alleg/haniensis.
Leaves pubescent, at least on the lower surface, when mature.
Drupe $1.5-2.5 \mathrm{~cm}$. in diameter; coast plants.
Leaves ovate or oval, acute ; stone pointed at both ends.
7. P. maritima.

Leaves orbicular, very obtuse ; stone pointed at base.
 Umbels only 1-2-flowered.
10. $P$. spinosa.

Leaves conduplicate in vernation; fruit mostly small ; pit mostly globose.
Flowers 6-12 mm. broad ; low shrubs.
Leaves oblanceolate or spatulate; northern. II. P. pumila.
Leaves oval, oblong, or slightly obovate.
Petioles $8-20 \mathrm{~mm}$. long ; drupe $8-10 \mathrm{~mm}$. in diameter ; eastern.
12. P. cuneata.

Petioles 4-6 mm. long ; fruit $\mathbf{1 2}-16 \mathrm{~mm}$. in diameter ; western.
13. P. Besseyi.

Flowers $15-30 \mathrm{~mm}$. broad ; trees.
Leaves glabrous; pedicels short ; fruit sour. 14. P. Cerasus.
Leaves pubescent beneath, at least on veins; pedicels long; fruit sweet.
15. P. Avium.
$\dagger \dagger$ Inflorescence more or less corymbose : leaves shining.
16. P. Pennsylvanica.

*     * Flowers corymbose, terminating twigs of the season.

17. P. Mahaleb.
*** Flowers racemed, terminating branches of the season.

Fruit red to purple, astringent ; leaves obovate or oval.
Fruit purple or purplish-black, sweet or bitter.
Leaves oval or obovate ; shrub or small tree. 19. P. demissa.
Leaves oval-lanceolate to ovate; large tree.
18. P. Virginiana.
20. P. serotina.
I. Prunus Americàna Marsh. Wild Yellow or Red Plum. (I. F. f. 2007.) A shrub or small tree; branches more or less thorny; bark thick. Leaves ovate or obovate, nearly or quite glabrous when mature, usually pubescent when young, sharply and often doubly serrate, rounded at the base, slender-petioled; petioles usually glandless; flowers white, $1.5-2.5 \mathrm{~cm}$. broad; pedicels $\mathrm{I}-2 \mathrm{~cm}$. long; drupe $1.8-2.5 \mathrm{~cm}$. in diameter, the skin tough, bloom little or none, the stone somewhat flattened, its ventral edge acute or margined, the dorsal faintly grooved. N. Y. to Mont., Fla. and Colo. April-May. Fruit ripe Aug.-Oct.
2. Prunus nigra Ait. Canada Plum. Horse Plum. (I. F. f. 2008.) A tree, 6-10 m. high ; bark thin. Leaves oval, ovate or obovate, long-acuminate, pubescent when young, crenulate-serrate; petioles stout, $1-2.5 . \mathrm{cm}$. long, bearing I or 2 red glands near the blade; flowers $2.5-3 \mathrm{~cm}$. broad; pedicels $\mathbf{I}-2 \mathrm{~cm}$. long, glabrous; calyx-lobes glandular-serrate; drupe oval, $2.5-3 \mathrm{~cm}$. long, orange-red, thick-skinned, bloom little or none, the flesh adherent to the oval compressed stone, which is sharply ridged on the ventral edge, somewhat grooved on the dorsal. Newf. to Man., Mass. and Wis. ' May. Fruit Aug. Petals pink in age.
3. Prunus hortulàna Bailey. Wild Goose Plum. (I. F. f. 2009.) A small tree, similar to the two preceding; branches spreading; bark thin. Leaves ovatelanceolate to ovate, long-acuminate, closely glandular-serrate, $10-15 \mathrm{~cm}$. long; petioles not 2.5 cm . long, usually bearing two glands near the blade; pedicels I-2 cm . long ; calyx-lubes glandular-serrate; drupe subglobose or short-oval, bright red, thin-skinned, bloom little or none, stone swollen, roughish, not margined. Ill. to Tenn., Kans. and Tex. April-May.

Prunus hortulàna Mìneri Bailey. Leaves dull, thick, irregularly coarsely serrulate, conspicuously veiny beneath ; stone nearly smooth; leaves varying to oblanceolate. Ill. to Tenn. and Mo.
4. Prunus angustifòlia Michx. Chickasaw Plum. Hog Plum. (I. F. f. 2010.) A small tree, the branches somewhat thorny. Leaves acute, serrulate, often rounded at the base, $7-13 \mathrm{~cm}$. long; flowers smaller than those of the preceding, in lateral umbels, expanding before the leaves; drupe red, globose, $12-18 \mathrm{~mm}$. in diameter, nearly destitute of bloom, its stone ovoid, hardly flattened, both edges rounded, one of them slightly grooved. In dry soil, N. J. to Fla., west to the Rocky Mts. April. Fruit ripe May-July.
5. Prunus Wàtsoni Sargent. Watson's Plum. Sand Plum. (I. F. f. 201I.) A shrub, $2-3.5 \mathrm{~m}$. high, somewhat spiny. Leaves firm, acute or acuminate at the apex, finely crenulate-serrulate, $2-5 \mathrm{~cm}$. long, shining above, the petioles about $\mathbf{I} \mathrm{cm}$. long; flowers $10-12 \mathrm{~mm}$. broad; pedicels $8-12 \mathrm{~mm}$. long, red, glabrous; fruit globose or somewhat elongated, about 18 mm . in diameter, orangered, without a bloom, the flesh yellow; stone oval, pitted, mostly rounded on both margins, abruptly flattened at the summit. Sandy soil, Neb. to Ark. April-May.
6. Prunus Alleghaniénsis Porter. Porter's Plum. (I. F. f. 2012.) A low, straggling shrub or small tree; seldom thorny. Leaves acute or acuminate, finely serrate, rounded at the base, pubescent when young; flowers about 14 mm . broad; drupe globose-ovoid, about 1 cm . in greatest diameter, with a conspicuous bloom; pulp pleasantly acid; stone slightly flattened, a shallow groove on one margin, a slight expansion on the other. Barrens of Huntingdon Co., across the Alleghany Mts. to Clearfield Co., Pa. April.
7. Prunus marítima Wang. Beach Plum. (I. F. f. 2013.) A muchbranched shrub, $0.3^{-2} \mathrm{~m}$. high, not thorny. Leaves oval, ovate or obovate, finely
and sharply serrate, rounded at the base, pubescent beneath even when old; flowers white, numerous, in lateral umbels, expanding before the leaves, $10-16 \mathrm{~mm}$. broad; petals obovate; drupe globose, purple, $1.5-2.5 \mathrm{~cm}$. in diameter, sweet, covered with a bloom; stone little flattened, acute on one margin, slightly grooved on the other. On seabeaches and in sandy soil near the coast, Va. to N. B. April-May. Fruit ripe in Sept. or Oct.
8. Prunus Gràvesii Small. Graves' Beach Plum. (I. F. f. 2014.) A low shrub, reaching a maximum height of about $\mathbf{I} .3 \mathrm{~m}$., not thorny, the twigs of the season mostly puberulent. Leaves orbicular, oval-orbicular, or slightly obovate, 1. $6-3 \mathrm{~cm}$. long, rounded, retuse or apiculate at the apex, obtuse or truncate at the base, pubescent, at least on the nerves beneath ; flowers about 12 mm . broad, solitary or $2-3$ together in lateral umbels, expanding with the leaves; petals suborbicular; drupe globose, ro-16 mm . in diameter, nearly black, with a light blue bloom; stone nearly as thick as wide, pointed only at the base. On a gravelly ridge, Groton, Conn. May-June. Fruit ripe in Sept.
9. Prunus gracilis Engelm. \& Gray. Low Plum. (I. F. f. 2015.) A shrub, $3-12 \mathrm{dm}$. high, the foliage and young twigs densely soft-pubescent. Leaves shortpetioled, ovate-lanceolate or oval, acute or acutish at both ends, sharply serrate, glabrate on the upper surface at maturity; flowers $6-8 \mathrm{~mm}$. broad, in lateral umbels, appearing before the leaves; pedicels slender, pubescent; drupe oval-globose, 8 -10 mm . in diameter; stone little flattened, nearly orbicular. In sandy or dry soil, Tenn. to Kans. and Tex.
10. Prunus spinòsa L. Sloe. Blackthorn. Buckthorn. (I. F. f. 2016.) A shrub with thorny branches, $0.6-5 \mathrm{~m}$. high. Leaves ovate or oblong, obtuse at the apex, serrate, nearly glabrous when mature; flowers white, $8-12 \mathrm{~mm}$. broad, appearing before the leaves, the lateral clusters only $1-2$-flowered; drupe ovoid-globose, nearly black with a bloom, about 12 mm . in diameter; stone little flattened, acute on one edge. Along roadsides, etc., Penn. and N. J. to Mass. Nat. or adv. from Europe: April-May. [Prumus spinòsa insititia A. Gray.]
ir. Prunus pùmila L. Sand Cherry. Dwarf Cherry. (I. F. f. 2017.) Much branched from the base, sometimes bushy, o.2-2 m. high. Leaves mostly oblanceolate or spatulate, acute or azutish, narrowed at the base, serrate, especially toward the apex, usually pale beneath and deep green above, glabrous or very nearly so on both sides when mature; flowers $8-10 \mathrm{~mm}$. broad, appearing with the leaves in sessile lateral umbels ; drupe $8-\mathbf{1 2 ~ m m}$. in diameter, dark red or nearly black when mature without bloom; flesh thin, acid. On sandy or gravelly shores, N. B. to Manitoba, N. J. and Mich. April-May. Fruit ripe in August.
12. Prunus cuneata Raf. Appalachian Cherry. (I. F. f. 2018.) An erect shrub, 3-12 dm. high, the branches light-colored. Leaves oval, oblong or obovate, obtuse or sometimes acute at the apex, narrowed or wedge-shaped at the base, serrate with rather appressed teeth, rather thin, $2-8 \mathrm{~cm}$. long; flowers in umbels, appearing with the leaves, about 1 cm . broad; drupe globose, 8 - 10 mm . in diameter. In wet soil, or among rocks, N. H. to Minn., N. Car. and Wis.
13. Prunus Bésseyi Bailey. Western Sand Cherry. Bessey's Cherry. (I. F. f. 2019.) A shrub, 3-12 dm. high, the branches spreading or prostrate. Leaves elliptic, oblong or oval, the teeth appressed, the apex and base mostlyacute; flowers in sessile umbels, expanding with the leaves, $8-10 \mathrm{~mm}$. broad; fruit $\mathbf{1 2 - 1 6 ~ m m}$. in diameter, on stout pedicels; bitterish and astringent, hack, mottled or yellowish. Prairies, Manitoba and Minn. to Kans. and Utah. April-May.
14. Prunus Cérasus L. Sour Cherry. Egriot. (I. F. f. 2020.) A tree. Leaves ovate or ovate-lanceolate, variously dentate, abruptly acute or acuminate, rounded at the base, very resinous when young; flowers white. $1.5-2.5 \mathrm{~cm}$. broad, in sessile, lateral, very scaly umbels, expanding with the leaves or before them; pedicels little over 3 cm . long in flower; drupe globose, $\mathrm{S}_{-10} \mathrm{~mm}$. in diameter larger in cultivation), black or red, sour, without bloom; stone globose. In woods and thickets, N. H. and Mass. to N. Y. and Penn., escaped from cultivation. Native of Europe. April-May. Fruit June-July.
15. Prunus Àvium L. Wilid or Crab Cherry. Mayard. Gfañ. Swfet Cherry. (I. F. f. 202I.) A large tree. Leaves ovate, oval, or slightly obovate, abruptly short-acuminate, irregularly serrate, pubesent on the veins bencath, of over the entire lower surface when young ; flowers white, about 2.5 cm . broad, in
scaly lateral umbels, expanding with the leaves; pedicels slender, $2.5-6 \mathrm{~cm}$. long in flower; drupe globose, black or dark red, sweet. In thickets and woodlands, escaped from cultivation, Ont. to Mass. and Va. Native of Europe. April-May.
16. Prunus Pennsylvánica L. f. Wild Red Cherry. Pin or Pigeon Cherry. (I. F. f. 2022.) A small tree. Leaves oval or lanceolate, acute or acuminate, mainly rounded at the base, glabrous, serrulate, rather slender-petioled; flowers in lateral, peduncled or sessile leafless clusters, unfolding with the leaves; pedicels slender, glabrous, $\mathbf{I}-\mathbf{2 . 5} \mathrm{cm}$. long; drupe globose, red, $4-6 \mathrm{~mm}$. in diameter, without bloom, its flesh thin and sour, its stone globular. In rocky woods, and clearings, Newf. to Ga., west to the Rocky Mts. April-June. Fruit ripe in August.
17. Prunus Mahàleb L. Mahaleb. Perfumed Cherry. (I. F. f. 2023.) A small tree or shrub. Bark pale, smooth; leaves petioled, ovate, abruptly acute at the apex, rounded or slightly cordate at the base, glabrous, denticulate, fragrant; flowers about 1 cm . broad, in corymbs borne on short branches of the season, unfolding with the leaves; drupe reddish-black, globose or globose-ovoid, about 8 mm . long, the flesh thin, the stone slightly flattened. Roadsides and waste places, Conn. to Ont., N. Y., E. Penn. and Kans. Adv. from Europe. AprilMay. Fruit ripe July.
18. Prunus Virginiàna L. Choke Cherry. (I. F. f. 2024.) A shrub, or rarely a small tree, with gray bark. Leaves thin, obovate or broadly oval, abruptly acute or acuminate at the apex, rounded at the base, glabrous, or slightly pubescent along the veins beneath, serrulate with slender teeth; flowers $8-10 \mathrm{~mm}$. broad, in mainly loosely-flowered racemes, terminating leafy branches of the season; petals suborbicular; drupe red to nearly black, rarely yellow, globose, 8Io mm . in diameter, very astringent; stone globular. Along river-banks and in rocky situations, Newf. to Manitoba, Br. Col., Ga., Neb., Tex. and Colo. AprilMay. Fruit ripe in July or August.
ig. Prunus demíssa (Nutt.) Walp. Western Wild Cherry. (I. F. f. 2025.) A shrub or small tree. Leaves similar to those of the preceding, thicker, acute or often obtusish at the apex, and with shorter teeth; flowers $8-10 \mathrm{~mm}$. broad; racemes generally dense, terminating leafy branches ; drupe dark purple or black, sweet or but slightly astringent, globose, $6-8 \mathrm{~mm}$. in diameter; stone globular. Prairies and dry soil, Dak. to Kans., N. Mex., Br. Col. and Cal. May-July.
20. Prunus serótina Ehrh. Wild Black Cherry. Cabinet or Rum Cherry. (I. F. f. 2026.) A large tree, with maximum height of about 30 m ., the bark rough and black. Leaves thick, oval, oval-lanceolate or ovate, acuminate or acute, glabrous, or pubescent along the veins beneath, serrate with appressed callous teeth ; flowers similar to those of the two preceding, the racemes elongated, spreading or drooping ; petals obovate; drupe globose, $8-10 \mathrm{~mm}$. in diameter; dark purple or black, sweet but slightly astringent. In woods or open places, S. Ont. to Fla., Dak., Kans. and Tex. May. Fruit ripe Aug.-Sept.

Prunus serótina Smàllii Britton. Leaves firm, coriaceous, coarsely serrate, pale beneath; racemes thick, divergent, rather few-flowered; calyx and filaments pubescent. Summit of White Top Mountain, Va.

## 2. AMÝGDALUS L.

Trees or shrubs, with mostly lanceolate serrulate short-petioled leaves, and pink or white flowers solitary or clustered at the nodes of the twigs of the preceding season. Petals spreading. Stamens 20-30, distinct, the filaments filiform. Style and stigma as in Prunus. Exocarp of the fruit mostly fleshy, velvety in the following species; endocarp (stone) bony, deeply pitted or nearly smooth, oval or oblong, pointed, more or less compressed. [Name said to be Syrian.] About 5 species, natives of Asia.
I. Amygdalus Pérsica L. Peach. (I. F. f. 2027.) A small tree. Leaves lanceolate or oblong-lanceolate, $7-14 \mathrm{~cm}$. long, glabrous, long-acuminate, usually narrowed at the base, finely serrate ; petioles $2-6 \mathrm{~mm}$. long; flowers pink, $\mathbf{I}-5 \mathrm{~cm}$. broad, scaly-bracted; drupe subglobose, grooved, softly velvety, $3-8 \mathrm{~cm}$. in diameter. Escaped from cultivation, S. N, Y. to Ga. April-May.

## Mimosa Family.

Herbs, shrubs or trees, with alternate, commonly $2-3$-pinnate leaves, the stipules various, and small regular mostly perfect flowers in heads, spikes or racemes. Calyx 3-6-toothed or 3-6-lobed, the teeth or lobes mostly valvate in the bud. Corolla of as many distinct or united petals, also valvate. Stamens distinct, or monadelphous. Ovary r-celled; style simple. Fruit a legume. Seeds without endosperm; cotyledons fleshy. About 30 genera and I 350 species, mostly tropical.

Shrubs or trees, with bipinnate leaves, the ultimate leaflets usually small and numerous, or the leaves in many exotic species modified into flat simple phyllodes. Flowers small, in heads or spikes. Calyx campanulate, usually 4-5-toothed, or of 4 or 5 distinct sepals. Petals mostly 4 or 5 or wanting. Stamens exserted; filaments filiform; pollen-grains cohering in 2's-6's. Pod linear, oblong or oval, flat or swollen, often constricted between the seeds. [Greek, point, or thorn, many species being thorny.] About 450 species, chiefly in subtropical regions. Besides the following, some 15 others occur in the southern U . S.
I. Acacia filicoìdes (Cav.) Trelease. Prairie Acacia. (I. F. f. 2028.) A thornless shrub. Pinnæ of the leaves $2-15$ pairs, oblong in outline, $2-5 \mathrm{~cm}$. long; leaflets 10-15 pairs, oblong or linear-oblong, about 4 mm . long, less than 2 mm . wide, slightly inequilateral, I-veined; heads globose, many-flowered, axillary, slender-peduncled, $\mathbf{1} \mathbf{- 2} \mathrm{cm}$. in diameter; sepals distinct or nearly so; filaments yellow; pod linear, acute, stipitate, mostly stright, $2-5 \mathrm{~cm}$. long, about 6 mm . wide, flat, its valves thin, reticulated, impressed between the seeds. Prairies Mo. and Kans. to Tex., Ariz. and Mex. May-July.

## 2. ÁCUAN Medic.

Perennial herbs or shrubs, with bipinnate leaves, small stipules, and greenish or whitish small regular flowers in axillary peduncled heads or spikes. Flowers perfect, sessile, or the lowest sometimes staminate, neutral or apetalous. Calyx campanulate, its teeth short. Petals valvate, distinct, or slightly united or coherent below. Stamens 10 or 5, distinct, mainly exserted; anthers all alike. Ovary nearly sessile; ovules $\infty$. Pod linear, straight or curved, acute, flat, several-seeded, 2 -valved, the valves coriaceous or membranous. About io species, natives of warm and tropical America, one widely distributed in tropical regions of the Old World.

Pods few, linear, erect, straight.
Pods numerous in globose heads, oblong, curved.

1. A. leptoloba.
2. A. Illinoensis.
I. Acuan leptóloba (T. \& G.) Kuntze. Prairie Mrmosa. (I. F. f. 2020.) Stems ascending, rough-angled, 6-9 dm. long. Leaves short-petioled. bipinnate: pinnæ 5-10 pairs, sessile; leaflets $10-24$ pairs, sessile, linear-lanceolate, acute, inequilateral, rounded at the base, usually glabrous, $3-+\mathrm{mm}$. long, 1 mm . Wide or less; peduncles $\mathbf{x}-2.5 \mathrm{~cm}$. long, few-flowered; stamens (always?) 5: pods 3 S. narrowly linear, acuminate, about 3 times the length of the peduncle, 6-S-sceded. Prairies, Kans. to Tex. Summer.
3. Acuan Illinoénsis (Michx.) Kuntze. Intinois Minonsa. (I. F. f. 20jo.) Glabrous or nearly so ; stems angled, 3-9 dm. high. Foliage resembling that of the preceding, but the pinnex and obtusish leaflets are sometimes more numerous : peduncles $2-8 \mathrm{~cm}$. long; pods numerous, densely capitate. oblong or lancoolate. strongly curved, $1.5-2.5 \mathrm{~cm}$. long, acute, slightly impressed between the $2-5$ seeds. Prairies and river-banks, Ind. to Ky., Fla., S. Dak. and Tex. May-Sept.

## 3. PROSOPIS L.

Trees or shrubs often with spines in the axils, with 2 -pinnate leaves and small spicate or capitate flowers. Calyx with 5 short teeth. Petals 5, valvate, distinct, or connate below. Stamens 10, distinct; filaments long. Ovary often stalked, many-ovuled; style slender or filiform; stigma very small. Pod linear, compressed, leathery, indehiscent, the mesocarp spongy or dry. Seeds flattened. [Ancient name for some very different plant.] About 15 species, natives of warm and tropical regions. Besides the following, 2 or 3 others occur in the southwestern U. S.
I. Prosopis glandulòsa Torr. Prairie Mesquite. (I. F. f. 2032a.) A shrub, the axils usually with a pair of sharp spines. Leaves petioled, with 2 spreading short-stalked pinnæ, each of numerous sessile pinnules; pinnules linear or linear-oblong, entire, mostly mucronulate, firm, veiny, $1-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide ; spikes axillary, peduncled, densely many-flowered, $5-13 \mathrm{~cm}$. long; calyx campanulate ; petals $2-4$ times as long as the calyx ; ovary villous; pods linear, stipitate, I-2 dm. long, $8-\mathbf{1 2} \mathrm{mm}$. wide, constricted between the seeds. Kans. to Tex., Ariz. and Mex. April-June.

## 4. MORÓNGIA Britton.

Perennial herbs, or shrubs, mainly prostrate or procumbent, armed with recurved prickles. Leaves bipinnate; usually sensitive; leaflets numerous, small; stipules setaceous. Flowers regular, small, 4-5-parted, pink or purple, perfect or polygamous, in axillary peduncled heads or spikes. Stamens usually 8-12, distinct or united at the base; anthers all alike. Ovary nearly sessile; ovules $\infty$. Pod linear, acute or acuminate, spiny all over, at length 4 -valved, several-seeded. [Named in honor of the late Rev. Thos. Morong, a contributor to this work.] About io species, natives of warm and tropical America, I in tropical Africa.
Leaflets elliptic, strongly veined. 1. M. uncinata.
Leaflets linear-oblong, scarcely veined.
2. M. angustata.
I. Morongia uncinàta (Willd.) Britton. Sensitive-brier. (I. F. f. 203I.) Decumbent, 6-12 dm. long. Stem, branches, petioles and peduncles thickly armed with hooked prickles $\mathbf{1 - 2} \mathrm{mm}$. long; stem grooved and angled; leaves petioled ; pinnæ $4^{-8}$ pairs, distant; leaflets $8-15$ pairs, obliquely elliptic, thick, obtusish and mucronate at the apex, inequilateral and rounded at the base, slightly ciliate on the margins, $4^{-8} \mathrm{~mm}$. long; heads globose, very dense, $1.5-2.5 \mathrm{~cm}$. in diameter; flowers pink; pods terete, very densely spiny; about 5 cm . long. In dry soil, Va. to Ill., S. Dak., Fla. and Tex. May-July.
2. Morongia angustàta (T. \& G.) Britton. Narrow-leaved Sensitivebrier. (I. F. f. 2032.) Similar to the preceding species. Pinnæ 3-6 pairs; leaflets numerous, thin, acutish or obtuse, not mucronate or but very slightly so, not at all reticulated, $3-6 \mathrm{~mm}$. long; peduncles shorter than the leaves; heads densely flowered, $\mathbf{I}-\mathbf{I} .6 \mathrm{~cm}$. in diameter; flowers pink; pods linear, sparingly or densely spiny, 5-13 cm. long. In dry soil, Va. to Fla., Tenn. and Tex. [Mimosa microphylla Dryand. ?].

## Family 15. CAESALPINIACEAE KI. \& Garcke.

## Senna Family.

Trees, herbs or shrubs, with alternate simple or compound mostly stipulate leaves. Flowers mostly clustered and perfect, sometimes monœcious, diœcious or polygamous, nearly regular, or irregular. Calyx mostly of 5 sepals or 5 -toothed. Petals usually 5, imbricated, and the upper (unpaired) one enclosed by the lateral ones in the bud. Stamens io or fewer in our genera, the filaments distinct, or more or less united. Ovary I-celled, I-many-ovuled. Fruit a legume, mostly dehiscent into 2 valves. Seeds with or without endosperm. About go genera and 1000 species, mostly of tropical distribution.
Trees or shrubs; leaves simple; corolla irregular, apparently papilionaceous, but the lateral petals enclosing the upper one.

1. Cercis.

Herbs (all our species); flowers perfect; leaves pinnate or bipinnate; corolla nearly regular.

Leaves pinnate, not punctate. Leaves bipinnate, glandular-punctate.
Trees; leaves pinnate or bipinnate; flowers diœcious or polygamous.
Receptacle short; stamens 3-5; pod flat.
Receptacle elongated; stamens io; pod oblong, woody.
2. Cassia.
3. Hoffmanseggia
4. Gleditsia.
5. Gymnocladus.

## 1. CERCIS L.

Small trees or shrubs, with broad leaves, and pink flowers in short lateral fascicles borne on the twigs of preceding season. Calyx somewhat oblique, broadly campanulate, 5 -toothed. Corolla irregular; petals 5 ; standard enclosed by the wings in the bud; keel larger than the wings. Stamens 10, distinct, declined; anthers all alike, versatile, longitudinally dehiscent. Ovary short-stipitate; ovules $\infty$. Pod linear-oblong or oblong, flat, margined along the upper suture, 2 -valvde at maturity, the valves thin, reticulate-veined. [Ancient name of the Old World Judas-tree]. About 5 species, natives of N. A., Europe and temperate Asia.
I. Cercis Canadénsis L. Red-bud. American Judas-tree. (I. F. f. 2033.) A tree, with greatest height of about 18 m ., or often shrubby. Stipules membranous, small, caducous; leaves petioled, cordate-orbicular, blunt-pointed, rather thick, glabrous, or pubescent along the veins beneath, $5-15 \mathrm{~cm}$. broad; flowers several together in sessile umbellate clusters, appearing before the leaves; pedicels slender, $8-25 \mathrm{~mm}$. long; corolla pink-purple, about 8 mm . long; pod shortstalked in the calyx, linear-oblong, acute at each end, glabrous, $5-8 \mathrm{~cm}$. long, several-seeded. In rich soil, S. Ont. to Minn., Neb., N. J., Fla. and Tex. April.

## 2. CÁSSIA L.

Herbs, shrubs, or in tropical regions trees, with evenly pinnate leaves, and mainly (in all our species) yellow flowers. Calyx-teeth nearly equal, generally longer than the tube. Corolla nearly regular; petals 5 , spreading, nearly equal, imbricated, clawed. Stamens usually 10, sometimes 5, often unequal and some of them imperfect; anthers all alike, or those of the lower stamens larger, opening by 2 pores at the summit. Ovules $\infty$. Pod often curved. Seeds numerous. [Ancient name.] About 275 species, of wide distribution in warm and temperate regions. Besides the following, about 20 others occur in the Southern States.
Leaflets linear to oblong, numerous, $6-20 \mathrm{~mm}$. long ; plants $1.5-6.5 \mathrm{dm}$. high.

Flowers $4-8 \mathrm{~mm}$. broad, short-pedicelled; anthers 5 .
Flowers $2.5-4 \mathrm{~cm}$. broad, slender-pedicelled ; anthers ro.

1. C. nictitans.
2. C. Chamaecrista. Leaflets ovate, oblong or obovate, $2-5 \mathrm{~cm}$. long ; plants $3^{-15} \mathrm{dm}$. high.

Leaflets 6 or 4 , broadly obovate.
Leaflets 8 -18, oblong or ovate-lanceolate.
Perennial ; leaflets oblong, obtuse.
Annual; leaflets ovate-lanceolate, acute or acuminate.
3. C. Tora.
4. C. Marylandica.
5. C. occidentalis.

1. Cassia níctitans L. Sensitive Pea. Wild Sensitive-plant. (I. F.
f. 2034.) Annual, more or less pubescent, I.5-4 dm. high. Stipules subulatelinear, persistent; leaves petioled, sensitive, bearing a small gland near the base of the petiole; leaflets I2-44, linear-oblong, obtuse and mucronate at the apex, rounded and oblique at the base, $6-16 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. wide; flowers $2-3$ together in the axils; calyx-lobes acute or acuminate; stamens 5, all perfect; pod linear, 2.5-4 cm. long. In dry soil, Me. to Ga., Ind., Kans. and Tex. July-Oct.
2. Cassia Chamaecrista L. Partridge Pea. Large-floweren Sensitive Pea. (I. F. f. 2035.) Annual, widely branched. Stipules subulate-linear, persistent; leaves petioled, with a sessile gland on the petiole, sensitive; flowers 2-4 together in the axils, showy, some of the petals often purple-spotted; leaflets 20-30, linear-oblong or the upper lanceolate, obtuse, mucronate, oblique at the base, $8-20 \mathrm{~mm}$. long, $3-4 \mathrm{~mm}$. wide; calyx-lobes long-acuminate; stamens io, all perfect; pod linear, pubescent or glabrate, $3^{-6} \mathrm{~cm}$. long, 4-6 mm. wide. In dry soil, Me. to S. Dak., Fla. and Tex. July-Sept.

Cassia Chamaecrista robústa Pollard. Taller ; stems stouter, densely pubescent; flowers larger. Ky. to Ala. and Miss.
3. Cassia Tòra L. Low Senna. (I. F. f. 2036.) Annual, glabrous, \&-6 dm. high. Stipules linear-subulate, at length deciduous; leaves petioled, the gland
borne between or above the lowest pair of leaflets; leaflets 2-4 pairs, thin, obovate, obtuse and mucronulate at the apex, $2-4 \mathrm{~cm}$. long; flowers $\mathrm{I}-2.5 \mathrm{~cm}$. broad, few, in short axillary racemes; calyx-lobes oblong, obtuse; stamens 10 , the anthers of the upper 3 imperfect; pod linear, very slender, strongly curved, I-I. 5 dm . long, about 3 mm . wide. Along rivers, S. Tenn. to Ind., Kans., Fla. and Mex., and throughout tropical America and the warmer parts of the Old World. July-Oct.
4. Cassia Marylándica L. Wild or American Senna. (I. F. f. 2037.) Perennial, glabrous or pubescent with a few scattered hairs, o.9-2.4 m. high, little branched. Stipules subulate-linear, caducous; leaves petioled, the gland borne near the base of the petiole; leaflets $\mathbf{1 2 - 2 0}$, oblong or lanceolate-oblong, obtuse or obtusish, mucronate, rounded at the base, $2-5 \mathrm{~cm}$. long; flowers $14-18 \mathrm{~mm}$. broad, numerous in axillary racemes; calyx-lobes oblong, obtuse; stamens 10, the upper 3 imperfect; pod linear, pubescent or becoming glabrous, $7-10 \mathrm{~cm}$. long, 6 mm . wide, curved. In swamps and wet soil, N. E. to Fla., Mich., Neb. and La. July-Aug.
5. Cassia occidentàlis L. Coffee Senna. (I. F. f. 2038.) Glabrous, much branched, $1.3^{-2} \mathrm{~m}$. high. Stipules caducous; gland borne near the base of the petiole; leaflets $8-\mathbf{1 2}$, rounded at the base, $2-5 \mathrm{~cm}$. long, $8-18 \mathrm{~mm}$. wide; flowers 14-18 mm. broad, in short axillary racemes; stamens 10 , the upper 3 imperfect; calyx-lobes oblong, obtuse ; pod linear, glabrous, I-r. 5 dm . long, about 6 mm . wide, somewhat curved, its margins thickened. In waste places, Va. to Ind., Kans., Fla. and Mex., and throughout tropical Am. Also in the Old World. July-Aug.

## 3. HOFFMANSÉGGIA Cav.

Herbs, or low shrubs, with glandular-punctate bipinnate leaves, small stipules, and yellow flowers in racemes. Calyx deeply 5 -parted, the lobes nearly equal. Petals 5, oval or oblong, imbricated. Stamens 10, distinct, slightly declined; filaments often glandular at the base; anthers all alike, longitudinally dehiscent. Ovary nearly sessile; ovules $\infty$. Pod flat, linear, oblong or ovate, curved or straight, 2-valved, several-seeded. [In honor of Joh. Centurius, Graf Hoffmansegge, a writer on Portuguese botany.] About 20 species, natives of western Am. and S. Africa. Besides the following, some 9 others occur in the southwestern U. S.
Leaflets black-puntate ; pod obliquely oblong.

1. H. Jamesiz.

Leaflets not punctate; pod linear-oblong.
2. H. Falcaria.
I. Hoffmanseggia Jàmesii T. \& G. James' Hoffmanseggia. (I. F. f. 2039.) Herbaceous, finely pubescent, branching from a deep woody root; stems 1.5-3 dm. high. Stipules subulate ; leaves petioled, bipinnate; pinnæ 5-7; leaflets $9-19$, oval or oblong, obtuse at each end, inequilateral, $3-6 \mathrm{~mm}$. long; racemes elongated; flowers yellow, distant, deflexed, $6-8 \mathrm{~mm}$. long, the upper petal spotted with red; pod flat, black-punctate, about 2.5 cm . long and I cm . wide, $2-3$-seeded, tipped with the base of the style. Prairies, Kans. to Tex. and N. Mex. June-July.
2. Hoffmanseggia Falcària Cav. Sickle-fruited Hoffmanseggia. (I. F. f. 2040.) Herbaceous, puberulent, the glands of the peduncles and petioles stalked; stems 3 dm . high or less. Stipules ovate ; leaves slender-petioled, bipinnate ; pinnæ 7-11 ; leaflets 12-21, oblong, obtuse, 3-6 mm. long; racemes few-several-flowered; pod flat, curved or nearly straight, $2.5-4 \mathrm{~cm}$. long, about 6 mm . wide, blunt, 8-12-seeded, the fruiting pedicels recurved. Kans. (according to Fisher) to Tex: and Cal. Also in Central and South America. April-June.

## 4. GLEDITSIA L.

Large trees, with evenly once or twice pinnate leaves, small stipules, and small greenish polygamous flowers in axillary spicate racemes. Calyx campanulate, 3-5cleft. Petals 3-5, equal, sessile, inserted at the summit of the calyx-tube. Stamens 6-10, distinct; anthers all alike, longitudinally dehiscent. Ovary rudimentary or none in the staminate flowers, in the fertile ones nearly sessile. Ovules $2-\infty$. Pod linear or oval, coriaceous, tardily dehiscent. [In honor of J. T. Gleditsch, 17141786, German botanist, the name often spelled Gleditschia.] About 6 species, natives of eastern N. A. and Asia.
r. G. triacanthos.

Pod obliquely oval, short, I-seeded.
2. G, aquatica.
I. Gleditsia triacánthos L. Honey or Sweet Locust. Three-thorned Acacia. (I. F. f. 204I.) A large tree, with rough bark, usually armed with stout branching or simple thorns. Leaves petioled, I-2-pinnate; leaflets shortstalked, oblong-lanceolate or oval, obtuse at each end, inequilateral at the base, often pubescent on the veins beneath, crenulate, $1.5-3 \mathrm{~cm}$. long; racemes drooping, dense, $7-13 \mathrm{~cm}$. long; flowers greenish, about 4 mm . broad; pod $3-5 \mathrm{dm}$. long, $2.5-4 \mathrm{~cm}$. wide, stalked, shining, twisted, pulpy within. In woods, W. N. Y. and Ont. to S. Dak., Ga., Kans. and Tex. Nat. and extensively planted further east. May-July.
2. Gleditsia aquática Marsh. Water or Swamp Locust. (I. F. f. 2042.) A tree, with maximum height of about 20 m . Foliage similar to that of the preceding, but the leaflets thicker, darker green, usually larger, ovate-lanceolate or lanceolate in outline, the margins more crenulate; racemes drooping, elongated; pod glabrous, narrowed at each end, slender-stalked, $2.5-4 \mathrm{~cm}$. long, $1.8-2.5 \mathrm{~cm}$. wide, not pulpy within. In swamps, Ind. to Mo., S. Car., Fla. and La. July.

## 5. GYMNÓCLADUS Lam.

Trees, with bipinnate leaves, and showy white diœcious or polygamous flowers in terminal racemes. Calyx tubular, 5 -lobed, the lobes narrow, nearly equal. Petals 5 (rarely 4), oblong or oval, nearly equal, imbricated, inserted at the top of the calyx-tube. Stamens io, distinct, shorter than the petals and inserted with them; filaments pubescent; anthers all alike, longitudinally dehiscent. Ovary rudimentary, or none in the staminate flowers, sessile and many-ovuled in the pistillate and polygamous ones; style straight. Pod oblong, thick, large, coriaceous, flat, pulpy between the seeds, 2 -valved. [Greek, naked-branch.] A monotypic genus of eastern N. A.

1. Gymnocladus dioìca (L.) Koch. Kentucky Coffee-tree. (I. F. f. 2043.) A large forest tree, with rough bark. Leaves large, petioled; pinnæ 5-9; leaflets 7-15 (or the lowest pair of pinnæ of but a single leaflet), ovate, acute or acuminate at the apex, rounded at the base, glabrous or pubescent on the veins beneath, ciliate, $2-8 \mathrm{~cm}$. long; racemes many-flowered, elongated; flowers slenderpedicelled, $16-18 \mathrm{~mm}$. long; pod 1.2-2.5 dm. long, about 5 cm . wide, the valves thick and coriaceous. Rich woods, S. Ont. to Penn., Tenn., S. Dak. and the Ind. Terr. May-June.

## Family 16. KRAMERIÀCEAE Dumort.

## Krameria Family.

Pubescent herbs, or low shrubs, with alternate simple or digitately 3 -foliolate leaves, and purple or purplish, irregular perfect flowers. Peduncles 2-bracted at or above the middle. Stipules wanting. Sepals 4 or 5 , usually large, the outer one commonly wider than the others. Petals usually 5, smaller than the sepals, the 3 upper ones long-clawed, often united by their claws, or the middle one of the 3 wanting, the 2 lower ones reduced to suborbicular fleshy glands. Stamens 3 or 4 , monadelphous, at least at the base; anther-sacs opening by a terminal pore. Ovary I-celled, or partly 2-celled; ovules 2, collateral, anatropous, pendulous; style slender, acute or truncate. Fruit spiny, indehiscent, i-seeded. Seed without endosperm ; cotyledons fleshy. Only one genus, with about i 5 species, distributed from the southern U.S. to Chile.

## I. KRAMERIA Loefl.

[In honor of Johann Georg Heinrich Kramer, an Austrian physician of the last century.]
I. Krameria secundiflòra DC. Linear-leayed Krameria. (I. F. f. 2044.) A perennial herb from a thick woody root, the stems often 3 dm . long or more. Leaves linear, linear-lanceolate or linear-oblong, sessile, simple, entire, about 2.5 cm . long, acute, tipped with a minute prickle; peduncles solitary, axillary, I-flowered, sometimes secund, bearing 2 leaf-like bracts just below the
flower; flowers about 2.5 cm . broad, the sepals purple within, pubescent without; claws of the 3 upper petals united; stamens 4 ; fruit globose, pubescent, very spiny, about 1.2 cm . in diameter. Fla. to Kans., N, Mex. and Mex. April-June.

## Family 17. PAPILIONÀCEAE L. <br> Pea Family.

Herbs, shrubs, vines or trees, with alternate mostly compound stipulate leaves, and irregular (papilionaceous) perfect or sometimes polygamodiœccious flowers, mainly in spikes, heads, racemes or panicles. Calyx $4-5$-toothed, or 4 -5-cleft, sometimes 2 -lipped. Petals more or less united, or separate, perigynous or hypogynous, usually consisting of a broad upper one (standard, banner), two lateral ones (wings), and two front ones more or less united (forming the keel); the standard encloses the wings in the bud. Stamens monadelphous, diadelphous, or sometimes separate, 10 in most of the genera, sometimes 9 , rarely 5 . Pistil simple, superior; ovary mainly i-celled, sometimes 2 -celled by the intrusion of the sutures, or several-celled by cross-partitions; style simple; ovules i-many, anatropous or amphitropous. Fruit a legume, I-many-seeded, dehiscent into 2 valves, or indehiscent, in one tribe a loment. Seeds mostly without endosperm ; cotyledons thick. About 320 genera and 5000 species, most abundant in temperate and warm regions.

## * The 10 stamens distinct.

Leaves pinnate.
Tribe I. Sophoreae.
Leaves digitate (in ours 3 -foliolate), or simple.
Tribe 2. Podalyrieae.

> ** The stamens monadelphous or diadelphous.

Herbs, shrubs, woody vines or trees, the leaves not tendril-bearing.
Pod not a loment, 2 -valved or indehiscent.
Foliage not glandular-dotted (except in Glycyrrhiza, which has many-seeded pods).
Stamens monadelphous; anthers of 2 kinds. Tribe 3. Genisteae.
Stamens diadelphous (except in Ononis) ; anthers all alike.
Leaves, in our species, 3 -foliolate, rarely I -foliolate.
Leaflets denticulate. Tribe 4. Trifolieae.
Leaflets entire. Tribe 5. Loteae.
Leaves pinnately several-many-foliolate ( 3 -foliolate in Orophaca), very. rarely r -foliolate. Tribe 7. Galegeae.
Foliage glandular-dotted ; pod indehiscent, x-2-seeded ; herbs.
Tribe 6. Psoraleae.
Tribe 8. Hedysareae.
Pod a loment; herbs.
Tribe 9. Vicieae.
Vines, ours herbaceous, or erect herbs; leaves odd-pinnate, mostly 3 -foliolate, without tendrils.

Tribe io. Phaseoleae.
Tribe I. Sophoreae.

Our species herbs; flowers racemed.
Trees; flowers panicled.
Tribe 2. Podalyrieae.
Ovary sessile, or nearly so; pod flat in our species.
Ovary distinctly stipitate; pod inflated.

## Tribe 3. Genisteae.

Herbs, with simple or $5-\mathrm{rr}$-foliolate leaves.
Leaves simple; pod inflated.
Leaves 5 -II-foliolate; pod flattened.
Shrubs, with 1-3-foliolate leaves.
Calyx divided into 2 lips; leaves very prickly.
Calyx cleft into 2 lips to about the middle.
Calyx-teeth long.
Calyx-teeth short.

1. Sophora.
2. Cladrastis.
3. Thermopsis. 4. Baptisia.

## Tribe 4. TrifolieaE.

Flowers spiked, or capitate; pods curved, or coiled. 10. Medicago.
Flowers in long racemes; pods coriaceous.
11. Melilotus.

Flowers capitate or umbelled; pods straight, membranous.
12. Trifolium.

Tribe 5. Loteae.
A single genus in our area.

## Tribe 6. Psoraleae.

Leaves digitately 3 - 5 -foliolate, or pinnately 3 -foliolate.
13. Lotus.
14. Psoralea.

Leaves pinnately 5 -many-foliolate.
Stamens io or 9, monadelphous, at least at the base.
Corolla of only I petal (the standard).
15. Amorpha.

Corolla of 5 petals, the wings and keel united to the filament-tube.
16. Parosela.

Stamens only 5 , monadelphous.
17. Kuhnistera.

## Tribe 7. Galegeae.

Standard very broad, ovate or orbicular.
Herbs; leaves odd-pinnate.
Pod 4-angled in our species. 18. Indigofera.
Pod flat.
High-climbing woody vines.
Trees or shrubs.
Herbs; leaves evenly pinnate.
Standard narrow; our species all herbs.
Pod not prickly; foliage not glandular-punctate.
Keel of the corolla blunt.
Leaves pinnate, rarely 1 -foliolate.
Pod not flattened, swollen, or one or both sutures intruded. Pod not much swollen, fleshy, leathery or papery.

Pod much inflated, membranous.
Pod flat, both sutures prominent externally.
Leaves 3 -foliolate.
23. Astragalus.
24. Phaca.
25. Homalobus.

Keel of the corolla acute.
Pod prickly; foliage glandular-punctate.
26. Orophaca.
27. Aragallus.

Tribe 8. Hedýsareae.
Leaves odd-pinnate.
Flowers purplish, umbellate.
29. Coronilla.

Flowers purple or white, racemose
Flowers yellow, small.
Leaves 4 -foliolate or 2 -foliolate.
Leaves 3 -foliolate, the terminal leaflet stalked.
Flowers yellow.
28. Glycyrrhiza.

Flowers purple, blue or white.
Pod of several joints; leaflets stipellate.
Pod of 1 or 2 joints; leaflets not stipellate.
30. Hedysarum.
31. EEschynomene.
33. Zornia.
32. Stylosanthes.
.
34. Meibomia.

## Tribe 9. Vicieae.

Style slender, with a tuft of hairs at the summit.
Style flattened, bearded along the inner side.
36. Vicia.

## Tribe io. Phaseoleae.

Style bearded along the inner side; rachis not thickened at the insertion of the flowers ; keel of corolla not curved nor coiled.
39. Clitoria.

Style glabrous, or slightly pubescent below; keel of corolla not curved nor coiled. Standard spurred at the base.
38. Bradburya.

Standard not spurred.
Flowers blue, purple, purplish, or white.
Leaves odd-pinnate ; leaflets 5-7.
Leaves 3 -foliolate, rarely $x$-foliolate.
Calyx tubular, not bracteolate.
Calyx short, bracteolate.
Flowers yellow.
41. Apios.
40. Falcata.
42. Galactia.
43. Dolicholus.

Style bearded along the inner side; rachis thickened at the insertion of the flowers.

Keel of the corolla spirally coiled; flowers racemed.
Keel strongly incurved; flowers purple, capitate.
Keel short, slightly incurved; flowers yeilowish, capitate.
44. Phaseolus.
45. Strophostyles.
46. Vigna.

## 1. SOPHORA L.

Leaves odd-pinnate. Flowers white, yellow or violet, in terminal racemes or panicles. Calyx generally campanulate, its teeth short. Standard obovate or orbicular; wings obliquely oblong; keel oblong, nearly straight. Stamens all distinct or very nearly so; anthers versatile. Ovary short-stalked; style incurved. Pod stalked, coriaceous or fleshy, terete, constricted between the seeds, mainly indehiscent. [Name Arabic, yellow.] About 25 species, natives of warm and tropical regions. Besides the following, about 5 others occur in the Southern States.
I. Sophora serícea Nutt. Silky Sophora. (I. F. f. 2045.) Herbaceous, woody at the base, silky or silvery pubescent, $15-30 \mathrm{~cm}$. high. Stipules subulate, deciduous; leaves short-petioled; leaflets 7-25, short-stalked, obovate or elliptic, obtuse or emarginate at the apex, narrowed or cuneate at the base, $6-13 \mathrm{~mm}$. long; raceme peduncled, $5-10 \mathrm{~cm}$. long; flowers white, about 16 mm . long, nearly sessile; pod dry, coriaceous, $3-5 \mathrm{~cm}$. long, about 4 mm . thick, finely pubescent, fewseeded. Prairies, Neb. and Colo. to Tex. and Ariz. April-June.

## 2. CLADRÁSTIS Raf.

Trees, with odd-pinnate leaves, no stipules nor stipels. Flowers showy, white, fragrant, in terminal panicles. Calyx-teeth 5, short, broad. Standard orbicularobovate, reflexed; wings oblong; keel incurved, obtuse, its petals distinct. Stamens ıo, all distinct; filaments slender; anthers all alike, versatile. Ovary sessile or nearly so ; ovules few ; style incurved ; pod linear or lanceolate, short-stalked, flat, at length 2 -valved, few-seeded. [Greek, brittle-branch.] Two known species, the following and one in Mantchuria.
I. Cladrastis lùtea (Michx.) Koch. American or Kentucky Yellowwood. (I. F. f. 2046.) A smooth-barked tree. Foliage nearly glabrous; leaves p stioled; leaflets 5-11, ovate, oval or obovate, stalked, 4-8 mm. long, pointed or blunt-acuminate at the apex, obtuse or the terminal one cuneate at the base; panicles many-flowered, drooping, $2-5 \mathrm{dm}$. long ; pedicels $\mathbf{I}-2 \mathrm{~cm}$. long ; calyx tubu-lar-campanulate; corolla about 2 mm . long; pod short-stalked, glabrous, 4-8 mm. long, 8-10 mm. wide. In rich soil, Ky., Mo., Tenn. and N. Car. June.

## 3. THERMOPSIS R. Br.

Perennial herbs, with sheathing scales at the base, alternate 3 -foliolate leaves, and large yellow or purple flowers in racemes. Stipules usually foliaceous. Calyx campanulate or short-turbinate, its lobes equal and separate, or the two upper ones united. Standard nearly orbicular, equalling the oblong wings and about equalling the keel. Stamens 10, incurved, separate. Ovary sessile or short-stipitate; ovules $\infty$; style slightly incurved ; stigma terminal, small ; pod sessile or shortstalked, flat (in our species), linear or oblong, straight or curved. [Greek, Lupinelike.] About 15 species, of N. Am. and Asia. Besides the following, 5 others occur in the southern and western N. Am.
Leaflets $2.5-5 \mathrm{~cm}$. long; panicle elongated, usually long-peduncled; eastern.
I. T. mollis.

Leaflets $1-2.5 \mathrm{~cm}$. long; panicle short, short-peduncled; western. 2. T. rhombifolia.
I. Thermopsis móllis (Michx.) M. A. Curtis. Alleghany Thermopsis. (I. F. f. 2047.) Erect, 6-9 dm. high, finely appressed-pubescent. Leaves petioled; leaflets oval, rhombic-elliptic or obovate, entire, nearly sessile; stipules ovate or lanceolate, shorter than the petiole; racemes mainly terminal; pedicels $4-12 \mathrm{~mm}$. long, bracted at the base; flowers yellow, about 2 cm . long; pod short-stalked, linear, slightly curved, about 10 cm . long. Va., N. Car. and Tenn., in the mountains. July-Aug.
2. Thermopsis rhombifòlia (Nutt.) Richards. Prairie Thermopsis. (I. F. f. 2048.) Erect, 2-5 dm. high, appressed silky-pubescent. Leaves petioled; leaflets oval or obovate or rhombic-elliptic, obtuse, sessile; stipules broad; racemes rather dense, few-flowered; pedicels $4-8 \mathrm{~mm}$. long, bracted; flowers yellow, about 2 cm . long; pod linear, recurved-spreading, several-seeded, stalked, 7 - 10 cm . long. In sandy soil, on prairies, Kans., Neb., S. Dak. and Manitoba, west to the Rocky Mts. June-July

## 4. BAPTÍSIA Vent.

Perennial herbs, with sheathing basal scales, 3 -foliolate or sometimes simple perfoliate leaves, and yellow, white or blue flowers in racemes. Calyx campanulate, obtuse at base, or slightly turbinate, the teeth equal and separate, or the two upper ones united. Corolla and stamens as in Thermopsis. Ovary stipitate; pod stalked, tipped with the subulate style, inflated, the valves often coriaceous. [Greek, dyeing.] About 16 species, natives of eastern N. Am.
Flowers blue ; plant glabrous.
Flowers yellow ; leaves turning black in drying.
Racemes numerous, terminal; plant glabrous. 2. B. tinctoria.
Racemes few, lateral ; plant more or less pubescent. 3 3. $B$. villosa.
Flowers white or cream color.
Very pubescent.
Glabrous or nearly so.
Leaflets oblong or lanceolate, green in drying.
Leaflets obovate-cuneate, black in drying.

> 1. B. australis.
4. B. bracteata.
5. B. alba.
6. B. leucantha.
I. Baptisia austràlis (L.) R. Br. Blue Wild or Blue False Indigo. (I. F. f. 2049.) Stout, I-3 mm. high. Leaves short-petioled; leaflets oblanceolate or oval, obtuse, cuneate at the base, entire, $2-6 \mathrm{~cm}$. long, sessile or nearly so; stipules lanceolate, equalling the petioles, or longer, persistent; racemes terminal, erect, loosely flowered, elongated ; bracts narrow, caducous; pedicels $3-5 \mathrm{~mm}$. long; flowers $2-2.5 \mathrm{~cm}$. long; pod oblong, stalked, $2-3 \mathrm{~cm}$. long. In rich soil. W. Penn. to Kans., Ga. and Ark. June-Aug. A hybrid of this with B. bracteata has been observed by Prof. A. S. Hitchcock in Kans.
2. Baptisia tinctòria (L.) R. Br. Wild Indigo. Yellow or Indigo Broom. Horsefly-weed. (I. F. f. 2050.) Erect, succulent, 6-I2 dm. high. Leaves petioled; leaflets obovate or oblanceolate, $2-4 \mathrm{~cm}$. long, sessile or nearly so, obtuse, cuneate at the base, entire; stipules minute, caducous ; racemes few-flowered; bracts minute, deciduous; pedicels $2-4 \mathrm{~mm}$. long; flowers about 12 mm . long; pods ovoid or nearly globose, $5-10 \mathrm{~mm}$. long. In dry soil, Me. to S. Ont., Minn., Fla. and La. June-Sept.
3. Baptisia villòsa (Walt.) Nutt. Hairy Wild Indigo. (I. F. f. 2051.) Erect, 6-12 dm. high. Leaves short-petioled or sessile; leaflets oblong, oval or obovate, obtusish at the apex, narrowed or cuneate at the base, $5-10 \mathrm{~cm}$. long, entire; stipules lanceolate or subulate, longer than the petioles; racemes sometimes 2.5 dm . long, many-flowered; pedicels $5-8 \mathrm{~cm}$. long; flowers about 2.5 cm . long; bracts caducous or deciduous; pods oblong-ovoid, about 4 cm . long, finely ap-pressed-pubescent. In dry soil, Va. and N. Car. to Ark. June-July.
4. Baptisia bracteàta Ell. Large-bracted Wild Indigo. (I. F. f. 2052.) Bushy-branched. Leaves sessile or short-petioled; leaflets oblanceolate or spatulate, narrowed or cuneate at the base, 4-8 cm. long, thick, reticulate-veined; stipules lanceolate or ovate, persistent; racemes usually few, mainly lateral, sometimes 3 dm . long, reclining, many-flowered; flowers about 2.5 cm . long, showy; pedicels slender, $\mathbf{I}-3 \mathrm{~cm}$. long, spreading, somewhat secund ; bracts large, persistent; pods ovoid, $2-5 \mathrm{~cm}$. long, pubescent, tipped with a long, at length deciduous, style. Prairies, Ill., Mich. and Minn. to La. and Tex. April-May.
5. Baptisia álba (L.) R. Br. White Wild Indigo. (I. F. f. 2053.) Divergently branching, 3-6 dm. high. Leaves petioled; petioles $5-20 \mathrm{~mm}$. long; leaflets narrowed at the base, obtuse at the apex, $2-4 \mathrm{~cm}$. long, $8-12 \mathrm{~mm}$. wide, rather thin; stipules and bracts minute, subulate, deciduous; racemes erect, 15-25 cm . long, lateral, long-peduncled; pedicels $6-20 \mathrm{~mm}$. long; flowers $12-1+\mathrm{mm}$. long; pod linear-oblong, about 4 cm . long, 7 mm . thick, abruptly tipped with an almost filiform deciduous style. In dry soil, Mo. to S. Ind., La., N. Car. and Fla. May-June.
6. Baptisia leucántha T. \& G. Large White Wild Indigo. (I. F. f. 2054.) Succulent, $6-12 \mathrm{dm}$. high, the branches ascending. Leaves petioled; leaflets 2-5 cm . long, $1-2 \mathrm{~cm}$. wide, very obtuse, rounded and sometimes slightly emarginate at the apex, narrowed or cuneate at the base; stipules lanceolate or linear, deciduous; racemes lateral, sometimes 3 dm . long, loosely flowered; flowers $1.5-2 \mathrm{~cm}$. long; pedicels $3-5 \mathrm{~mm}$. long; pod ellipsoid, long-stalked in the calyx, about 2 cm . long. In rich soil, Lake Erie to Minn., Ky., N. Car., Fla, and Tex. June-July.

## 5. CROTALARIAL.

Herbs, sometimes slightly woody, with simple (or in some tropical species 3-7foliolate) leaves and racemose yellow flowers. Calyx 5 -toothed, slightly 2 -lipped; standard orbicular or ovate, often cordate ; wings oblong or obovate; keel curved. Stamens monadelphous, their sheath deeply cleft; anthers of 2 forms, alternating with each other, the one small, versatile, the other larger; style more or less -curved; pod oblong or globose, inflated, many-seeded, the seeds loose at maturity. [Greek, a rattle.] About 250 species, mainly of tropical regions. Besides the following some 7 others occur in the southern U.S.
Stem and branches erect or ascending ; leaves, at least the upper, lanceolate or oblong.

1. C. sagittalis.

Stems prostrate, from a deep root ; leaves broadly oval.
2. C. rotundifolia.
I. Crotalaria sagittàlis L. Rattle-box. (I. F. f. 2055.) Annual, or perennial (?), villous-pubescent, rarely over 3 dm . high. Leaves simple, oval, lanceolate or oblong, rounded at the base, nearly sessile, $2-6 \mathrm{~cm}$. long, stipules persistent and unted, decurrent on the stem, sagittate above, or the lower wanting ; peduncles $2-10 \mathrm{~cm}$. long, $2-4$-flowered; pedicels $3-6 \mathrm{~mm}$. long; flowers $8-12 \mathrm{~mm}$. long, the corolla about equalling the calyx ; pod oblong, glabrous, nearly sessile, 2.5 cm . long, $8-10 \mathrm{~mm}$. in thickness, much inflated, nearly black at maturity; seeds shining. In dry, open places, northern N. Eng. to Fla., S. Dak., Ark. and Mex. June-Sept.
2. Crotalaria rotundifòlia (Walt.) Poir. Prostrate Rattle-box. (I. F. f. 2056.) Perennial by a deep root, the slender branches usually prostrate. Pubescence mostly dense, brownish, appressed; leaves broadly oblong or oval, obtuse, paler beneath, $\mathbf{1}-4 \mathrm{~cm}$. long; petioles $2-4 \mathrm{~mm}$. long; upper stipules sagittate ; peduncles lateral, $5-15 \mathrm{~cm}$. long, slender, 2-6-flowered; flowers $\mathbf{1 2 - 1 5} \mathrm{mm}$. long; corolla little longer than the calyx; pod nearly as in the preceding. Mostly in dry soil, S. Va. to Fla. and Miss. May-Aug.

## 6. LUPİNUS L.

Herbs, rarely shrubs, with digitately-compound 7-15-foliolate (rarely simple or $3-5$-foliolate) leaves, and showy flowers in terminal spikes or racemes. Calyx deeply toothed and 2 -lipped. Standard orbicular or ovate, its margins reflexed; wings oblong or obovate; keel incurved, sometimes beaked. Stamens monadelphous, their sheath not cleft; anthers of two forms as in Crotalaria. Ovary sessile; style incurved ; pot flattened, generally constricted between the seeds, the valves coriaceous. [Latin name of some pulse, from lupus, wolf.] Over roo species, mainly natives of temperate and warm regions. About 70 occur in N. Am., mainly on the western side of the continent.
Perennial ; flowers $14-18 \mathrm{~mm}$. long; leaflets oblanceolate.
Corolla blue, pink or white, the standard not spotted.

1. L. perennis.

Corolla blue, with a conspicuous dark spot on the standard.
2. L. Plattensis.

Perennial ; flowers $8-12 \mathrm{~mm}$. long; leaflets oblong-linear.
Annual ; leaflets mainly oblong; pod 2 -seeded.
3. L. argenteus.
4. L. pusillus.
I. Lupinus perénnis L. Wild Lupine. (I. F. f. 2057.) Erect, more or less pubescent, $3^{-6} \mathrm{dm}$. high. Leaves slender-petioled, $5^{-8} \mathrm{~cm}$. broad, leaflets 7-II (commonly about 8), sessile or nearly so, obtuse and mucronate, $2-4 \mathrm{~cm}$. long, appressed-pubescent or glabrate ; raceme terminal, peduncled, $15-25 \mathrm{~cm}$. long, loosely flowered; flowers $12-15 \mathrm{~mm}$. long; pod linear-oblong, pubescent, 4 cm . long, usually $4-5$-seeded, the valves coiling at dehiscence; style subulate. In dry, sandy soil, Me. and Ont. to Minn., Fla., Mo. and La. May-June.

Lupinus perénnis occidentàlis S . Wats. Villous-pubescent all over. Mich. and Wis.
2. Lupinus Platténsis S. Wats. Nebraska Lupine. (I. F. f. 2058.) Resembles the preceding, 3-5 dm. high, villous or appressed-pubescent, the living plant with a glaucous appearance ; leaflets 7 -10, oblanceolate, spatulate or narrowly oval, 1.5-4 cm. long, 5-10 mm. wide; raceme terminal, I-2 dm. long, loosely flowered; corolla $12-15 \mathrm{~mm}$. long. Plains, Neb., Wyo. and Dak. JuneJuly.
3. Lupinus argénteus Pursh. Silvery Lupine. (I. F. f. 2059.) Rather shrubby, bushy-branched, 3-6 dm. high, densely silky-pubescent with appressed hairs. Petioles equalling or the lower exceeding the leaves; stipules minute, subulate; leaflets sessile, narrowed at the base, $2-4 \mathrm{~cm}$. long; racemes terminal, rather dense, $5-12 \mathrm{~cm}$. long; flowers purple, $7-10 \mathrm{~mm}$. long; pod silky-pubescent, about 2.5 cm . long, mostly 3 - 5 -seeded. Praíries, W. Neb. and S. Dak. to Mont., N. Mex. and Ariz. July-Aug.
4. Lupinus pusillus Pursh. Low Lupine. (I. F. f. 2060.) Annual, villouspubescent, I-2 dm. high, from a deep root, much branched near the base. Leaves petioled, $2-5 \mathrm{~cm}$. wide; leaflets 5-7 (commonly 5), narrowed at the base, glabrous or nearly so above, pubescent with long scattered hairs beneath; racemes shortpeduncled or sessile, $3-8 \mathrm{~cm}$. long, densely few-flowered; pedicels $2-5 \mathrm{~cm}$. long; flowers blue, $5-7 \mathrm{~mm}$. long; pod oblong, very pubescent, $12-18 \mathrm{~mm}$. long; style subulate. Dry plains, Kans. to S. Dak., west to the Sierra Nevada, south to Ariz. and N. Mex. March-July.

## 7. Ùlex L.

Shrubs, with stiff spine-like branches, simple, linear stiff, very prickly leaves, and large yellow solitary or racemed flowers. Calyx membranous, mostly yellow, divided nearly to its base into 2 concave lips; upper lip mostly 2 -toothed, and lower 3-toothed ; teeth short ; standard ovate ; wings and keel oblong, obtuse ; anthers alternately longer and shorter, the shorter versatile ; ovary sessile, several-manyovuled ; style somewhat incurved, smooth ; pod ovoid, oblong or linear; seeds strophiolate. [The ancient Latin name.] About 20 species, natives of eastern Europe.
I. Ulex Europaèus L. Furze. Gorse. Whin. (I. F. f. 2061.) Much branched, $3 \mathrm{dm} .-2 \mathrm{~m}$. high, more or less pubescent. Branchlets very leafy; leaves $4-15 \mathrm{~mm}$. long, the lowest sometimes lanceolate and foliaceous; flowers solitary in the axils, $12-15 \mathrm{~mm}$. long, the twigs appearing like racemes; pedicels short, bracted at the base; calyx a little shorter than the petals, minutely 2 -bracteolate; pod few-seeded, compressed, scarcely longer than the calyx. In waste places, southern N. Y. to Va. Also on Vancouver Island. Fugitive from Europe. May-July.

## 8. GENISTA L.

Low shrubs, mainly with r-foliolate leaves, and clustered yellow flowers. Calyx 2-lipped; teeth long; standard oval or ovate ; wings oblong ; keel oblong, deflexed, the claws of its petals adnate to the uncleft sheath of the stamens; anthers alternately long and short; ovary sessile, several-ovuled; style incurved at the apex; pod various, flat in our species, several-seeded; seeds not strophiolate. [Celtic, gen, a small bush.] About 80 species, natives of Europe, N. Africa and W. Asia.
I. Genista tinctòria L. Dyeweed or Greenweed. Woad-waxen. Base Broom. (I. F. f. 2062.) Sterile shoots decumbent, the flowering ones erect, stiff, 3-6 dm. high, slightly pubescent. Leaves I-foliolate, sessile, lanceolate or ellipticlanceolate, $\mathrm{I}-4 \mathrm{~cm}$. long, glabrous or with scattered hairs, acute, narrowed at the base, entire, shining; stipules none; racemes terminal, $3-5 \mathrm{~cm}$. long, few-flowered; bracts ovate-lanceolate, acute; flowers yellow, nearly sessile, about 1 cm. long ; calyx bracteolate at the base, its 3 lower teeth narrower than the 2 upper; pod about 2.5 cm . long, glabrous. On dry hills, Me., Mass. and eastern N. Y. Naturalized from Europe. Summer.

## 9. CÝTISUS L.

Shrubs, with 3 -foliolate or I-foliolate leaves, and showy, clustered flowers, mainly in terminal racemes. Calyx 2 -lipped, the teeth short; standard ovate or orbicular; wings oblong or obovate ; keel straight or curved; anthers alternately larger and smaller ; ovary sessile, many-ovuled : style incurved ; pod that, oblong or linear, several-seeded; seeds strophiolate. [From Cythrus, one of the Cyclades. About 45 species, natives of Europe, western Asia and northern Africa.
I. Cytisus scopàrius (L.) Link. Broom. (I. F. f. 2003.) Stiff, wiry, $\mathbf{1} \mathbf{- 1 . 5} \mathbf{~ m}$. high, nearly glabrous. Branches elongated, straight, angled; lower
leaves petioled, 3 -foliolate, the leaflets obovate, acute, or mucronate-tipped, $5 \mathbf{- 1 5} \mathrm{~mm}$. long, entire; upper leaves sessile, often I-foliolate; stipules none ; flowers bright yellow, nearly 2.5 cm . long, in elongated leafy racemes; pedicels solitary or $2-3$ together, $5-15 \mathrm{~mm}$. long; pod flat, glabrous on the sides, ciliate on the margins, $3-5 \mathrm{~cm}$. long; style slender, at length spirally curved. In waste places, N. S. to Ka. Adv. or naturalized from Europe. Summer.

## ro. MEDICAGO L.

Herbs, with 3 -foliolate leaves, and small yellow or violet flowers in axillary heads or racemes. Leaflets commonly dentate, the veins terminating in the teeth. Calyx-teeth short, nearly equal; standard obovate or oblong; wings oblong; keel obtuse; stamens diadelphous, the I opposite the standard separate from the other 9 ; anthers all alike ; ovary I-several-ovuled; style subulate ; pod curved or spirally twisted, reticulated or spiny, indehiscent, I-few-seeded. [Greek, Medike, from Medea, whence the Medic, or Lucerne, was derived.] About 50 species, natives of Europe, Asia and Africa.

Perennial; flowers violet, conspicuous.
Annual; flowers bright yellow, small.
Pod I-seeded, curved, not spiny.
Pod several-seeded, spiny on the edges, spirally twisted. Pod loosely coiled, not furrowed on the edge. Pod densely coiled, its edge furrowed.

1. M. sativa.
2. M. Iupulina.
3. M. denticulata. 4. M. Arabica.
4. Medicago satìva L. Purple Medic. Alfalfa. Lucerne. (I. F. f. 2064.) Decumbent or ascending, 3-5 dm. high, the young shoots and leaves with some scattered hairs. Leaflets oblanceolate or obovate, 4-25 mm. long, dentate, obtuse, truncate or emarginate and often mucronate, narrowed or cuneate at the base; stipules entire; peduncles $\mathbf{I}-5 \mathrm{~cm}$. long, bearing a short raceme; petals about 5 mm . long; pod pubescent, twisted into 2 or 3 spires. In fields and waste places, N. Eng. and Ont. to Minn., Va. and Kans. Much cultivated for fodder in the Southern and Western States. Introduced from Europe. Summer.
5. Medicago lupulina L. Black or Hop Medic. Blackseed Hop Clover. Nonesuch. (I. F. f. 2065.) Pubescent, the branches decumbent and spreading, often 3-6 dm. long; leaflets obovate, oval or nearly orbicular, sometimes $10-15$ mm . long, denticulate or crenulate, obtuse, mucronate or emarginate; stipules ovate or lanceolate, dentate; peduncles $3-8 \mathrm{~cm}$. long; head oblong or cylindric, dense, $4-20 \mathrm{~mm}$. long; flowers about 2 mm . long; pods black when ripe, curved, strongly veined. In fields and waste places, common nearly throughout our area. Native of Europe and Asia. March-Dec.
6. Medicago denticulàta Willd. Toothed Medic. (I. F. f. 2066.) Branches spreading or ascending, glabrous or with a few appressed hairs. Leaflets obovate, rounded, emarginate or obcordate, cuneate, crenulate, $1-2 \mathrm{~cm}$. long; stipules dentate; flowers few, in small, peduncled heads; pod spirally twisted, the 2 or 3 coils flat and rather loose, reticulated with elevated veins, the edges armed with 1 or 2 rows of curved prickles. In waste places and in ballast, N. S. to Penn. Also in the Southern and Western States and on the Pacific Coast. Fugitive or adventive from Europe. Summer.
7. Medicago Arábica All. Spotted Medic. (I. F. f. 2067.) Resembling the preceding species, but generally stouter. Leaflets often nearly 2.5 cm . long, and with a dark spot or spots near the centre; pod globose, of 3 or 4 compactly wound coils, reticulate-veined on the sides, the edge thicker and furrowed between the marginal rows of curved prickles. In waste places and ballast. N. B. to Penn. Also on the Pacific Coast. Fugitive or adventive from Europe. Summer.

## ii. MELiLòtUS Juss.

Herbs, with 3 -foliolate leaves, dentate leaflets, their veins commonly ending in the teeth, and small white or yellow flowers in slender racemes. Calyx-teeth short, nearly equal; standard obovate or oblong; keel obtuse; ovary sessile or stipitate, few-ovuled; style filiform; pod ovoid or globose, straight, indehiscent or finally 2-valved; seeds solitary or few. [Greek, Honey-lotus.] About 20 species, natives of Europe, Africa and Asia.

Flowers white; standard a little longer than the wings.
Flowers yellow ; standard about equalling the wings.

1. M. alba.
2. M. officinalis.
3. Melilotus álba Desv. White Melilot. White Sweet-clover. (I. F. f. 2068.) Erect or ascending, I-3 m. high. Leaves rather distant; leaflets oblong or slightly oblanceolate, serrate, narrowed at the base, truncate, emarginate or rounded at the apex, $1-2 \mathrm{~cm}$. long; stipules subulate; racemes slender, $5-10 \mathrm{~cm}$. long, often 1 -sided; pedicels 2 mm . long or less; pod ovoid, slightly reticulated, glabrous, $2-3.5 \mathrm{~cm}$. long. In waste places, frequent throughout our area and in the Southern States. Adventive or nat. from Europe. Leaves fragrant in drying, as in other species of the genus. June-Nov.
4. Melilotus officinàlis (L.) Lam. Yellow Melilot. Yellow SweetClover. (I. F. f. 2069.) Resembling the preceding species. Leaflets oblong, oblanceolate or oval, serrate, the apex rounded, not truncate; pod about 4 mm . long, with irregularly reticulated veins, often slightly pubescent with appressed hairs. In waste places, frequent throughout our area and in the Southern States. Adventive gr nat. from Europe. Summer, blooming later than M. alba.

Melilotus Indica (L.) All., introduced on ballast about the seaports, and an exceedingly abundant weed in the Far West, may be readily distinguished from this by its much smaller yellow flowers.

Ononis rèpens L., an herb of the tribe Trifolieae, with axillary flowers, forming terminal leafy racemes, has been found as a waif in central New York. The genus is distinguished from others of the tribe by its monadelphous stamens.

## 12. TRIFÒLIUM L.

Herbs, with mostly 3 -foliolate (occasionally 4-II-foliolate) denticulate leaves, the flowers in dense heads or spikes. Stipules adnate to the petiole. Calyx-teeth nearly equal. Petals commonly persistent, their claws adnate to the stamen-tube. Stamens diadelphous, or the tenth one separate for only a portion of its length. Ovary few-ovuled. Pod often included in the calyx, membranous, indehiscent or tardily dehiscent by I suture, 1 - 6 -seeded. [Latin, referring to the 3 leaflets.] About 250 species, most abundant in the north temperate zone. Besides the following, about 50 others occur in the southern and western states.

Flowers yellow.
Head $12-18 \mathrm{~mm}$. long; stipules linear; leaflets all sessile. I. T. aureum.
Head 8-12 mm. long, nearly globose; stipules ovate; terminal leaflet stalked.
Head 20-40-flowered ; standard conspicuously striate. 2. T. procumbens.
Head 3-20-flowered ; standard scarcely striạte. 3. T. dubium.
Flowers red, purple, pink or white.
Head or spike much longer than thick ; calyx silky, its teeth plumose.
Corolla crimson, equalling or exceeding the calyx-teeth. 4. T. incarnatum.
Corolla whitish, shorter than the calyx-teeth.
5. T. arvense.

Head globose, oval or ovoid ; calyx nearly glabrous.
Flowers sessile, or very nearly so ; heads dense, ovoid, oval or globose. Heads sessile, or nearly so.
6. 1. pratense.

Heads always distinctly peduncled.
Calyx-teeth pubescent.
7. T. medium.

Plant glabrous throughout.
8. T. Beckwithiz.

Flowers pedicelled; heads umbel-like, globose.
Heads 2.5 cm . in diameter or more ; peduncles $2-8 \mathrm{~cm}$. long.
Prostrate ; pubescent ; perennial. 9. 7. Virginicum.
Ascending ; pubescent; annual or biennial. 1о. T. reflexum.
Stonoliferous ; glabrous; perennial.
11. T. stoloniferum.

Heads $12-18 \mathrm{~mm}$. in diameter; lower peduncles $5-20 \mathrm{~cm}$. long.
Ascending or procumbent ; flowers pink, pinkish or purple.
Ascending ; calyx much shorter than the pink or nearly white corolla. 12. T. hybridum.
Procumbent ; tufted; calyx nearly equalling the purple corolla.
13. T. Carolinianum.

Creeping ; flowers white or pinkish. 14. T. repens.
r. Trifolium aùreum Poll. Yellow or Hor-cloyer. (I. F. f. 207o.) Glabrous or slightly pubescent, annual, $\mathbf{1} .5-5 \mathrm{dm}$. high. Leaves petioled; stipules acuminate, $7-15 \mathrm{~mm}$. long, adnate to the petiole for about one-half their length: leaflets all from the same point, obovate or oblong, finely acnticulate, narrowed at
the base, rounded, truncate or emarginate at the apex, $\mathrm{I} 2-18 \mathrm{~mm}$. long; peduncles $1-5 \mathrm{~cm}$. long; head oblong, or oval, densely many-flowered; flowers 4-6 mm. long, at length reflexed; pedicels shorter than the calyx; standard slightly emarginate, exceeding the pod, conspicuously striate, and brown, especially when dry. Along roadsides and in waste places, N. S. to Va., Ont. and Iowa. Nat. from Europe. May-Sept. [T. agrarium L., in part.] This species and the two following are sometimes referred to the genus Chrysaspis Desv.
2. Trifolium procumbens L. Low, or Smaller Hop-clover or HopTREFOIL. (I. F. f. 2071.) Similar to the preceding, but lower, more spreading and more pubescent. Leaflets obovate, cuneate at the base, rounded, truncate or emarginate at the apex, finely denticulate, $7-15 \mathrm{~mm}$. long, the lateral ones nearly sessile, the terminal stalked; stipules ovate, adnate to the lower part of the petiole, about 4 mm . long; peduncles $5-25 \mathrm{~mm}$. long; heads $20-40$-flowered; flowers at length reflexed, about 4 mm . long; standard dilated, not folded, exceeding the pod, brown when dry. In fields and along roadsides, frequent or occasional throughout our area and in the Southern States. Nat. from Europe. May-Sept.
3. Trifolium dùbium Sibth. Least Hop-clover or Hop-trefoll. (I. F. f. 2072.) Straggling or ascending, nearly glabrous; stems $5 \mathrm{~cm} .-5 \mathrm{dm}$. long, branching. Leaflets obovate, truncate or emarginate at the apex, or even obcordate, denticulate, cuneate at the base, the lateral ones nearly sessile, the terminal stalked; stipules ovate or lanceolate, adnate to the lower part of the petiole; peduncles 5-25 mm . long; heads nearly globose, $4-6 \mathrm{~mm}$. in diameter; flowers about 3 mm . long, turning brown, at length reflexed; standard exceeding and folded over the pod. In fields and waste places, N. Eng., N. J. and in the Southern States. Also in Br. Col. Nat. from Europe. Summer. Said to be the true Shamrock.
4. Trifolium incarnàtum L. Crimson, or Italian Clover. (I. F. f. 2073.) Annual, softly pubescent, little branched, 2-9 dm. high. Leaves longpetioled; stipules broad, membranous, dentate, $7-25 \mathrm{~mm}$. wide; leaflets nearly sessile, obovate or obcordate, narrowed or cuneate at the base, denticulate, $12-25 \mathrm{~mm}$. long; heads terminal, oblong or ovoid, $2.5-6 \mathrm{~cm}$. long; flowers sessile, $7-\mathbf{I} 2 \mathrm{~mm}$. long; calyx hairy, calyx-lobes plumose. In fields, waste places and ballast, Me. to N. Y., N. J. and Penn. Introduced from Europe. Summer.
5. Trifolium arvénse L. Rabbit-foot, Old-field or Stone Clover. (I. F. f. 2074.) Annual, erect, silky-pubescent, I.5-5 dm. high. Leaves shortpetioled; stipules narrow, $5-10 \mathrm{~mm}$. long, subulate-tipped, entire or nearly so ; leaflets linear or oblanceolate, denticulate above, obtuse and often emarginate, narrowed or cuneate at the base, $\mathbf{1 2 - 2 5 ~ m m}$. long; heads terminal, peduncled, oblong or cylindric, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long, very dense; calyx very silky. In fields and waste places, common in most sections throughout our area and in the Southern States. Nat. from Europe. May-Sept.
6. Trifolium praténse L. Red, Purple or Meadow Clover. (I. F. f. 2075.) Perennial, pubescent, I.5-6 dm. high. Leaves long-petioled; stipules ovate, strongly veined, subulate-tipped, $12-20 \mathrm{~mm}$. long; leaflets short-stalked, oval, oblong or obovate, narrowed at base, hardly cuneate, obtuse and sometimes emarginate at the apex, often dark-spotted near the middle, finely denticulate, $\mathbf{r}-$ 3.5 cm . long; heads globose or ovoid, rarely slightly peduncled, about 2.5 cm . long; flowers red (rarely white), about 12 mm . long, remaining erect in fruit; calyx sparingly hairy, its subulate teeth shorter than the corolla. In fields and meadows, throughout our area and in the Southern States. Nat. from Europe. April-Nov.
7. Trifolium mèdium L. Zig-zag Cloter. Cow- or Marl-grass. (I. F. f. 2076.) Resembling the preceding. Stem sometimes conspicuously zigzag. Stipules lanceolate; leaflets lanceolate or oblong, not spotted, frequently entire except for the projecting tips of the veins; corolla $\mathbf{1 2 - 1 4} \mathbf{~ m m}$. long, bright purple; calyxtube nearly glabrous, the teeth slightly pubescent. In fields and waste places, Salem, Mass. Reported from N. S. and Quebec to N. Y. Adventive or nat. from Europe. Summer.
8. Trifolium Beckwíthii Brewer. Beckwith's Clover. (I. F. f. 2077.) Perennial; stems rather stout, straight, I.5-5 dm. high. Basal leaves long-petioled; stipules narrow, acute, 2.5 cm . long or less; leaflets oblong, or somewhat oblanceolate, obtuse, denticulate, $2-5 \mathrm{~cm}$. long; heads long-peduncled, globose; flowers purple or purplish, $\mathbf{1 2 - 1 6 ~ m m}$. long, very short-pedicelled, the lower at length re-
flexed; calyx-teeth linear-subulate, the longer nearly equalling the tube; pod 2-6. seeded. Eastern S. Dak. to Mont. and Cal. May-June.
9. Trifolium Virgínicum Small. Prostrate Mountain Clover. (I. F. f. 2078.) Perennial by a long root, diffusely branched at the base. Leaflets linear, narrowly lanceolate or oblanceolate, $\mathrm{I}-4 \mathrm{~cm}$. long, obtuse or cuspidate, ser-rate-dentate, glabrous above, more or less silky beneath, conspicuously veined; flowers whitish, crowded, the slender pediceis $2-5 \mathrm{~mm}$. long; standard emarginatemucronate, striate; calyx silky, the teeth long, subulate. W. Va. June.
10. Trifolium refléxum L. Buffalo Clover. (I. F. f. 2079.) Annual or biennial, 2-5 dm. high. Leaves long petioled; stipules ovate-lanceolate, acuminate, foliaceous, few-toothed or entire, $17-25 \mathrm{~mm}$. long; leaflets short-stalked, oval or obovate, cuneate at the base, obtuse or emarginate at the apex, denticulate, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long; heads dense; flowers $\mathbf{I I - 1 3 ~ m m . ~ l o n g , ~ o n ~ s l e n d e r ~ p e d i c e l s , ~ a t ~}$ length $7-11 \mathrm{~mm}$. long and reflexed; standard red; wings and keel nearly white; calyx-teeth linear, shorter than the corolla; pods 3-6-seeded. In meadows, Ont., N. Y. and Penn. to Iowa, Neb., Fla. and Tex. April-Aug.
ir. Trifolium stoloníferum Muhl. Running Buffalo Clover. (I. F.f. 2080.) Branching, I.5-3 dm. long, forming runners at the base. Leaves longpetioled; stipules ovate-lanceolate, acute, membranous, often 2.5 cm . long; leaflets short-stalked, obovate or obcordate, cuneate at the base, denticulate, $2-3 \mathrm{~cm}$. long; heads nearly 2.5 cm . in diameter; flowers white, purplish-tinged, $8-14 \mathrm{~mm}$. long; pedicels $7-9 \mathrm{~mm}$. long, at length reflexed; calyx-teeth subulate, longer than the tube; pod commonly 2 -seeded. Prairies and dry woods, Ohio to Neb., Ky. and Mo. Introduced into S. Dak. May-Aug.
12. Trifolium hýbridum L. Alsike or Alsatian Clover. (I. F. f. 208i.) Perennial, 3-6 dm. high, glabrous or nearly so. Leaves long-petioled; stipules ovate-lanceolate, acuminate, membranous, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long; leaflets short-stalked, obovate, sometimes emarginate but not obcordate, narrowed or cuneate at the base, serrulate, $\mathbf{1 2 - 2 5 ~ m m}$. long; heads long-peduncled; flowers pink or nearly white, 7-9 mm. long; pedicels $2-5 \mathrm{~mm}$. long, reflexed when old; corolla $3-4$ times as long as the calyx; calyx-teeth subulate, about equalling the tube; pod $2-4$-seeded. In meadows and waste places, N. S. to Idaho, Ga. and Kans. May-Oct.
13. Trifolium Caroliniànum Michx. Carolina Clover. (I. F. f. 2082.) Perennial, pubescent, much branched, $7-20 \mathrm{~cm}$. high. Leaves slender-petioled; stipules ovate or ovate-lanceolate, foliaceous, $4-8 \mathrm{~mm}$. long, acute, few-toothed toward the apex, or entire; leaflets short-stalked, obovate, emarginate or obcordate, cuneate at the base, denticulate, $4-15 \mathrm{~mm}$. long; peduncles elongated; flowers purplish, $4-7 \mathrm{~mm}$. long; standard apiculate; pedicels $2-5 \mathrm{~mm}$. long, reflexed in fruit; corolla scarcely longer than the calyx; calyx-teeth subulate, longer than the tube; pod about 4 -seeded. In waste places about Phila., and in fields and open places, Va. to Fla., Kans. and Tex. March-Oct.
14. Trifolium rèpens L. White, Dutch or Honeysuckle Clover. (I. F. f. 2083.) Perennial, glabrous or with a few scattered hairs, the branches often rooting at the nodes, $\mathbf{I}-3 \mathrm{dm}$. long. Leaves long-petioled; stipules ovatelanceolate, membranous, acute, $4-\mathbf{1 2} \mathrm{mm}$. long; leaflets short-stalked, obovate, emarginate or obcordate, broadly cuneate at the base, denticulate, $8-20 \mathrm{~mm}$. long; heads long-peduncled; flowers $7-12 \mathrm{~mm}$. long; pedicels $2-5 \mathrm{~mm}$. long, finally reflexed; corolla 2-3 times as long as the calyx; calyx-teeth acuminate, somewhat shorter than the tube ; pod about 4 -seeded. In fields and waste ground, common throughout our area and in the Southern States. Also in the Northwest. MayDec.

## 13. LOTUS L.

Herbs or shrubs, with I-3-foliolate, simple or pinnate leaves, and solitary or clustered reddish yellow or white flowers. Calyx-teeth nearly equal. Petals free from the stamen-tube; standard ovate or orbicular; wings oblong or obovate; keel incurved, obtuse or beaked. Stamens diadelphous (I and o). (Ovary sessile, I-several-ovuled. Pod linear or oblong, 2 -valved, 1 -several-seeded. [The Greek name of several different plants.] About $\mathbf{r} 20$ species, of wide distribution. Besides the following, some 40 others occur in the western U. S.

Corolla yellow ; flowers umbelled.
Corolla rose-color ; flowers solitary in the axils.

1. L. corniculatus.
2. L. Americanus.
I. Lotus corniculàtus L. Bird'S-foot Trefoil. Ground Honeysuckle. Bloom-Fell (I. F. f. 2084.) Perennial, appressed-pubescent or glabrate. Stems decumbent or ascending, $7 \mathrm{~cm} .-6 \mathrm{dm}$. long; leaves 3 -foliolate, short-petioled; leaflets obovate, oblanceolate or oblong, 7-17 mm . long; stipules similar to the leaflets, often as large; peduncles sometimes $10-13 \mathrm{~cm}$. long, 3-12-flowered; calyxlobes acute, as long as the tube, or shorter; corolla bright yellow, $12-20 \mathrm{~mm}$. long, or the standard reddish; pods linear, spreading, several-seeded. In waste places and on ballast, N. B. and about the seaports of the Eastern and Middle States. Adventive from Europe. June-Sept.
3. Lotus Americanus (Nutt.) Bisch. Prairie Bird's-foot Trefoil. (I. F. f. 2085.) Annual, erect, $2.5-5 \mathrm{dm}$. high. Leaves 3 -foliolate, or the upper sometimes I-foliolate, sessile or the lower on petioles about 3 mm . long; stipules minute or none; middle leaflet longer-stalked than the lateral ones, oblong, the lateral lanceolate, rounded at the base, $\mathbf{1 2 - 1 7} \mathrm{mm}$. long; peduncles leafy-bracted at the summit, $2-2.5 \mathrm{~cm}$. long in fruit; flowers about 5 mm . long. the standard darkerveined; keel acute; calyx-lobes linear, about twice the length of the tube; pods linear, straight, acute, glabrous, $4-7$-seeded, deflexed at maturity. In dry soil, Minn. and S. Dak. to Mo., Ark., Kans., N. Mex. and Sonora. Summer.

## 4. PSORÀLEA L.

Herbs or shrubs, with dark glands or pellucid dots, $\mathbf{I}-5$-foliolate leaves, and purple, blue, pink or white flowers, mainly in spikes or racemes; stipules broad; caly $x$-lobes equal or the lower longest, or the two upper ones sometimes united; standard ovate or orbicular, clawed; wings oblong or falcate; keel incurved, obtuse; stamens monadelphous or diadelphous; ovary 1 -ovuled; pod ovoid, short, indehiscent, I-seeded. [Greek, scurfy, from the glandular dots, whence the name Scurfy-pea.] About IIO species, of wide distribution. In addition to the following, about 20 others occur in the western U. S.
Leaves digitately $3-5$-foliolate (leaflets all from the same point).
Plants leafy-stemmed.
Flowers small, 4-9 mm. long.
Pods subglobose.
Leaflets narrowly oblong. $\quad$. $P$. lanceolata.
Leaflets, except those of basal leaves, filiform-linear.
2. P. micrantha.

Pods ovoid, or ovate.
Pods with a short, mostly abrupt beak.
Flowers few, scattered in slender elongated racemes.
3. P. tenuiflora.

Flowers numerous clustered or crowded in racemes.
Leaflets oblong-obovate. 4. P. obtusiloba.
Leaflets oblong.
5. P. floribunda.

Pods with slender sharp or elongated beak.
Leaflets linear ; flowers in loose elongated racemes.
6. P. linearifolia.

Leaflets linear-lanceolate, oblong, oblanceolate or obovate; flowers spiked.

Leaflets oblanceolate or obovate ; pubescence gray.
7. P. collina.

Leaflets linear-lanceolate to obovate; pubescence silvery.
Leaflets linear to oblanceolate; calyx inflated in fruit.
8. P. digitata.

Leaflets oblong to obovate ; calyx not inflated in fruit.
9. P. argophylla.

Flowers large, ${ }^{13-17} \mathrm{~mm}$. long, densely spicate.
10. P. cuspidata.

Plants acaulescent, or nearly so, low, spreading; roots tuberous.
Leaflets oblong-cuneate.
ir. P. esculenta.
Leaflets linear-oblong.
12. P. hypogaea.

Leaves pinnately 3 -foliolate (the terminal leaflet stalked).
Racemes short, on peduncles about equalling the leaves.
13. P. stipulata.

Racemes spicate, elongated, much exceeding the leaves.
Leaflets oblong-lanceolate, obtuse; pods 4 mm . long, nearly orbicular.
14. $P$. pedunculata.

Leaflets ovate-lanceolate, acuminate ; pods 9-1r mm. long, obliquely ovoid.
15. P. Onobrychis.
I. Psoralea lanceolàta Pursh. Lance-leaved Psoralea. (I. F. f. 2086.) Nearly glabrous, much branched, light green, 3-6 dm. high. Root not tuberous; stipules linear, 6-9 mm. long, early deciduous; leaflets 3 , sessile, sometimes with a few scattered hairs, linear-oblong or oblanceolate, entire, narrowed or cuneate at the base, $17-30 \mathrm{~mm}$. long; peduncles slender; spikes dense, short, $9-13 \mathrm{~mm}$. thick, 6-10-flowered; bracts membranous, caducous; flowers bluish white, 6 mm . long; corolla $2-3$ times as long as the calyx; pod about 4 mm . long, sparingly pubescent or glabrous, punctate; seed globose, brown. In dry soil, Kans. to S. Dak., the N. W. Terr., Ariz., Wash. and Br. Col. June-July.
2. Psoralea micrántha A. Gray. Small-flowered Psoralea. (I. F. f. 2087.) Assurgent, 3 dm. high or more; stems glabrous, with scattered brown glands, and often with scales at the base. Stipules setaceous; leaves crowded; leaflets 3 , linear or filiform-linear, $1-5 \mathrm{~cm}$. long, the basal ones oblong or cuneateoblong; peduncles about the length of the leaves; flowers about 4 mm . long, white or bluish, in small heads or scattered in short spikes; bracts minute; calyx somewhat pubescent, glandular, the lobes about equal; pod over 6 cm . long, glabrous, brownish with raised darker glands and a slender beak. Neb. to Ariz. June-Aug.
3. Psoralea tenuifì̀ra Pursh. Few-flowered Psoralea. (I. F. f. 2088.) Erect, finely appressed-canescent, especially when young, 6-12 dm. high. Root not tuberous; leaves short-petioled, 3-5-foliolate; stipules subulate, $2-4 \mathrm{~mm}$. long; leaflets short-stalked, entire, oval, oblong or elliptic, $\mathbf{1}-2 \mathrm{~cm}$. long, obtuse and mucronulate at the apex, narrowed or cuneate at the base; peduncles longer than the leaves; racemes 6-14-flowered; bracts scale-like, persistent; flowers purplish, 4 mm . long; corolla about twice the length of the calyx; pod ovate, glabrous, punctate, $4^{-6} \mathrm{~mm}$. long; seed ovoid, brown. Prairies, Ill. to S. Dak., Tex., Sonora, Colo. and Mont. May-Oct.
4. Psoralea obtusíloba T. \& G. Black-dotted Psoralea. (I. F. f. 2089.) Erect, 3-6 dm. high; stems canescent with appressed silky white hairs. Stipules small, setaceous; petioles much shorter than the leaflets; leaves 3 -foliolate, or the basal often $4-5$-foliolate; leaflets $5-35 \mathrm{~mm}$. long, oblong-obovate, retuse or mucronulate, glabrous above, minutely canescent beneath; bracts small, ovate, cuspidate; calyx canescent with white silky hairs; pod ovate, about 9 mm . long ; seed compressed, obliquely ovoid. Kans. (?), Tex. to Ariz. and Mex.
5. Psoralea floribúnda Nutt. Many-flowered Psoralea. (I. F. f. 20go.) Stem 3-12 dm. high, branching, canescent, not glandular. Petioles mostly shorter than the leaflets; stipules $3-7 \mathrm{~mm}$. long, subulate; leaves $3-5$ - (sometimes 7 -) foliolate; leaflets $\mathbf{I}-4 \mathrm{~cm}$. long, oblong, rugose, glabrous or with a few scattered hairs above, canescent with appressed white hairs beneath; peduncles $5-18 \mathrm{~cm}$. long ; spikes oblong or cylindric, the flowers about 9 mm . long, at length interrupted and appearing as if whorled; bracts $2-3 \mathrm{~mm}$. long, lanceolate, hirsute; calyx canescent, the lobes triangular, acute; pod ovoid. glabrous, light brown, covered with darker glands, its beak short, stout ; seed 5 mm . long, compressed. Ill. to Mont., Tex., Ariz. and Mex. May-Oct.
6. Psoralea linearifolia T. \& G. Narrow-leaved Psoralea. (I. F. f. 2091.) Erect, 3-6 dm. high. Stipules $3-7 \mathrm{~mm}$. long, lanceolate or setaceous; leaves sessile or short-petioled, I-3-foliolate; leaflets II-3I mm. long, linear, rugose, glabrous or with a few appressed hairs; peduncles $2.5-22 \mathrm{~cm}$. long; flowers blue. loosely scattered, I-4 together on slender pedicels, $4-9 \mathrm{~mm}$. long; bracts 2 mm . long, ovate, acuminate; mature calyx 4 mm . long, glandular, slightly pubescent; pod 9 mm . long, narrowly ovoid or oblong, glandular, with a short stout straightish beak; seed flat, oblique, brown. Prairies, Neb. to Tex. May-Aug.
7. Psoralea collìna Rydberg. Nebraska Psoralea (I. F. f. 2092.) Somewhat grayish-pubescent, 3-6 dm. high. Stipules narrow, $2-0 \mathrm{~mm}$. long : leaves 3 -foliolate, or sometimes 5 -foliolate; leaflets obovate or oblanceolate. mucronate. mostly glabrous above; bracts pointed, $3-4 \mathrm{~mm}$. long; peduncles $1.5-10 \mathrm{~cm}$. long; flowers about 6 mm . long; calyx-segments linear-lanceolate, shorter than the orate pod, the lower one a little longer than the others; pod $5-6 \mathrm{~mm}$. long, tipped with a flat straight beak about 3 mm . long. Hillsides, W. Neb. July-Aug.
8. Psoralea digitàta Nutt. Digitate Psoralea. (I. F. f. zon3.) Canescent with appressed hairs, 3-6 dm. high. Petioles shorter than or sometimes a little exceeding the leaves; stipules linear. $3^{-4} \mathrm{~mm}$. long; peduncles often $3^{-5}$
times as long as the leaves; leaflets 5 , or of the upper leaves 3 , short-stalked, ob-long-linear or oblanceolate, $2-4 \mathrm{~cm}$. long, mostly obtuse or mucronulate at the apex, narrowed or cuneate at the base; inflorescence spicate, interrupted, the blue flowers short-pedicelled or sessile in clusters of 3-5; corolla 9-II mm. long, exceeding the broad mucronate bracts; calyx-lobes acute; pod ovoid, flattish, pubescent. Plains, S. Dak. to Kans. and Tex. June-July.
9. Psoralea argophýlla Pursh. Silver-leaf Psoralea. (I. F. f. 2094.) Densely silvery pubescent with white appressed hairs. Stem often zigzag, 3-9 dm. high; stipules narrowly linear, 6-9 mm. long; leaflets 3-5, short-stalked, oval, oblong or obovate, obtuse and mucronate or acutish, $1.5-3 \mathrm{~cm}$. long; peduncles exceeding the leaves; inflorescence spicate, interrupted, the blue flowers sessile, about 9 mm . long, in clusters of 2-4; bracts lanceolate, slightly longer than the corolla, persistent; calyx-lobes lanceolate; pod ovate, straight-beaked. Wis. and Minn. to the N. W. Terr., Kans. and N. Mex. June-Aug.
io. Psoralea cuspidàta Pursh. Large-bracted Psoralea. (I. F. f. 2095.) Finely appressed-pubescent, at least above, 3-9 dm. high, from a deep tuberous thickened root. Petioles $3.5-5 \mathrm{~cm}$. long; stipules linear, acuminate, 13-17 mm. long; leaflets 5, short-stalked, broadly oblanceolate or oval, obtuse and commonly mucronate at the apex, narrowed or cuneate at the base, $2.5-5 \mathrm{~cm}$. long; spikes oblong, $3 \cdot 5-8 \mathrm{~cm}$. long; peduncles longer than the petioles; bracts lanceolate, long-cuspidate, equalling or exceeding the bluish corolla; pod oval. membranous, enclosed in the calyx. Plains, N. W. Terr. to S. Dak., Kans., Colo. and Tex. May-June.
if. Psoralea esculénta Pursh. Pomme Blanche. Prairie Apple or Turnip. (I. F. f. 2096.) Rather stout, erect from a large farinaceous root or cluster of roots, I-5 dm. high, densely villous-pubescent with whitish hairs. Lower petioles 2-4 times longer than the leaves; stipules lanceolate, $17-25 \mathrm{~mm}$. long; leaflets 5 , short-stalked, obtuse, narrowed at base, $2.5-5 \mathrm{~cm}$. long; peduncles equalling or longer than the petioles; spikes oblong, dense, $3 \cdot 5-8 \mathrm{~cm}$. long; bracts lanceolate or ovate, acute, $\mathrm{II}^{1-17} \mathrm{~mm}$. long, nearly equalling the bluish corolla; pod oblong, glabrous, about 5 mm . long, slightly wrinkled, enclosed in the calyxtube. Plains, Manitoba and Dak. to Neb. and Tex. June.

т2. Psoralea hypogaèa Nutt. Small Indian Bread-root. (I. F. f. 2097.) Similar to the preceding, but smaller, nearly acaulescent, the stem hardly rising above the ground, densely pubescent with appressed whitish hairs. Petioles 2-4 times as long as the leaves; stipules oblong, acutish, about 13 mm . long; leaflets 5 , sessile or nearly so, $2-3 \mathrm{~cm}$. long, often mucronate-tipped, narrowed at the base; peduncles $1-8 \mathrm{~cm}$. long; spikes dense, 13-25 mm. long; bracts ovate, acute, shorter than or nearly equalling the dull blue corolla; pod II mm. long or more, somewhat hirsute, slender-beaked. Plains, Neb. and Colo. to Tex. and N. Mex. May-June.

I3. Psoralea stipulàta T. \& G. Large-stipuled Psoralea. (I. F. f. 2098.) Sparingly pubescent or glabrous, nearly glandless; stems $3^{-6} \mathrm{dm}$. long. Petioles shorter than the leaves; stipules ovate or lanceolate, about 13 mm . long; leaves 3 -foliolate; leaflets oval or elliptic, $2-5 \mathrm{~cm}$. long, narrowed at the base, obtusish at the apex, the terminal one on a stalk $6-13 \mathrm{~mm}$. long; racemes dense, 2.5 cm . long or less; flowers purple, $9-$ II mm. long; bracts ovate, acute or acuminate, deciduous. In rocky places, Ohio, Ind. and Ky. June-July.
14. Psoralea pedunculàta (Mill.) Vail. Samson's Snakeroot. (I. F. f. 2099.) Erect, $3-5 \mathrm{dm}$. high, more or less pubescent and rough. Glands small and inconspicuous; leaves petioled, 3 -foliolate; petioles shorter than or equalling the leaflets; stipules subulate; leaflets oblong-lanceolate, $3-8 \mathrm{~cm}$. long, entire, obtuse at each end, the apex mucronulate, the terminal one on a stalk $4-13 \mathrm{~mm}$.

- long; racemes rather loosely flowered, $5-13 \mathrm{~cm}$. long; bracts ovate-lanceolate, acuminate, deciduous, glandular; flowers purplish, about 4 mm . long ; pod wrinkled transversely. In dry soil, Kans. to Ind., N. Car., Tex. and Fla. March-July.

15. Psoralea Onóbrychis Nutt. Sainfoin Psoralea. (I. F. f. 2100.) Glabrous or slightly pubescent, $1-2 \mathrm{~m}$. high. Glands few and small; stipules subulate; petioles about equalling the 3 -foliolate leaves: leaflets ovate-lanceolate, $5-10 \mathrm{~cm}$. long, entire, rounded or truncate at the base, acuminate at the apex, the terminal one on a stalk about 2.5 cm . long; racemes numerous, loosely flowered,

7-15 cm. long; peduncles equalling or shorter than the leaves; flowers purplish ; pod $9-12 \mathrm{~mm}$. long, transversely wrinkled and roughened with points. Along rivers, Mo. to Ohio, S. Ont., Ky. and S. Car. June-July.

## 15. AMÓRPHAL.

Glandular-punctate shrubs, with odd-pinnate leaves, and small violet blue or white flowers, in terminal spike-like racemes. Calyx-teeth nearly equal, or the lower ones longer; standard obovate, erect, clawed, folded around the stamens and style; wings and keel none; stamens monadelphous below; ovary 2-celled; style curved; stigma terminal; pod short, oblong, curved, nearly indehiscent, I-2seeded. [Greek, deformed, four petals being absent.] About io species, natives of N. Am. and Mex.
Tall shrub ; leaflets $2.5-5 \mathrm{~cm}$. long; pod usually 2 -seeded. Low shrubs: leaflets $9^{-15} 5 \mathrm{~mm}$. long; pod I-seeded.
Glabrous or nearly so ; spikes commonly solitary.
Densely canescent ; spikes commonly clustered.

## 1. A. fruticosa. <br> 2. A. nana. <br> 3. A. canescens.

I. Amorpha fruticòsa L. False or Bastard Indigo. (I. F. f. 21ol.) A shrub I.5-6 m. high. Leaves petioled, I.5-4 dm. long; leaflets II-2I, distant, short-stalked, oval or elliptic, obtuse and mucronulate, or sometimes slightly emarginate, entire; racemes dense, $7-15 \mathrm{~cm}$. long; flowers $6-9 \mathrm{~mm}$. long; standard violet-purple, $2-3$ times as long as the calyx, emarginate; stamens exserted; pod glandular, thick-stalked, $6-9 \mathrm{~mm}$. long, acute. Along streams, Ohio to Minn., Manitoba, Fla., Colo. and Chihuahua. Also escaped from cultivation in the Middle and Eastern States. May-July.
2. Amorpha nàna Nutt. Fragrant False Indigo. (I. F. f. 2102.) A low bushy shrub, seldom more than 3 dm . high. Leaves short-petioled, numerous, 38 cm . long; leaflets 13-19, rigid, short-stalked, oval or oblong, rounded or emarginate and mucronate at the apex; flowers fragrant; standard purplish, about 4 mm . long; calyx-teeth acuminate; pod short. Prairies, Iowa to Minn., Dak. and the N. W. Terr. May.
3. Amorpha canéscens Pursh. Lead-plant. Shoe-strings. (I. F. f. 2103.) A bushy, white-canescent shrub, 3-9 dm. high. Leaves sessile or very nearly so, numerous, $5-10 \mathrm{~cm}$. long; leaflets $2 \mathbf{I}-49$, approximate, almost sessile, oval or short-lanceolate, rounded or truncate at the base, less pubescent above than beneath; spikes $5-18 \mathrm{~cm}$. long; calyx-teeth lanceolate; standard bright blue, nearly orbicular or obcordate, about 4 mm . long; pod slightly exceeding the calyx. Prairies, Ind. to Minn., Manitoba, La. and Tex. Named from its leaden hue, not as indicative of lead. July-Aug.

## 16. PAROSÈLA Cav.

Herbs, or sometimes shrubs, with usually glandular-punctate foliage, odd-pinnate leaves, minute stipules, and small flowers in terminal or lateral spikes. Calyxteeth nearly equal; standard cordate or auriculate, clawed; wings and keel mainly exceeding the standard, adnate by their claws to the lower part of the stamen-tube; stamens 10 or 9 , monadelphous; ovules 2 or 3 ; style subulate; pod included in the calyx, membranous, mostly indehiscent and I-seeded. [Anagram of Psoralea.] About IIO species, natives of America. In addition to the following some +2 others occur in the western U. S.

Spikes elongated, narrow, loosely flowered.

Foliage glabrous ; corolla white ; leaflets linear.
Foliage pubescent; corolla purple or red ; leaflets obovate.
Spikes oblong to ovoid, thick, densely flowered.
Foliage glabrous; corolla pink or white; leaflets 15-41.
Foliage pubescent ; corolla yellow to red; leaflets 3-9.
Plant 3-6 dm. high ; calyx-teeth acuminate.
Plant not over 2.5 dm . high ; calyx-teeth aristate.
Spikes $x-3 \mathrm{~cm}$. long; bracts shorter than the calyx, mucronate.

$$
\text { 5. } P . \text { nana. }
$$

Spikes 3-9 cm. long; bracts as long as the calyx, or longer, acuminate.
6. I. Jame'siz.
I. Parosela enneándra (Nutt.) Britton. Slender Parosela. (I. F. f. 2104.) Erect, 3-12 dm. high, with numerous slender ascending branches. Leaflets 5-II, linear or linear-oblong, obtusish, 2-II mm. long, narrowed at the base, nearly sessile; spikes $5-13 \mathrm{~cm}$. long; bracts obtuse, nearly orbicular, punctate, 3 mm . long, often mucronate; flowers $9-13 \mathrm{~mm}$. long; calyx-teeth subulate, beautifully plumose, shorter than the corolla; standard small, cordate; keel exceeding the wings; stamens 9. Iowa to S. Dak., Colo., Miss. and Tex. June-Aug.
2. Parosela lanàta (Spreng.) Britton. Wooly Parosela. (I. F. f. 2105.) Decumbent, branching, softly and densely pubescent, 3-6 dm. long. Leaflets 9-13, obovate, obtuse, truncate or emarginate at the apex, narrowed or cuneate at the base, $9-13 \mathrm{~mm}$. long. about 4 mm . wide above; spikes short-peduncled, $2.5-10 \mathrm{~cm}$. long; bracts oval or obovate, long-acuminate or mucronate, about 3 mm . long; flowers 6 mm . long; calyx-teeth subulate, plumose; standard cordate, slightly exceeding the wings and keel; stamens ro. Plains, Kans. to Tex., Utah and N. Mex. Summer.
3. Parosela Dàlea (L.) Britton. Pink Parosela. (I. F. f. 2106.) Erect, 3-6 dm. high. Leaflets oblanceolate or linear-oblong, obtuse at the apex, narrowed at the base, $4-6 \mathrm{~mm}$. long ; spikes oblong, dense, $2.5-5 \mathrm{~cm}$. long, about II mm. thick, peduncled; bracts ovate or lanceolate, acuminate, deciduous, about equalling the calyx ; calyx silky-pubescent, its teeth linear-lanceolate, acuminate, plumose; corolla about 4 mm . long; keel about equalling the wings. Prairies, Ill. to Minn., S. Dak., Tex. and Mex. Aug.-Sept.
4. Parosela aùrea (Nutt.) Britton. Golden Parosela. (I. F. f. 2107.) Erect, pubescent, 3-6 dm. high. Leaflets sessile, obovate, oblong or oblanceolate, obtuse, narrowed at the base, $9-13 \mathrm{~mm}$. long: spikes solitary, short-peduncled, ovoid or oblong, dense, $2.5-8 \mathrm{~cm}$. long, $13-17 \mathrm{~mm}$. thick; bracts ovate, mucronate, shorter than the plumose and pubescent calyx-teeth; corolla $9-11 \mathrm{~mm}$. long; standard shorter than the wings and keel. Plains, S. Dak. and Neb. to Tex. Summer.
5. Parosela nàna (Torr.) Heller. Low Parosela. (I. F. f. 2107a.) Suffrutescent, silky-villous. Stems $\mathbf{1 - 2 . 5} \mathrm{dm}$. high; leaflets 5, rarely 3, $6-10 \mathrm{~mm}$. long, obovate to linear-oblong, usually minutely glandular beneath; spikes oblongovoid, $\mathbf{I}-3 \mathrm{~cm}$. long, short-peduncled; bracts ovate, mucronate or short-aristate, caducous; corolla somewhat longer than the setaceous aristate and plumose calyxteeth. Sand hills and prairies, Kans. to Tex. and Cal.
6. Parosela Jámesii (Torr.) Vail. James' Parosela. Prostrate or ascending from a woody base, $\mathbf{1 - 2} \mathrm{dm}$. high. Leaves 3 -foliolate; leaflets 7 - 18 mm . long, obovate, obtuse, mucronulate, narrowed at the base, densely silky-pubescent; spikes thick, ovoid to oblong, sessile or nearly so; calyx-teeth plumose, aristate; bracts ovate-lanceolate, long-acuminate, usually longer than the calyx; standard reddish-purple; keel yellowish, exceeding the wings. Kans. and Colo. to N. Mex. May-June. [Dalea Jamesii Torr.]

## 17. KUHNİSTERA Lam.

Perennial glandular-punctate herbs, with long or deep roots, odd-pinnate leaves, and pink purple or white spicate or capitate flowers. Calyx-teeth nearly equal. Petals with long slender claws ; standard oblong or cordate ; wings and keel-petals similar to each other, their claws adnate to the sheath of the stamen-tube almost to its summit. Stamens 5, alternate with the petals. Ovary sessile, 2 -ovuled ; style subulate. Pod membanous, included in the calyx, I-2-seeded. [Named from the resemblance of these plants to the genus Kuhnia.] About 35 species, natives of N. Am. and Mex.

Foliage glabrous or very slightly pubescent.
Flowers white ; leaflets 3-9.
Leaflets oblong, linear-oblong or oblanceolate ; spikes cylindric or oblong.
Calyx villous-pubescent.

1. K. compacta.

Calyx glabrous or nearly so.
Stem little branched; spikes cylindric ; leaflets $\mathrm{I}^{\mathbf{3}-25 \mathrm{~mm} \text {. long, thin. }}$ 2. $K$. candida.

Stem much branched; spikes oblong; leaflets smaller, firm.
3. K. oligophylla.

Leaflets narrowly linear to oblanceolate; heads globose.
4. K. multiflora.

Flowers pink or purple.
Leaflets $3-5$; calyx silky-pubescent.
Bracts glabrous; leaflets mucronulate.
Bracts silky-pubescent; leaflets obtuse.
Leaflets I3-3x ; calyx glabrous.
Foliage silky-pubescent; leaflets 9-17.
5. K. purpurea.
6. K. tenuifolia.
7. $K$. foliosa.
8. K. villosa.
I. Kuhnistera compácta (Spreng.) Kuntze. Dense-flowered Prairieclover. (I. F. f. 2108.) Erect, 3-8 dm. high. Leaflets 5-7, short-stalked, oblong-lanceolate or linear-oblong, $13-25 \mathrm{~mm}$. long; peduncles elongated, not bracted; spikes $4-15 \mathrm{~cm}$. long, about 13 mm . thick, the rachis pubescent ; flowers about 4 mm . long; bracts awn-pointed, longer than the calyx; wings and keel-petals oblong; standard cordate; pod pubescent, enclosed by the calyx. In dry soil, S. Dak. to Kans., Colo. and Wyo. July-Aug.
2. Kuhnistera cándida (Willd.) Kuntze. White Prairie-clover. (I. F. f. 2109.) Stems 3-6 dm. high. Leaves petioled; leaflets 5-9, oblong or oblanceolate, $17-25 \mathrm{~mm}$. long, often mucronulate, narrowed at the base, very short-stalked ; peduncles elongated, bracted; spikes $2.5-10 \mathrm{~cm}$. long, II-I3 mm. thick; bracts awn-pointed, longer than the calyx; corolla 4-6 mm. long; wings and keel-petals oval; standard cordate; calyx-teeth and pod slightly pubescent. Prairies, Ind. to Minn., the N. W. Terr., La., Tex. and Colo. July-Aug.
3. Kuhnistera oligophýlla (Torr.) Heller. Slender White Prairieclover. (I. F. f. 21 Io.) Slender, 3-7 dm. tall, the branches ascending. Leaves short-petioled; leaflets about 7 (5-9), linear, linear-oblong or somewhat oblanceolate, firm, $2-4 \mathrm{~mm}$. wide, mostly less than 2 cm . long, or those of the lower leaves larger; spikes oblong or short cylindric, blunt, less densely flowered than those of the preceding; bracts lanceolate, acuminate, equalling the calyx, or longer, early deciduous; calyx-teeth usually pubescent. Plains, S. Dak. to Wyo., Tex., Ariz. and Mex. June-Sept.

## 4. Kuhnistera multiflòra (Nutt.) Heller. Round-headed Prairie-clover.

 (I. F. f. 2111 .) Erect, 3-6 dm. high. Leaves short-petioled; leaflets 3-9, linear or oblanceolate, obtuse or obtusish at the apex, cuneate or narrowed at the base, shortstalked, 9-I 3 mm . long, $0.5-\mathrm{Imm}$. wide, peduncles elongated; heads globose, 9-I3 mm . in diameter; bracts subulate, shorter than the calyx; calyx-teeth slightly pubescent; corolla about 4 mm . long; wings and keel-petals ovate, oval or slightly cordate. Plains, Kans. to Tex. Summer.5. Kuhnistera purpùrea (Vent.) MacM. Violet Prairie-clover. (I. F. f. 2112.) Glabrous or slightly pubescent, 4-9 dm. high. Leaves short-petioled; leaflets 3-5, narrowly linear, 6-19 mm. long, narrowed at the base, very shortstalked; spikes peduncled, oblong or cylindric, $1.3-5 \mathrm{~cm}$. long, about $\mathbf{I} \mathrm{cm}$. thick; bracts obovate, mucronate, nearly glabrous, equalling the silky-pubescent calyx, or shorter; corolla about 4 mm . long; standard cordate; wings and keel-petals oblong. Prairies, Ind. to the N. W. Terr., Tex. and Colo. July-Aug.
6. Kuhnistera tenuifòlia (A. Gray) Kuntze. Silky Prairie-clover. (I. F. f. 2113.) More or less pubescent, erect, branching, 3-6 dm. high. Leaves short-petioled; leaflets $3-5$, linear, somewhat involute, dotted with sessile glands. $6-25 \mathrm{~mm}$. long, very short-stalked or sessile; peduncles terminal. elongated, bracted; spikes oblong or cylindric, $\mathbf{I} .2-4 \mathrm{~cm}$. long, about II mm. thick, the rachis pubescent; flowers rose-purple, about 5 mm . long; bracts ovate, aristate, silkypubescent, slightly exceeding the very silky-pubescent calyx; standard nearly orbicular, cordate, cucullate. In dry soil, Kans. and Ark. to N. Mex. July-Aug.
7. Kuhnistera foliòsa (A. Gray) Kuntze. Leafy Prairif-cloyer. (I. F. f. 21I4.) Erect, branching, or sometimes simple, glabrous. 3-9 dm. high. Leaves numerous, petioled; leaflets 13-3I, close together, short-stalked. linear-oblong or slightly oblanceolate. $9-15 \mathrm{~mm}$. long, acute or obtuse, mucronate at the apex. narrowed at the base; spike's terminal, long-ovoid or cylindric. 2.55 cm . long. II-I3 mm. thick, densely flowered; peduncles short; bracts lanceolate, awnpointed, longer than the calyx; flowers rose-purple, about + mm. long; standard broad, nearly orbicular; wings and keel-petals owal; calyx-tecth tinely ciliate. Along rivers, Ill. and Ky. July-Aug.
8. Kuhnistera villosa (Nutt.) Kunze. HAIRY Pratrie-Cthter. (l. F. f. 2115.) Ascending or decumbent, 3-6 dm. high. Leates short-petioked or nearly
sessile; leaflets 9-17, approximate, linear-oblong or slightly oblanceolate, narrowed at the base, $6-$ II mm. long; spikes terminal, short-peduncled, cylindric, $2.5-8 \mathrm{~cm}$. long, $\mathbf{I I}-\mathbf{1 3} \mathrm{mm}$. thick, dense; bracts lanceolate, acuminate, exceeding the densely villous calyx; corolla rose-purple or rarely white; standard oblong; wings and keel-petals oblong-obovate. Prairies, Wis. to Sask., Mo., Kans., and Mont. Aug.

## 18. INDIGÓFERA L.

Herbs, or rarely shrubs, often canescent with hairs affixed by the middle, with odd-pinnate leaves, small stipules, and pink or purple spicate or racemose flowers. Calyx-teeth oblique, nearly equal, or the lower longer; standard ovate or orbicular, sessile or clawed; wings oblong; keel erect, somewhat gibbous, or spurred; stamens mainly monadelphous; ovary $\mathbf{I}-\infty$-ovuled; style slender; pod linear, 4 -angled (in our species), septate between the seeds. [Name from the yield of indigo by some species.] About 250 species, natives of warm and temperate regions. In addition to the following, some 5 others occur in the southern U. S.
I. Indigofera leptosépala Nutt. Wild or Western Indigo-plant. (I. F. f. 2116.) Perennial, decumbent, cinereous-pubescent, slender, 1.5-6 dm. long. Leaves short-petioled; leaflets 5-9, oblanceolate or oblong-linear, $6-25 \mathrm{~mm}$. long, obtuse and often mucronulate at the apex, narrowed or cuneate at the base, shortstalked; spikes peduncled, loosely few-flowered; flowers about 6 mm . long; calyx-teeth subulate, equal; pods linear, acute, sessile, $17-25 \mathrm{~mm}$. long, 2 mm . thick, reflexed at maturity. Kans. to Tex. and Mex., east to Fla. May-Nov.

## 19. CRACCA L.

Herbs, sometimes slightly shrubby, with odd-pinnate not punctate leaves, and purple red or white flowers in racemes or short clusters. Stipules small; leaflets entire; calyx-teeth usually nearly equal ; petals all clawed; standard orbicular or broadly ovate; wings obliquely obovate or oblong; keel curved; stamens monadelphous or diadelphous; ovules several or many; pod linear, flat, 2-valved, sev-eral-seeded. [Latin, vetch.] About $\mathbf{1 2 0}$ species, mainly natives of warm and tropical regions. Besides the following, II species occur in the southern U. S.

Raceme terminal, dense, nearly sessile, many-flowered.
Peduncles lateral and terminal, elongated, few-flowered.
Villous ; flowers in an interrupted spike or raceme.
Pubescent; peduncles few-flowered near the summit.
I. C. Virginiana.
2. C. spicata.
3. C. hispidula.
I. Cracca Virginiàna L. Cat-gut. Goat's Rue. (I. F. f. 2II7.) Villous or silky with whitish hairs, 3-6 dm. high. Roots long, fibrous, tough; leaves short-petioled; leaflets 7-25, oblong, linear-oblong or the terminal one oblanceolate, narrowed or cuneate at the base, rounded, mucronate or emarginate at the apex, 18-25 mm. long ; flowers yellowish-purple, $13-19 \mathrm{~mm}$. long ; pedicels $4-9 \mathrm{~mm}$. long; pod linear, densely pubescent, $2.5-5 \mathrm{~cm}$. long. In dry sandy soil, Me. to Minn., Fla., La. and Mex. June-July.

Cracca Virginiàna holoserícea (Nutt.) Vail. Densely woolly-pubescent; leaflets acutish. Ill. to Wis., La. and Ark.
2. Cracca spicàta (Walt.) Kuntze Loosely-flowered Goat's Rue. (I. F. f. 2118 .) Villous-pubescent with long brown hairs, decumbent or straggling, much branched, 3-6 dm. long. Leaves few and distant, short-petioled; leaflets 915, short-stalked, oval, oblanceolate or narrowly obovate, obtuse and mucronate,
 cm . long; flowers purplish, $12-17 \mathrm{~mm}$. long; pod linear, finely pubescent, about 5 cm . long. In dry soil, Del. to Fla., Ala. and Miss. June-Aug.
3. Cracca hispídula (Michx.) Kuntze. Few-flowered Goat's Rue. (I. F. f. 2119.) More or less pubescent, procumbent or straggling, much branched, slender, 3-6 dm. long. Leaves petioled; leaflets 5-19, short stalked, oval, oblong, oblanceolate or obovate: peduncles slender, $5-10 \mathrm{~cm}$. long; flowers red-purple, few, about 12 mm . lony; pod linear, $2.5-4 \mathrm{~cm}$. long, minutely pubescent. Dry sandy soil, Va. to Fla., west to Ala. May-Aug.
20. BRÁDLEYA Adans.

High-climbing woody vines, with odd-pinnate leaves, and showy blue or purplish flowers in large terminal racemes. Calyx somewhat 2-lipped, the 2 upper
teeth slightly shorter than the 3 lower; standard large, reflexed, clawed, with 2 small appendages at the base of the blade; wings oblong, falcate, auriculate at the base; keel incurved, obtuse; stamens diadelphous; ovary stalked; ovules $\infty$; pod elongated, torulose, 2 -valved, coriaceous. [Named for Richard Bradley, 16751732, Professor at Cambridge.] Five known species, the following of southeastern N. Am., the others Asiatic.

Racemes $4-10 \mathrm{~cm}$. long; calyx-segments shorter than the tube. I. B. frutescens. Racemes $20-30 \mathrm{~cm}$. long; calyx-segments as long as the tube, or the lower one longer.
2. B. macrostachys.
I. Bradleya frưtéscens (L.) Britton. American Wistaria. (I. F. f. 2120.) A slender vine becoming 10 m . long Leaves $\mathrm{I}-2 \mathrm{dm}$. long; leaflets $9-15$, oblong to ovate or lanceolate, $1.5-4 \mathrm{~cm}$. long, acute or slightly acuminate at the apex, acute or rounded at the base; racemes ovoid or oblong, $4-10 \mathrm{~cm}$. long, with lanuginous rachis and pedicels; calyx pubescent with appressed hairs, $5-6 \mathrm{~mm}$. long; corolla ${ }^{15} 5-18 \mathrm{~mm}$. long. In low grounds, Va. to Fla. April-June. [Kraunhia frutescens Greene.]
2. Bradleya macróstachys (T. \& G.) Small. Long-clustered Wistaria. (I. F. f. 2120a.) A stout vine with stems often becoming $2-3 \mathrm{~cm}$. thick and 8 m . long. Leaves $2-3 \mathrm{dm}$. long; leaflets usually 9 , oval, oval-ovate to elliptic or elliptic-lanceolate, $3-7 \mathrm{~cm}$. long, acuminate at the apex, rounded or cordate at the base; racemes $2-3 \mathrm{dm}$. long, narrowly conic, with densely hirsute and glandular rachis and pedicels; calyx pubescent like the pedicels, $10-12 \mathrm{~mm}$. long; corolla $18-21 \mathrm{~mm}$. long. In and about swamps, Ind. to Kans. and La. Spring. [Kraunhia macrostachys Small.]

## 2I. ROBÍNIA L.

Trees or shrubs, with odd-pinnate leaves, and axillary or terminal racemes of showy flowers. Stipules small, often spiny. Petioles slightly dilated at the base, enclosing the buds of the next year. Calyx-teeth short, broad, the 2 upper somewhat united. Standard large, reflexed, not appendaged; wings oblong, curved; keel curved, obtuse. Stamens diadelphous; anthers uniform, or the alternate ones smaller. Ovary stalked; ovules $\infty$. Pod flat, linear, not septate between the seeds, margined along the upper suture, 2-valved. [Named in honor of John and Vespasian Robin, who first cultivated the Locust-tree in Europe, 1550-1629.] About 6 species, natives of N. Am. and Mex.
Twigs, petioles and pods glabrous; flowers white; a tree.

1. R. Pseudacacia. Twigs and petioles glandular; pods hispid; flowers pinkish; a tree. 2. R. viscosa.
Twigs and petioles bristly ; pods hispid ; flowers pink or purple ; a shrub.

> 3. R. hispida.
I. Robinia Pseudacàcia L. Locust-tree. False or Bastard Acacia. Silver-chain. (I. F. f. 2I2I.) A large tree with very rough bark. Stipules often spiny; leaflets $9-19$, stalked, ovate or oval, mainly rounded at the base, obtuse or emarginate and mucronulate at the apex, entire, $2.5-5 \mathrm{~cm}$. long; stipels small, setaceous; racemes loose, drooping; pedicels slender, $6-13 \mathrm{~mm}$. long; flowers fragrant, $15-20 \mathrm{~mm}$. long, the standard yellowish at base; pod $5-10 \mathrm{~cm}$. long, 4-7 seeded. Penn. to Ga., Iowa and the Ind. Terr. Extensively naturalized in the Middle and Eastern States and eastern Canada. May-June.
2. Robinia viscòsa Vent. Clammy Locust. (I. F. f. 2122.) A small tree with rough bark. Stipules short, sometimes spiny; leaflets II-25, stalked, obtuse and mucronate, ovate or oval, nearly glabrous, $2.5-5 \mathrm{~cm}$. long, thicker than those of the preceding; stipels small, subulate; racemes rather dense; pedicels $4-0 \mathrm{~cm}$. long; flowers 18-25 mm. long, not fragrant; pod 5-10 cm . long, glandular-hispid. southwestern Va. to Ga. Occasionally escaped from cultivation in the Middle and Eastern States and in Canada. June.
3. Robinia híspida L. Rose Acacia. Bristly or Moss Loctest. (I. F. f. 2123.) A much-branched shrub, $1-2.5 \mathrm{~m}$. high. Stipules very small, or none; leaflets 9-13, stalked, broadly ovate or oblong, entire, mainly ohtuse or rounded at each end, mucronate, $2.5-5 \mathrm{~cm}$. long; stipels subulate or none; racemes loose; pedicels $6-12 \mathrm{~mm}$. long; flowers $17-30 \mathrm{~mm}$. long, not fragrant; pods linear, bristlyhispid Mountains of Va. and Tenn. to Ga. May-June.

## 22. SÉSBAN Adans.

Herbs or shrubs, with evenly pinnate leaves, the leaflets numerous, entire, not stipellate, or the stipels minute. Flowers in axillary racemes, the slender pedicels with 2 deciduous bractlets under the calyx. Calyx campanulate, nearly equally 5 -toothed. Standard broad, ovate or orbicular; wings oblong; falcate; keel blụnt. Stamens diadelphous (9 and I). Ovary mostly stipitate, many-ovuled; style glabrous; stigma small. Pod elongated-linear, wingless, compressed, partitioned between the oblong seeds. [Name Arabic.] About 15 species, natives of warm and tropical regions, only the following known in N. Am.

1. Sesban macrocàrpa Muhl. Long-podded Sesban. (I. F. f. 2124.) Annual, glabrous, $1-3.5 \mathrm{~m}$. tall. Leaflets $10-35$ pairs, oblong, obtuse, mucronate, thin, 2.5 cm . long or less, pale beneath; racemes shorter than the leaves, 1-5flowered; calyx-teeth subulate; corolla yellowish, purple-spotted, the standard 17-21 mm. long; pod $1_{5-25} \mathrm{~mm}$. long, about 4 mm . wide, somewhat curved, drooping. In wet or moist soil, Mo. to Tex., S. Car. and Fla., south to Central Am. Collected also in S. Penn. June-Sept.

Colutèa arboréscens L. A European shrub, with odd-pinnate leaves, yellow flowers in short racemes, and greatly inflated membranous pods, is reported escaped from cultivation in E. Mass.

## 23. ASTRÁGALUS L.

Herbs, sometimes woody, mostly with odd-pinnate or sometimes simple leaves, the flowers in spikes or racemes, or rarely umbellate or solitary. Stipules present. Calyx tubular, its teeth nearly equal. Petals clawed; standard erect, ovate or oblong; wings oblong; keel obtuse, about equalling the wings. Stamens diadelphous; anthers all alike. Ovules $\infty$. Pod dehiscent or indehiscent, 1-2-celled, very different in different species and affording the best characters in classification. [Greek name of some leguminous plant.] About Iooo species, of wide geographic distribution. In addition to the following, at least 175 others occur in the western and southern U. S.

## * Pod 2-celled.

Pod fleshy, thick-walled, indehiscent.
Pod glabrous, globose or oval.
Corolla purple; pod pointed. I. A. crassicarpus.
Corolla yellowish-white; pod obtuse.
2. A. Mexicanus.

Pod pubescent, ovoid or oblong.
Pod ovoid, about 12 mm . long, not wrinkled.
Pod oblong, curved, 2.5 cm . long or more, wrinkled.
3. A. Plattensis.
4. A. Tennesseensis.

Pod dry, leathery, cartilaginous or papery, dehiscent.
Plant densely villous-pubescent all over.
5. A. mollissimus.

Plants glabrous or grayish-pubescent.
Flowers yellowish; pod terete, glabrous.
6. A. Carolinianus.

Flowers purple; pod with a deep furrow, pubescent.
Pod finely appressed-pubescent.
7. A. adsurgens.

Pod densely villous with white hairs.
8. A. Hypoglottis

## ** Pod I-celled, but one or both sutures sometimes intruded.

Pod triangular or heart-shaped in section, membranous; flowers mostly yellowish-white.

Pod heart-shaped in section; plant woolly-pubescent.
Pod triangular in section; plant appressed-pubescent.
Pod 2-grooved on the upper side; flowers purple.
9. A. Drummondiz.

1о. A. racemosus.
II. A. bisulcatus.

Pod nearly circular, or 8 -shaped, in section, mostly coriaceous.
Leaflets narrowly linear, elongated, persistent ; flowers yellow.
12. A. pectinatus.

Leaflets oblong, lanceolate, oblanceolate, oval or linear, deciduous.
Plants scapose, or short-stemmed, villous or silvery-pubescent.
Plant gray-villous; flowers yellow. 13. A. lotiflorus.
Plants silvery-pubescent; flowers blue, violet or purple.
Pod nearly circular in section, straight.
14. A. Missouriensis.

Pod 8 -shaped in section, its summit curved.
15. A. Shortianus.

Plants leafy-stemmed, appressed-pubescent or glabrate; flowers purple.
Pod $6-12 \mathrm{~mm}$. long, wrinkled; flowers 6 mm . long or less.
Plant erect; leaflets obtuse, very narrow. 16. A. gracilis.
Plant diffuse; leaflets emarginate, short-linear. 17. A. microlobus.
Pod more than 12 mm . long, smooth; flowers 12 mm . long.
Pod not grooved, puberulent.
18. A. flexuosus.

Decumbent ; raceme short ; peduncles only slightly exceeding the leaves.

> Pod flattened, grooved on the lower side, membranous, stalked.
> Pod pubescent, slightly grooved, 19 mm . long ; fowers white or purple. 22. A. Robbinsii.
> Pod pubescent, deeply grooved on lower side, 12 mm. long ; flowers violet.
> $23 . A$. alpinus.

1. Astragalus crassicàrpus Nutt. Ground Plum. (I. F. f. 2125.) Ap-pressed-pubescent; branches decumbent or ascendirg, 1.5-4.5 dm. long. Stipules ovate, acute, $4^{-6} \mathrm{~mm}$. long; leaflets $\mathrm{I}^{-25}$, oblong, elliptic or sometimes obovate, obtuse, narrowed at the base, $6-\mathbf{1 2} \mathrm{mm}$. long; flowers violet-purple, $16-18 \mathrm{~mm}$. long, in short racemes; pods sessile, thick, short-pointed, $17-25 \mathrm{~mm}$. in diameter. Prairies, Minn. to Manitoba, the N. W. Terr., Iowa, Colo. and Tex. Fruit edible, collected by prairie-dogs for their winter store. April-June.
2. Astragalus Mexicànus A. DC. Larger Ground Plum. (I. F. f. 2126.) Similar to the preceding, but less pubescent and with the hairs somewhat spreading. Leaflets $17-33$, oblong to obovate, obtuse or emarginate, narrowed at the base; Hlowers yellowish-white, or purplish at the tip, $18-25 \mathrm{~mm}$. long, in short racemes; pod sessile, thick, globose, $2.5-3 \mathrm{~cm}$. in diameter. Prairies, Ill. to S. Dak., Ark. and Tex. Fruit edible. May.
3. Astragalus Platténsis Nutt. Platte Milk Vetch. (I. F. f. 2127.) Villous-pubescent, prostrate or ascending, $1.5-2.5 \mathrm{~cm}$. high or long. Leaflets 13-29, oblong to obovate, obtuse, narrowed at the base, 9-18 mm. long; stipules broad, ovate, pointed, $6-9 \mathrm{~mm}$. long; flowers yellowish-white or tipped with purple, about 18 mm . long, in short heads; pod sessile, pointed, smooth, loosely pubescent, nearly straight. Prairies, Ind. to Minn., S. Dak., Ala. and Tex. May.
4. Astragalus Tennesseénsis A. Gray. Tennessee Milk Vetch. (I. F. f. 2128.) Villous with long whitish hairs. Leaflets 15-3I, oblong or linear-oblong, obtuse or emarginate, nearly glabrous above, $\mathbf{1 2 - 2 1 ~ m m}$. long; stipules lanceolate, oval or ovate-lanceolate; racemes short, several-many-flowered ; flowers about 2 cm . long; pod strongly wrinkled, at least when dry, its summit curved. On hillsides, Tenn. to Ala. and Mo. March-May.
5. Astragalus mollíssimus Torr. Woolly Loco-weed or Crazy-weed. (I. F. f. 2129.) Bushy, 3-6 dm. high. Stem very short; stipules membranous, ovate, pointed, 6-11 mm. long, adnate to the petiole; leaflets 19-27, oval, obtuse, but pointed at the apex, $9-13 \mathrm{~mm}$. long; flowers violet-purple, $18-25 \mathrm{~mm}$. long, in dense spikes; pod oblong, glabrous, somewhat compressed, sessile, $10-21 \mathrm{~mm}$. long, about 6 mm . thick, furrowed at both sutures, slightly curved at maturity. Plains, Neb. and Colo. to Tex. and N. Mex. June. The popular name of the plant is from its poisonous eftects on cattle.
6. Astragalus Caroliniànus L. Carolina Milk Vetch. (I. F. f. 2130.) Glabrous or slightly pubescent, 3-12 dm. high. Stipules membranous, broadly lanceolate, acuminate, $4-9 \mathrm{~mm}$. long; leaflets $15-31$, elliptic or oval, obtuse or slightly emarginate at the apex, rounded at the base, $2.5-5 \mathrm{~cm}$. long; flowers $12-17$ mm . long in dense spikes; pod sessile, coriaceous, erect, or sometimes slightly furrowed at the dorsal suture, pointed, nearly straight, $10-17 \mathrm{~mm}$. long. Along streams, Hudson Bay and Quebec to the Rocky Mts., south to Vt., W. N. Y.., Ga., La. and Colo. July-Aug.
7. Astralagus adsúrgens Pall. Ascending Milk Vetch. (I. F. f. 2131.) Minutely cinereous-pubescent or glabrate, ascending or decumbent, I-2 dm. long. Stipules membranous, ovate, acuminate, $6-11 \mathrm{~mm}$. long; leaflets $15-25$. oval to linear-oblong, obtuse and sometimes emarginate, narrowed at the base, $10-25 \mathrm{~mm}$. long; peduncles exceeding the leaves; flowers purplish, 12-17 mm. long, in dense short spikes; pod sessile, oblong, pointed, coriaceous, erect, cordate-trianguiar in section, $9-13 \mathrm{~mm}$. long. Plains, Minn. to the N. W. Terr.. Br. Col., Kans. and Colo. Also in northern Asia. June-July.
8. Astragalus Hypoglóttis L. Purple Milk Vetch or Cock's-head. (I. F. f. 2I32.) Slender, branched at the base, I.5-6 dm. long. Stipules ovatelanceolate, acute, 4-6 mm. long; leaflets $\mathbf{1 7 - 2 5}$, oblong or elliptic, obtusish and generally emarginate at the apex, rounded at the base, $6-15 \mathrm{~mm}$. long; flowers violet-purple, $\mathbf{1} 2-21 \mathrm{~mm}$. long, in dense heads; pods membranous, sessile, ovoidoblong, 9-II mm. long. Kans. to Minn., Hudson Bay, Nev. and Alaska. Also in northern Europe and Asia. May-Aug.
9. Astragalus Drummóndii Dougl. Drummond's Milk Vetch. (I. F. f. 2133.) Erect, 3-6 dm. high, rather stout. Stipules ovate, long-acuminate, 6-II mm . long; leaflets 19-33, oblong or sometimes oblanceolate, obtuse, narrowed at the base, $\mathbf{I I}^{1} \mathbf{- 2 1 \mathrm { mm }}$. long; flowers yellowish-white or the keel purplish tinged, 17 19 mm . long, in loose spikes; pod distinctly stipitate, cartilaginous, linear, pendent, glabrous, grooved, about 5 cm . long ; calyx dark-pubescent above. Plains, Neb. to Manitoba, Wyo. and the N. W. Terr. June-July.
10. Astragalus racemòsus Pursh. Racemose Milk Vetch. (I. F. f. 2134.) Stem somewhat zigzag, 3-6 dm. high. Stipules ovate-lanceolate, membranous, 4-6 mm. long; leaflets 17-21, elliptic or linear-oblong, acutish or mucronate, $2-3 \mathrm{~cm}$. long; flowers $17-19 \mathrm{~mm}$. long, in loose racemes; pedicels $2-4 \mathrm{~mm}$. long; pods linear-oblong, imperfectly 2 -celled by the intrusion of the dorsal suture, acute at each end, glabrous, stipitate, broadly sulcate, pendent, about 2.5 cm . long. Plains, Neb. and Kans. to the N. W. Terr. June-July.
ri. Astragalus bisulcàtus (Hook.) A. Gray. Two-grooved Milk Vetch. (I. F. f. 2135.) Rather stout, 3-9 dm. high. Stipules membranous, ovate-lanceolate, acute, $9-13 \mathrm{~mm}$. long; leaflets $17-27$, oval or oblong, obtuse, narrowed at the base, $17-25 \mathrm{~mm}$. long; flowers $15-17 \mathrm{~mm}$. long, in elongated narrow racemes; peduncles longer than the leaves; pod linear, stipitate, deflexed, pointed, glabrous at maturity, membranous, 'I3-2I mm. long. Neb. and Colo. to Mont. and the N. W. Terr. June-Aug.
11. Astragalus pectinâtus (Hook.) Dougl. Narrow-leaved Milk Vetch. (I. F. f. 2136 .) Ascending, 3-6 dm. high, finely canescent or glabrate. Stipules membranous, ovate-lanceolate, acute or acuminate, 9-II mm. long; leaflets II-2I, narrowly linear, acute, $1.5-8 \mathrm{~cm}$. long; flowers $16-25 \mathrm{~mm}$. long, in loose spikes; standard much longer than the wings and keel; pod nearly terete, sessile, oblong, pointed, glabrous, not furrowed, keeled along the upper suture, $12-17 \mathrm{~mm}$. long. Plains, Neb. and Kans. to the N. W. Terr. June-Aug.
12. Astragalus lotiflòrus Hook. Low Milk Vetch. (I. F. f. 2137.) Silky-pubescent with white hairs; stems $2-8 \mathrm{~cm}$. high. Stipules ovate, acuminate, $3-4 \mathrm{~mm}$. long; leaflets 7-15, oval or oblong, obtuse and sometimes mucronulate, narrowed at the base, $11-17 \mathrm{~mm}$. long; flowers $9-13 \mathrm{~mm}$. long, in rather dense short spikes; peduncles sometimes very short; pod sessile, villous-pubescent, ovoid-oblong, somewhat inflated, pointed, dehiscent, keeled along the straight dorsal suture. Plains, Manitoba to Neb., '「ex., Colo. and the N. W. Terr. JuneJuly.

Astragalus lotiflorus Nebraskénsis Bates. Whole plant densely hirsute. Central Neb.
14. Astragalus Missouriénsis Nutt. Missouri Milk Vetch. (I. F. f. 2138.) Densely silky-canescent, tufted, $5-13 \mathrm{~cm}$. long. Stipules ovate-lanceolate, acute, 4-9 mm. long; leaflets 7-2I, elliptic or obovate, obtuse but sometimes mucronate, $6-$ II mm. long; flowers few, violet-purple, II-I9 mm. long in loose heads or short spikes; pod sessile, acute, oblong, pubescent, dehiscent, slightly keeled along the ventral suture, transversely wrinkled, about 2.5 cm . long. Plains, Neb. to the N. W. Terr., south to N. Mex. May-July.
15. Astragalus Shortiànus Nutt. Short's Milk Vetch. (I. F. f. 2139.) Silvery canescent. Stipules ovate, acutish, about 4 mm . long; leaflets $9-15$, elliptic or obovate, acutish, II-19 mm. long; flowers blue or violet, $\mathrm{I}_{5}-19 \mathrm{~mm}$. long; pod sessile, dehiscent at maturity, lanceolate-ovoid, puberulent, transversely wrinkled, strongly curved at the summit, $2.5-4 \mathrm{~cm}$. long. Plains, Neb. and Colo. to N. Mex. May-July.
i6 Ast̂ragalus grácilis Nutt. Slender Milk Vetch. (I. F. f. 2140.) Slender, finely pubescent, 3-6 dm. high. Stipules ovate, acute or acuminate,

4-6 mm. long; leaflets II-2I, narrowly linear, distant, obtuse ; flowers purple, 6-8 mm. long, in narrow elongated racemes; pods sessile, pendent, straight, ellipsoid, appressed-pubescent with white hairs, especially on the ventral side, transversely veined, 4-6 mm. long. Prairies, Minn. to S. Dak., Mo., Colo. and Wyo. May-June.
17. Astragalus micrólobus A. Gray. Notched-leaved Milk Vetch. (I. F. f. 214I.) Finely canescent, about 3 dm . high. Stipules ovate-lanceolate, acute, 3-4 mm. long; leaflets 7-17, linear or linear-oblong, truncate or emarginate, narrowed at the base, $9-15 \mathrm{~mm}$. long; flowers in loose spikes; peduncles often longer than the leaves; pod sessile, ovoid or ellipsoid, reflexed, finely pubescent, transversely veined, flattened on the back, keeled along the ventral suture, 4-6 mm. long. Plains, Neb. to Mo. and Colo. Similar to A. gracilis. Summer.
18. Astragalus flexuòsus (Hook.) Dougl. Flexile Milk Vetch. (I. F. f. 2142.) Finely pubescent, $3-5 \mathrm{dm}$. high. Stipules ovate or ovate-lanceolate, 4-6 mm. long; leaflets 9-2I, linear, oblong or oblanceolate, obtuse or emarginate, narrowed or cuneate at the base, $6-12 \mathrm{~mm}$. long ; peduncles exceeding the leaves ; flowers purplish, 9-II mm. long ; pod sessile, cylindric, linear or linear-oblong, dehiscent, pointed, $16-25 \mathrm{~mm}$. long. Plains, Minn. and Neb. to Colo. and the N. W. Terr. June-Aug.
19. Astragalus distórtus T. \& G. Bent Milk Vetch. (I. F. f. 2143.) Sparingly pubescent or glabrate, diffuse or ascending; stems $2-4 \mathrm{dm}$. long. Leaflets $11-25$, obovate or oval, emarginate or rounded at the apex, narrowed at the base, 4 -II mm. long; flowers in loose short spikes; pod sessile, slightly inflated, linear-oblong, coriaceous, strongly curved, $2.5-4 \mathrm{~cm}$. long. In dry soil, Ill. to Iowa, Kans., W. Va., Miss. and Tex. March-July.
20. Astragalus élegans (Hook.) Britton. Pretty Milk Vetch. (I. F. f. 2144.) Glabrous or finely strigose, erect or ascending, 2.5-5 dm. high. Stipules ovate, acute, about 4 mm . long; flowers $6-8 \mathrm{~mm}$. long, in elongated racemes; leaflets 9 17, oblong or linear-oblong, $16-20 \mathrm{~mm}$. long; pod ellipsoid, pendent, slightly inflated, obtuse at each end, apiculate, black-pubescent all over, $5-8 \mathrm{~mm}$. long. Quebec, Lab., the Saskatch. region and in the higher and northern Rocky Mts. June-Aug.

2I. Astragalus Bódini Sheldon. Bodin’s Milk Vetch. Finely strigose ; stems $3-10 \mathrm{dm}$. long. Stipules ovate, acute; flowers $8-10 \mathrm{~mm}$. long in dense racemes; calyx sparingly black-strigose; leaflets II-15, oval, $8-15 \mathrm{~mm}$. long, acute at both ends; pod ellipsoid, somewhat flattened on the dorsal side, finely black-strigose, obtuse, 7 -10 mm. long. River valleys, from W. Neb. to Wyo. and Colo. JuneAug.
22. Astragalus Robbínsii (Oakes) A. Gray. Robbins' Milk Vetch. (I. F. f. 2146 .) Glabrous or nearly so, erect, slender, $2.5-4.5 \mathrm{dm}$. high. Stipules ovateoblong, membranous, 4-6 mm. long; leaflets $9-25$, oblong, obtuse or slightly emarginate, 9-17 mm. long; flowers $6-11 \mathrm{~mm}$. long in loose racemes; pod much flattened, oblong, short-stipitate, rather abruptly pointed at each end, membranous, finely blackish-pubescent, dehiscent, nearly straight, $18-25 \mathrm{~mm}$. long. In rocky places, Vt. and N. H. June-July.
23. Astragalus alpìnus L. Alpine Milk Vetch. (I. F. f. 2147.) Ascending or decumbent, I.5-4 dm. high, slightly pubescent, or glabrous. Stipules ovate, foliaceous, 4-6 mm. long; leaflets 13-25, oval or elliptic, obtuse or retuse. 6-12 mm. long; flowers violet, the keel commonly darker, in short racemes; peduncles mostly exceeding the leaves; pod membranous, stipitate, pendent. dehiscent, rather densely black-pubescent, oblong, acute, somewhat inflated, about $I_{3}$ mm. long; calyx dark-pubescent. On rocks, N. N. Eng. to Newf. and Lab., west to Alaska and Br. Col., south in the Rocky Mts. to Colo. Also in northern Eurupe and Asia. June.

## 24. PHACA L.

Perennial herbs, similar to Astragalus, mostly with pinnate leaves, and racemed or spicate purplish or purple flowers. Pod much inflated, membranous in texture, strictly I-celled, neither of the sutures intruded. [Greek. Lentils.] A large genus, mainly of the north temperate zone. Besides the following, numerous other species occur in the western parts of N. Am.

Leaflets 7-21, oblong, elliptic or ovate ; flowers white.
Pod stalked; flowers slender-pedicelled.

1. P. Americana.
2. $P$. neglecta.

Pod sessile; flowers short-pedicelled.
3. P. longifolia.

Leaflet only I, or sometimes 3-5, very narrowly linear; flowers pink.
I. Phaca Americàna (Hook.) Rydberg. Arctic Milk Vetch. (I. F. f. 2148.) Erect, nearly simple, glabrous, 3-6 dm. high. Stipules foliaceous, ovateoblong, $4-12 \mathrm{~mm}$. long; leaflets $7-17,2-4 \mathrm{~cm}$. long; peduncles generally exceeding the leaves; flowers $16-19 \mathrm{~mm}$. long, in loose racemes; pedicels filiform, 13 mm . long in fruit; pod stipitate, $21-25 \mathrm{~mm}$. long, acute at each end, oblong, dehiscent at maturity, glabrous, shining. In wet rocky places, Quebec and arctic Am. to Br. Col. and Alaska, south in the Rocky Mts. to Colo. June-July.
2. Phaca neglécta T. \& G. Cooper’s Milk Vetch. (I. F. f. 2149.) Glabrous or nearly so, $3-6 \mathrm{dm}$. high. Stipules ovate, acute, 2-4 mm. long; leaflets 9-21, thin, oblong or elliptic, often minutely pubescent beneath, $16-25 \mathrm{~mm}$. long, obtuse or emarginate, narrowed at the base; flowers 11 I- 15 mm . long, in loose spikes; calyx pubescent with blackish hairs, its teeth subulate; pod sessile, the ventral suture somewhat intruded, ovoid, acute, glabrous, slightly furrowed along both sutures, $13-20 \mathrm{~mm}$. long. On banks and shores, Quebec to Minn. and Iowa. June-July.
3. Phaca longifòlia (Pursh) Nutt. Long-leaved Milk Vetch. (I. F. f. 2150 .) Erect, slender, finely canescent, 1.5-4.5 dm. high. Stipules subulate, rigid, those of the lower part of the stem connate; leaflet usually i, nearly terete, 2.5-10 cm . long, sometimes 3 or 5; flowers few, 6-II mm. long, in short loose racemes; peduncles shorter than the leaves; pod short-stalked, spotted, glabrous, ovoid, short-pointed, not furrowed, about 2.5 cm . long. In sandy soil, Neb. to Kans. and N. Mex. Leaves persistent. May-June.

## 25. HOMÁLOBUS Nutt.

Perennial herbs, with pinnate simple or pinnately $3-5$-foliolate leaves, and racemose mostly small flowers, the peduncles short or elongated. Keel of the corolla obtuse; pod flat, glabrous or pubescent, completely r.celled, few-several-seeded, the sutures both prominent externally. [Greek, regular-lobes.] Besides the following species, some 30 others occur in western N. Am.
Plants leafy-stemmed.
Leaves pinnate ; leaflets 9-23, thin.
Finely pubescent. blackening in drying ; pod straight.
Canescent, not blackening ; pod slightly curved.
Leaves pinnate ; leaflets $3-7$, rigid, very narrow, spiny.

1. H. tenellus.
2. H. aboriginum.
3. H. montanus.

Plant scapose ; leaves simple or pinnately 3 -5-foliolate, the leaflets very narrow.
4. H. caespitosus.
I. Homalobus tenéllus (Pursh) Britton. Loose-flowered Milk Vetch. (I. F. f. 215 I.) Finely pubescent or glabrate, 2.5-4.5 dm. high. Stipules broadly ovate, $3^{-6} \mathrm{~mm}$. long, the upper ones connate; leaflets oblong, linear-oblong or oblanceolate, obtuse, narrowed at the base, 13-2I mm. long; flowers yellowish-white, $6-9 \mathrm{~mm}$. long, in loose spike-like racemes; pod stalked, straight, oblong, acute at each end, papery, glabrous, $13-17 \mathrm{~mm}$. long. Dry soil, S. Dak., Neb. and Colo. to Cal., the N. W. Terr. and Br. Col. May-Aug.
2. Homalobus aboriginum (Richards.) Rydberg. Indian Milk Vetch. (I. F. f. 2145.) Finely canescent, 2-5 dm. high. Stipules ovate, acute, 4-6 mm. long; leaflets 9-13, linear or oblong, $\mathbf{1 2 - 2 1 ~ m m}$. long; flowers 9-II mm. long, in rather loose racemes; peduncles longer than the leaves; pod compressed, oval in section, half-elliptic, long-stipitate, acute at each end; calyx blackish-pubescent, its teeth subulate. S. Dak. to Manitoba, the N. W. Terr. and Colo. [Astragalus aboriginum Richards.] May-June.
3. Homalobus montànus (Nutt.) Britton. Prickly Milk Vetch. (I. F. f. 2152.) Densely tufted, intricately branched, $5-25 \mathrm{~cm}$. high, finely canescent. Stipules linear-lanceolate, spiny-tipped, 4-II mm . long; leaflets linear, widely spreading, $6-13 \mathrm{~mm}$. long; flowers $1-4$ together in the axils, nearly sessile, yellowish white or bluish-tinged, 4-6 mm . long; pod sessile or short-stalked, I-3-seeded, ovoid-oblong, acute, coriaceous, dehiscent, pubescent, 6-9 mm. long. In dry, rocky places, Neb. to N. Mex., Nev. and the N. W. Terr. June-Sept.
4. Homalobus caespitòsus Nutt. Tufted Milk Vetch. (I. F. f. 2153.) Silvery-canescent, tufted from a deep root, $7-15 \mathrm{~cm}$. high. Stipules scarious, imbricated, lanceolate, acuminate, $8-12 \mathrm{~mm}$. long; leaves simple, spatulate-linear, $2.5-5 \mathrm{~cm}$. long, or some of them 3-5-foliolate, with oblong-linear leaflets; peduncles scapiform; flowers purple, 9-II mm. long, in short spike-like racemes; pod erect, sessile, few-seeded, oblong, acute, coriaceous, slightly curved, pubescent, 9-II mm. long; calyx-teeth subulate. In dry rocky soil, Neb. and Colo. to the N. W. Terr. May-July.

## 26. ORÓPHACA Britton.

Perennial, silvery or villous-pubescent low tufted herbs, with branched woody caudices, deep roots, membranous scarious stipules, sheathing and united below, and digitately 3 -foliolate (rarely 5 -foliolate) leaves, resembling those of Lupines. Flowers few, capitate or racemose, the clusters sessile or peduncled. Keel of the corolla blunt. Pod coriaceous, completely I-celled, ovoid or oval, few-seeded, villous, partly or wholly enclosed by the calyx. [Greek, mountain vetch.] Three known species, the following, and one in Colo. and Wyo.
$\begin{array}{ll}\text { Flowers yellowish, } 1-3 \text { together in the axils. } & \text { 1. O. caespitosa. } \\ \text { Flowers blue-purple, in peduncled racemes. } & \text { 2. O. serzcea. }\end{array}$
i. Orophaca caespitòsa (Nutt.) Britton. Sessile-flowered Milk Vetch. (I. F. f. 2154.) Silvery-canescent, $5-10 \mathrm{~cm}$. high. Stipules imbricated, glabrous, ovate-lanceolate, $6-9 \mathrm{~mm}$. long; leaves digitately $3-5$-foliolate, slender-petioled; leaflets oblong or oblanceolate, narrowed or cuneate at the base, $13-17 \mathrm{~mm}$. long; flowers $13-17 \mathrm{~mm}$. long, sessile; pod sessile, ovoid, acute or acuminate, coriaceous, dehiscent, enclosed by the calyx, 4-6 mm. long. Plains, Kans, to S. Dak., Mont. and the N. W. Terr. May-July.
2. Orophaca serícea (Nutt.) Britton. Hoary Milk Vetch. (I. F. f. 2155.) Villous-pubescent, spreading on the ground, the stems $8-10 \mathrm{~cm}$. long. Leaves short-petioled, 3 -foliolate; leaflets oblong or oblanceolate, narrowed or cuneate at the base, 4 -II mm. long; peduncles 2-6-flowered; flowers about 6 mm . long; pod sessile, ovoid-oblong, coriaceous, acute, about 6 mm . long, partly enclosed by the calyx. In dry, sandy or rocky places, Neb. and Colo. May-July.

## 27. ARAGÀLLUS Neck. [Spiesia Neck.]

Herbs, sometimes shrubby, and mostly acaulescent, with odd-pinnate leaves, and racemose or spicate flowers. Calyx-teeth nearly equal. Petals clawed; standard erect, ovate or oblong; wings oblong; keel erect, shorter than or equalling the wings, its apex mucronate, acuminate or appendaged; stamens diadelphous; style filiform. Pod sessile or stipitate, 2-valved, 1-celled, or more or less 2-celled by the intrusion of the ventral suture. About 120 species of the north temperate zone. In addition to the following, some II others occur in western N. Am.

## Leaves simply pinnate.

Plants $2.5-10 \mathrm{~cm}$. high ; heads few-flowered.
Pods membranous, pubescent, much inflated, r-celled. I. A. inflatus.
Pod coriaceous, ovoid, little inflated, pubescent, partly 2 -celled.
Calyx gray-pubescent ; leaflets $7-9$, oblong.
2. A. multiceps.

Calyx dark-pubescent; leaflets 7-21, linear. 3. A. arcticus.
Plants 1.5-4.5 dm. high; heads or spike-like racemes many-flowered.
Flowers $17-19 \mathrm{~mm}$. long ; pods papery.
Calyx black-hirsute; pod about Icm . long. 4. A. campestris.
Calyx finely pubescent; pod $15-20 \mathrm{~mm}$. long.
Flowers $19-30 \mathrm{~mm}$. long; pods coriaceous.
Leaflets linear or linear-lanceolate, slightly silky.
Leaflets oblong or broadly lanceolate, densely silky.
5. A. Johannensis.
6. A. Lambertiz.
7. A. sericeus.

Leaves pinnate, the leaflets verticillate.
Pod scarcely longer than the calyx, its tip spreading. \&. A. splendens.
Pod $2-3$ times as long as the calyx, its tip erect.
9. A. Belliii.
I. Aragallus inflàtus (Hook.) A. Nelson. Inflaten Oxytrupe. (I. F. f. 2156.) Acaulescent or nearly so, villous pubescent. much tufted, $2-10 \mathrm{~cm}$. high. Stipules membranous, imbricated, adnate to the petiole. lancolate, about +mm . long; leaflets $9-2 \mathbf{1}$, linear, $4^{-8} \mathrm{~mm}$. long, about 1 mm . wide, obtuse or obtusish;
peduncles 1-2-flowered, scarcely exceeding the leaves; flowers violet, $14-17 \mathrm{~mm}$. long; calyx densely dark-pubescent; pod I-celled, ovoid, short-stalked or sessile, about 18 mm . long, pointed; ventral-suture slightly intruded. Lab. and arctic Am., south in the Rocky Mts. to Colo. Summer. [Spiesia inflata (Hook.) Britton.]
2. Aragallus múlticeps (Nutt.) Heller. Tufted Oxytrope. (I. F. f. 2157.) Nearly acaulescent, tufted and matted, silky-canescent, 8 cm . high or less. Stipules membranous, acute, adnate to the petiole; leaflets oblong, $6-12 \mathrm{~mm}$. long, $2-4 \mathrm{~mm}$. wide; scape I-3-flowered; flowers purple, nearly 2.5 cm . long; calyx slightly pubescent, its teeth short; pod short-stalked, coriaceous, about ${ }^{1} 3 \mathrm{~mm}$. long, acute, enclosed by the swollen calyx. W. Neb., Wyo. and Colo. Summer. [Spiesia multiceps (Nutt.) Kuntze.]
3. Aragallus àrcticus (R. Br.) Greene. Arctic Oxytrope. (I. F.f. 2158 .) Acaulescent, tufted, villous-pubescent, $2-1 \mathrm{c} \mathrm{cm}$. high. Stipules membranous, lanceolate, imbricated, pubescent; leaflets linear or linear-oblong, obtusish, 4-6 mm . long; peduncles exceeding the leaves, $2-5$-flowered; flowers violet (?), 13-21 mm. long; pod coriaceous, little inflated, oblong or ovoid-oblong, sessile, pubescent. Shores of the Gulf of St. Lawrence, Hudson Strait, and along the Arctic seacoast. Summer. [Spiesia arctica (R. Br.) Kuntze.]
4. Aragallus campéstris (L.) Greene. Yellow Oxytrope. (I. F. f. 2159.) Acaulescent or nearly so, much tufted, sparingly pubescent or glabrate, $\mathrm{I}-3 \mathrm{dm}$. high. Stipules membranous, lanceolate, acuminate, imbricated, $6-9 \mathrm{~mm}$. long; leaves $8-15 \mathrm{~cm}$. long; leaflets $13-23$, linear-lanceolate or oblong, rounded at the base, sessile, $8-13 \mathrm{~mm}$. long; peduncles generally exceeding the leaves; flowers several or numerous in short spikes, white, yellowish-white or blue; pods sessile, ovoid or oblong, blackish-pubescent, acuminate with the subulate style. In rocky places, Lab. and Hudson Strait. Also in Europe. Summer. All American specimens belong to the var. carulea, with bluish flowers. [Spiesia campestris (L.) Kuntze.]
5. Aragallus Johannénsis (Fernald) Rydberg. St. John's Oxytrope. Like the preceding, but larger, $1.5-3.5 \mathrm{dm}$. high, sparingly silky, especially the large scarious stipules; leaves $2-3 \mathrm{dm}$. long; leaflets $17-27$, oblong or lanceolate, $2-3 \mathrm{~cm}$. long; spike of about 12 rose-colored flowers, elongated, especially in fruit; pod sessile, cylindric, acute, sparingly white-silky; dorsal suture less intruded than in A. campestris. Gravelly beaches of St. John and other rivers of Me., N. B. and Quebec. June-July. [Oxytropis campestris var. Fohannensis Fernald.]
6. Aragallus Lámbertii (Pursh) Greene. Stemless Loco-weed or Crazyweed. Colorado Loco-vetch. (I. F. f. 216o.) Sparingly silky-pubescent, acaulescent or nearly so. Stipules imbricated, membranous, pubescent, lanceolate, acute or acuminate, $9-15 \mathrm{~mm}$. long; leaves $10-23 \mathrm{~cm}$. long; leaflets $9-19$, 17-19 mm. long; peduncles longer than the leaves; flowers purple or purplish, seldom yellowish, in dense heads; pod incompletely 2 -celled, sessile, erect, ovoid-
 calyx. Plains, Minn. to the N. W. Terr., Br. Col., Tex. and N. Mex. AprilAug. [Spiesia Lambertii (Pursh) Kuntze.]
7. Aragallus seríceus (Nutt.) Greene. Silvery Loco-weed. Densely silky throughout, stout, acaulescent. Stipules membranous, very silky, broadly ovate, $1-2 \mathrm{~cm}$. long; leaflets $9-17,15-30 \mathrm{~mm}$. long and $5-10 \mathrm{~mm}$. wide; peduncles stout; bracts ovate, acuminate; flowers pink purple; pod as in A. Lambertii, but larger and densely silky. W. Neb. to Utah, Ore. and Saskatch. June-Aug. [Spiesia Lambertii sericea (Nutt.) Rydberg.]
8. Aragallus spléndens (Dougl.) Greene. Showy Oxytrope. (I. F. f. 216I.) Densely silvery and silky-villous, acaulescent. Stipules imbricated, membranous, villous-pubescent, lanceolate, acute, $9-13 \mathrm{~mm}$. long; leaves $\mathbf{I}-2.5 \mathrm{dm}$. long, erect; leaflets numerous, in verticils of $3-6$, oblong or oblong-lanceolate, acute or acutish, 13-2I mm. long; peduncles exceeding the leaves, sometimes 3 dm . long; flowers deep purple, about 12 mm . long, in dense spikes; pods ovoid, erect, 2 -celled or nearly so, long acuminate with a spreading or oblique tip, villouspubescent, $13-19 \mathrm{~mm}$. long. Plains, Minn. and Manitoba to the N. W. Terr., Colo. and N. Mex. June-Aug. [Spiesia splendens (Dougl.) Kuntze.)
9. Aragallus Béllii (Britton) Greene. (I. F. f. 2162.) Acaulescent, loosely
villous with white hairs. Stipules membranous, ovate or oblong, acute or acuminate, imbricated, II-I5 mm. long; leaves $7-15 \mathrm{~cm}$. long; leaflets oblong or oblong lanceolate, subacute, rounded at the base, 6-9 mm. long, in verticils of 3 or 4; peduncles about equalling the leaves; inflorescence capitate; calyx black-pubescent; pod oblong, erect-spreading, densely pubescent with black hairs or some longer whitish ones intermixed, about 19 mm . long, very nearly or quite 2 -celled by the intrusion of the ventral suture, the tip erect. Hudson Bay. Summer. [Spiesia Bellii Britton.]

## 28. GLYCYRRHİZA L.

Perennial herbs, with thick sweet roots, odd-pinnate leaves, and spicate or capitate flowers. Calyx-teeth nearly equal. Standard narrowly ovate or oblong, short-clawed; wings oblong, acutish; keel acute or obtuse, shorter than the wings. Stamens mainly diadelphous; anthers alternately smaller and larger. Pod sessile, covered with prickles or glands, nearly indehiscent, continuous between the seeds. [Greek, sweet-root.] About 15 species, natives of the north temperate zone, southern S. Am. and Australia. The following is the only N. Am. species.
I. Glycyrrhiza lepidòta Pursh. Wild Liquorice. (I. F. f. 2163.) Erect, 3-9 dm. high, the foliage with minute scales or dots. Stipules lanceolate or ovatelanceolate, acute, 2-3 mm. long, deciduous; leaves petioled; leaflets II-I9, lanceolate or oblong, entire, very short-stalked, $2-3.5 \mathrm{~cm}$. long; peduncles axillary, shorter than the leaves; spikes many-flowered $2.5-5 \mathrm{~cm}$. long ; flowers yellowishwhite, 13 mm . long; calyx-teeth slender, longer than the tube; pod about 13 mm . long, few-seeded, oblong. Fort Erie, Ont.; Hudson Bay to Manitoba and Minn., Wash., Iowa, Mo., Chihuahua and Cal. May-Aug.
29. CORONÍLLA L.

Herbs, with odd-pinnate leaves, and purple purplish or yellow flowers, in peduncled heads or umbels. Calyx-teeth nearly equal, the 2 upper more or less united. Petals clawed; standard nearly orbicular; wings oblong or obliquely obovate; keel incurved, beaked. Stamens diadelphous ( 9 and 1) ; anthers all alike. Pod jointed. [Diminutive of corona, crown.] About 25 species, natives of Europe, Asia and northern Africa.
I. Coronilla vària L. Coronilla. Axseed. Axwort. (I. F. f. 2164.) Perennial, straggling or ascending, glabrous, 3-6 dm. long. Leaves sessile; leaflets $11-25$, oblong or obovate, obtuse and mucronate at the apex, $1_{3}-19 \mathrm{~mm}$. long; peduncles longer than the leaves; flowers $9-\mathbf{1} 3 \mathrm{~mm}$. long, in dense umbels; standard pink; wings white or purple-tipped; pod coriaceous, linear, 4 -angled, the joints 6-9 mm. long. Roadsides and waste places, Mass. to N. Y. and N. J. Adventive or nat. from Europe. June-Aug.

## 30. HEDÝSARUM L.

Perennial herbs, with odd-pinnate leaves, and showy flowers in axillary peduncled racemes. Calyx bracteolate, its teeth nearly equal. Standard ovate or obcordate, narrowed at the base; wings oblong, shorter than the standard; keel longer than the wings, obtuse, obliquely truncate. Stamens diadclphous ( 9 and I ). Pod flat, linear, its joints oval, orbicular or quadrate. [Greek, sweet-broom.] About 60 species, natives of the north temperate zone and northern Africa. Besides the following, another occurs in northwestern N. Am.

$$
\begin{array}{ll}
\text { Calyx-teeth ovate, acute, shorter than the tube. } & \text { 1. H. Americanum. } \\
\text { Calyx-teeth subulate, acuminate, longer than the tube. } & \text { 2. H. Mackensii. }
\end{array}
$$

1. Hedysarum Americànum (Michx.) Britton. Hedysarum. (I. F. f. 2165.) Stem glabrous or nearly so, $\mathbf{1} .5-7.5 \mathrm{dm}$. high. Leaves short-petioled; stipules lanceolate, long-acuminate, 4-17 mm. long; leaflets 11-21, oblong or oblanceolate, obtuse and often mucronulate, mostly rounded at the hase, 13-20 mm. long; racemes longer than the leaves; flowers violet-purple, or sometimes white. numerous, deflexed, $15-20 \mathrm{~mm}$. long, in loose elongated racemes; pod $\mathrm{r} .3-4 \mathrm{~cm}$. long, drooping, of 3-5 oval or orbicular nearly glabrous strongly reticulated joints. In rocky places, northem N. Eng. to Newt., Maskar and br. Col., south in the Rocky Mts. to Utah and in the Black Hills. June-July.
2. Hedysarum Mackénzii Richards. Mackenzie's Hedysarum. (I. F. f. 2166.) Similar to the preceding, but usually minutely pubescent; stem 3-7.5 dm. high. Leaflets II-I9; flowers slightly larger, violet-purple, deflexed; calyx-teeth longer than the tube, or equalling it; pod minutely pubescent, 3-8-jointed. Hudson Bay (according to Macoun); N. W. Terr. to Alaska, south to Colo. Súmmer.

## 3r. AESCHYNÓMENE L.

Herbs, or in tropical regions shrubs, mainly with odd-pinnate leaves, and yellow flowers in axillary clusters. Calyx-teeth nearly equal, more or less united into 2 lips. Standard orbicular, short-clawed; wings oblong or obliquely obovate, about as long as the standard; keel curved. Stamens diadelphous (5 and 5); anthers all alike. Qvary stipitate; ovules $2-\infty$. Pod stalked, flat, jointed. [Greek, to be ashamed, referring to the sensitive leaves.]. About 55 species, in warm and tropical regions. Besides the following, I occurs in the Southern States.
I. Aeschynomene Virgınica (L.) B. S. P. Sensitive Joint Vetch. (I. F. f. 2167.) Annual, rough-pubescent or glabrate, 6-15 dm. high. Stipules membranous, ovate, acuminate, 4-9 mm. long, deciduous; leaves short-petioled; leaflets $25-55$, oblong, linear-oblong or oblanceolate, obtuse, $6-18 \mathrm{~mm}$. long, somewhat sensitive; flowers few, reddish-yellow, about II mm. long; petals veined; pod linear, $2.5-6 \mathrm{~cm}$. long, sparingly tuberculate or glabrous, of 5-10 nearly square easily separable joints. River banks, Penn. and N. J. to Fla., west to La. Aug.-Sept.

## 32. STYLOSÁNTHES Sw.

Perennial herbs, mainly with villous or viscid pubescence, 3 -foliolate leaves, and yellow terminal or axillary spicate or capitate flowers. Calyx-tube campanulate, its teeth membranous, the 4 upper ones more or less united. Petals and stamens inserted at or near the summit of the tube; standard orbicular; wings oblong; keel curved, beaked. Stamens monadelphous; anthers alternately longer and shorter. Ovary nearly sessile; ovules 2 or 3 ; style filiform. Pod sessile, flattened, I-2-jointed, reticulate, dehiscent at the summit. [Greek, column-flower, alluding to the column-like calyx-tube.] About 25 species, of warm and temperate regions. Besides the following, another occurs in the Southern States.
Leaves oblong-linear to oblanceolate ; floral bracts entire. r. S. biflora.
Leaves elliptic to obovate; floral bracts deeply cleft. 2. S. riparia.
I. Stylosanthes bifiòra (L.) B. S. P. Pencil-flower. (I. F. f. 2168.) Stems wiry, villous-pubescent or glabrate, I.5-6 dm. long. Stipules sheathing, linear-filiform above; leaves short-petioled; leaflets acute or acutish and mucronate, 12-36 mm. long, strongly veined, the terminal one stalked; flowers few, mainly terminal, sessile or nearly so, ciliate-bracted, 6-9 mm. long; pod obovate or suborbicular, pubescent, about 4 mm . long, of I perfect and I abortive joint. In dry soil, N. Y. to Fla., Ind., Kans. and La. June-Sept.
2. Stylosanthes ripària Kearney. Decumbent Pencil-flower. (I. F. f. 2168a.) Stems $1-3 \mathrm{~cm}$. long, usually with a tomentose line on the elongated internodes. Stipules subulate above; petioles pubescent; leaflets elliptic to obovatecuneate, the terminal one $10-18 \mathrm{~mm}$. long, the lateral ones somewhat smaller; spikes terminal, about 6 -flowered, with only I or 2 perfect flowers: calyx-tube conspicuously veined; vexillum proportionately longer than in S. biflora; upper segment of the pod nearly twice as broad as in S. biflora. In dry woods, Va. and W. Va. to Ala. and Tenn. May-Aug.
33. ZÓRNIA Gmel.

Herbs, with digitately 4 -foliolate or 2 -foliolate petioled leaves, the leaflets not stipellate, the stipules sagittate. Flowers yellow in our species, small, interruptedly spicate, large-bracted, sessile, rarely solitary, the spikes peduncled. Bracts 2 together, nearly enclosing the flower. Calyx 2-lipped, 5-lobed. Standard nearly orbicular, clawed; wings oblique; keel incurved. Stamens monadelphous; anthers alternately longer and shorter. Ovary sessile; ovules several; style very slender. Loment flat, several-jointed. [In honor of Johann Zorn, a German apothecary.] About 12 species, all natives of America. Besides the following, another occurs in the Southwestern States.
I. Zornia bracteàta (Walt.) Gmel. Zornia. (I. F. f. 2169.) Perennial by a long woody root, glabrous or sparingly finely pubescent; stems wiry, prostrate, 3-6 dm. long. Stipules about 6 mm . long; petioles $12-25 \mathrm{~mm}$. long; leaflets 4 , oblong, lanceolate or oblong-obovate, acute at both ends, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long, or those of the lower leaves obtuse and shorter; peduncles longer than the petioles; spikes several-flowered, much interrupted in fruit, $5-10 \mathrm{~cm}$. long; bracts ovate or broadly oval, acute or acutish; pod $3-5$-jointed, the joints oval, $3-5 \mathrm{~cm}$. long, densely spinulose. In dry sandy soil, Va. to Fla., Tex. and Mex. May-Aug.

Arachis hypogaèa L., the Pea-nut is occasionally seen as a waif, not permanently established.

## 34. MEibòmia Heist.

Perennial herbs, sometimes woody at the base, with stipellate 3 -foliolate or in some species I- or 5 -foliolate leaves, and usually small flowers in racemes or panicles. Calyx-tube short, its teeth more or less united into 2 lips, the upper one 2 -toothed, the 3 lower teeth acute or attenuate. Standard oblong, ovate or orbicular, narrowed or rarely clawed at the base; wings obliquely oblong; keel nearly straight, obtuse. Stamens monadelphous or diadelphous (9 and 1); anthers all alike. Ovules $2-\infty$. Loment flat, several-jointed, the joints mainly coriaceous and pubescent or muricate, indehiscent or rarely partially dehiscent, readily separable. [Named for Dr. Brandus Meibom; died at Helmstadt, 1740.] About 160 species, natives of warm and temperate regions. Besides the following, about 20 others occur in the Southern and Southwestern States.

* Loment not constricted above, deeply constricted below, long-stalked; leaflets broad. Panicle arising from the base of the plant; peduncle usually leafless. 1. M. nudifora.

Fanicle terminal; leaves crowded at its base.
leaves scattered along the stem.
2. M. grandiflora.
3. M. pauciflora.

## ** Loment constricted on both margins, more deeply below than above.

$\dagger$ Stems trailing or reclining.
Leaflets orbicular or nearly so.
Leaflets 2.5 cm . long or less, glabrate, coriaceous. 4. M. arenicola.
Leaflets $2.5-6 \mathrm{~cm}$. long, thinnish, usually quite pubescent.
5. M. Michauxiz. Leaflets ovate or oval.

Corolla whitish; leaves yellowish-green ; stipules broadly ovate.

Corolla purple ; leaves dull-green ; stipules subulate.
$\dagger \dagger$ Stems erect or ascending.
Leaves sessile or nearly so; leaflets linear or lanceolate. Leaves petioled.

Leaflets narrowly linear; joints of the loment usually concave on the back. 9. $M$. stricta.

Leaflets broad (except in M. paniculata Chapmani).
I. Joints of the loment notably longer than broad.

Leaflets obtuse, rough-pubescent, yellowish green. 1о. M. canescens. Leaflets long-acuminate, scabrate above, slightly villous beneath.
11. M. Iongifolia.

Leaflets long-acuminate, glabrous, glaucous beneath. 12. M. bracteosa.
2. Joints of the loment little longer than broad.
(a) Loment distinctly long-stalked in the calyx.

Plants glabrous or nearly so (except in M. paniculata pubens).
Leaflets lanceolate or oblong. 13. M. paniculata.
Leaflets broadly ovate or oval, glaucous beneath.
14. M. laevigata.

Plants pubescent or scabrous.
Leaflets thick, coriaceous, villous and reticulated beneath.
15. M. thombifolia. velvety-pubescent beneath.
16. M. viridifora.

Leaflets scarcely coriaceous, appressed-pubescent or villous beneath.
17. M. Dillenit.
(b) Loment sessile in the calyx or nearly so.

Loment-joints 4-7 ; flowers numerous, showy.
Leaflets coriaceous, strongly reticulated beneath.
18. M. Illmbensis.

Leaflets not coriaceous, scarcely reticulated beneath; loments numerous.

## Loment-joints 1-3.

Leaflets scabrous, $2-5 \mathrm{~cm}$. long. 20. M. rigida.
Leaflets not scabrous, $1-2 \mathrm{~cm}$. long. Plant nearly glabrous throughout. 21. M. Marylandica. Stem pubescent ; leaflets and petioles ciliate.
22. M. obtusa.
I. Meibomia nudifiòra (L.) Kuntze. Naked-flowered Tick-trefoll. (I. F. f. 2170 .) Slender, the leaves clustered at the summit of the sterile stems; peduncle leafless or rarely with I or 2 leaves; stipules subulate, deciduous; petioles $2.5-10 \mathrm{~cm}$. long; leaflets oval or ovate, glabrous or slightly pubescent, pale beneath, $2.5-8 \mathrm{~cm}$. long, the terminal one rhomboid, the others inequilateral; panicle narrow, few-flowered; flowers rose-purple, $6-11 \mathrm{~mm}$. long; calyx-teeth obtuse, the lowest one largest; loment 2-3-jointed, the joints longer than wide, straight or concave on the back, obliquely semi-rhomboidal, pubescent with uncinate hairs, the sutures glabrous. In dry woods, Quebec to Minn., Fla. and La. July-Aug.
2. Meibomia grandiflòra (Walt.) Kuntze. Pointed-leaved Tick-trefoil. (I. F. f. 217 I.) Erect, glabrous or somewhat pubescent, 3-15 dm. high. Petioles 6-12 mm. long; stipules subulate, generally persistent; leaflets ovate acuminate, $5-15 \mathrm{~cm}$. long, pubescent with scattered hairs; panicle ample; flowers large, rosepurple; loment $2-3$-jointed; joints longer than wide, concave above, obliquely rounded below, uncinate-pubescent. In dry or rocky woods, Quebec to S. Dak., Fla., Neb. and the Ind. Terr. June-Sept.
3. Meibomia paucifìra (Nutt.) Kuntze. Few-flowered Tick-trefoil. (I. F. f. 2172.) Decumbent or ascending, pubescent with scattered hairs, 3-9 dm. long. Stipules subulate, deciduous; leaves alternate, distant, petioled; leaflets ovate, pubescent, $2 \cdot 5-8 \mathrm{~cm}$. long, the terminal one rhomboid; racemes simple, fewflowered; calyx-lobes acute, ciliate; corolla white (?), about 6 mm . long; loment $\mathrm{I}-$ 4 -jointed, the joints concave or straight on the back, obliquely rounded below, uncinate-pubescent. In woods, Ont. ?; W. N. Y. to Fla., Ohio, Ark. and La. July-Aug.
4. Meibomia arenícola Vail. Sand Tick-trefoil. (I. F. f. 2173.) Decumbent or prostrate, pubescent or glabrate, slender, 3-6 dm. long. Stipules subulate, persistent; petioles about 12 mm . long; leaflets ovate-orbicular, glabrous or nearly so, coriaceous, reticulate-veined; racemes elongated, usually pubescent; flowers purple, $4-6 \mathrm{~mm}$. long; pedicels slender; loment small, $2-4$-jointed, the joints uncinate-pubescent, less convex above than below, $3-5 \mathrm{~mm}$. long; stipe about equalling the calyx-lobes. In dry woods, Md. to Fla., west to La. July-Sept.
5. Meibomia Michàuxii Vail. Prostrate Tick trefoll. (I. F. f. 2174.) Prostrate, $6-18 \mathrm{dm}$. long, softly pubescent or densely villous. Stipules ovate or triangular-ovate, persistent, acuminate, somewhat cordate, ciliate; leaflets nearly orbicular; panicles loose; flowers purple, 6-II mm. long; calyx-lobes ciliate; loment 2.5 cm . long or more, $3-5$-jointed; joints obliquely rhomboid below, slightly convex above, uncinate-pubescent; stipe equalling or longer than the calyx-lobes. Dry woods, Me. and Ont. to Minn., Fla. and La. July-Sept.
6. Meibomia ochroleùca (M. A. Curtis) Kuntze. Cream-flowered Ticktreforl. (I. F. f. 2175.) Procumbent or decumbent, hirsute, 3-9 dm. long. Stipules persistent, cordate; petioles $1.3-3.5 \mathrm{~cm}$. long; leaflets recticulate-veined and somewhat scabrous beneath, $1.7-5 \mathrm{~cm}$. long, the terminal one rhomboid, the lateral obliquely ovate, smaller or sometimes wanting; racemes simple; loment $2-3$-jointed, the joints slightly more convex below than above, twisted, oval, pale green, glabrous except the uncinate pubescent sutures; stipe about as long as the calyx-lobes. In woodlands, N. J. to Ga. and Mo. Aug.-Sept.
7. Meibomia glabélla (Michx.) Kuntze. Trailing Tick-trefoil. (I. F. f. 2176.) Procumbent, glabrous or nearly so; stem sometimes 2.4 m . long. Leaflets obtuse, glabrous or sparingly pubescent above, pale beneath, $2.5-6 \mathrm{~cm}$. long, the terminal one slightly rhomboid; racemes panicled; loment 3 - 5 -jointed, the joints obliquely semi-rhomboid, less convex above than below; stipe about 4 mm . long. In dry sandy woods, E. Mass. to N. Y., Penn. and S. Car. Aug.-Sept.
8. Meibomia sessilifòlia (Torr.) Kuntze. Sessile-leaved Tick-trefoll.
(I. F. f. 2177.) Erect, 6-12 dm. high, uncinate-pubescent. Stipules small, deciduous; leaflets obtuse at each end, nearly glabrous above, reticulate-veined and pubescent beneath, $2-8 \mathrm{~cm}$. long; flowers $4-6 \mathrm{~mm}$. long; loment $\mathrm{I}-3$-jointed, the joints about 4 mm . long, obliquely obovate, hispid, somewhat twisted, less convex above than below; stipe not exceeding the calyx-lobes. In dry soil, Mass., R. I. and Conn. to Mich., Ky., Ark. and Tex. July-Sept.
9. Meibomia strícta (Pursh) Kuntze. Stiff Tick-trefoil. (I. F. f. 2178. ) Erect, slender, finely pubescent, 6-12 dm. high. Stipules subulate, deciduous; leaves petioled; leaflets obtuse, glabrous, thick, reticulate-veined, $2.5-6 \mathrm{~cm}$. long, about 6 mm . wide; flowers $2-4 \mathrm{~mm}$. long; loment small, $\mathbf{I}-3$-jointed; joints semiobovate or semi-rhomboid, uncinate-pubescent, about 4 mm . long; stipe about equalling the calyx-lobes. Pine barrens of N. J. to Fla., west to La. July-Sept.
10. Meibomia canéscens (L.) Kuntze. Hoary Tick-trefoil. (I. F. f. 2179.) Erect, densely pubescent, 1-1.7 m. high. Stipules ovate, acuminate, somewhat cordate, persistent; leaflets ovate, $\mathbf{I} .5-10 \mathrm{~cm}$. long, scabrous above, pubescent beneath, ciliate, the terminal one commonly rhomboid and larger than the lateral ones; racemes compound; flowers $4-5 \mathrm{~mm}$. long; loment $4^{-6 \text {-jointed, }}$ joints longer than wide, unequally rhomboid, $9-13 \mathrm{~mm}$. long; stipe about equalling the upper lobe of the calyx. In rich soil, Ont. to Mass., Fla., Minn. and Tex. July-Sept.

Meibomia canéscens hirsùta (Hook.) Vail. Stem and branches more densely villous-pubescent ; leaflets narrower. Mo.
11. Meibomia longifòlia (T. \& G.) Vail. Long-leaved Tick-trefoil. (I. F. f. 2180 .) Erect, $6-15 \mathrm{dm}$. high, the angled stems and panicle minutely pubescent. Stipules lanceolate-setaceous; leaflets $5-12 \mathrm{~cm}$. long, lanceolate-ovate or ovate, scabrate above, lighter, appressed-pubescent or villous beneath; flowers showy, purple; loment $2.5-8 \mathrm{~cm}$. long, 4-6-jointed, the joints triangular-oblong or lozenge-shaped, unicinate-pubescent throughout; stipe about the length of the calyx-lobes. In rich soil and low woods, Ill. to La. and Ala. June-Sept.
12. Meibomia bracteòsa (Michx.) Kuntze. Large-bracted Tick-trefoil. (I. F. f. 2181.) Erect, 9-18 dm, high, glabrous or nearly so below, the panicle finely pubescent. Stipules lanceolate, cuspidate, somewhat cordate; leaflets $5-20 \mathrm{~cm}$. long, ovate or ovate-lanceolate; flowers purple, $9-11 \mathrm{~mm}$. long; bracts cuspidate, striate, deciduous; loment $2.5-8 \mathrm{~cm}$. long, $3-7$-jointed, the joints ob. liquely oblong, about twice as long as wide, uncinate-pubescent; stipe about the length of the lower calyx-lobes. In thickets, Me. to Ont., Fla., Mo. and Tex. Aug.-Sept.
13. Meibomia paniculàta (L.) Kuntze. Panicled Tick-treforl. (I. F. f. 2182.) Erect, slender, 6-12 dm. high. Stipules small, subulate; leaflets oblonglanceolate or linear-lanceolate, obtuse, $2.5-5 \mathrm{~cm}$. long; racemes compound; flowers purple, $6-9 \mathrm{~mm}$. long ; loment 2.5 cm . long or more, $4-6$ jointed, the joints obliquely triangular or rhomboid, minutely uncinate-pubescent; stipe nearly equalling the lower lobes of the calyx. In dry soil, Ont. to Minn., Mass., Fla. and Tex. July-Sept.

Meibomia paniculàta Chápmaní Britton. More slender; leaflets linear. Intermediate forms also occur. In dry, sandy soil, Va. to Fla., Ky. and Tex.

Meibomia paniculàta pùbens (T. \& G.) Vail. Stems puberulent ; leaflets coriaceous when old, oblong-lanceolate, sometimes scabrous above, pubescent beneath ; lomentjoints strongly angled on the back. In sandy soil, Va. to Fla., the Ind. Terr. and Tex.
14. Meibomia laevigàta (Nutt.) Kuntze. Smooth Tick-trefoil. (I. F. f. 2183.) Stem terete, glaucous, erect or ascending, 6-12 dm. high. glabrous; stipules subulate, deciduous; petioles $2.5-5 \mathrm{~cm}$. long, leaflets ovate, acutish, the terminal one more or less rhomboid; racemes compound, slightly pubescent; bracts deciduous; calyx scabrous; flowers pink, $11-13 \mathrm{~mm}$. long; loment $3-4$-jointed, the joints triangular, angled on the back, uncinate-pubescent; stipe $4^{-6} \mathrm{~mm}$. long. In dry woods, S. N. Y. to Fla., Mo. and Tex. Aug.-Sept.
15. Meibomia rhombifolia (Ell.) Vail. Rhomb-lifiven Tick-trfforl. (I. F. f. 2184.) Erect or ascending, 6-9 dm. high or more, uncinate pubescent. Stipules subulate, taper-pointed; leaflets ovate, often mucronulate, scabrous above. villous and reticulated beneath, 5-9 cm. long, the terminal rhomboid, the lateral
ones often wanting; racemes elongated, usually leafless; bracts minute; loment 25 -jointed, the joints obliquely semi-rhomboid, rounded on the back, uncinate- pubescent; stipe often as long as the lowest joint. In sandy soil and pine lands, Va. to Fla., Ala. and La. May-Sept.
16. Meibomia viridififora (L.) Kuntze. Velvet-leaved Tick-trefoil. (I. F. f. 2185.) Erect, downy-pubescent, $6-12 \mathrm{dm}$. high. Stipules lanceolate, mainly deciduous; petioles $\mathrm{I}-4 \mathrm{~cm}$. long; leaflets broadly ovate, rough above, vel-vety-pubescent beneath, $3-9 \mathrm{~cm}$. long, the terminal one somewhat rhomboid; racemes compound, elongated, uncinate-pubescent; flowers purple, $6-9 \mathrm{~mm}$. long; loment $2-4$-jointed, the joints semi-rhomboid, uncinate, about 4 mm . long; stipe about equalling the lower lobes of the calyx. Dry woods, E. Penn. and S. N. Y. to Fla., Mich., Mo. and Tex. Aug.-Oct.
17. Meibomia Dillènii (Darl.) Kuntze. Dillen’s Tick-trefoil. (I. F. f. 2186.) Erect, 6-9 dm. high, pubescent or nearly glabrous. Stipules subulate, mainly deciduous; leaflets usually thin, oval or oblong-ovate, obtuse, $3-1 \mathrm{~cm}$. long, sparingly pubescent or glabrous above, softly pubescent or villous beneath; racemes compound, loose ; bracts small, deciduous; flowers $6-9 \mathrm{~mm}$. long; loment 2-4jointed, the joints nearly triangular, about 6 mm . long, somewhat convex on the back, uncinate-pubescent. Woods, Me. and Ont. to Minn., Va., Ky., Mo. and Tex. June-Sept.
18. Meibomia Illinoénsis (A. Gray) Kuntze. Illinois Tick-Trefoil. (I. F. f. 2187.) Erect, stout, 6-12 dm. high, uncinate-pubescent. Stipules ovate, acute, cordate, ciliate, pubescent, persistent; leaflets lanceolate or ovate-lanceolate, obtusish, scabrous above, reticulate veined and cinereous beneath, $2.5-9 \mathrm{~cm}$. long; bracts ovate-lanceolate; flowers $6-9 \mathrm{~mm}$. long; loments $\mathbf{1 - 2 . 5} \mathrm{cm}$. long, often in pairs, ${ }^{3-6 \text {-jointed. the joints oval or orbicular, densely uncinate-pubescent. }}$ Prairies, Ill. to S. Dak, Iowa and Kans. June-Sept,
19. Meibomia Canadénsis (L.) Kuntze. Canadian or Showy Ticktreforl. (I. F. f. 2188.) Erect, stout, pubescent, 6-24 dm. high. Stipules linear-lanceolate, mostly persistent; lower petioles $1-2.5 \mathrm{~cm}$. long, the upper leaves nearly sessile; leaflets oblong or lanceolate-oblong, obtuse, appressedpubescent beneath; racemes densely panicled; flowers $11 \mathbf{1 7} \mathrm{~mm}$. long, conspicuous, purple or bluish-purple; bracts ovate-lanceolate, acute, ciliate; calyxlobes attenuate; loment about 2.5 cm . long, $3-5$ - jointed; joints triangular, straight or convex on back, uncinate-pubescent. Thickets and river-banks, N. B. to Manitoba, N. Car., Mo. and the Ind. Terr. July-Sept.
20. Meibomia rígida (Ell.) Kuntze. Rigid Tick-Trefoil. (I. F. f. 2189.) Erect, rather rigid, finely uncinate-pubescent, 6-9 dm. high. Stipules small, lanceolate, deciduous; leaflets ovate or oval, obtuse, thickish, scabrous above, pubescent, especially along the veins beneath, $2.5-5 \mathrm{~cm}$. long; racemes compound; flowers $2-4 \mathrm{~mm}$. long, purplish; loment-joints obliquely ovate, rounded on the back, uncinate-pubescent, about 3 mm . long. In dry soil, N. H. to Fla., Mich., Kans. and La. July-Oct.
21. Meibomia Marylándica (L.) Kuntze. Smooth Small-leaved Ticktreforl. (I. F. f. 2190.) Erect or ascending, rarely with a few scattered hairs, $6-9 \mathrm{dm}$. high. Stipules subulate; leaves crowded; leaflets $\mathbf{1 2 - 2 5} \mathrm{mm}$. long, ovate or nearly orbicular, obtuse, glabrous, the lateral often subcordate; racemes panicled; corolla purplish, $2-4 \mathrm{~mm}$. long; loment-joints small, obliquely oval or semiorbicular. In dry soil, Ont. to Mass., Fla., Mich. and La. July-Sept.
22. Meibomia obtùsa (Muhl.) Vail. Hairy Small-leaved Tick-trefoil. (I. F. f. 2191.) Erect, 6-9 dm. high, pubescent. Stipules subulate, deciduous: leaves crowded; petioles ciliate, shorter than the leaflets; leaflets broadly ovate or oval, obtuse, somewhat coriaceous, more or less pubescent on both sides, ciliate, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long; racemes uncinate-pubescent; flowers $2-4 \mathrm{~mm}$. long; loment-joints obliquely oval; stipe not exceeding the calyx-lobes. Dry soil, Ont. to Mass., Fla., Mich. and Tex. July-Oct.
35. LESPEDĖZA Michx.

Herbs, often somewhat woody, with pinnately 3 -foliolate leaves, small stipules, and small purple or whitish flowers in axillary clusters, heads or panicles. Flowers often of 2 kinds intermixed, the one petaliferous and mainly sterile, the
other minute, apetalous, abundantly fertile. Calyx lobes nearly equal. Standard in the petaliferous flowers obovate or oblong, clawed; wings oblong; keel incurved. Stamens more or less diadelphous ( 9 and $\mathbf{I}$ ); anthers all alike. Ovary sessile or stipitate, I-ovuled. Pod ovate, oblong, oval or suborbicular, flat, indehiscent, reticulated, composed of a single joint, or rarely with a second stalk-like joint at the base. [Named for Lespedez, governor of Florida, patron of Michaux.] A genus of about 35 species, natives of eastern N. Am., Asia and Australia.

## i. Perennials; stipules and bracts subulate; calyx-lobes narrow.

## * Both petaliferous and apetalous flowers present; carolla purple or purplish; pod exserted.

Peduncles slender and mostly exceeding the leaves.
Petaliferous flowers capitate or spicate.
Plants trailing or diffusely procumbent. Glabrous or appressed-pubescent. r. L. repens. Woolly or downy-pubescent.
Plants erect, rather stout, pubescent.
2. L. procumbens. etaliferous flowers loosely paniculate; stem erect or ascending.
4. L. violacea.

Flower-clusters of both kinds sessile or nearly so.
Leaflets oval, oblong or orbicular.
Foliage densely downy-pubescent. 5. L. Stuvei.
Foliage glabrate or appressed-pubescent.
6. L. frutescens.

Leaflets linear or linear-oblong.
7. L. Virginica.

* Flowers all complete; corolla whitish or yellowish; pod included or scarcely exserted.

Leaves oblong, ovate-oblong or nearly orbicular. Peduncles' exceeding the leaves. Peduncles shorter than the leaves.
Leaves linear or linear-oblong; peduncles elongated.
Spikes densely flowered. Spikes interrupted, loosely-flowered.
2. Annual; stipules ovate; calyx-lobes broad.
I. Lespedeza rèpens (L.) Bart. Creeping Bush-clover. (I, F. f. 2192.) Glabrate or appressed-pubescent, tufted; stems slender, I.5-6 dm. long. Petioles shorter than the leaves; stipules about 2 mm . long; leaflets oval or obovate, obtuse or retuse at the apex, $6-17 \mathrm{~mm}$. long; inflorescence rather loose; corolla violetpurple, $4^{-6} \mathrm{~mm}$. long; pod oval-orbicular, acute, finely pubescent, 3 mm . long. In dry or sandy soil, L. I. to Fla., Minn., Kans. and Tex. Aug.-Sept.
2. Lespedeza procúmbens Michx. Trailing Bush-clover. (I. F. f. 2193.) Woolly or downy-pubescent, sometimes ascending, stouter than the preceding species; stems $3-7.5 \mathrm{dm}$. long. Petioles commonly much shorter than the leaves; leaflets oval or elliptic, rarely slightly obovate, obtuse or retuse at the apex, rounded at the base, $\mathbf{I I - 2 5} \mathrm{mm}$. long; peduncles longer than the leaves, or the flowers sometimes all apetalous and nearly sessile; corolla violet-purple or pinkishpurple; pod oval-orbicular, acute, pubescent, 3 mm . long. In dry soil, N. H. to Fla., the Ind. Terr. and La. Aug.-Sept.
3. Lespedeza Nuttàllii Darl. Nuttall's Bush-clover. (I. F. f. 2104.) More or less villous-pubescent, 6-9 dm. high. Petioles shorter than the leaves; leaflets oval, obovate or suborbicular, thickish, obtuse or emarginate, dark green and glabrous or nearly so above, villous-pubescent beneath, $9 \mathrm{~mm} .-4 \mathrm{~cm}$. long; inflorescence capitate or spicate, dense; flowers violet-purple, about 6 mm . long; pod oblong or oval, acuminate or acute at each end. very pubescent. $5-6 \mathrm{~mm}$. long. Dry soil, southern N. Eng. and N. Y. to Mich., Fla. and Kans. Aug.-S.pt.
4. Lespedeza violàcea (L.) Pers. Bush-Clover. (I. F. f. 2195.) Sparingly pubescent, usually much branched, 3-9 dm. hish. Stipules $4-6 \mathrm{~mm}$. long; leaflets oval, elliptic or elliptic-oblong, thin, obtuse or retuse, rounded at the base, $\mathbf{I}_{3} \mathrm{~mm} .-5 \mathrm{~cm}$. long, appressed-pubescent beneath; peduncles, at least the upper ones, longer than the leaves; inforescence loose, paniculate; corolla violet-purple, 6-11 mm. long; pod ovate or oval, acute, finely and sparingly pubescent or gla-
brate, 4-6 mm. long. In dry soil, N. Eng. to Fla., Minn., Kans., La. and northern Mex. Aug.-Sept.
5. Lespedeza Stùvei Nutt. Stuve's Bush-clover. (I. F. f. 2196.) Wandlike, velvety or downy pubescent, 6-12 dm. high. Stipules $4-6 \mathrm{~mm}$. long; petioles commonly much shorter than the leaves; leaflets oval, oblong or suborbicular, obtuse or retuse, $12-30 \mathrm{~mm}$. long; flowers in nearly sessile axillary clusters; corolla violet-purple, 4-6 mm. long; pod ovate-oblong to orbicular. 4-6 mm. long, downypubescent. Dry soil, Conn. to Va., Mich. and the Ind. Terr. Aug.-Sept.

Lespedeza Stùvei neglécta Britton. Leaflets linear or linear-oblong, obtuse, mucronulate. N. J. and Penn. to.N. Car., Ga., Mo. and Tex.
6. Lespedeza frutéscens (L.) Britton. Wand-Like Bush-clover. (I. F.f. 2197.) Finely appressed-pubescent or glabrate, 3-9 dm. high. Stipules 4-6 mm. long; petioles equalling or shorter than the leaves; leaflets oval, oblong or elliptic, obtuse, truncate or retuse, $\mathbf{1 2 - 3 8} \mathrm{mm}$. long, glabrous and dark green above, paler and pubescent beneath; flowers in short-stalked or nearly sessile axillary clusters, generally crowded toward the summit of the stem; corolla violetpurple, 4-6 mm. long; pod ovate-oblong, acute, pubescent, about 4 mm . long. Dry soil, Me. to Ont., Mich., Fla., Ill. and Tex. Aug.-Sept.
7. Lespedeza Virgínica (L.) Britton. Slender Bush-clover. (I. F. f. 2198.) Slender, resembling the preceding. Leaflets linear or oblong-linear, $12-38 \mathrm{~mm}$. long, $2-5 \mathrm{~mm}$. wide, truncate, finely pubescent beneath, or glabrate on both surfaces; clusters crowded in the upper axils; flowers violet-purple, $4-6 \mathrm{~mm}$. long; pod ovate or oval-orbicular, 4 mm . long, pubescent, or nearly glabrous. Dry soil, Mass. to Ont., Minn., Kans., Fla. and Tex. Aug.-Sept.
8. Lespedeza hírta (L.) Ell. • Hairy Bush-clover. (I. F. f. 2199.) Erect or ascending, villous or silky-pubescent, 6-12 dm. high. Stipules $2-5 \mathrm{~mm}$. long; petioles shorter than the leaves; leaflets oval, or suborbicular, obtuse at each end, sometimes emarginate, $12 \mathrm{~mm} .-5 \mathrm{~cm}$. long; peduncles elongated; heads oblongcylindric, rather dense, $12-35 \mathrm{~mm}$. long; flowers all complete; corolla yellowishwhite or the standard purple-spotted, about 6 mm . long; pod oval, acute, very pubescent, about equalling the calyx-lobes. Dry soil, Me. and Ont. to Fla., Ill., Minn. and La. Aug.-Oct.

Lespedeza hìrta oblongifòlia Britton. Leaflets oblong, obtuse at each end, x.8-3 cm . long, 4-6 mm . wide, glabrate above, appressed-pubescent beneath ; peduncles slender; spikes looser, $2.5-3.8 \mathrm{~cm}$. long; calyx very pubescent. Pine barrens, Egg Harbor, N. J., and in the Southern States.
9. Lespedeza capitàta Michx. Round-headed Bush-clover. (I. F. f. 2200.) Stiff, mainly simple and wand-like, silky or silvery pubescent, 6-16 dm. high. Leaves nearly sessile; leaflets oblong or oval, $2.5-3.8 \mathrm{~cm}$. long; peduncles shorter than the leaves, or the dense globose-oblong heads sessile in the upper axils; flowers all complete; corolla yellowish-white, with a purple spot on the standard, 6 mm . long; pod ovate-oblong, pubescent, about half as long as the calyxlobes. Dry fields, Ont. and Me. to Fla., S. Dak., Kans. and La. Aug.-Sept.

Lespedeza capitàta longifòlia (DC.) T. \& G. Leaflets linear-lanceolate or linearoblong, sometimes I dm. long. Ill. and Mo.
10. Lespedeza angustifòlia (Pursh) Ell. Narrow-Leaved Bush-clover. (I. F. f. 220I.) Erect, appressed-pubescent, 6-9 dm. high. Leaves nearly sessile; leaflets linear or oblong-linear, rarely some of the lower ones lance-linear, 2.5-3 cm . long, obtuse, truncate or acutish; peduncles usually exceeding the leaves; flowers nearly as in the preceding; pod ovate-orbicular, shorter than the calyxlobes. Dry sandy soil, E. Mass. to Fla., Mich. and La. Aug.-Sept.
in. Lespedeza leptostàchya Engelm. Prairie Bush-clover. (I. F. f. 2202.) Erect, 3-9 dm. high, silvery-pubescent with appressed hairs. Petioles shorter than the leaves; leaflets linear, $2.5-3 \mathrm{~cm}$. long; spikes slender, on peduncles equalling or exceeding the leaves; corolla as in the preceding; pod ovate, pubescent, about 3 mm . long, nearly equalling the calyx. Prairies, Ill. to Iowa, IVis. and Minn. Aug.-Sept.
12. Lespedeza striàta (Thunb.) H. \& A. Japan Clover. (I. F. f. 2203.) Diffuse or ascending, sparingly appressed-pubescent, 1.5-3 dm. long. Stipules
ovate, acute or acuminate, $2-4 \mathrm{~mm}$. long; petioles much shorter than the leaves; leaflets oblong or oblong-obovate, $9-20 \mathrm{~mm}$. long, obtuse, narrowed at the base; flowers 1-3 together, sessile or nearly so in the axils; corolla pink or purple, about 12 mm . long; calyx-lobes ovate; pod oval, acute, exceeding the calyx-lobes. In fields, Va. to Ill., Mo., Kans. and very common in the Southern States. Nat. from eastern Asia. July-Aug.

## 36. VÍCIA L.

Climbing or trailing, herbaceous vines, with pinnate tendril-bearing leaves, half-sagittate or entire stipules, and axillary, mostly racemose, flowers. Calyx-tube somewhat oblique, obtuse at the base, its teeth about equal. Standard obovate or oblong, emarginate, clawed; wings obliquely oblong, adherent to the shorter oblong curved keel. Stamens diadelphous (9 and 1), or monadelphous below. Ovules $\infty$; style very slender, with a tuft or ring of hairs at its summit. Pod flat, dehiscent, 2 valved, continuous between the seeds. [The classical Latin name of the Vetch.] About 120 species of wide distribution. In addition to the following, about 12 others occur in southern and western N. Am.
Flowers racemed or spicate ; peduncles elongated.
Indigenous perennials.
Spike-like racemes dense, I-sided, 15-40-flowered. I. V. Cracca. Racemes loose, 1-20-flowered.

Flowers $1.5-2 \mathrm{~cm}$. long.
Leaflets elliptic, or ovate-oblong. 2. V. Americana.
Leaflets narrowly linear; western.
3. $V$. linearis.

Flowers 4 -10 mm. long.
Racemes 8 -20-flowered; flowers $9-11 \mathrm{~mm}$. long. 4. V. Caroliniana.
Racemes 1 - 6 -flowered; flowers $4-9 \mathrm{~mm}$. long.
Leaflets 2-5 pairs, linear, or those of the lower leaves oval or obovate.
5. V. micrantha.

Leaflets 4 or 5 pairs, all oval, elliptic or obovate.
6. V. Ludoviciana.

Introduced annuals ; flowers few, 4-6 mm. long.
Pod glabrous, $3^{-6}$-seeded.
7. V. tetrasperma.

Pod pubescent, 2 -seeded. 8. V. hirsuta.
Flowers sessile or very nearly so, few, axillary.
Flowers 1 or 2 in the axils; annuals.
Leaflets oblong, oval or obovate. 9. $V$. sativa.
Leaflets, except those of lower leaves, linear or linear-oblong.
10. V. angustifolia.

Flowers 2-6 in a short nearly sessile raceme; perennial. II. $V$. Sepium.
I. Vicia Crácca L. Tufted or Cow Vetch. Blue Vetch. (I. F. f. 2204.) Finely pubescent or sometimes glabrate; stems weak, 6-12 dm. long. Stipules linear, acute, entire, $2-9 \mathrm{~mm}$. long; leaves nearly sessile; leaflets $18-24$, thin, linear or linear-oblong, mucronate, $1.7-2 \mathrm{~cm}$. long; peduncles axillary, shorter than or equalling the leaves; racemes $2.5-10 \mathrm{~cm}$. long; flowers bluish-purple, 11 13 mm . long, reflexed; claw of the vexillum about equalling its blade; pod shortstalked, glabrous, $1.8-2.5 \mathrm{~cm}$. long, $5^{-8}$-seeded. In dry soil, Newf. to Br. Col., N. J., Ky. and Kans. Also in Europe and Asia. June-Aug.

Vicia villòsa Roth, a European species found by Dr. C. D. Fretz in eastern Pennsylvania, differs from the above in having the claw of the standard half the length of its blade.
2. Vicia Americàna Muhl. American Vetch. Pea Vine. (I. F. f. 2205.) Glabrous, or with some appressed pubescence, 6-9 dm. long. Leaves nearly sessile; stipules broad, foliaceous, triangular-ovate, sharply-toothed, 4-II mm. long; leaflets 8-14, elliptic, ovate or oblong, obtuse or sometimes emarginate and mucronuhte, rounded at the base, $1.7-3.8 \mathrm{~cm}$. long; peduncles usually shorter than the leaves; racemes $3-9$ flowered; flowers bluish purple, $17-21 \mathrm{~mm}$. long, spreading; pod short-stalked, glabrous, $2.5-3 \mathrm{~cm}$. long, $4-7$-sceded. In moist ground, N. B. to Manitoba, Br. Col., Va., Ky. and Nev. May-Aug.

Vicia Americìna truncita (Nutt.) Brewer. Leaflets thick, oblong or obovate, truncate and dentate at the apex. Kans. to S. Dak., Cal. and Br. Col.
3. Vicia lineàris (Nutt.) Grcenc. Narrow-lfated American Vetch. (I. F. f. 2206.) Glabrous or nearly so; stems often zigzag. 3-6 dm. long. Leaf-
lets 4-7 pairs, narrowly linear to linear oblong, $1.8-3.5 \mathrm{~cm}$. long, rather thick, the apex not toothed, mucronate; stipules $4-9 \mathrm{~mm}$. long, half-sagittate, acuminate, their bases prolonged, sometimes dentate; racemes 2-6-flowered; flowers purple or purplish, about 18 mm . long; pod about 2.5 cm . long, glabrous, short-stalked. In dry soil, N. W. Terr. to Br. Col., S. Dak., Kans., N. Mex. and Cal. May-Aug.
4. Vícia Caroliniàna Walt. Carolina Vetch. (I. F. f. 2207.) Glabrous or nearly so, slender, 6-9 dm. long. Stipules linear or oblong, entire, 4-6 mm. long; leaves short-petioled; leaflets $8-18$, oblong or linear-oblong, entire, obtuse or emarginate, or sometimes acutish and mucronate, $\mathbf{1}-2 \mathrm{~cm}$. long; peduncles equalling or shorter than the leaves; racemes 8-20-flowered; flowers nearly white, 9-II mm . long, the keel bluish-tipped; pod glabrous, $1.7-3 \mathrm{~cm}$. long, short-stalked, 5-8-seeded. Banks and cliffs, Ont. to Minn., Ga., Ky. and Kans. May-July.
5. Vicia micrantha Nutt. Small-flowered Vetch. (I. F. f. 2208.) Perennial (or sometimes annual?), glabrous; stems slender, 3-6 dm. long. Leaflets 2-5 pairs, narrowly linear to linear-oblong, thin, $\mathrm{I}-4 \mathrm{~cm}$. long, obtuse, acutish or emarginate, or those of the lower leaves obovate, oval or even obcordate, usually shorter; peduncles $8-30 \mathrm{~mm}$. long, $\mathbf{I}-2$-flowered; flowers $4-6 \mathrm{~mm}$. long, purplish; pod slightly pubescent or glabrous, about 2.5 cm . long, 6-12-seeded; seeds compressed. On prairies and in thickets, Mo. to Tenn., Ala. and Tex. April-May.
6. Vicia Ludoviciàna Nutt. Louisiana Vetch. (I. F. f. 2209.) Glabrous, or the young parts pubescent; stem rather stout, angled, 4-9 dm. long. Leaflets elliptic, oval or obovate, thin, $1.2-2 \mathrm{~cm}$. long, obtuse or emarginate; stipules very narrow, rarely over 6 mm . long, linear or half-sagittate; peduncles shorter than the leaves, or about equalling them, 1 - 6 -flowered; flowers $6-9 \mathrm{~mm}$. long, bluish; pod 2.5 cm . long, or rather more, glabrous, $4-6$-seeded, the seeds compressed. Kans. (?), Tex. and La. to Fla. April-May.
7. Vicia tetraspérma (L.) Moench. Slender Vetch. Smooth or Lentil Tare. (I. F. f. 22Io.) Glabrous or nearly so, weak, slender, $1.5-6 \mathrm{dm}$. long. Stipules linear, long-auriculate; leaves short-petioled; leaflets 6-12, thin, linear or linear-oblong, commonly mucronulate, $\mathbf{1 2 - 1 7} \mathrm{mm}$. long; peduncles filiform, equalling or shorter than the leaves, I-6-flowered; flowers pale, blue or purplish, 4-6 mm . long; pod 8-I3 mm. long. In meadows and waste places, N. S. and Ont. to Va. Nat. from Europe. June-Sept.
8. Vicia hirsùta (L.) Koch. Hairy Vetch or Tare. (I. F. f. 22Ir.) Sparingly pubescent or glabrous, much resembling the preceding. Stipules linear, long-auriculate and sometimes toothed; leaves nearly sessile; leaflets 12-14, oblong or linear, obtuse, emarginate or truncate, mucronulate, $8-17 \mathrm{~mm}$. long, narrowed at the base; peduncles slender, mainly shorter than the leaves, 2 - 6 -flowered; flowers pale purplish-blue, about 3 mm . long; pod $8-13 \mathrm{~mm}$. long. In fields and waste places, Va. to Ohio, N. B. and Alberta. Nat. from Europe. May-Sept.
9. Vicia satìva L. Common Vetch or Tare. Pebble-vetch. (I. F. f. 2212.) Pubescent or glabrate, spreading, 3-9 dm. long. Stipules broad, generally sharply toothed; leaves short-petioled; leaflets 8-14, obovate, oblong or oblanceolate, obtuse, truncate or retuse and mucronate at the apex, narrowed at the base, 1. $8-3 \mathrm{~cm}$. long; flowers bluish-purple, $1.8-2.5 \mathrm{~cm}$. long; calyx-teeth about as long as the tube; pod linear-oblong, glabrous, $4-8 \mathrm{~cm}$. long, $5-10$-seeded. In fields and waste places, frequent or occasional throughout our area, in the Southern States and on the Pacific Coast. Adventive from Europe. May-Aug.
10. Vicia angustifòlia Roth. Smaller Common Vetch. (I. F. f. 22I3.) Glabrous or puberulent; stem slender, 3-6 dm. long. Stipules mostly half-sagittate, toothed or entire; leaves short-petioled, or nearly sessile; leaflets 8 -16, linear, lanceolate or oblanceolate, $9-35 \mathrm{~mm}$. long, mucronulate, those of the lower leaves commonly obovate, broader and shorter; flowers 1 or 2 in the upper axils, purple, 12-17 mm. long; calyx-teeth as long as the tube or shorter; pod linear, glabrous, $2.5-5 \mathrm{~cm}$. long. In fields and waste places, N. S. to Fla. Nat. from Europe. AprilJuly.
II. Vicia Sèpium L. Bush Vetch. Wild Tare. (I. F. f. 22I4.) Perennial by stolons, minutely pubescent; stem slender, 6-9 dm. long. Leaves shortpetioled, $5-15 \mathrm{~cm}$. long; leaflets 10-18, ovate or oval, $1.2-2.5 \mathrm{~cm}$. long, emarginate or truncate at the apex, mucronulate, thin; stipules half-sagittate, Icm . long or less; racemes $\mathbf{I}-2.5 \mathrm{~cm}$. long; flowers very short-pedicelled, pale purple, $\mathbf{I}-\mathbf{2} \mathrm{cm}$.
long; calyx-teeth unequal, shorter than the tube; pod $2-3 \mathrm{~cm}$. long, glabrous. Near Hamilton, Ont. Adventive or fugitive from Europe. May-July.

Ervum Léns L.., the Lentil, distinguished from all our species of Vicia by its elongated calyx-lobes and oval, $\mathrm{x}-2$-seeded pod, is collected occasionally as a waif.

## 37. LÁthYRUS L.

Herbaceous vines, rarely erect herbs, with pinnate mostly tendril-bearing leaves, and racemose or sometimes solitary flowers. Calyx oblique or gibbous at the base, its teeth nearly equal or the upper ones somewhat shorter than the lower; corolla nearly as in Vicia, but commonly larger; stamens diadelphous ( 9 and $\mathbf{1}$ ), or monadelphous below. Ovary sessile or stalked; ovules generally numerous; style curved, flattened, hairy along its inner side; pod flat, or sometimes terete, 2 -valved, dehiscent, continuous between the seeds. [Ancient Greek name of some leguminous plant. About 110 species, natives of the northern hemisphere and of S. Am. Besides the following, about 25 others occur in southern and western N. Am.
Leaflets 3-7 pairs ; flowers purple.
Stipules foliaceous ; plant of the seashore and the Great Lakes. 1. L. maritimus. Stipules half-sagittate or small, or wanting ; inland plants.

Plants climbing or trailing; stipules present; pod sessile. Leaflets ovate or oval, large; flowers 10-20.
Leaflets linear, oblong or oval, smaller ; flowers 2-6.
Leaflets linear or linear-oblong; stem winged.
Leaflets oblong or oval ; stem wingless.
Plants mainly erect ; stipules often wanting ; pod stipitate. Leaflets lanceolate or oblong.
Leaflets linear.
Leaflets 3-5 pairs; stipules foliaceous; flowers yellowish-white.
Leaflets i pair ; stipules foliaceous.
Perennial ; introduced; flowers yellow.
Annual; native western species; flowers purple.
2. L. venosus.
3. L. palustris.
4. L. myrtifolius.
5. L. decaphyllus.
6. L. ornatus.
7. L. ochroleucus.
8. L. pratensis.
9. L. pusillus.
I. Lathyrus marítimus (L.) Bigel. Beach Pea. (I. F. f. 2215.) Perennial, glabrous or nearly so, slightly glaucous; stems angled, decumbent, 3-6 dm. long. Stipules ovate, half-hastate, acute, $2.5-5 \mathrm{~cm}$. long; leaves nearly sessile; leaflets 3-6 pairs, oblong, oval or obovate, obtusish and mucronulate at the apex, mainly narrowed at the base, somewhat larger than the stipules; tendrils branched; peduncles shorter than the leaves; flowers 6-10, $18-25 \mathrm{~mm}$. long; pod sessile, linearoblong, nearly glabrous, veined, $4-8 \mathrm{~cm}$. long. Beaches, N. J. to arctic Am., the Great Lakes, and on the Pacific coast. Also in Europe and Asia. May-Aug.
2. Lathyrus venòsus Muhl. Veiny Pea. (I. F. f. 2216.) Finely pubescent or glabrous, perennial, 6-9 dm. long. Stems 4 -angled; stipules lanceolate, halfsagittate, acute or acuminate, $8-25 \mathrm{~mm}$. long; leaves petioled; leaflets $4-7$ pairs, ovate or oval, mucronulate, often reticulated, mostly rounded at the base, $2.5-5 \mathrm{~cm}$. long; tendrils branched; peduncles shorter than the leaves; flowers $12-16 \mathrm{~mm}$. long; pod linear, sessile, glabrous, veined, $4-8 \mathrm{~cm}$. long. River shores and banks, N. J. and Penn. to Ind., Assiniboia, Ga., La. and Kans. May-July.
3. Lathyrus palústris L. Marsh Vetchling. (I. F. f. 2217.) Perennial, glabrous or sparingly pubescent; stems slender, 3-6 dm. long; stipules half-sagittate, I-2 cm. long; leaflets 2-4 pairs, lanceolate, oblong or linear-oblong, acute or obtusish and mucronate, $2.5-6 \mathrm{~cm}$. long; tendrils branched; peduncles generally about equalling the leaves; flowers $\mathbf{1}-\mathbf{1} .5 \mathrm{~cm}$. long; pod linear, sessile, slightly pubescent or glabrous, $4-6 \mathrm{~cm}$. long. In moist or wet grounds, Lab. to Alaska, Mass., N. Y., S. Dak. and Br. Col. Also in Europe and Asia. May-Aug.
4. Lathyrus myrtifòlius Muhl. Myrtle-leaved Marsh Pea. (I. F. f. 2218.) Perennial, usually glabrous; stems angled, 3-9 dm. long, weak. Stipules obliquely ovate or half-sagittate, $\mathbf{1 2 - 2 5} \mathbf{~ m m}$. long, toothed; leaflets $2-+$ pairs, mostly 3 pairs, oval, oval-oblong or ovate, mucronate, narrowed at the base, $1.8-5 \mathrm{~cm}$. long, rather thin; tendrils branched; peduncles equalling the leaves or shorter, 3-9-flowered; flowers similar to those of the preceding; pod linear. glabrous, sessile, $2.5-5 \mathrm{~cm}$. long. In moist or wet grounds, N. B. to Manitoba, N. Car. and Tenn. May-July.

Lathyrus myrtifolius macránthus White. Pubescent; stipules larger, often half as large as the leaflets; flowers $2-2.5 \mathrm{~cm}$. long. Me.
5. Lathyrus decaphýllus Pursh. Prairie Vetchling (I. F. f. 2219.) Perennial, erect or ascending, glabrous or finely pubescent, 1.5-4.5 dm. high. Stems angled; stipules half-sagittate, acuminate, $8-25 \mathrm{~mm}$. long; leaflets 3-7 pairs, mucronulate, narrowed at the base, thick, reticulated, $2.5-6 \mathrm{~cm}$. long; stipules often wanting; peduncles usually shorter than the leaves; flowers $2.5-4 \mathrm{~cm}$. long; pod linear, seeds with a narrow stalk and short hilum. Kans. (?); Idaho and Colo. to Ariz. and N. Mex. March-July.
6. Lathyrus ornàtus Nutt. Showy Vetchling. (I. F. f. 2220.) Closely resembling the preceding, but generally lower, often less than 3 dm . high. Stipules lanceolate or linear, $4-20 \mathrm{~mm}$. long; leaflets narrow, acute and mucronate, 9-25 mm. long; tendrils commonly wanting; flowers $2.5-4 \mathrm{~cm}$. long; pod linear; seeds with abroad stalk and long hilum. Ind. Terr. to Kans., S. Dak., Colo. and Utah. May-June.

Lathyrus ornàtus incànus Smith and Rydb. Plant densely villous-canescent. Neb. and Colo.
7. Lathyrus ochroleùcus Hook. Cream-colored Vetchling. (I. F. f. 2221.) Perennial, glabrous, slightly glaucous; stem somewhat angled, climbing or trailing, 3-8 dm. long; stipules broad, half-ovate and half-cordate, $1.7-2.5 \mathrm{~cm}$. long; leaves petioled; leaflets thin, pale beneath, ovate or broadly oval, rounded at the base, $2.5-5 \mathrm{~cm}$. long; tendrils branched; peduncles shorter than the leaves; flowers 5-10, $15-18 \mathrm{~mm}$. long; pod oblong-linear, sessile, glabrous, $2.5-5 \mathrm{~cm}$. long. On river banks and hillsides, N. J. to Quebec and arctic Am., Iowa, Wyo. and Br. Col. May-July.
8. Lathyrus praténsis L. Meadow Pea. Yellow Vetchling. (I. F. f. 2222.) Perennial, glabrous or sparingly pubescent, climbing or straggling, 3-9 dm. long. Stems angled; stipules lanceolate, half-sagittate, acuminate, I.3-2.5 cm . long; leaflets oblong or linear-oblong, acute or acutish, mucronulate, 2.5-4 cm . long; racemes exceeding the leaves; flowers $6-\mathbf{1 2}, 12-17 \mathrm{~mm}$. long; pods linear, glabrous, $2.5-4 \mathrm{~cm}$. long. In waste places, Me., N. Y., Mass. and Ont. Nat. from Europe. June-Aug.
9. Lathyrus pusíllus Ell. Lọw Vetchling. Annual, glabrous; stem winged, $3-6 \mathrm{dm}$. long. Leaflets I pair, linear-lanceolate, $2-5 \mathrm{~cm}$. long, acute; stipules sagittate, 2 cm . long or more; peduncles elongated, I -3-flowered; flowers purple, small; pod $10-\mathbf{1} 5$-seeded. S. Car. to Miss., Kans. and Tex. Apr.-May.

## 38. BRADBÙRYA Raf.

Slender vines, with pinnately 3 -foliolate leaves (rarely 5-7-foliolate), persistent stipules, and large axillary flowers. Calyx campanulate, its teeth or lobes nearly equal; standard orbicular. nearly flat, spurred on the back near its base; clawed; wings obovate, curved; keel curved; stamens more or less diadelphous ( 9 and 1); style incurved, bearded at the apex around the stigma; pod linear, flattened, nearly sessile, partially septate between the seeds, 2 -valved, the valves thick-edged, longitudinally finely nerved along their margins. [In honor of John Bradbury, who travelled in America early in the century.] About 30 species, natives of America. Besides the following, a nother occurs in the Southern States.
I. Bradburya Virginiàna (L.) Kuntze. Spurred Butterfly-pea. (I. F. f. 2223.) Perennial, finely rough-pubescent, 6-12 dm. long. Stipules linear, acute; leaflets 3 , ovate, or oblong-lanceolate, stipellate, rounded at the base, retic-ulate-veined, $2.5-5 \mathrm{~cm}$. long; peduncles about equalling the petioles, $\mathbf{I}$ - 4 -flowered; bracts ovate, acute, finely striate; flowers $2.5-4 \mathrm{~cm}$. long: corolla violet; calyxlobes linear; pod IO-I3 cm. long, long-acuminate, its margins much thickened. Dry sandy soil, N. J. to Fla., Ark., Tex. and tropical Am. July-Aug.

## 39. CLITORIA L.

Woody vines, or erect or climbing herbs, with pinnately 3 -foliolate (sometimes 5-9-foliolate) leaves, persistent stipules, and large axillary flowers. Calyx tubular, 5 -toothed, the 2 upper teeth more or less united; standard large, erect, retuse, narrowed at the base, not spurred; wings oblong, curved; keel acute, shorter than the wings; stamens more or less monadelphous; anthers all alike; ovary stipitate; style
elongated, incurved, hairy along the inner side; pod stalked in the calyx, linear or linear-oblong, flattened, 2 -valved, partly septate between the seeds. About 30 species, natives of warm and temperate regions. The following is the only one known to inhabit N. Am.
I. Clitoria Mariàna L. Butterfly-pea. (I. F. f. 2224.) Erect or ascending, sometimes twining, glabrous or nearly so, 3-9 dm. high. Stipules ovate-lanceolate, acute; leaflets stipellate, ovate-lanceolate or oblong-lanceolate, obtuse, mucronate, $2.5-5 \mathrm{~cm}$. long; peduncles short, I-3-flowered; bracts lanceolate, striate, deciduous; flowers about 5 cm . long, very showy; calyx tubular, $\mathbf{1 2 - 1 7} \mathbf{~ m m}$. long, its teeth ovate, acute ; corolla pale blue; pods acute, about 2.5 cm . long. Dry soil, N. J., to Fla., Mo. and Tex. June-July.

## 40. FALCÀTA Gmel.

Twining perennial vines, with pinnately 3 -foliolate leaves, small white or violet flowers in axillary racemes, and also solitary apetalous fertile flowers in the lower axils or on the slender creeping branches from the base. Calyx of the petaliferous flowers tubular, 4-5-toothed; standard obovate, erect, folded around the other petals; wings oblong, curved, adherent to the incurved obtuse keel; stamens diadelphous ( 9 and 1); style filiform, not bearded; pods from the upper flowers linearoblong, several-seeded, 2 -valved, those from the lower obovoid, fleshy, mainly I-seeded. [Latin, referring to the curved keel of the corolla.] About 7 species, natives of N. Am., eastern Asia and the Himalayas. Only the following in N. Am.

Leaves thin; bracts small; plant pubescent or glabrate.
Leaves firm; bracts large; plant villous-brown-pubescent.

1. F. comosa.
2. F. Pitcheri.
I. Falcata comòsa (L.) Kuntze. Wild or Hog Pea-nut. (I. F. f. 2225.) Slender, 3-24 dm. long. Stipules oblong or ovate, 4 mm . long, striate; leaflets broadly ovate or rhombic-ovate, acute, rounded at the base, $2.5-8 \mathrm{~cm}$. long; racemes of petaliferous flowers mainly simple ; bracts ovate, obtuse; flowers purplish or white, $\mathbf{1 2 - 1 5 ~ m m}$. long; pedicels equalling or exceeding the bracts; pods of the petaliferous flowers about 2.5 cm . long, 6 mm . wide, pubescent, especially along the margins. Moist thickets, N. B. to Fla., Manitoba, Neb. and La. Aug.-Sept.
3. Falcata Pítcheri (T. \& G.) Kuntze. Pitcher’s Hog Pea-nut. (I. F.f. 2226.) Similar to the preceding, but generally stouter, villous-pubescent with reflexed brown hairs. Leaflets larger and thicker, sometimes I dm. long; pedicels mostly shorter than the nearly orbicular canescent bracts; ovary and pods of the petaliferous flowers pubescent throughout; subterranean fruit less abundantly produced than in $F$. comosa; calyx larger. Moist thickets, Mass. to western N. Y., S. Dak., Neb., Kans. and Tex. Aug.-Sept.

## 4I. ÀPIOS Moench.

Twining perennial vines, with pinnately $3-7$-foliolate leaves, small stipules and rather large brownish-purple or red flowers, mainly in axillary racemes or panicles. Calyx campanulate, somewhat 2 -lipped, the 2 lateral teeth very small, the 2 upper united and short, the lower one long and acute. Standard ovate or orbicular, reflexed. Wings obliquely obovate, adherent to the elongated incurved at length twisted keel. Stamens diadelphous (9 and 1). Ovary nearly sessile, ovules $\infty$; style slender. Pod linear, straight or slightly curved, compressed, 2 -valved, manyseeded. Rootstocks usually tuberous. [Greek, pear, from the shape of the tubers.] Five known species, 2 of eastern N: Am., 2 of China and I of the Himalayas.

Standard suborbicular, rounded or retuse at the apex. Standard produced at apex into a thickened appendage.

1. A. Apios.
2. A. Friceana.
I. Apios Àpios (L.) MacM. Ground-nut. (I. F. f. 2227.) Slender, pubescent or glabrate. Stipules subulate, $2-4 \mathrm{~mm}$. long. deciduous; leaves petioled; leaflets 5-7 (rarely 3), ovate or ovate-lanceolate, acute or acutish, rounded at the base, $2.5-8 \mathrm{~cm}$. long; racemes often compound; peduncles shorter than the leaves; flowers numerous, odorous, about 12 mm . long; rachis of the inflorescence ki:ohby; pod pointed, $2.5-10 \mathrm{~cm}$. long, about 5 mm . wide. In moist ground, N. B. tu Fla., Ont., Minn., Kans. and La. Stem with milky juice; tubers edible. July-Sept.
3. Apiós Priceàna Robinson. Price's Ground-nut. Stem soon glabrous. Stipules 6 mm . long. Leaflets 3-9; racemes dense, mostly 2 or 3 together in the axils; standard 2.5 cm . long; pods $\mathbf{1 2 - 1 5} \mathrm{cm}$. long. Root solitary. Ky.

## 42. GALACTIA P. Br.

Perennial vines (sometimes erect and shrubby), mainly with pinnately 3 -foliolate leaves, small and deciduous stipules, and purple or violet axillary racemose flowers. Calyx 4-lobed, bracteolate, the lobes acute, often as long as the tube. Standard orbicular or obovate. Wings narrow, obovate, adherent to the narrow, nearly straight keel. Stamens diadelphous or nearly so (9 and $\mathbf{1}$ ). Ovary nearly sessile; ovules $\infty$; style filiform, not bearded. Pod linear, straight or slightly curved, usually flattened, 2 -valved, several-seeded. Fleshy few-seeded pods are sometimes produced from subterranean apetalous flowers. [Greek, milk-yielding, many of the species having milky sap.] About 50 species, natives of warm and temperate regions, most abundant in America. Besides the following about 15 others occur in the Southern and Southwestern States.

Nearly glabrous throughout; pods slightly pubescent.
Finely downy-pubescent; pods very downy.

1. G. regularis.
2. Galactia regulàris (L.) B. S. P. Milk Pea. (I. F. f. 2228.) Prostrate; stems matted, 3-6 dm. long. Leaflets elliptic or ovate-oblong, obtuse and often emarginate, rounded or slightly cordate at the base, $2-4 \mathrm{~cm}$. long, $8-18 \mathrm{~mm}$. wide; peduncles longer than the petioles and generally exceeding the leaves, erect, 4-10flowered; flowers reddish purple, $12-17 \mathrm{~mm}$. long; pods $2.5-4 \mathrm{~cm}$. long, $4-7$ seeded. In dry sandy soil, N. Y. and Penn. to Fla., Kans. and Miss. July-Aug.
3. Galactia volúbilis (L.) Britton. Downy Milk Pea. (I. F. f. 2229.) Similar to the preceding. Leaflets ovate, elliptic or oval, sometimes emarginate, rounded or slightly cordate at the base, $2-4 \mathrm{~cm}$. long, II- 25 mm . wide; racemes rather loose ; flowers purplish, about 12 mm . long; pod $2.5-4 \mathrm{~cm}$. long. In dry soil, N. Y. to Fla., Penn., Ky., Kans. and Tex. June-July.

## 43. DOLÍCHOLUS Medik.

## [Rhynchosia Lour.]

Perennial twining trailing or erect herbs, with pinnately $\mathbf{1}-3$-foliolate leaves, and yellow mostly axillary and racemose flowers. Leaflets generally punctate with resinous dots, not stipellate ; calyx 4-5-lobed, somewhat 2 -lipped; standard obovate or orbicular, spreading or reflexed; wings narrow; keel incurved at the apex or falcate; stamens diadelphous ( 9 and 1); ovary nearly sessile; ovules 2, rarely $\mathbf{1}$; style filiform; pod flat, oblong or obliquely orbicular, 2-valved, I-2-seeded. [Greek, diminutive of Dolichos.] About 100 species, natives of warm and temperate regions. In addition to the following, some 9 others occur in the Southern States.

## Leaflets 3 .

Stem twining or trailing.
Racemes shorter than the leaves ; flowers $6-8 \mathrm{~mm}$. long. I. D. tomentosus.
Racemes longer than the leaves; flowers about 12 mm . long.
2. D. latifolius.

Stem erect, 3-7.5 dm. high.
3. D. erectus.

Leaflet solitary, very broad ; plant low, erect, 8-23 cm. high.
4. D. simplicifolius.
I. Dolicholus tomentòsus (L.) Vail. Twining Dolicholus. (I. F. f. 2230.) Pubescent with spreading hairs, 3-9 dm. long. Stipules ovate, acute, sometimes wanting; petioles shorter than the leaves; leaflets 3 , or the lowest leaves I-foliolate, ovate, orbicular or broader than long, obtuse but generally pointed, 2.55 cm . long ; racemes short-peduncled or sessile, 2-8-flowered ; flowers $6-8 \mathrm{~mm}$. long; calyx deeply 4 -parted, the upper lobe 2 -cleft; pod oblong, acute, pubescent, 16-19 mm. long. In dry sandy soil, Va. to Fla., west to Tex. May-July.
2. Dolicholus latifòlius (Nutt.) Vail. Prairie Dolicholus. (I. F. f. 223I.) Softly pubescent; stem angled, sometimes $\mathbf{1 . 5} \mathrm{m}$. long. Stipules lanceolate or wanting; petioles $2.5-8 \mathrm{~cm}$. long; leaflets broadly ovate or somewhat rhomboid, or the end one orbicular, $2.5-8 \mathrm{~cm}$. long, mostly obtuse; racemes elongated, sometimes 3 dm . long in fruit, many-flowered; calyx about 12 mm . long, deeply parted,
the segments narrowly lanceolate, acuminate; corolla little longer than the calyx; pod oblong, acute, very pubescent, about 2.5 cm . long. In dry soil, Mo. to La. and Tex. May-June.
3. Dolicholus eréctus (Walt.) Vail. Erect Dolicholus. (I. F. f. 2232.) Erect, velvety-pubescent or tomentose, 3-8 dm. high. Stipules linear-lanceolate, acuminate; petioles shorter than or equalling the leaves; leaflets oval, ovate or slightly obovate, thick, densely tomentose, especially beneath, $2.5-5 \mathrm{~cm}$. long; racemes $5-15$-flowered, sessile or short-peduncled; flowers $6-10 \mathrm{~mm}$. long; pod oblong, $12-17 \mathrm{~mm}$. long. In dry soil, Del. to Fla., Tenn. and La. May-Sept.
4. Dolicholus simplicifòlius (Walt.) Vail. Round-leaved Dolicholus. (I. F. f. 2233.) Simple, pubescent. Stipules lanceolate, acuminate; petioles shorter than or exceeding the leaves; leaflet orbicular or broader, thick, obtuse, slightly cordate at the base, $2.5-3 \mathrm{~cm}$. long (leaflets rarely 3 , the lateral ones ovate); racemes rather densely flowered, peduncled; flowers $6-10 \mathrm{~mm}$. long; pod as in the preceding. In dry soil, Va. to Fla., west to La. May-July.

## 44. PHASEOLUS L.

Vines, rarely erect herbs, with pinnately 3 -foliolate leaves, and axillary racemose flowers. Calyx 5 -toothed or 5 -lobed, or the 2 upper teeth more or less united. Standard orbicular, recurved, spreading or somewhat contorted; wings mainly obovate; keel spirally coiled, linear or obovoid. Stamens diadelphous (9 and I). Style longitudinally bearded; stigma oblique or lateral; ovary sessile or nearly so; ovules $\infty$. Pod linear, 2-valved, several-seeded, tipped with the persistent style. Seeds mostly with rounded ends. Rachis thickened at the bases of the pedicels. [Ancient name of the Kidney Bean.] About 170 species, of warm and temperate regions. Besides the following, about 12 others occur in the Southern States.
I. Phaseolus polystàchyus (L.) B.S.P. Wild Bean or Bean Vine. (I. F. f. 2234.) Perennial, finely pubescent, I.2-4 m. long. Stipules lanceolate, deciduous; leaflets broadly ovate or nearly orbicular, acute or acuminate, rounded at the base, $5-10 \mathrm{~cm}$. long, the terminal one often slightly cordate; racemes peduncled, $1-3 \mathrm{dm}$. long, narrow, loosely flowered; pedicels minutely bracted at the base; corolla purple, about 8 mm . long: pods stalked, drooping, somewhat curved, flat, $4^{-6} \mathrm{~cm}$. long, $4^{-6}$-seeded, glabrous or nearly so; seeds chocolate-brown, $6-8 \mathrm{~mm}$. long. In thickets, Canada (Torrey and Gray); Conn. to Fla., Minn., Neb. and La. July-Sept.

## 45. STROPHOSTÝLES Ell.

Herbaceous vines, rarely erect, with pinnately 3 -foliolate stipellate leaves, and pink-purple or nearly white flowers capitate at the ends of long axillary peduncles. Calyx as in Phaseolus. Standard nearly orbicular; wings mostly obovate; keel strongly curved. Stamens diadelphous (9 and 1). Style longitudinally bearded, bent. Pod linear, usually straight, few-several-seeded, tipped by the persistent style. Seeds truncate at the ends, more or less pubescent or mealy. [Greek, bent style.] An American genus, of about 6 species.

$$
\begin{array}{ll}
\text { Leaflets mainly lobed, } 2-5 \mathrm{~cm} \text {. long; pod } 5-8 \mathrm{~cm} \text {. long. } & \text { I. } S . \text { helvola. } \\
\text { Leaflets mainly entire, } 1-4 \mathrm{~cm} \text {. long; pod } 2-5 \mathrm{~cm} . \text { long. } & \text { 2. S. umbella } \\
\text { Flowers several, about } \mathbf{1 2} \mathrm{mm} \text {. long; root perennial. } & \text { 3. S. pauciffo } \\
\text { Flowers few, about } 6 \mathrm{~mm} \text {. long ; root annual. } &
\end{array}
$$

I. Strophostyles hélvola (L.) Britton. Trailing Wild Bein (L F f 2235.) Prostrate or low-twining, rather rough-pubescent, $6-16 \mathrm{dm}$. long, rarely erect, and $2.5-5 \mathrm{dm}$. high. Stipules narrowly lanceolate, $2-4 \mathrm{~mm}$. long; leaflets broadly ovate, rounded at the base, thickish; peduncles axillary, exceeding the petioles; flowers $3-\mathbf{1 0}$, sessile; corolla greenish purple, $9-12 \mathrm{~mm}$. long; keel slender, curved; pod slightly pubescent; seeds oblong, pubescent. In sandy soil, Quebec to Fla., S. Dak., Neb. and Tex. July-Oct.

Strophostyles hélvola Missouriénsis (S. Wats.) Rritton. Climbing in trees to a height of 6-10 m . Leaflets larger, usually entire; seeds larger. Said to bloom later. Mo. and Kans.
2. Strophostyles umbellàta (Muhl.) Britton. Pink Wilin Bean. (I. F. f. 2236.) Stems trailing, more or less pubescent with retrorse hairs. 3-15 dm. long.

Stipules ovate-lanceolate, $2-4 \mathrm{~mm}$. long; leaflets ovate, lanceolate or oblong, sparingly pubescent, entire, or rarely with 1 or 2 shallow lobes; peduncles generally much longer than the leaves; flowers several, pink, fading yellowish, similar to those of the preceding; pod straight, little compressed, sparingly pubescent; seeds mealy-pubescent. In sandy soil, L. I. to Fla., Ind. and La. July-Sept.
3. Strophostyles paucifiora (Benth.) S. Wats. Small Wild Bean. (I. F. f. 2237.) Stems finely retrorsely hirsute, low-climbing or trailing, 3-7 dm. long. Stipules ovate-lanceolate, $\mathrm{I}-3 \mathrm{~mm}$. long; leaflets lanceolate or linear-oblong, obtuse, entire; peduncles exceeding the leaves; flowers 2-6, purplish; pod flat, about 2.5 cm . long and 4 mm . wide, pubescent; seeds purple, glabrous and shining at maturity. Along rivers, Ind. to S. Dak., Miss., Kans. and Tex. July-Sept.

## 46. VÍGNA Savi.

Herbaceous vines, or sometimes erect herbs, with pinnately 3 -foliolate stipulate leaves, the leaflets broad. Flowers clustered at the ends of long axillary peduncles, yellowish or purplish, the rachis of the head or raceme knotty, the bracts and bractlets early deciduous. Calyx 5 -toothed, or the 2 upper teeth united. Standard nearly orbicular, auricled at the base; wings shorter than the standard; keel about equalling the standard, slightly incurved. Stamens diadelphous (9 and I). Ovary sessile; ovules numerous; style bearded along the inner side. Pod linear, nearly terete, 2-valved. [In honor of Domenic Vigni, a commentator on Theophrastus.] About 30 species, natives of warm and tropical regions. Besides the following another occurs in the southern U. S.
I. Vigna Sinénsis (L.) Endl. Cow Pea. China Bean. Black-eyed Bean. (I. F. f. 2238.) Annual; stem striate. Stipules ovate or ovate lanceolate, acuminate, prolonged backward, $6-20 \mathrm{~mm}$. long; terminal leaflet rhombic-ovate, $5-15 \mathrm{~cm}$. long, often about as wide, long-stalked; lateral leaflets very obliquely ovate and inequilateral, short-stalked; flowers few, yellowish, $1.6-2 \mathrm{~cm}$. long; pod fleshy, I-2 dm. long, $6-8 \mathrm{~mm}$. thick, nearly straight. Escaped from cultivation. Mo. to Tex. and Ga. Native of Asia. July-Sept.

## Order 19. GERANIÀLES.

Dicotyledonous herbs, shrubs or trees, usually with petals, and these separate (more or less united in Polygalaceae, wanting in most Euphorbiaceae, in Callitrichaceae, and in some species of Xanthoxylum in Rutaceae) ; sepals mostly distinct; stamens few, rarely more than twice as many as the sepals, opposite them when as many; ovary superior, compound ; ovules pendulous, the raphe toward the axis of the ovary.
Stamens more than one; land plants.
Flowers regular or nearly so ; petals present, usually as many as the sepals. Herbs, the leaves not punctate; flowers perfect.

Leaves not pinnately compound.
Capsule at length splitting into its 5 carpels; leaves lobed or dissected.
Fam. r. Geraniaceae.
Capsule 2-5-celled, not splitting into its carpels.
Stamens 2-3 times as many as the petals; leaves 3 -foliolate in our species.

Fam. 2. Oxalidaceae. Stamens as many as the petals; leaves entire. Fam. 3. Linaceae.
Leaves pinnately compound.
Fam. 4. Zygophyllaceae.
Our species trees or shrubs with compound leaves, often punctate; flowers diœecious or polygamous.
Leaves punctate.
Fam. 5. Rutaceae.
Leaves not punctate, the bitter bark with oil-sacs. Fam. 6. Simarubaceae. Flowers very irregular; petals 3 ; stamens usually 8; herbs. Fam. 7. Polygalaceae. Flowers regular, often apetalous, small, monœecious; carpels mostly 3 ; herbs or low shrubs, mostly with milky juice.

Fam. 8. Euphorbiaceae.
Stamen only I ; perianth none; styles 2 ; small aquatic or rarely terrestrial plants with opposite entire leaves.

Fam. 9. Callitrichaceae

## Family 1. GERANIÀCEAE J. St. Hil.

## Geranium Family.

Herbs with alternate or opposite leaves, and axillary solitary or clustered perfect regular flowers. Stipules commonly present. Sepals 5 (rarely fewer), mostly persistent. Petals of the same number, hypogynous. Stamens as many as the sepals, or $2-3$ times as many, distinct ; anthers 2 -celled, versatile. Ovary 1, usually 5 -lobed and 3 -celled ; ovules I or 2 in each cavity. Fruit capsular. Embryo straight or curved : cotyledons flat or plicate. About io genera and 450 species, natives of temperate regions, most abundant in South Africa.

Anthers io, rarely 5 ; carpel-tails not hairy inside. Anthers 5 ; carpel-tails bearded inside.

1. Geranium.
2. Eroduum.

## 1. GERÀNIUM L.

Herbs with stipulate, palmately lobed, cleft or divided leaves, and axillary r-2. flowered peduncles. Flowers regular, 5 -merous. Sepals 5, imbricated. Petals 5 . hypogynous, imbricated. Stamens io (rarely 5), generally 5 longer and 5 shorter. Ovary 5-lobed, 5 -celled, beaked with the compound style. Ovules 2 in each cavity. Capsule elastically dehiscent, the 5 cavities I-seeded and long tailed by the persistent style-divisions which are naked on the inner side. [Greek, a crane, from the long beak of the fruit.] About 170 species, widely distributed in temperate regions. Besides the following, some 6 others occur in western N. Am.

6. G. Carolinianum.

Beak long-pointed; infloresence loose.
7. G. Bicknellii.

Flowers deep purple; seeds pitted. Seeds smooth or nearly so.

Stamens 5 ; carpels hairy, not rugose.
Stamens io ; carpels glabrate, rugose.
8. G. dissectum.
9. G. pusillum.
10. G. molle.

1. Geranium maculàtum L. Wild or Spotted Crane's-bill. Alumiroot. (I. F. f. 2239.) Pubescent with spreading or retrorse hairs, $3-6 \mathrm{dm}$. high. Basal leaves $7 \cdot 5-\mathrm{I} 5 \mathrm{~cm}$. wide, deeply $3-5$-parted, the divisions obovate, cuneate, variously toothed and cleft; stem-leaves 2, similar to the basal ones; peduncles 1-5, elongated; ultimate pedicels $2.5-5 \mathrm{~cm}$. long; flowers rose-purple; sepals awnpointed, villous, ciliate; petals woolly at the base; beak of the fruit $2.5-3.75 \mathrm{~cm}$. long; carpels pubescent; seed reticulate. In woods, Newf. to Manitoba, Neb., Ga., Ala. and Kans. . April-July.

Geranium praténse L., the meadow geranium of Europe, is reported as escaped from cultivation in Quebec and N. B. It differs from the preceding by its blue-purple flowers and narrower lobes of the leaf-segments.
2. Geranium Robertiànum L. Herb Robert. Red Robin. (I. F. f. 2240.) Glandular-villous, weak, extensively branching, 1.5-4.5 dm. high, heavyscented. Leaves ovate orbicular; peduncles slender. 2-flowered, $2.5-7.5 \mathrm{~cm}$. long: pedicels divaricate, $\mathbf{1 . 2 5 \mathrm { cm } \text { . long; sepals acuminate and awn-pointed; flowers }}$ red-purple, about 12 mm . broad; petals narrow-clawed; beak of the fruit about
2.5 cm . long, awn-pointed, nearly glabrous; carpels nearly glabrous, slightly wrinkled; seed smooth. In rocky woods, rarely in sandy places, N. S. to Manitoba, N. J., Pa. and Mo. Also in Europe, Asia and Africa. May-Oct.
3. Geranium Sibíricum L. Siberian Crane’s-bill. (I. F. f. 2241.) Villous pubescent, freely branched, 3-I3 dm. high. Leaves deeply 3-5-parted, 5-6 cm. broad, nearly orbicular, or cordate-reniform, the divisions oval lanceolate, cleft or toothed; peduncles slender, $5-7.5 \mathrm{~cm}$. long, 2-bracted near the middle; flowers nearly white, $6-8 \mathrm{~mm}$. broad; sepals oval, awned; beak of the fruit canescent, I.4-I. 8 cm . long, tipped with a short prolongation; lobes of the capsule puberulent or hairy; seed minutely reticulate. Along roadsides in the northern part of N. Y. City; also found at Cambridge, Mass., and in Ill. Adventive from Asia. Some of the pedicels are rarely 2 -flowered. June-Sept.
4. Geranium columbinum L. Long-stalked Crane's-bill. (I. F. f. 2242.) Slender, slightly hispid-pubescent with whitish appressed hairs. Leaves $2.5-3.75 \mathrm{~cm}$. in diameter, deeply 5-9-divided into narrow, variously cleft segments; petioles very slender; peduncles slender, longer than the upper leaves; pedicels $2.5-7.5 \mathrm{~cm}$. long; flowers purple, about 8 mm . broad; sepals ovate, awnpointed, enlarging in fruit; petals notched; capsule-lobes nearly glabrous, keeled, not rugose; beak I. $2-2 \mathrm{~cm}$. long, hispid; seeds deeply pitted. In fields and along roadsides, N. J., Penn., Md. and Va. Also in S. Dak. Nat. or adventive from Europe. May-July.
5. Geranium rotundifòlium L. Round-leaved Crane's-bill. (I. F. f. 2243.) Often tufted, I.5-4 dm. high, much branched, softly pubescent with spreading white purple-tipped hairs. Leaves reniform-orbicular, $3-4 \mathrm{~cm}$. wide, cleft about to the middle into 5-9 obtuse broad lobes, which are $3-5$-toothed; petioles slender; flowers purple, $4-6 \mathrm{~mm}$. broad; sepals ovate, or oval, short-pointed, somewhat shorter than the entire obovate petals; ovary and capsule-lobes hairy, not wrinkled; beak pubescent, about 1.2 cm . long, tipped by a short awn. In waste places, Mich., and in ballast about N. Y. Fugitive from Europe. Summer.
6. Geranium Caroliniànum L. Carolina Crane's-bill. (I. F. f. 2244.) Erect, generally branched, stout, 1.5-4 dm. high, loosely pubescent with spreading often glandular gray hairs. Leaves reniform-orbicular, $2.5-7.5 \mathrm{~cm}$. wide, deeply cleft into 5-9 oblong or obovate cuneate toothed or lobed segments; peduncles rather short and stout; flowers in compact clusters, pale pink or whitish, $8-14 \mathrm{~mm}$. broad; sepals ovate, ciliate, about equalling the obovate emarginate petals; ovarylobes hispid-pubescent; persistent filaments not longer than the carpels; beak nearly 2.5 cm . long. In barren soil, N. Eng. and Ont. to Br. Col., Fla. and Mex. Also in Bermuda. April-Aug.
7. Geranium Bicknéllii Britton. Bicknell's Crane’s-bill. (I. F. f. 2245.) Similar to the preceding, but taller, the stems usually more slender, loosely pubescent. Leaves somewhat angulate, the segments oblong or linear-oblong, mostly narrower; peduncles slender, the inflorescence loose; sepals lanceolate; ovary-lobes pubescent; persistent filaments longer than the carpels; beak about 2.5 cm . long, its tip 4-6 mm. long. N. S. to W. Orit., Br. Col., Mont. and S. N. Y. May-Sept.
8. Geranium disséctum L. Cut-leaved Crane’s-bill. (I. F. f. 2246.) Closely related to the two preceding species, but smaller in every way, more slender, the branches decumbent or ascending; leaves seldom more than 3.75 cm . wide, deeply cleft into narrower segments; inflorescence loose; peduncles short; flowers purple, about 6 mm . broad; sepals ovate, awned, equalling or slightly longer than the notched petals; capsule-lobes and beak pubescent. In waste places and in ballast, N. Y. and N. J. Also in the Northwest. Fugitive from Europe. June-Sept.
9. Geranium pusillum Burm. f. Small-flowered Crane's-bili.. (I. F. f. 2247.) Widely branching, slender, pubescent or villous, $\mathrm{r}-\dot{4} .5 \mathrm{dm}$. long. Leaves petioled, reniform orbicular, $1.25-3.75 \mathrm{~cm}$. wide, deeply divided into 7-9 oblong, or sometimes linear-oblong, entire or 3 -toothed, cuneate lobes; peduncles short, 618 mm . long; pedicels $6-24 \mathrm{~mm}$. long; sepals acute, awnless; flowers pale purple. 6-10 mm . broad; petals notched; capsule-lobes hairy, keeled, not wrinkled; beak about 1 cm . long. canescent. In waste places, S. N. Eng. to N. J., Ohio, Ont., Neb., Wyo. and Br. Col. Adventive from Europe. May-Sept.
io. Geranium mólle L. Dove's-foot Crane's-bill. (I. F. f. 2248.) Resembling the preceding species, but more villous, the leaves nearly orbicular
and not as deeply cleft, generally only to just below the middle, into 7-II obovate or cuneate lobes, which are $3-5$-toothed at the apex ; flowers dark-purple, $6-10 \mathrm{~mm}$. broad; sepals obtusish, not awned; capsule-lobes distinctly marked with transverse wrinkles; beak about 1 cm . long, sparingly pubescent. In waste places, Me. to Penn., N. Y., Ohio and Ont. Also in Wash. and Vancouver. Fugitive from Europe. May-Sept.

## 2. ERÒDIUM L'Her.

Herbs, generally with jointed nodes, opposite or alternate stipulate leaves, and axillary umbellate nearly regular flowers. Sepals 5, imbricated. Petals, 5, hypogynous, imbricated, the 2 upper slightly smaller. Glands 5. Anther-bearing stamens 5 , alternating with as many sterile filaments. Ovary 5 -lobed, 5 -celled, beaked by the united styles, the beak terminating in 5 stigmas; ovules 2 in each cavity. Capsule-lobes I-seeded, the styles elastically dehiscent and coiled spirally at maturity, villous-bearded on the inner side. Seeds not reticulate. [Greek, a heron, from the resemblance of the truit to its beak and bill.] About 60 species, widely distributed in temperate and warm regions. There are three native species in the southwest; several exotic ones have been collected on ballast at the seaports.
I. Erodium cicutàrium (L.) L'Her. Hemlock Stork's-bill or Heron'sbill. Alfilaria. (I. F. f. 2249.) Annual, tufted, villous-pubescent, somewhat viscid, $1.5-3 \mathrm{dm}$. high. Basal and lower leaves $7.5-18 \mathrm{~cm}$. long, $\mathbf{I} .25-2.5 \mathrm{~cm}$. wide, pinnate, the segments finely pinnatifid; peduncles generally longer than the leaves, umbellately $2-12$-flowered; flowers purple or pink, $8-10 \mathrm{~mm}$. broad; sepals acute, villous, about equalling the entire petals; carpels hairy; beak $1.25-3.75 \mathrm{~cm}$. long, its divisions spirally coiled when ripe. Waste places and fields, N. S., Ont., N. J., N. Eng., Penn. and Mich., and very abundant from Tex. to Ore. Adventive from Europe, in our area. A common weed in the Old World. April-Sept.

Erodium moschàtum Willd., reported from Ont., Mass. and Me., has much broader serrate or incised leaf-segments.

## Family 2. OXALIDÀCEAE Lindl.*

## Wood-sorrel Family.

Leafy-stemmed or acaulescent herbs, or rarely shrubs, often with rootstocks or scaly bulbs, the sap sour. Leaves mostly palmately 3foliolate, in some exotic species pinnate, or entire and peltate; stipules commonly present as scarious expansions of the petiole-bases; leaflets mostly obcordate. Flowers perfect, in umbel-like or forking cymes, or sometimes solitary; peduncles mostly long. Sepals 5 , often unequal. Petals 5, white, pink, purple or yellow. Stamens IO-1 5. Ovary 5-celled, 5-lobed; styles united, or distinct; ovules 2-many in each cavity ; fruit a loculicidal globose or columnar capsule, rarely baccate. Embryo straight, in fleshy endosperm. About 7 genera and 280 species, chiefly of tropical distribution.

## r. ÓXALIS L.

Annual or perennial, caulescent or acaulescent, often bulbous herbs, with alternate, mostly digitately compound leaves ( 3 -foliolate in our species) and axillary, I-several-flowered peduncles. Flowers regular, often heterogonous. Sepals 5 . imbricated. Petals 5. Stamens io, monadelphous at base. 5 longer and 5 shorter, all anther-bearing. Ovary 5 -celled; ovules several in each cavity; styles 5 . separate, persistent, stigmas terminal. Capsule loculicidally dehiscent. Seeds 2 or more in each cavity, anatropous, with a loose aril-like dehiscent outer coat. [Greek. sour, from the acid juice.] About 250 species, mostly natives of warm or tropical regions. Besides the following, some 10 others occur in the Southern and Western States.

Acaulescent; flowers white, pink or rose-purple.
Scape 1-flowered; flower pink, rarely white ; capsule subglobose. 1. O. Acetosella.
Scape several-flowered; flowers rose-purple, or rarely white; capsule ovoid.
2. O. violacea.

Caulescent ; flowers yellow.
Cymes umbel-like; pedicels reflexed or deflexed at maturity. Pedicels pubescent with appressed hairs.

Stems or branches creeping; introduced species. 3. O. corniculata.
Stems erect, or if decumbent, not creeping; native species.
Stems pubescent with appressed hairs. 4. O. stricta.
Stems pubescent with spreading hairs or glabrous.
Cymes maturing several or all the flowers at about the same time, not accompanied by drooping buds.
Leaflets, or most of them, less than 1 cm . wide; stems copiously leafy.
5. O. filipes.

Leaflets, or most of them, over I cm. wide; stems sparingly leafy.
6. O. Brittoniae.

Cymes maturing 1 or 2 flowers at a time, these accompanied by several drooping buds.
7. O. Bushii.

Pedicels pubescent with spreading hairs.
Foliage, especially the leaves, bright green. Styles recurved ; petals not ciliate. 8. O. recurva. Styles erect ; petals ciliate. 9. O. Priceae. Foliage, especially the leaves, reddish purple. Io. O. rufa. Cymes dichotomous; pedicels erect or spreading.

Leaflets not discolored, green or reddish purple; petals $8-10 \mathrm{~mm}$. long.
Foliage, especially the leaves, reddish purple; stems often glabrous.
10. O. rufa.

Foliage, especially the leaves, green; stems pubescent.
Pedicels pubescent with appressed hairs.
6. O. Brittoniae.

Pedicels pubescent with spreading hairs. II. O. cymosa.
Leaflets discolored, the margins brownish; petals $12-16 \mathrm{~mm}$. long.
12. O. grandis.
I. Oxalis Acetosélla L. White or True Wood-sorrel. Alleluia. (I. F. f. 2250.) Rootstock scaly, elongated. Foliage pubescent with scattered brownish hairs; petioles jointed and dilated at the base; leaflets obcordate, wider than long; scapes $5-15 \mathrm{~cm}$. high; flowers broadly campanulate, about 1.25 cm . long; sepals obtusish; petals veined with deep pink, 3-4 times as long as the calyx; capsule subglobose, $2-4 \mathrm{~mm}$. in diameter, glabrous; seeds ovoid, longitudinally grooved. In cold damp woods, N. S. to Manitoba, the mountains of N. Car. and the shore of Lake Superior. Also in Europe, Asia, and N. Africa. Cleistogene flowers are borne on recurved scapes at the base of the plant. May-July.
2. Oxalis violàcea L. Violet Wood-sorrel. (I. F. f. 225 I.) Bulb brownish, with ciliate scales. Foliage nearly or quite glabrous; leaves about $2.5-3 \mathrm{~cm}$. wide; leaflets obcordate, minutely reticulated, the midrib sometimes sparingly hairy; scapes $1-3 \mathrm{dm}$. high; pedicels slender; flowers $1.6-2 \mathrm{~cm}$. long, heterogonous; sepals obtuse; petals lighter toward the base, obtuse or truncate, 3 times as long as the sepals; capsule ovoid, 4 mm . long: seeds flattened, rugose-tuberculate. In woods, northern N. Eng. to Minn. and the Rocky Mts., south to Fla. and N. Mex. Also apparently the same plant in the Andes of Bolivia. May-June.
3. Oxalis corniculàta L. Yellow Procumbent Wood-sorrel. (I. F. f. 2252.) Pubescent with appressed hairs or nearly glabrous, deep green, freely branching from the base; stem $2.5-3.5 \mathrm{~cm}$. long, the branches diffuse, mainly procumbent and often creeping. Leaflets about $8-12 \mathrm{~mm}$. wide; petioles dilated at the base into oblong rounded or truncate stipules; peduncles $\mathbf{I}$-3-flowered; flowers $5-10 \mathrm{~mm}$. wide; pedicels strigillose, more or less reflexed; capsule oblong, $\mathbf{I}-1.5 \mathrm{~cm}$. long; appressed-pubescent; seeds compressed, transversely ridged. In ballast about the Eastern seaports, and frequently growing on the ground in greenhouses. Tex. and throughout tropical Am. Recently found in Ont. Occurs also in warm and tropical regions of the Old World. Feb.-Nov.
4. Oxalis stricta L. Upright Yellow Wood-sorrel. (I. F. f. 2254.) Foliage pale green. Stem commonly branched at the base, the branches spreading, $\mathrm{I}-3 \mathrm{dm}$. long; leaves $\mathrm{I} .8-3.7 \mathrm{~cm}$. broad; leaflets coarsely cellular, sensitive, drooping when touched; petiole-bases narrowly dilated; flowers fragrant; peduncles

3-15 cm. long; sepals linear or lanceolate, about 5 mm . long, ciliolate, erect or ascending; petals $8-10 \mathrm{~mm}$. long, commonly reddish at the base; capsule columnar, ${ }^{16}-30 \mathrm{~mm}$. long; seeds fully 1 mm . long, with interrupted transverse ridges. In woods and fields, N. S. to N. Dak. and Colo., south to Fla. and Tex. Introduced into Europe as a weed. April-Oct.
5. Oxalis fílipes Small. Slender Yellow Wood-Sorrel. (I. F. f. 2253.) Foliage deep green. Stem wiry, usually very leafy, 0.5-2 dm. high; leaves 6-12 mm . wide, not stipulate, or the stipules very narrow; leaflets with unequal sides; peduncles filiform, $2-3$-flowered; pedicels very slender, recurved when mature; sepals oblong-lanceolate, 3-4 mm. long, obtuse, with a tuft of hairs at the apex; petals 4-8 mm . long, emarginate; capsule $8-12 \mathrm{~mm}$. long, gradually narrowed, often curved; seeds 1 mm . long, with continuous ridges. In woods, Va. and W. Va. to Tenn., south to Ga. Plant smaller than the next preceding species. May-Aug.
6. Oxalis Brittòniae Small, n. sp. Foliage bright green. Stem slender, sparingly leafy, I-4 dm. tall, often branched; leaves mostly $\mathbf{I - 2} \mathrm{cm}$. broad; petioles filiform, sparingly villous; leaflets broader than long, nearly glabrous; peduncles about twice as long as their subtending petioles; cymes dichotomous or the primary branches suppressed, thus more umbel-like; sepals elliptic to narrowly oblong, about 3 mm . long; corolla light yellow, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. wide; filaments glabrous; styles glabrous; capsules columnar, acuminate, $1.5-2 \mathrm{~cm}$. long; seeds Imm . long, sharply ridged. In woods and fields, N. Y. to N. Car. and Tenn. Type from Staten Island, N. Y. May-July.
7. Oxalis Búshii Small. Bush's Wood-sorrel. Foliage bright green. Stems erect, $0.5^{-2} \mathrm{dm}$. tall, often simple; leaves few; petioles especially pubescent near the base; leaflets with rounded lobes, strigillose; peduncles slender, nearly erect, usually solitary, conspicuously overtopping the leaves, glabrous or nearly so except near the base; cymes umbel-like; sepals oblong, 3.5-4 mm. long, obtuse; corolla light yellow, $9-12 \mathrm{~mm}$. broad; filaments much dilated at the base; styles slightly pubescent. In dry soil, Penn., Mo. and Ark. May-June.
8. Oxalis recúrva Ell. Large-flowered Wood-sorrel. (I. F. f. 2255.) Foliage villous. Stems $\mathrm{I}-3 \mathrm{dm}$. tall, often woody at the base; leaves $\mathrm{I}-2 \mathrm{~cm}$. broad; leaflets often glaucescent; petioles filiform, slightly dilated at the base; flowers bright yellow, I or 2 opening at a time; sepals oblong, about $4.5-6 \mathrm{~mm}$. long, obtuse, nearly erect; corolla $1.5-2 \mathrm{~cm}$. broad; petals slightly notched; capsule columnar, IO-15 mm. long, slender; seeds fully 1 mm . long, with broken transverse ridges. In rocky or sandy places, Mo. to N. Car. and Ala. April-Aug.
9. Oxalis Prìceae Small. Price's Wood-sorrel. Foliage deep green. Stems early decumbent, I-3 dm. long; leaves often numerous; leaflets pale or glaucescent beneath, ciliate; peduncles sometimes slightly longer than the petioles; sepals linear or nearly so, $6-8 \mathrm{~mm}$. long, pubescent at the base and tip; corolla deep chrome-yellow, $\mathbf{I} .4-2 \mathrm{~cm}$. broad; petals pubescent without; styles copiously villous; capsules stout, columnar, $10-15 \mathrm{~mm}$. long. On rocky hillsides and in open woods, Ky. Summer and fall.
10. Oxalis rùfa Small, n. sp. Red Wood-sorrel. Foliage reddish-purple. Stems early branched at the base and decumbent, I-3 dm. long, sometimes glaucescent; leaves numerous, commonly clustered; leaflets sometimes pale along the midrib; peduncles glabrous or villous, usually surpassing the leaves; cymes dichotomous or the primary branches suppressed, thus umbel-like; sepals oblong or oblong-lanceolate, $2-2.5 \mathrm{~mm}$. long; corolla light yellow, $6-10 \mathrm{~cm}$. broad; petals glabrous, sometimes erose at the apex; capsules gradually narrowed, $\delta-12 \mathrm{~mm}$. long, usually pubescent with glandular hairs. In woods, Mass. to N. I., Ga. and Tenn. Type from New York Botanical Garden. April-Sept.
ir. Oxalis cymòsa Small. Tall Yellow Wood-sorrfi.. (I. F. f. 2256.) Foliage bright green. Stem 1.5-II dm. high, branched above, often villous; leaves $\mathbf{I} .8-3 \mathrm{~cm}$. broad; leaflets broader than long, sharply notched; potiole-bases scarcely dilated; pedicels $6-8 \mathrm{~mm}$. long, more or less villous; sepals lanceolate or narrowly elliptic, 4-6 mm. long; corolla bright yellow, $S-10 \mathrm{~mm}$. broad; petals obtuse or emarginate; capsule columnar, $10-16 \mathrm{~mm}$. long. gradually narrowed to the summit; seeds almost 1.5 mm . long, with nearly continuous ridges. In woods and fields, Ont. to Mich., Fla., Neb. and Tex. May-Oct.
12. Oxalis grandis Small. Great lellow Wood-sorrel. (I. F. f.
2257.) Foliage bright green. Stem 3-12 dm. tall, simple or nearly so; leaves $3.5-8 \mathrm{~cm}$. broad; leaflets with brown margins more or less ciliate; petioles villous, hardly dilated at the base; pedicels $1-1.4$ long; sepals ovate or oblong, 4-6 mm. long, often ciliate at the apex; corolla deep yellow, $1.5-2.5 \mathrm{~cm}$. broad; petals rounded at the apex; capsule ovoid or ovoid-oblong; seeds 2 mm . long, with prominent broken transverse ridges. On river banks, Penn. to Ill., N. Car. and Ala. May-Aug.

## Family 3. LINÀCEAE Dumort.

## Flax Family.

Herbs, or shrubs, with perfect regular nearly symmetrical flowers. Stipules mostly small or none. Sepals 5, rarely 4, imbricated, persistent. Petals of the same number and alternate with the sepals, imbricated, generally contorted. Stamens of the same number, alternate with the petals; filaments monadelphous at the base; anthers versatile, z-celled. Ovary 1, 2-5-celled, or by false septa 4-10-celled. Ovules anatropous. Styles 2-5. Fruit mainly capsular. Seeds I-2 in each cavity, oily; endosperm little or none ; embryo straight ; cotyledons flat. Four known genera and about 150 species of wide distribution.

## I. LìNUM L.

Herbs, sometimes woody at the base, with sessile leaves, and perfect flowers. Inflorescence cymose, racemose or paniculate. Stipules a pair of glands, or wanting. Sepals 5. Petals 5, fugacious. Stamens 5, sometimes with interspersed staminodia. Ovary 4-5-celled, or 8-10-celled by false partitions, the real cavities 2 -ovuled. Capsule 5-Io-valved. [The classical Latin name.] About 90 species, natives of temperate or warm regions. In addition to the following some 17 others occur in the southern and western U.S.

* Flowers blue.

Annual; introduced; capsule about as long as the calyx.

1. L. usitatissimum. Perennial ; western ; capsule much exceeding the calyx.
2. L. Lewisii.

*     * Flowers yellow.

Capsules 2-3 mm. long.
Leaves and bracts entire.
Stem nearly terete, corymbosely branched; usually only the lowest leaves opposite.
Leaves thin, oblong or oblanceolate, spreading. 3. L. Virginianum.
Leaves firm, appressed-ascending.
Capsule depressed-globose, 2 mm . high.
4. L. medium.

Capsule ovoid, 3 mm . high.
5. L. Floridanum.

Stem angled, racemosely branched; leaves below the branches mostly all opposite.
6. L. striatum.

Upper leaves and bracts glandular-ciliate.
Capsules 4-5 mm. long.
7. L. sulcatum.
8. L. rigidum.

* ** Flowers white, small,-long-pedicelled.

9. L. catharticum.
10. Linum usitatíssimum L. Flax. Linseed. (I. F. f. 2258.) Often tufted, branching above, $3-5 \mathrm{dm}$. high; leaves alternate, 3 -nerved, lanceolate, I. $25-3.75 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide; inflorescence a terminal cymose leafy panicle; flowers I.2-I. 6 cm . broad; pedicels slender; sepals oval, acuminate, the interior ones ciliate and 3 -ribbed; petals obcuneate, crenulate, twice the length of the sepals; capsule ovoid-conic, $6-8 \mathrm{~mm}$. long, indehiscent, the septa not ciliate. Along roadsides, and in waste places, fugitive from cultivation. Summer.

Linum hùmile Mill., variously regarded by authors as a distinct species or a variety or form of the Common Flax, may be distinguished by its dehiscent capsule with ciliate septa. It is rarely met with in our area in similar situations. Both have been cultivated since prehistoric times for their fibre and oil. Their origin is unknown.
2. Linum Lewísii Pursh. Lewis' Wild Flax. (I. F. f. 2259.) Perennial, 3-6 dm. high, glaucous, densely tufted, simple up to the cymose inflorescence.

Leaves crowded, oblong or linear, 6-40 mm. long, I-4 mm. wide, acute or acutish, $3-5$-nerved; flowers $2.5-3.75 \mathrm{~cm}$. broad; sepals oval, mainly obtuse, one-third or one-fourth the length of the petals; stigmas shorter than the styles; capsule broadly ovoid, obtuse, dehiscent, the septa ciliate. Plains, Manitoba to S. Dak., Kans., Tex., Ariz., Utah and Alaska. Summer.
3. Linum Virginiànum L. Wild or Slender Yellow Flax. (I. F. f. 2260.) Perennial by suckers, rather dark green, corymbose-paniculate above, $3-6 \mathrm{dm}$. high. Stem and branches slender, not stiff; flowering branches ascending or sometimes weak and recurved; leaves oblong or oblanceolate, I-nerved, I.2-2.6 cm. long, 4-6 mm. wide, acute, or the lower opposite and spatulate, obtuse; pedicels filiform, the lower 4-12 mm. long, longer than the calyx; flowers $6-8 \mathrm{~mm}$. broad; sepals ovate, acute, not ciliate, about equalling the depressedglobose io-celled capsule. In shaded situations, N. Eng. to Ga. June-Aug.
4. Linum mèdium (Planch.) Britton. Stiff Yellow Flax. (I. F. f. 226I.) Perennial by suckers; stems erect, striate, stiff, corymbosely branched above, the branches erect-ascending both in flower and in fruit; leaves appressed-ascending, the lowest commonly spatulate and opposite, the others lanceolate to linear-lanceolate, acute, $8-24 \mathrm{~mm}$. long, I-4 mm. wide; pedicels $\mathbf{I}-6 \mathrm{~mm}$. long, the lower rarely longer than the calyx; sepals ovate, or ovate-lanceolate, acute, about equalling the capsule. In dry soil, Ont. to Mass., Fla., Mo. and Tex. June-Aug.
5. Linum Floridànum (Planch.) Trel. Florida Yellow Flax. (I. F. f. 2262.) Perennial; stem stiff, $4 \cdot 5-7 \cdot 5 \mathrm{dm}$. high, corymbosely branched above, the branches erect-ascending, slightly angled. Leaves acute, the lowest mostly opposite, narrowly oblong or oblanceolate, the others linear-lanceolate, appressed-ascending, alternate, $\mathbf{I - 2 ~ c m}$. long, $\mathbf{I}-4 \mathrm{~mm}$. wide; fruiting branches erect-ascending; fruiting pedicels shorter than or little exceeding the calyx, or the lowest ones slightly longer; sepals ovate, acute or acuminate, about equalling the capsule; capsule ovoid, about 3 mm . long; petals twice as long as the calyx. Ill. (according to Trelease); Fla. to La. June-Aug.
6. Linum striàtum Walt. Ridged Yellow Flax. (I. F. f. 2263.) Perennial, racemosely branched, light green and somewhat viscid. Leaves usually opposite nearly up to the inflorescence, oblong; branches of the panicle short and divergent; flowers small, often clustered; capsule subglobose, usually rather longer than the sepals. In bogs and swamps, rarely in drier ground, Ont. to Conn., Fla., Ky., Ark. and Tex. Summer.
7. Linum sulcàtum Riddell. Grooved Yellow Flax. (I. F. f. 2264.) Annual, 3-6 dm. high. Stem wing-angled and grooved, at least above; leaves alternate, lanceolate or linear, $1.6-2.4 \mathrm{~cm}$. long, $2-3 \mathrm{~mm}$. wide, 3 -nerved, the lower glabrous; sepals glandular-ciliate; stipules a pair of small globose darkcolored glands; flowers racemose or corymbose, about 1.2 cm . broad; pedicels $2-8$ mm . long; sepals lanceolate, acute, slightly longer than the ovoid, acute, incompletely ro-celled pod; styles separate above the middle; septa of the capsule ciliate. In dry soil, Ont. to Manitoba, Conn., Ga., Kans. and Texas. Summer.
8. Linum rígidum Pursh. Large-flowered Yellow Flax. (I. F. f. 2265.) Perennial (?), I.5-4 dm. high, glaucous, glabrous or puberulent. Branches stiff, angular; leaves erect, linear or linear-lanceolate, $8-24 \mathrm{~mm}$. long, $\mathrm{I}-2 \mathrm{~mm}$. wide, acute or mucronate, the upper ones glandular-serrulate or ciliate; stipular glands minute, globose, sometimes wanting; flowers yellow, $\mathbf{1} .8-3 \mathrm{~cm}$. broad: sepals lanceolate, acute or awn-pointed, glandular-serrulate; petals cuneate-obovate, twice the length of the sepals; styles separate only at the summit; capsule ovoid, 5 -valved, shorter than the sepals. Prairies, S. Dak. to Manitoba, Mo., Tex.. N. Mex., Ariz. and Mex. Summer.
9. Linum cathàrticum L. Dwarf or Cathartic Flan. (I. F. f. 2266.) Annual, slender, $7 \cdot 5-20 \mathrm{~cm}$. high. Leaves opposite, sessile, oval or somewhat obovate, entire, 4-8 mm . long; flowers 4-6 mm . broad, on long slender erect or ascending pedicels; sepals lanccolate, acute or acuminate; petals olowate; pod small, globose. Along a low sandy seashore, l'ictou, N. S. Apparently nat. from Europe. July-Aug.

## Family 4. ZYGOPHYLLÀCEAE Lindl.

Caltrop Family.

Herbs, shrubs, or some tropical species trees, the branches often jointed to the nodes. Leaves mostly opposite, stipulate, pinnate, or 2-3foliolate, the leaflets entire. Stipules persistent. Flowers perfect, axillary, peduncled. Sepals usually 5, distinct, or united by their bases. Petals the same number as the sepals, or none. Stamens as many as the petals, or $2-3$ times as many, inserted on the base of the receptacle, the alternate ones sometimes longer ; anthers versatile, longitudinally dehiscent; filaments usually with a small scale at the base or near the middle. Ovary 4-12-celled; style terminal ; stigma usually simple; ovules i-numerous in each cavity, pendulous or ascending. Fruit various, dry in our species. About 20 genera and 150 species, widely distributed in warm and tropical regions.
Fruit spiny, splitting into 53-5-seeded segments.

1. Tribulus.

Fruit not spiny, often tubercled, splitting into 10-12 I-seeded segments. 2. Kallstroemia.

## 1. TRÍBULUS L.

Herbs, with evenly pinnate leaves and peduncled axillary yellow flowers. Sepals 5, persistent. Petals 5, deciduous. Stamens 10, the alternate ones somewhat longer. Ovary sessile, 5 -lobed, 5 -celled, hairy, the hairs erect; style short; stigma 5 -ridged; ovules $3-5$ in each cavity, pendulous. Fruit 5 -angled, spiny, splitting into $53-5$-seeded segments. [Greek, three-pronged, Caltrop, from the resemblance of the fruit to that implement.] About 12 species, of warm and tropical regions. Besides the following, another occurs in the Southwestern States.
I. Tribulus terréstris L. Ground Bur-nut. Land Caltrop. (I. F. f. 2267.) Pubescent, the stem prostrate or ascending, sometimes 3 dm . long or more. Leaves petioled; stipules small; leaflets $4^{-8}$ pairs, oblong, inequilateral, opposite, short-stalked, $6-16 \mathrm{~mm}$. long; flowers solitary, about 1.2 cm . broad, peduncled; petals oblong, about as long as the sepals; segments of the fruit usually with 2 long spines, 2 shorter ones, and a row of very short ones forming a crest on the back, also commonly with some bristle-like hairs. In ballast and waste places about the Eastern seaports, and in central Neb. Fugitive from Europe. June-Sept.

## 2. KALLSTROEMMA Scop.

Mostly annual pubescent herbs, with opposite stipules, evenly pinnate leaves, and solitary axillary peduncled yellow flowers. Sepals usually 5. Petals the same number, obovate or oblanceolate, deciduous. Stamens twice as many as the petals. Ovary sessile, 10-12 celled; ovule I in each cavity, pendulous; style long, or short, IO-12 grooved, persistent; stigma mostly 10-12-ridged. Fruit 10-12lobed, not spiny, often tuberculed, splitting into IO-I2 I-seeded segments. [In honor of Kallstroem.] About Io species, widely distributed in warm and tropical regions. Besides the following, 3 others occur in the Southern and Western States.
I. Kallstroemia maxima (L.) T. \& G. Greater Caltrop. (I. F. f. 2268.) Branches slender, prostrate, 1.5-4.5 dm. long. Leaves short-petioled; stipules subulate; leaflets 3-5 pairs, oval or oblong, inequilateral, rounded or subcordate at the base, $8-20 \mathrm{~mm}$. long; peduncles slender, $1.2-5 \mathrm{~cm}$. long in fruit; flowers 2.5 cm . broad, or less; sepals linear-lanceolate, very pubescent, persistent, shorter than the petals; fruit ovoid-conic, about 6 mm . in diameter, about as long as the stout persistent style, the segments tubercled. In dry soil, Kans. to Ga., Fla. and Tex. Also in tropical Am. April-Sept.

## Family 5. RUTÀCEAE Juss.

## Rue Family.

Trees or shrubs, rarely herbs, with heavy-scented and glandularpunctate foliage, mainly compound exstipulate leaves, and (in our species) polygamo-diœcious generally cymose flowers. Sepals 4 or 5 , or none. Petals 4 or 5 , hypogynous or perigynous. Stamens of the same number, or twice as many, distinct, inserted on the receptacle; anthers 2-celled, mostly versatile. Disk annular. Pistils 2-5, distinct, or 1 and compound of $2-5$ carpels, inserted on the receptacle. Fruit (in our species) a capsule, or samara. Seeds oblong or reniform; endosperm generally fleshy, sometimes none. About ino genera and 880 species, most abundant in South Africa and Australia.

Pistils 2-5, distinct; fruit fleshy, capsular.
Pistil I, 2-celled; fruit a samara.

1. Xanthoxylum. 2. Ptelea.

## I. XANTHÓXYLUM L.

Trees or shrubs with alternate odd-pinnate leaves, the twigs and petioles commonly prickly. Flowers axillary or terminal, cymose, whitish or greenish, mostly small. Sepals 4 or 5 , or none. Petals imbricated. Staminate flowers with 4 or 5 hypogynous stamens. Pistillate flowers with $2-5$ distinct pistils, rarely with some stamens. Carpels 2 -ovuled. Pods 2 -valved, $\mathbf{1}-2$-seeded. Seeds oblong, black and shining. [Greek, yellow-wood.] About IIO species, of temperate and tropical regions. In addition to the following, 2 others occur in the Southern States.

| Flowers in small sessile axillary cymes; calyx none. | I. X. Americanum. |
| :--- | :--- |
| Flowers in large terminal compound cymes; calyx present. | 2. X. Clava-Herculis. |

## I. Xanthoxylum Americanum Mill. Prickly Ash. Toothache-tree.

 (I. F. f. 2269.) A shrub, or small tree. Leaves pubescent when young, glabrous or nearly so when old; leaflets 5-1I, ovate, opposite, dark green above, lighter beneath, $3-5 \mathrm{~cm}$. long, crenulate or entire, acutish; flowers greenish, about 3 mm . broad, borne on the wood of the previous season and appearing before the leaves; pistils 2-5; capsules black, ellipsoid, about 4 mm . long, short-stiped, 1-2-seeded. In woods and thickets, Quebec to Va., S. Dak., Neb. and Kans. April-May.2. Xanthoxylum Clàva-Hérculis L. Southern Prickly Ash. Sea Ash. Pepper-wood. (I. F. f. 2270.) A small, very prickly tree, the prickles supported on cushions of cork sometimes 2 dm . broad. Leaves glabrous, shining above, dull beneath; leaflets $5 \mathbf{- 1 7}$, obliquely ovate, $3-7.5 \mathrm{~cm}$. long, acute, crenulate; flowers greenish white, appearing before the leaves; pistils 2 or 3 ; capsules about 4 mm . long, sessile. Along streams, Va. to Fla., Ark. and Tex. June.

## 2. PTELEA L.

Shrubs or small trees, without prickles, the bark bitter. Leaves $3-5$-foliolate; flowers greenish white, polygamous, corymbose-paniculate; calyx 4-5-parted, the lobes imbricated; petals 4 or 5 , much longer than the calyx, also imbricated; stamens 4 or 5 , alternate with the petals; filaments hairy on the inner side, present in the pistillate flowers but the anthers abortive or wanting; ovary flattened. z-celled (rarely 3 -celled)s fruit nearly orbicular, 2 -winged (rarely 3 -winged), indehiscent: cells I-seeded; seed oblong-ovoid. [Greek, Elm.] About 6 species, natives of the U. S. and Mex.

1. Ptelea trifoliàta L. Three-Leaved Hop-tree. Shrubby Trefoll. (I. F. f. 227 I.) A shrub or small tree. Leaves 3 -foliolate, pubescent when young, glabrate when old; leaflets $5-12 \mathrm{~cm}$. long; crenulate; flowers about I cm. broad; odor disagreeable; sepals 1 mm . long, obtuse; petals about 6 mm . long, oblong: samara $\mathbf{1} .6-\mathbf{I} .8 \mathrm{~cm}$. in diameter, the wing membranous and reticulated, emarginate. In woods, Conn. to Fla., S. Ont., Minn., Kans. and Tex. June.

## Family б. SIMARUBÀCEAE DC.

## Ailanthus Family.

Trees or shrubs, with bitter bark, and mainly alternate and pinnate, not punctate leaves. Stipules minute or none. Inflorescence axillary, paniculate or racemose. Flowers regular, diœcious or polygamous. Calyx 3-5-lobed or divided. Petals 3-5. Disk annular or elongated, entire or lobed. Stamens of the same number as the petals, or twice as many; anthers 2 -celled. Ovaries 2-5, or single and 2-5-lobed, 1-5-celled ; styles 1-5. Seeds generally solitary in the cavities. About 27 genera and 145 species, natives of warm or tropical regions.

## I. AILÁNTHUS Desf.

Large trees, with odd-pinnate leaves, and terminal panicles of greenish white flowers. Calyx short, 5 -cleft, the lobes imbricated; petals 5 , spreading, valvate; disk ro-lobed; staminate flowers with 10 stamens inserted at the base of the disk; pistillate flowers with a deeply $2-5$-cleft ovary, its lobes flat, cuneate, 1 -celled, and 2-3 stamens; ovules solitary in each cavity; samaras 2-5, linear or oblong, membranous, veiny, I-seeded at the middle: seed compressed; cotyledons nearly orbicular. [From the Chinese name.] Three species, natives of China and the E. I.
I. Ailanthus glandulòsa Desf. Tree-of-heaven. Ailanthus. (I. F. f. 2272.) A tree, $12-27 \mathrm{~m}$. high. Leaves 3-9 dm. long, glabrous; leaflets 13-41, stalked, ovate or ovate-lanceolate, cordate or truncate and often oblique at the base; flowers greenish, about 6 mm . broad, pedicelled, the staminate ones ill-scented; samaras twisted, nearly 5 cm . long. Escaped from cultivation, along roadsides and in fields, spreading extensively by suckers, and seeding freely in some localities, S. Ont. to Mass., Va. and Kans. Nat. from China. June-July.

## Family 7. POLYGALÀCEAE Reichenb. <br> Milkwort Family.

Herbs, rarely shrubs or small trees in tropical regions. Stipules none. Pedicels generally 2-bracted at the base. Flowers perfect, irregular. Sepals 5, the two lateral ones (wings) large, colored, the others smaller. Petals 3 (or 5), hypogynous, more or less united into a tube, the lower one often crested. Stamens generally 8, united in I or 2 sets. Ovary 2-celled; style simple; stigma curved, dilated or lobed; ovules I in each cavity, anatropous. Fruit mainly capsular. Seeds generally caruncled; embryo straight. About 10 genera and 750 species, widely distributed.

## 1. POLÝGALA L.

Herbs or shrubs. Flowers racemose, spicate or capitate, rarely solitary and axillary, sometimes also cleistogamous and subterranean. Sepals very unequal, the two lateral ones large and petaloid. Petals 3 , united into a tube which is split on the back, and more or less adnate to the stamens. Stamens 8 or 6 , monadelphous below, or diadelphous; capsule membranous, compressed, dehiscent along the margin. Seeds I in each cavity, generally hairy. [Greek, much milk.] A genus of about 260 species, of wide distribution. Besides the following, about 36 others occur in southern and western N. Am.

[^30]Leaves verticillate and alternate; spikes $4-6 \mathrm{~mm}$. thick, acute.
Verticillate leaves predominating; spikes dense; flowers green to purplish.
6. P. verticillata.

Alternate leaves predominating; spikes loose, long; flowers more purple.
7. P. ambigua.

Leaves all alternate.
Petals united into a cleft tube, $6-8 \mathrm{~mm}$. long; flowers pink. 8. $P$. incarnata.
Petals not conspicuously united into a tube.
Spikes ovoid to globose.
Bracts persistent; flowers rose-purple to white.
Spikes blunt; wings broadly ovate. 1. 9. P. viridescens.
Spikes acutish ; wings narrowly ovate or elliptic. 10. P. Curtissii. Bracts deciduous; flowers rose-purple: II. P. Mariana.
Spikes cylindric.
Leaves oblanceolate to linear, 4-12 mm. long; flowers greenish to purplish.
12. P. Nuttallii.

Leaves lanceolate, $2.5-5 \mathrm{~cm}$. long, flowers white or greenish. 13. P. Senega. Spikes elongated-conic; flowers white. 14. P. alba.

*     *         * Flowers distinctly racemose, rose or purple.

15. P. polygama.
**** Flowers 1-4, large, axillary, but apparently terminal, rose-purple to white.
16. P. paucifolia.
17. Polygala cymòsa Walt. Tall Pine-barren Milkwort. (I. F. f. 2273.) Stem erect, 6-9 dm. high, slightly angular. Basal leaves $5-7.5 \mathrm{~cm}$. long, 4-6 mm. wide, entire, densely tufted; stem-leaves linear-subulate, scale-like, 1-1. 6 cm . long; pedicels $2-4 \mathrm{~mm}$. long; bracts persistent; flowers drying greenish black; seeds globose, minute, nearly glabrous; caruncle none. In wet pine barrens, Del. to Fla., west to La. May-July.
18. Polygala ramòsa Ell. Low Pine-barren Milkwort. (I. F. f. 2274.) Stems tufted or single, $1.5-4 \mathrm{dm}$. high. Stem-leaves linear-oblong, obtuse, I.2-2 cm . long, 2-4 mm. wide; basal leaves much broader and often larger; inflorescence $7 \cdot 5-15 \mathrm{~cm}$. broad; flowers 3 mm . long, drying dark green; pedicels 2 mm . long or less; wings oblong, acuminate; crest minute; seed hairy, twice or thrice as long as the caruncle. In low pine barrens, Del. to Fla., west to La. June-Sept.
19. Polygala lùtea L. Orange Milkwort. Wild Bachelor’s Button. (I. F. f. 2275.) Stems tufted, at length divaricately branched, I.5-3 dm. high. Stemleaves oblong-lanceolate, acute or obtuse, $1.5-3 \mathrm{~cm}$. long, $4^{-8} \mathrm{~mm}$. wide, entire; spike-like racemes ovoid or oblong, very dense, $\mathbf{I} .25-4 \mathrm{~cm}$. long, $\mathbf{I} .2-1.8 \mathrm{~cm}$. thick, obtuse; flowers $4-6 \mathrm{~mm}$. long; pedicels $2-4 \mathrm{~mm}$. long; wings oblong-ovate, abruptly acuminate; crest of the corolla-tube minute; caruncle-lobes linear, about equalling the hairy seed, or shorter. In pine-barren swamps, L. I. to Fla., Pa. and La. June-Oct.
20. Polygala cruciàta L. Cross-leaved or Marsh Milkwort. (I. F. f. 2276.) Erect, I-4 dm. high, at length freely branching above. Stem square or slightly wing-angled; leaves of the stem and branches in 4's, or a few of them scattered, linear or oblanceolate, $\mathbf{1 . 2 5 - 4} \mathrm{cm}$. long, $2-4 \mathrm{~mm}$. wide, entire, obtuse, mucronulate; spike-like racemes oval, $8-18 \mathrm{~mm}$. thick, sessile or short-peduncled; pedicels slender, $3-4 \mathrm{~mm}$. long; bracts persistent; wings sessile, somewhat cordate, $3^{-6} \mathrm{~mm}$. long, much exceeding the pods; crest of the corolla minute; seed oblong, slightly hairy, about equalling the caruncle. In sandy swamps, Me. to Fla., Minn. and La. July-Sept.
21. Polygala brevifòlia Nutt. Short-leaved Milkwort. (I. F. f. 2277.) Resembling the preceding species, but lower, more slender and weaker. Leaves shorter, often scattered on the branches and upper part of the stem; spikes smaller, $6-10 \mathrm{~mm}$. thick, on slender peduncles; wings obtuse or mucronulate. In sandy swamps, R. I. to Fla. and Miss. Summer.
22. Polygala verticillàta L. Whorled Milkwort. (I. F. f. 227S.) Slender, 1.5-3 dm. high, usually branched. Stem-leaves linear, $6-30 \mathrm{~mm}$. long, 1-4 mm . wide, acute, entire, punctate, mucronulate, mostly in 4's or 5 's, with some scattered ones on the stem or branches; spikes conic, long-peduncled, acute. +mm . thick at the base, very dense, $8-20 \mathrm{~mm}$. long; pedicels about 1 mm . long; wings broadly oval, distinctly clawed, shorter than the pod; crest of the corolla manifest; seed oblong, hairy, twice the length of the caruncle; bracts deciduous. In dry or moist soil, Quebec and Ont. to Minn., Saskatch., Fla., Colo. and Mex. June-Nov.
23. Polygala ambígua Nutt. Loose-spiked Milkwort. (I. F. f. 2279.) Resembling the preceding species, but often taller, I-4 dm. high, slender. Lower stem-leaves commonly verticillate, but the others all alternate; spikes long, loose, the lower flowers often quite distant; peduncles often several inches long; flowers rather larger: wings purple or purplish, nearly circular in outline; mature capsule hardly longer than the wings, which are appressed to it; seed hairy. In dry soil, Me. to Ga., Mo. and La.
24. Polygala incarnàta L. Pink Milkwort. (I. F. f. 2280.) Erect, glaucous, very slender, 3-6 dm. high; stem-leaves distant, linear or subulate, sessile, $2-12 \mathrm{~mm}$. long, rarely wanting; spike dense, $2.5-3.75 \mathrm{~cm}$. long, 4-8 mm. thick; pedicels 1 mm . long or less; bracts minute or none; flowers $\mathrm{I}-\mathrm{I} .2 \mathrm{~cm}$. long; corollatube slender, $2-5$ times the length of the wings, its keel prominently crested; wings cuspidate; seed hairy, the caruncle-lobes enveloping its beaked extremity. In dry soil, Ont. to Wis., N. J., Fla., Kans. and Mex. Summer.
25. Polygala viridéscens L. Field or Purple Milkwort. (I. F.f. 228I.) Erect, I.5-4 dm. high, at length branching above, leafy. Stem somewhat angled; stem-leaves oblong or linear-oblong, $1.6-3 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, mucronulate; heads becoming oval, $8-12 \mathrm{~mm}$. thick; pedicels about I mm . long; flowers rose-purple, greenish or sometimes white; wings sessile, sometimes slightly cordate, exceeding the pod; seed obovoid, hairy, about the length of the caruncle; crest minute. In fields and meadows, N. S. to N. Car., Minn., Kans. and La. June-Sept. The contrast between the green-flowered and purple-flowered forms is striking where the two grow together.
26. Polygala Curtíssii A. Gray. Curtiss' Milkwort. (I. F. f. 2282.) Erect, slender, $2-2.5 \mathrm{dm}$. high, much resembling the preceding species and the following; heads globose or rarely elongated, loosely flowered, $8-12 \mathrm{~mm}$. thick; wings clawed, nearly erect, twice the length of the pod; seed obovoid, very hairy, apiculate; caruncle minute, much shorter than the seed. In dry soil, Penn. to Ky. and Ga. Aug.-Sept.
if. Polygala Mariàna Mill. MarylandMilkwort. (I. F. f. 2283.) Slender, $1.5-4 \mathrm{dm}$. high, at length much branched above; stem-leaves linear, 6-18 mm . long. about 2 mm . wide, entire, mostly acute, mucronulate; heads globose or slightly longer than thick, obtuse, $6-8 \mathrm{~mm}$. wide; pedicels slender, 3-4 mm . long; flowers rose-purple; wings ovate-oblong or obovate, pointed, narrowed at the base, slightly longer than the pod; caruncle-lobes embracing the smaller extremity of the slightly hairy obovoid seed; corolla minutely crested. In dry soil, southern N. J. to Fla., Ky. and La. July-Sept.

I2. Polygala Nuttallii T. \& G. Nuttall's Milkwort. (I. F. f. 2284.) Erect, slender, I-2 dm. high, branching above; stem-leaves numerous, $\mathrm{I}-2 \mathrm{~mm}$. wide, entire; spikes about 4 mm . thick, $6-12 \mathrm{~mm}$. long, the floral axis elongating as the fruits fall away from below; pedicels 1 mm . long or less; bracts subulate, persistent; flowers greenish or yellowish purple, 2 mm . long; seed obovoid, very hairy, longer than the caruncle; wings oblong to oval, about equalling the pod; crest very small. In dry sandy soil, Eastern Mass. to N. Car., Mo. and Ala. Aug.Sept.
13. Polygala Sénega L. Seveca Syakeroot. Mountain Flax. (I. F. f. 2285.) Stems several, from woody rootstocks, erect or ascending, $1.5-3 \mathrm{dm}$. high; leaves alternate, sessile, $6-8 \mathrm{~mm}$. wide, serrulate, the lowest much smaller and scale-like; spike short-peduncled. dense, acute, $2.5-5 \mathrm{~cm}$. long; flowers 3 mm . long, white or tinged with green; pedicels less than I mm. long; wings orbicularobovate, concave; crest of the corolla short, few-lobed; seed hairy, slightly longer than the lobes of the caruncle. In rocky woods, N. B. to Minn. and the Canadian Rocky Mts., N. Car. and Ark. May-June.

Polygala Sénega, latifôlia T. \& G. Stem taller, often branched; leaves ovate or ovate-oblong, $5-\mathrm{rocm}$. long, acuminate, acute at the base. Ont. to S. Dak., Md. and Tenn.
14. Polygala álba Nutt. White Milkwort. (I. F. f. 2286.) Stems numerous, erect from hard woody rootstocks, slender, 1.5-4 dm. high. Leaves alternate, narrowly linear, acute, $6-24 \mathrm{~mm}$. long, $\mathrm{I}-2 \mathrm{~mm}$. wide, their margins entire and revolute, the lower somewhat broader and shorter, clustered; spike long-peduncled, dense, $2.5-5 \mathrm{~cm}$. long; flowers $2-3 \mathrm{~mm}$. long; pedicels less than

1 mm . long; wings oblong-ovate, slightly concave; crest of the corolla short; seeds silky, about twice the length of the caruncle-lobes. Plains, S. Dak. to Mex. and Arizona. May-July.
15. Polygala polýgama Walt. Racemed Milkwort. (I. F. f. 2287.) Stems simple, $\mathbf{I}-5 \mathrm{dm}$. high, from a deep biennial root. Stem-leaves crowded, oblong or oblanceolate, obtuse, mucronulate, $1.6-2.5 \mathrm{~cm}$. long, 2-4 mm. wide, entire, the lower smaller; basal leaves spatulate; raceme $2.5-10 \mathrm{~cm}$. long; pedicels $2-4 \mathrm{~mm}$. long; flowers rarely white, showy, $4-6 \mathrm{~mm}$. long; wings broadly obovate; crest of the corolla large, laciniate; stamens 8; subterranean branches horizontal, bearing numerous, cleistogamous flowers; seeds hairy, longer than the carunclelobes. In dry soil, N. S. to Manitoba, to Fla. and Tex. June-July.
i6. Polygala paucifòlia Willd. Fringed Milkwort. Flowering Wintergreen. Gay-wings. (I. F. f. 2288.) Glabrous, perennial by slender prostrate stems. Flowering branches I-2 dm. high; leaves of the summits of the stems clustered, ovate or oblong, $2-4 \mathrm{~cm}$. long, acute, rough-margined, with petioles 4-8 mm . long; those of the lower part of the shoots successively smaller, distant, the lowest scale-like; flowers I-4, axillary to the upper leaves, $1.4-2 \mathrm{~cm}$. long, slenderpeduncled, rose-purple or rarely white, showy; wings obovate; crest of the corolla beautifully fimbriate; seed slightly shorter than the caruncle; cleistogamous subterranean flowers few, on short lateral branches. In moist rich woods, N. B. and Anticosti to Saskatch., Ga. and Ill. May-July.

## Family 8. EUPHORBIACEAE J. St. Hil.* <br> Spurge Family.

Monœcious or diœcious herbs, shrubs or trees, with acrid often milky sap. Leaves opposite, alternate or verticillate. Flowers sometimes much reduced and subtended by an involucre which resembles a calyx (Euphorbia), the number of parts in the floral whorls often different in the staminate and pistillate flowers. Ovary usually 3-celled; ovules i or 2 in each cavity, pendulous; styles mostly 3, simple, divided, or many-cleft. Fruit a mostly 3-lobed capsule, separating, often elastically, into 3 2-valved carpels from a persistent axis. Seeds anatropous; embryo in fleshy or oily endosperm, the broad cotyledons almost filling the seed-coats. About 210 genera and 4000 species, of wide distribution.
Flowers not in an involucre, with a true calyx.
Ovules 2 in each cavity of the ovary.
Petals wanting ; stamens usually 3 .
Petals present, at least in staminate flowers; stamens 5 or 6.

1. Phyllanthus. Ovule I in each cavity of the ovary.

Plants clothed with stellate pubescence, or scales.
Ovary, and dehiscent capsule $2-4$-celled, mostly 3 -celled. 3. Croton.
Ovary, and capsule i-celled, achene-like. 4. Crotonopsis.
Plants variously pubescent, with simple hairs, these sometimes gland-tipped.
Inflorescence spicate, racemose or of axillary clusters.
Flowers with petals.
Flowers without petals. Styles many-cleft. 6. Acalypha. Styles simple, somewhat united at the base. 7. Tragia. Inflorescence cymose.
Plants glabrous or nearly so.
Inflorescence racemose, somewhat panicled; pistillate flowers above the staminate.
8. Ricinus.

Inflorescence spicate; pistillate flowers below the staminate. 1о. Stillinsiz. Flowers in an involucre, the calyx represented by a minute scale at the base of the fila-ment-like pedicel.
11. Euphorbia.

## r. PHYLLÁNTHUS L.

Annual or biennial herbs (some tropical species shrubs or trees). Leaves alternate, entire, often so arranged as to appear like the leatlets of a compound leaf. Flowers monœecious, apetalous, a staminate and a pistillate one together in the axils.

[^31]Calyx mostly 5-6-parted, the lobes imbricated. Stamens usually 3. Ovules 2 in each cavity; styles 3, each 2-cleft. [Greek, leaf-flower, the blossoms in some species being seated on leaf-like flattened branches.] More than 400 species, natives of the tropical and temperate zones of both hemispheres.

1. Phyllanthus Carolinénsis Walt. Carolina Phyllanthus. (I. F. f. 2289.) Annual; glabrous. Stem slender, I-5 dm. high, the branches 2 -ranked; leaves obovate or oblong, $6-20 \mathrm{~mm}$. long, obtuse; flowers inconspicuous, nearly sessile in the axils; calyx 6-parted, its lobes linear or oblong; glands of the pistillate flower more or less united; capsule about 2 mm . in diameter; seeds 1 mm . long, marked with lines and minute black papillæ. In sandy or gravelly soil, eastern Penn. to Ill., Kans., Fla., Tex. and Cent. Am. May-Oct.

## 2. ANDRÁCHNE L.

Herbs, or shrubby plants, with diffusely branching stems. Leaves alternate. Flowers monœecious, axillary, the staminate often clustered, with a 5 - 6 -lobed calyx, 5 or 6 petals, and 5 or 6 stamens; pistillate flowers solitary, with a 5-6-lobed calyx, minute petals, or these wanting; styles 2 -cleft or 2 -parted; ovules 2 in each cavity. [From the Greek for Portulaca.] About Io species, of wide distribution.

1. Andrachne phyllanthoides (Nutt.) Muell. Arg. Northern Andrachne. (I. F. f. 2289a.) A straggling much branched shrub, 3-10 dm. tall, with glabrous lustrous branches and minutely pubescent twigs. Leaves obovate or oval, o.81.8 cm . long, retuse or obtuse, often mucronulate, paler beneath than above; pedicels filiform, $6-20 \mathrm{~cm}$. long, glabrous; calyx-segments oblong-obovate, $\mathbf{I} .5-3 \mathrm{~mm}$. long; petals of two kinds, those of the staminate flowers narrowly obovate or oblong-obovate, 3 - 5 -toothed, those of the pistillate flowers smaller, broadly obovate, entire; capsule subglobose. On rocky barrens, Mo. to Ark. and Tex. Summer.

## 3. CROTON L.

Herbs or shrubs, strong-scented, stellate-pubescent. Leaves mostly alternate, sometimes with 2 glands at the base of the blade. Flowers often spicate or racemose. Staminate flowers uppermost; calyx 4-6-parted (usually 5-parted); petals usually present, but small or rudimentary, alternating with glands; stamens 5 or more. Pistillate flowers below the staminate; calyx 5-10-parted; petals usually wanting; ovary mostly 3 -celled; ovule I in each cavity; styles once, twice or many times 2-cleft. [The Greek name of the Castor-oil plant.] About 600 species, mostly of warm and tropical regions, a few in the temperate zones.

Plants monœcious.
Leaves toothed ; staminate calyx 4-lobed, pistillate 5 -lobed. 1. C. glandulosus.
Leaves entire ; staminate calyx 3-5-lobed, pistillate 5-12-lobed. Capsules conspicuously clustered, not nodding. 2. C. capitatus. Capsules solitary or never conspicuously clustered, nodding.

$$
\begin{array}{ll}
\text { Foliage whitish; capsules } 6-7 \mathrm{~mm} \text {. long. } & \text { 3. C. Lindheimerianus. } \\
\text { Foliage silvery ; capsules } 4-5 \mathrm{~mm} \text {. long. } & \text { 4. C. monanthogynus. }
\end{array}
$$

Plant diœcious.
I. Croton glandulòsus L. Glandular Croton. (I. F. f. 2290.) Deep green, rough with stellate hairs, and somewhat glandular. Stem $2-7.5 \mathrm{dm}$. high, corymbosely branched; leaves oblong, linear-oblong or ovate, $\mathbf{I} .2-7.5 \mathrm{~cm}$. long, bearing 2 glands at the base of the blade; staminate flowers in spikes, with 4 petals, a 4-rayed glandular disk and 8 stamens; pistillate flowers several, with rudimentary petals; capsule subglobose, about 5 mm . in length; seeds oblong, minutely wrinkled. In sandy soil, Va. to Ia. and Kans., south to Fla. and Cent. Am. Also in the W. I. and S. Am. March-Dec.
2. Croton capitàtus Michx. Capitate Croton. Hogwort. (I. F. f. 2291.) Silvery green, densely stellate-pubescent. Stem usually corymbosely branched above; leaves lanceolate, oblong or rarely ovate, often undulate; flowers clustered at the ends of the branches, the staminate racemose, with a 5 -parted calyx, 5 petals, and 10-14 stamens; pistillate flowers several, sessile, with 7-12 sepals, no petals: capsule depressed-globose, $6-7 \mathrm{~mm}$. in diameter; seeds gray or variegated, turtle-shaped. In dry soil, N. J. to Iowa, Ga. and Tex. May-Oct.

3 Croton Lindheimeriànus Scheele. Lindheimer's Croton. (I. F. f. 2292a.) Stems I-4 dm. tall, sometimes diffusely branched; leaves rather numer-
ous, the blades ovate to oblong-ovate, $\mathbf{r} .2-5 \mathrm{~cm}$. long, green above, undulate; pedicels $2-6 \mathrm{~mm}$. long, recurving; calyx slightly accrescent, its segments oblong or elliptic-oblong, becoming 4 mm . long, slightly keeled in age; capsules oval, 67 mm . long, tomentose, truncate-obtuse at both ends, drooping; seeds oblongelliptic, nearly 4 mm . long. In dry soil, Kans. to Tex. and N. Mex. Summer.
4. Croton monanthógynus Michx. Single-fruited Croton. (I. F.f. 2292.) Main stem slender, 1-2 dm. high, topped by a $3-5$-rayed umbel with rays 1-4 dm. long, forked or umbellately branched; leaves ovate or oblong, $1-3 \mathrm{~cm}$. long; staminate flowers clustered at the ends of erect peduncles, with $3-5$ unequal calyx-segments, the same number of petals and scale-like glands, and 3-8 stamens; pistillate flowers mostly solitary, on recurved pedicels, with 5 equal calyx-segments, no petals, and 5 glands; capsule ovoid or oblong-ovoid, $4-5 \mathrm{~mm}$. long; seeds oval or orbicular, variegated, minutely pitted, shining. In dry soil, N. Car. to Ind. and Kans., south to Fla. and Mex. June-Oct.
5. Croton Texénsis (Klotzsch.) Muell. Arg. Texas Croton. (I. F. f. 2293.) Stem rather slender, $2-6 \mathrm{dm}$. high, paniculately or corymbosely branched; leaves ovate to linear-oblong or almost linear, $2-7.5 \mathrm{~mm}$. long; staminate flowers racemose; pistillate flowers sessile or nearly so, in stalked clusters; calyx equally 5 -parted, the segments ovate; petals none; glands 5 , minute; stamens mostly 10 ; capsule subglobose, 5-6 mm. in diameter, somewhat muricate; seeds ovoid or oval, variegated, finely reticulated. In dry soil, S. Dak. to Mo., Ala. and N. Mex. June-Sept.

## 4. CROTONÓPSIS Michx.

Annual slender silvery-scurfy monœcious herbs with narrow alternate or rarely opposite leaves. Staminate flowers uppermost in the clusters, with an equally .5 parted calyx, 5 petals and 5 inflexed stamens opposite the petals enlarged at the summit. Pistillate flowers with 3-5 parted calyx, no petals, 5 petal-like glands opposite the calyx-segments, and a I-celled ovary; ovule I. Fruit a small scaly or spiny achene-like capsule. Seed longitudinally wrinkled. [Greek, Croton-like.] Two known species, natives of the southeastern U. S.
I. Crotonopsis lineàris Michx. Crotonopsis. (I. F. f. 2294.) Foliage covered with peltate somewhat fringed scales, except on the green upper surfaces of the leaves. Stem wiry, I-5 dm. high; leaves oblong-ovate to linear-lanceolate, $\mathbf{1}-3 \mathrm{~cm}$. long, entire; staminate flowers with spatulate petals; achene-like capsule ovoid-elliptic; seed ovoid, $2-3 \mathrm{~mm}$. long. In dry sandy soil, N. J. to Kans., south to Fla. and Tex. July-Sept.

## 5. DITÁXIS Vahl.

Monœcious perennial herbs, or shrubs. Leaves alternate, often strongly nerved. Flowers often racemed, usually bracted. Staminate flowers often crowded at the ends of the racemes; calyx 4-5-lobed, the lobes valvate; petals 4 or 5 , alternate with the calyx-lobes and with the lobes of the disk; stamens of the same number as the petals or two or three times as many, united into a column. Pistillate flowers with the calyx-lobes imbricated and smaller petals, the ovary 3-celled. Capsule 3-lobed, depressed. Seeds sometimes crested. [Greek, double-ranked, in allusion to the stamens.] About 20 species, natives of temperate and tropical regions.

Flowers in terminal and axillary racemes; leaves sessile.
Flowers in axillary clusters; leaves short-petioled.

1. D. mercurialina. 2. D. Iumilis.
2. Ditaxis mercuriàlina (Nutt.) Coult. Tall Ditaxis. (I. F. f. 2205.) Stem strict, silky, -6 dm . high. Leaves ovate to narrowly lanceolate, $2-5 \mathrm{~cm}$. long, undulate, often strongly 3 -nerved; staminate flowers with lanceolate or linear-lanceolate acute ciliate calyx-segments, and spatulate-oblong undulate petals; pistillate flowers with a 5 -parted calyx, the segments lanceolate, spreading, 3 times as long as those of the staminate; capsules 6-0 mm. in diameter. somewhat silky; seeds globose-ovoid, 4 mm . long, pointed, wrinkled. In dry soil. Kans. and Ark. to Tex. Lower leaves somewhat oblanceolate. April-July.
3. Ditaxis hùmilis (Engelm. \& Gray) Pax. Low DrTaxis. (I. F. f. 2206.) Stem much branched, the branches spreading. $1-3 \mathrm{dm}$. long. Leaves ovate, ob. long, obovate or oblanceolate, $\mathbf{x}-3 \mathrm{~cm}$. long; staminate flowers with petals a little
longer than the 5 caiyx-segments and longer than the lobes of the disk; pistillate flowers with a 5 -parted calyx ; capsule short-pedicelled, 4-6 mm . in diameter, 3-4lobed; seeds oval-globose, about 2 mm . long, muricate. Plains, Kans. to La. and Tex. March-Sept.

## 6. ACALỲPHAL.

Herbs or shrubs. Stems mostly erect. Leaves alternate, stipulate. Flowers in spikes or spike-like racemes, the staminate cluster peduncled, each flower in the axil of a minute bractlet, with a 4-parted calyx and 8-16 stamens united at their bases. Pistillate flowers subtended by a foliaceous bract, which often equals or overtops the staminate, the calyx 3 - 5 -parted; petals wanting in both kinds of flowers; capsule usually of 3 2-valved carpels, each I-seeded. [Greek, nettle.] About 230 species, mostly tropical and subtropical.
Staminate and pistillate flowers in separate spikes or racemes; capsule spiny.
I. A. ostryaefolia.

Staminate and pistillate flowers in the same spike or raceme; capsule smooth.
Plant not glandular; bract palmately many-lobed, equalling or exceeding the staminate spike.
2. A. Virginica.

Plant glandulaï; bract many-cleft, shorter than the spike.
3. A. gracilens.
I. Acalypha ostryaefolia Ridd. Hornbeam Three-seeded Mercury. (I. F. f. 2297.) Dark green, minutely pubescent. Stem erect, 3-8 dm. tall. Leaves thin, ovate, $6-10 \mathrm{~cm}$. long, short-acuminate, serrate, obtuse or cordate at the base, the petioles often as long as the blades; bractlets of the staminate flowers minute, those of the pistillate conspicuous, lobed; capsule much depressed, 3-lobed, $3-4 \mathrm{~mm}$. in diameter; seeds ovoid, 2 mm . long, wrinkled. N. J. to Kans., Fla. and Mex. June-Nov.
2. Acalypha Virgínica L. Virginia Three-seeded Mercury. (I F. f. 2298.) Dark green, or becoming purplish. Stem I-6 dm. tall; leaves ovate or elliptic, $2-10 \mathrm{~cm}$. long, thin, coarsely serrate except near the base; pistillate flowers I-3 at the base of the staminate peduncle; capsule 3-lobed, subglobose, about 3 mm . in diameter; seeds ovoid, reddish, striate. In woods and thickets, N. S. to Minn., Kans., Fla. and Tex. June--Oct.
3. Acalypha grácilens A. Gray. Slender Three-seeded Mercury. (I. F. f. 2299.) Pale green. Stem slender, $\mathbf{1}-8 \mathrm{dm}$. tall, the branches often nearly filiform; leaves lanceolate to linear-oblong, $\mathbf{I}-5 \mathrm{~cm}$. long, usually firm, acutish, serrate, narrowed to a short petiole; staminate spike very slender; pistillate flowers $\mathbf{I}$ or several; capsule subglobose, about 3 mm . in diameter; seeds globose-ovoid, dark red, or gray mottled with red, striate-pitted. In dry woods and thickets, Mass. to Kans., Fla. and Tex. June-Sept.

## 7. TRÀGIA L.

Monœcious herbs or shrubs, sometimes climbing, usually armed with stiff stinging hairs. Leaves alternate, mostly cordate; flowers in racemes, bracteolate, apetalous; staminate flowers with a 3-5-parted calyx and 1-3 or rarely numerous stamens; pistillate flowers with a 3-8-lobed calyx, the segments entire or pinnatifid, and 3 styles, often united to above the middle; capsule 3 -lobed, separating into 3 2-valved carpels. [From Tragus, the Latin name of Hieronymus Bock, 14981553, a German botanist.] About 50 species, mostly natives of tropical regions.
Stems not twining.
Staminate calyx 4-lobed; stamens 2. I. T. urens.
Staminate calyx 3-lobed; stamens 3 .
2. T. nepetaefolia.

Staminate calyx $4-5$-lobed; stamens 4 or 5 .
Stems twining.
3. T. ramosa.

1. Tragia ùrens L. Eastern Tragia. (I. F. f. 2300.) Dull green, pilose or hirsute. Stem erect, I-4 dm. tall, branched; leaves obovate or ovate to linear, entire or repand, short-petioled or sessile, 1.5 cm . long; spike-like racemes often I dm . long; pistillate flowers several at the base of the racemes, with a 5 -6-lobed calyx; capsule short-pedicelled, much depressed, 8 -10 mm . in diameter, sparingly pubescent; seeds subglobose, 4 mm . long, smooth. In sandy soil, Va. to Fla. and Tex. May-Aug.
2. Tragia nepetaefòlia Cav. Catnep Tragia. (I. F. f. 2301.) Hispid with stinging hairs. Stem erect or reclining, I.5-4 dm. long; leaves triangularovate or lanceolate, $\mathbf{I}-5 \mathrm{~cm}$. long, dentate-serrate, cordate, short-petioled, the lower sometimes orbicular; racemes $\mathbf{I - 4} \mathrm{cm}$. long, many-flowered; pistillate flowers with a 5-lobed calyx; capsule much depressed, 6 mm . in diameter, hirsute; seeds globose, chestnut brown, smooth, 4 mm . in diameter. In sandy soil, Kans. to Mex. and N. Mex. May-Oct.
3. Tragia ramòsa Torr. Branching Tragia. (I. F. f. 2302.) Light green, bristly with stinging hairs. Stem usually much branched, o. 5-3 dm. long; leaves lanceolate, ovate-lanceolate or triangular-lanceolate, $\mathbf{I . 2 - 5} \mathrm{cm}$. long, acute at the apex, coarsely and sharply serrate, truncate or cordate at the base, shortpetioled; racemes I-5 cm. long; pistillate flowers solitary, with a 5-lobed calyx subtended by a 3 -lobed bract; capsule much depressed, $6-8 \mathrm{~mm}$. in diameter, bristly; seeds globose, 4 mm . in diameter, orange, more or less variegated. In dry soil, Mo. to Tex., Colo. and Ariz. July-Aug.
4. Tragia macrocàrpa Willd. Twining or Large-fruited Tragia. (I. F. f. 2303.) Slightly hirsute. Stem 2.5-14 dm. long, twining; leaves ovate, $5-12 \mathrm{~cm}$. long, deeply cordate, coarsely dentate-serrate, acuminate; petioles mostly shorter than the blades; staminate flowers with a 3 -lobed calyx and 3 stamens; pistillate flowers with a 5 -lobed calyx; capsule depressed, $\mathbf{1 2 - 1 6 ~ m m}$. in diameter; seeds subglobose, 5 mm . long, smooth, variegated. In dry or rocky soil, Ky. to Mo., Fla. and Mex. June-Sept.

## 8. RÍCINUS L.

A tall stout monœcious herb, glabrous and glaucous, with alternate large peltate palmately lobed leaves, and numerous small apetalous greenish flowers in terminal racemes, the pistillate above the staminate. Staminate flowers with a 3-5-parted calyx, the segments valvate, and numerous crowded stamens; filaments repeatedly branched. Pistillate flowers with a caducous calyx. Capsule subglobose, or oval, separating into 3 2-valved carpels. Endosperm fleshy and oily. [The Latin name of the plant.] A monotypic genus of the warmer parts of Africa and Asia.
I. Ricinus commùnis L. Castor-oll Plant. Castor-bean. Palma Christi. (I. F. f. 2304.) Stem erect, I-5 m. tall, more or less branched, becoming tree-like in warm regions. Leaves nearly orbicular in outline, I-6 dm. broad, 6-II-palmately lobed and peltate, the lobes toothed, acute or acuminate; capsule $12-16 \mathrm{~mm}$. in diameter, usually spiny; seeds shining, smooth, black, variegated with white, or mottled with gray and brown markings. In waste places, escaped from cultivation, N. J. to Fla. and Tex. An imposing ornamental plant, and also of medicinal value.

## 9. JÁTROPHAL.

Monœcious or rarely diœcious perennial bristly herbs, or shrubs, with entire, lobed or divided leaves, the flowers in cymes. Staminate flowers on the upper parts of the cymes, with a corolla-like 5 -lobed calyx, 5 petals distinct or united, or none, the stamens usually numerous (5-30). Pistillate flowers in the lower forks of the cymes; capsule ovoid or subglobose, easily separating into 2 valved carpels. [Greek, healing nutriment.] About 70 species, widely distributed in warm and temperate regions. Besides the following, some 4 others occur in the Southern States.
I. Jatropha stimulòsa Michx. Spurge Nettle. Tread-softly: (I. F.f. 2305.) Perennial by a stout root, herbaceous, bright green, stinging. Stem erect. I-II dm. tall; leaves nearly orbicular in outline, $6-30 \mathrm{~cm}$. broad, truncate or cordate at the base, deeply 3-5-lobed, the lobes entire, toothed or pinnatifid; calyx of the staminate flowers salverform, white or pink, $2-4 \mathrm{~cm}$. broad; capsule oblong, $\mathbf{1 2 - 1 6 ~ m m}$. long, papillose, wrinkled; seeds oblong-obovoid, $10-12 \mathrm{~mm}$. long, smooth, mottled. In dry sandy soil, Va. to Fla. and Tex. March-Aug.
xo. STILLÍNGIA L.
Monœecious glabrous herbs or shrubs, with alternate or rarely opposite leaves. often with 2 glands at the base, the flowers bracteolate, in terminal spikes, apetalous, the bractlets 2-glandular. Staminate flowers several together in the axils of
the bractlets, the calyx slightly $2-3$-lobed; stamens 2 or 3 , exserted. Pistillate flowers solitary in the axils of the lower bractlets; calyx 3-lobed. Capsule 2-lobed or 3lobed, separating into 2 or 3 two-valved carpels. [In honor of Dr. B. Stellingfleet, an English botanist.] About I5 species, mostly of tropical America and the islands of the Pacific Ocean.
I. Stillingia sylvática L. Queen's Delight. Queen-root. (I. F. f. 2306.) A bright green slightly fleshy herb. Stem usually branched from the base, 3-II dm. tall. Leaves obovate, oblong or elliptic, $\mathbf{I}-10 \mathrm{~cm}$. long, serrate with appressed teeth, often narrowed at the 2 -glandular base, sessile; flowers lemon-colored, subtended by small bracts furnished with saucer-shaped glands; calyx cup-shaped; glandular disk none; capsule depressed, $\mathbf{I - 1 . 5} \mathbf{~ c m}$. in diameter, 3 -lobed; seeds ovoid, 6 mm . long, light gray, minutely pitted and papillose, the base flattened. In dry soil, Va. to Fla., Kans. and Tex. March-Oct.

## II. EUPHÓRBIA L.

Monœcious herbs (many tropical species shrubs), with alternate, opposite or verticillate leaves. Flowers borne in involucres. Sinuses of the involucres usually bearing glands, naked or appendaged. Staminate flowers scattered over the inner surface of the involucre, consisting of a stamen jointed on a filament-like pedicel, which is subtended by a minute bractlet supposed to represent a calyx. Pistillate flower solitary, at the bottom of the involucre, at length usually exserted on a stalk. Capsule 3 -lobed, separating into 32 -valved carpels. Seeds sometimes caruncled, variously pitted, ridged or wrinkled. [Named in honor of Euphorbus, King Juba's physician.] Species about 700, most abundant in the warmer parts of the temperate zones. Besides the following, some 95 others occur in the southern and western parts of N. Am.

* Glands of the involucre with petal-like appendages.
$\dagger$ Leaves opposite, inequilateral, their bases more or less oblique.
$\ddagger$ Leaves entire; seeds smooth.
Plants branched at the base, the branches prostrate. Seeds about 3 mm . long.

1. E. polygonifolia.

Seeds $1-2 \mathrm{~mm}$. long.
Leaves usually more than twice as long as broad; seeds nearly terete, 1.5 mm . long.
4. E. Geyeri.

Leaves usually less than twice as long as broad; seeds obtusely 4 -angled, 1 mm . long.
5. E. serpens.

Plants with an erect or ascending stem, branched above, the branches ascending. Seeds nearly terete, 2 mm . long; leaves usually flat and straight.
2. E. petaloidea. -

Seeds 4-angled, r. 5 mm . long; leaves often involute and curved.
3. E. Nuttallii.
$\ddagger \ddagger$ Leaves entire; seeds variously roughened.
Plants glabrous.
13. E. Fendleri.

Plants canescent. . 14. E. lata.
$\ddagger \ddagger \ddagger$ Leaves serrate or dentate; plants prostrate or spreading.
Herbage glabrous.
Seeds faintly transversely ridged and pitted.
Leaves of main branches mostly less than xcm . long; seeds gray.
6. E. serpyllifolia.

Leaves of main branches over Icm . long; seeds brown. 7. E. albicaulis. Seeds strongly transversely ridged, not pitted.
8. E. glyptosperma. Herbage pubescent or puberulent. Seeds gray or white.

Leaves toothed at the apex; involucres campanulate; seeds pitted.
12. E. stictospora.

Leaves toothed nearly to the base; involucres turbinate; seeds transversely, wrinkled.
9. E. hirsuta.

Seeds brown or black.
Involucres not split. 10, E. maculata.
Involucres split on one side.
11. E. humistrata.
$\ddagger \ddagger \ddagger \ddagger$ Leaves serrate or dentate; plant erect or ascending.
15. E. nutans.
$\dagger \dagger$ Leaves opposite, equilateral, their bases not oblique.
16. $E$. hexagona.
$\dagger \dagger \dagger$ Leaves alternate or scattered on the stem, except a whorl subtending the umbel.

Bracts and leaves of the umbel small and green; seeds ovoid, smooth, sparingly pitted.
Pale green; leaves all whorled or opposite. 17. E. Marylandica.
Deep green; leaves below the umbel alternate.
18. E. corollata.

Bracts and leaves of the umbel large, white-margined; seeds ovoid-globose, reticulatetuberculate.
19. E. marginata.

*     * Glands of the involucre without petal-like appendages.
$\dagger$ Leaves mostly opposite; herbage glabrous.
Plants slender; stems or branches forked.
Annual; stem branched at the base; leaves, or some of them, oblique at the base.

1. E. polygonifolia.

Perennial; stems several from a stout root; leaves not oblique at the base.
22. E. Ipecacuanhae.

Plants stout; stem usually simple below, topped by an umbel.
24. E. Lathyris.
$\dagger \dagger$ Leaves mostly opposite; herbage pubescent.
Leaves linear or linear-lanceolate; seeds narrowly ovoid, not prominently tuberculate.
20. E. cuphosperma.

Leaves ovate or ovate-lanceolate; seeds broadly ovoid, prominently tuberculate.
2I. E. dentata.
$\dagger \dagger \dagger$ Leaves alternate or scattered.
Stem not topped by an umbel.
23. E. heterophylla.

Stems topped by a several-rayed umbel.
Leaves serrulate; glands of the involucre oblong, oval or orbicular.
Seeds smooth or faintly reticulated.
Glands stalked; warts on the capsules elongated; seeds faintly reticulated.
26. E. obtusata.

Glands sessile; warts on the capsules depressed; seeds smooth.
27. E. platyphylla.

Seeds strongly and prominently reticulated.
Glands nearly sessile; capsules warty.
Upper leaves merely sessile; upper bracts of the umbel manifestly longer than broad. 28. E. Arkansana. Upper leaves with small basal lobes; upper bracts of the umbel about as broad as long or broader.
Glands stalked; capsules smooth.
29. E.Missouriensis.
30. E. Helioscopia.

Leaves entire; glands of the involucres crescent-shaped or reniform.
Annual or biennial; seeds pitted.
Capsules with 2-crested lobes. 31. E. Peplus.
Capsules with rounded lobes. 32. E. commutata.
Perennial.
Glands reniform or oblong, without horns.
Glands crescent-shaped, with horns.
Seeds smooth; glands with long slender horns. Stem-leaves 4-12 mm. broad; capsules smooth.

Bracts subtending the umbel lanceolate to oblanceolate.
Bracts ovate, oval or obovate. 33. E. Esula. Stem-leaves $0.5-3 \mathrm{~mm}$. wide; capsules with granular lobes.
35. E. Cyparissias. Seeds pitted; glands with short rather blunt horns. 35. E. robusta.

1. Euphorbia polygonifòlia L. Seaside or Knotweed Spurge. (I. F. f. 2307.) Pale green, glabrous. Branches radiately spreading, prostrate, forked. $5-20 \mathrm{~cm}$. long; leaves opposite, oblong, linear-oblong or linear-lanceolate, 6-z0 mm . long, fleshy, obtuse, often mucronulate, entire; involucres turbinate-campanulate, less than 2 mm . long, with 4 columnar nearly naked glands shorter than the lobes; capsule globose-ovoid, $3-4 \mathrm{~mm}$. long, minutely wrinkled; seeds ovoid, somewhat flattened, ash-colored, very minutely pitted and spotted. In sand along the Atlantic coast, N. H. to Fla., and on the shores of the Great Lakes. July-Sept.
2. Euphorbia petaloìdea Engelm. White-flowered Spurge. (I. F. f. 2308.) Pale green, glabrous. Stem erect, branched above, $1.5-6 \mathrm{dm}$. high; leaves opposite, linear, oblong or linear-lanceolate, $1-2.5 \mathrm{~cm}$. long. obtuse, usually flat. straight, entire; involucres oblong-campanulate, 2 mm . long, bearing + wineglassshaped glands about as long as the lobes, each subtended by a white ovate or orbicular appendage; capsule globose-reniform, 2 mm . long: scedsoblong-ovoid, nearly ash-colored, minutely pitted, nearly terete. Iowa to Wyo. and Tex. July-Sept.
3. Euphorbia Nuttàllii (Engelm.) Small. Prairie Spurge. (I. F. f. 2309.) Bright green, glabrous. Stem slender, erect or ascending, I-6 dm. high, the branches wiry; leaves mostly linear and mucronulate or truncate at the apex, often involute, obtuse or narrowed at the base, usually curved; involucres campanulate, less than 2 mm . long. long-peduncled, bearing 4 saucer-shaped glands subtended by white oblong or ovate appendages; seeds ovoid, 1.5 mm . long, gray, 4 -angled. Prairies, Mo. to Tex. and Mex. June-Sept.
4. Euphorbia Geýeri Engelm. \&E Gray. Geyer's Spurge. (I. F. f. 23Io.) Olive-green, glabrous. Branches prostrate, radiately spreading. wiry, $5-40 \mathrm{~cm}$. long; leaves oblong or ovate, $4-12 \mathrm{~mm}$. long, obtuse, usually mucronulate, entire or nearly so, oblique, obtuse or subcordate at the base; involucres campanulate, about I mm. high. with 4 wineglass-shaped glands shorter than the lobes, and inconspicuous white or red appendages; capsule globose-reniform, about 2 mm . long; seeds narrowly ovoid, ash-colored, nearly terete. In sandy soil, Minn. to Ill., S. Dak. and Kans. July-Sept.
5. Euphorbia sérpens H.B.K. Round-Leaved Spreading Spurge. (I. F.f. 23 II.) Pale green, glabrous, sometimes glaucescent. Branches slender or filiform, prostrate. $5-30 \mathrm{~cm}$. long; leaves orbicular, orbicular-ovate or oval, $2-6 \mathrm{~mm}$. long, obtuse or emarginate, entire, often slightly revolute, the base oblique, rounded or subcordate; involucres solitary in the axils, nearly I mm. high. bearing 4 sessile saucer-shaped glands shorter than the lobes, and minute irregular appendages; capsule nodding, depressed-globose, 2 mm . in diameter; seeds oblong-ovoid, smooth, obtusely 4 -angled, light gray. Ill. to Iowa and S. Dak., south to Mex. March-Oct.
6. Euphorbia serpyllifolia Pers. Thyme-Leaved Spurge. (I. F. f. 23I2.) Deep green, or becoming reddish, glabrous. Branches slender, prostrate, I-3 dm. long; leaves oblong to oval, $3-15 \mathrm{~mm}$. long, obtuse or retuse, serrulate to below the middle, the base oblique. mostly truncate or obtuse; involucres solitary in the axils, sometimes clustered toward the ends of the branchlets. less than 2 mm . long, bearing 4 disk-like glands and narrow lobed appendages; capsule 2 mm . broad; seeds ovoid. 4 -angled, the faces transversely wrinkled and pitted. In dry soil, Wis. to Cal., south to Mex. May-Sept.
7. Euphorbia albicaùlis Rydb. White-stemmed Sptrgae. Pale green or yellowish. Branches procumbent, I-3 dm. long, glabrous, shining; leaves linear or slightly broadened upward, $1-1.5 \mathrm{~cm}$. long, nearly entire or toothed at the apex; involucres turbinate. about I mm. high; appendages minute, rather broad, white, truncate or crenulate; capsule about 2 mm . long, smooth, acute-angled; seeds light brown, oblong, 1.3-1.5 mm. long, acutely 4 -angled, shallowly transversely wrinkled. In sandy soil, Neb. and Mont. June-Sept.
8. Euphorbia glyptospérma Engelm. Ridge-Seeded Spurge. (I. F. f. 2313.) Pale green, glabrous. Branches spreading or prostrate, $5-40 \mathrm{~cm}$. long; leaves oblong, linear-oblong or rarely orate. 2-12 mm. long, more or less falcate, obtuse at the apex, inequilateral, serrulate. very oblique and obtuse or subcordate at the base; involucres solitary in the axils, campanulate, 1 mm . long, with 4 dark ribs and 4 saucer-shaped glands, their appendages narrow; capsule depressed-globose, less than 2 mm . in diameter; seeds oblong. ash-colored, transversely wrinkled. In sandy soil, Ont. to Br. Col., Conn., Tex. and Mex. June-Oct.
9. Euphorbia hirsùta (Torr.) Wiegand. Hairy Spurge. (I. F. f. 23I4a.) Bright green, more or less hirsute. Branches prostrate or decumbent. 5-25 cm. long, zigzag; leaves ovate-oblong, $8-16 \mathrm{~mm}$. long, acutish. serrulate nearly to the oblique base. pale beneath; involucres funnelform, I mm. high, glabrous, bearing 4 stalked saucer-shaped dark brown glands. and white appendages; capsule about 2 mm . in diameter, broader than long. glabrous, its angles obtuse; seed 4 -angled, black beneath a white coating, its faces slightly wrinkled. In sandy or gravelly soil, Quebec and Ont. to Conn., N. Y. and Penn. June-Sept.
io. Euphorbia maculàta L. Milk Ptrilane. Spotted or Blotched Spürge. (I. F. f. 2314.) Dark green. puberulent or pilose. Branches slender, radiately prostrate. $5-40 \mathrm{~cm}$. long, often dark red; leaves usually blotched, oblong or ovate-oblung, $4-16 \mathrm{~mm}$. long. obtuse, more or less serrate, the base oblique. subcordate: involucres solitary in the axils, 2 mm . long. with 4 cup-shaped glands, the appendages narrow, white or red; capsule ovoid-globose. about 2 mm . in diameter, pubescent; seeds ovoid-oblong, obtusely angled, minutely pitted and transversely
wrinkled. Throughout N. Am. except the extreme north. Apparently introduced west of the Rocky Mts. June-Nov.
II. Euphorbia humistràta Engelm. Hairy Spreading Spurge. (I. F. f. 2315.) Light green, puberulent or sparingly pilose. Branches radiately prostrate, I-3 dm. long; leaves ovate-oblong or obovate-oblong, or sometimes narrower, 4-15 mm. long, serrulate, at least above the middle, oblique, obtuse or subcordate at the base; involucres in lateral clusters, split on one side, 2 mm . long, faintly nerved, with 4 disk-like glands, and narrow irregular red or white appendages; capsule depressed-globose, less than 2 mm . in diameter, its 3 lobes keeled; seeds oblong, papillose, obscurely transversely wrinkled. Quebec to N. Y., Kans. and Miss. Aug.-Oct.
10. Euphorbia stictóspora Engelm. Narrow-Seeded Spurge. (I. F. f. 2316.) Yellowish green, pilose. Branches radiating, 5-30 cm. long; leaves oblong to suborbicular, $4-6 \mathrm{~mm}$. long, obtuse, dentate-serrate at the apex, the bases truncate or subcordate; involucres clustered, campanulate, I mm. high, with 4 cup-shaped glands, and inconspicuous appendages; capsule ovoid, $\mathbf{I - 2 ~ m m}$. in diameter; seeds narrowly ovoid, pointed, pitted, gray or ash-colored, sharply 4 -angled. S. Dak., Neb. and Colo. to Mex. June-Oct.
11. Euphorbia Féndleri T. \& G. Fendler’s Spurge. (I. F. f. 2317.) Pale green, glabrous. Branches wiry, I-2 dm. long, brittle; leaves suborbicular, oval or elliptic, $3-8 \mathrm{~mm}$. long, obtuse, entire, the base oblique, obtuse or subcordate; involucres campanulate, $2-5 \mathrm{~mm}$. high, with 4 or 5 saucer-shaped oval glands and irregular appendages; capsule deflexed, 3 mm . in diameter, sharply 3 -lobed; seeds ovoid, wrinkled. Neb. and Colo. to Tex., Mex. and Ariz. April-Oct.
12. Euphorbia làta Engelm. Hoary Spurge. (I. F. f. 2318.) Pale green, canescent. Base somewhat woody; branches $5-10 \mathrm{~cm}$. long; leaves ovate to lanceolate, $5-10 \mathrm{~mm}$. long, revolute; abruptly narrowed, truncate or cordate at the base; involucres solitary in the axils, 1 mm . long, bearing 5 disk-like glands and narrow appendages; capsule subglobose, 2 mm . in diameter; seeds oblong, acutish at both ends, 4 -angled, the faces inconspicuously transversely wrinkled. Kans. to Tex. and N. Mex.
13. Euphorbia nùtans Lag. Large or Upright Spotted Spurge. (I. F. f. 2319.) Deep green. Stem 2-6 dm. high, the branches mostly spreading; leaves opposite, oblong, or linear-oblong, varying to ovate or obovate, often falcate, oblique, 3 -nerved, unequally serrate, often with a red blotch and red margins; involucres narrowly obovoid, 1 mm . long, bearing 4 glands subtended by orbicular or reniform white or red appendages; capsule glabrous, 2 mm . in diameter; seeds oblong-ovoid, 4 -angled, with broken transverse ridges. In fields and thickets, throughout eastern N. Am. except the extreme north, extending west to the Rocky Mts. May-Oct.
14. Euphorbia hexagòna Nutt. Angled Spurge. (I. F. f. 2320.) Yellowish green. Stem striate-angled, $\mathbf{I}-5 \mathrm{dm}$. tall, the branches ascending, often almost filiform; leaves opposite, linear, oblong or lanceolate, equilateral; involucres solitary in the axils, often clustered, $2-3 \mathrm{~mm}$. long, ciliate, pubescent, with 5 glands subtended by triangular-ovate whitish or green appendages; capsule glabrous, 4 mm . in diameter; seeds ovoid or oblong-ovoid, terete, papillose. Iowa to Mont., Tex. and Colo. Also at Wilmington, Del. June-Oct.
15. Euphorbia Marylándica Greene. Maryland Spurge. Perennial, glabrous, pale green, glaucescent. Stems trichotomous near the base, thence bushy, 3-4 dm. tall, the branches dichotomous; leaves linear to linear-lanceolate, $2-3.5 \mathrm{~cm}$. long, acute, opposite above the whorl of 3 at the first fork; involucres hemispheric, nearly 2 mm . high; appendages white, suborbicular to reniform. On sand hills, Anne Arundel Co., Md. Summer.
16. Euphorbia coroilàta L. Blooming or Flowering Spurge. (I. F. f. 2321.) Perennial by a long stout rootstock. Stem erect, $2.5-0 \mathrm{dm}$. tall, umbellately branched above; leaves linear, oblong or oblong-spatulate, $2-4 \mathrm{~cm}$. long, entire, short-petioled or sessile, the lower scattered, those subtending the umbel verticillate; bracts ovate to linear, green; involucres mostly terminal, less than 2 mm . long, bearing 4 or 5 yellowish green oblong glands subtended by white petal-like cuneate or orbicular-cuneate appendages; capsule ercct, subglobose, $2-4 \mathrm{~mm}$. in
diameter; seeds ovoid, smooth, sparingly pitted. In dry soil, Mass. and Ont. to Minn. and Kans., south to Fla. and Tex. April-Oct.
17. Euphorbia marginàta Pursh. White-margined Spurge. (I. F. f. 2322.) Bright green. Stem 2.5-9 dm. tall, usually pilose, topped by a mostly 3 -rayed umbel; leaves, except the whorl subtending the umbel, scattered, ovate to obovate, $2-8 \mathrm{~cm}$. long, entire; bracts large, white-margined; involucres campanulate, often clustered, 4 mm . long, bearing 3 glands subtended by white reniform appendages; capsule depressed-globose, 6 mm . in diameter; seeds ovoid-globose, terete, dark ash-colored, reticulate-tuberculate. In dry soil, Minn. to Colo. and Tex. Introduced into waste places in the Central and Atlantic States. May-Oct.
18. Euphorbia cuphospérma (Engelm.) Boiss. Warty Splrgé. (I. F. f. 2323.) Dull green. Stem 2-4 dm. high; leaves opposite or alternate, linear, oblong, or linear-lanceolate, $2-8 \mathrm{~cm}$. long, entire, undulate, or denticulate; involucres crowded at the ends of the branches, glabrous, or nearly so, nearly 4 mm . long, bearing about 4 unappendaged glands; capsule 5 mm . in diameter; seeds narrowly ovoid, about 3 mm . long, irregularly 4 -angled, ridged and slightly tuberculate. S. Dak. to Colo. and Mex. Aug.-Sept.
19. Euphorbia dentàta Michx. Toothed Spurge. (I. F. f. 2324.) Dull green. Stem 2-4 dm. high, the branches mostly ascending; leaves opposite, or the lower alternate, ovate to nearly linear or orbicular-oblong, $\mathrm{I}-8 \mathrm{~cm}$. long, coarsely dentate, the nerves prominent beneath; involucres clustered at the ends of the branches, oblong-campanulate, about 3 mm . long, 3-5-lobed, bearing 1-4 yellowish glands; capsule $4-5 \mathrm{~mm}$. in diameter; seeds ovoid or ovoid-globose, ash-colored, irregularly tuberculate, inconspicuously 4 -angled. In dry or moist soil, Penn. to S. Dak., Tenn., La. and Mex. July-Oct.
20. Euphorbia Ipecacuánhae L. Wild Ipecac. Ipecac Spurge. (I. F. f. 2325.) Root deep. Stems several or many, slender, $\mathrm{I}-2.5 \mathrm{dm}$. long; leaves green or red, wonderfully variable in shape from linear to orbicular, $1-7 \mathrm{~cm}$. long, mostly opposite, entire, short-petioled; involucres axillary, mostly hemispheric, nearly 2 mm . long, slender-peduncled, bearing 5 transversely elliptic or oblong green glands; capsule 3 mm . in diameter; seeds light gray, oblong-ovoid or ovoid, pitted, obscurely 4 -sided. In dry sandy soil, Conn. to Fla., mostly near the coast. Also in southern Ind. An emetic. May-Oct.
21. Euphorbia heterophýlla L. Various-Leaved Spurge. (I. F. f. 2326.) Bright green. Stem 3-9 dm. tall, with the branches ascending, or the lower spreading, leafy at the ends; leaves alternate, very variable, linear to orbicular, entire, undulate, sinuate or dentate, the uppermost often fiddle-shaped and blotched with red; involucres clustered at the ends of branches, 3 mm . long; lobes 5 , ovate or oblong, laciniate, the sinuses bearing I or several sessile glands; capsule glabrous or minutely pubescent, 6 mm . in diameter: seeds oblong-ovoid, tranversely wrinkled and tuberculate. Ill. to Mont., Fla. and Trop. Am. April-Nov.
22. Euphorbia Láthyris L. Caper or Myrtle Spurge. (I. F.f. 2327.) Glaucous. Stem 2-10 dm. tall, mostly simple below. umbellately branched above; leaves numerous, the lower scattered, linear, reflexed, those subtending the umbel verticillate, the upper lanceolate or linear-lanceolate, entire, sessile, subcordate at the base; bracts ovate or ovate-lanceolate, truncate or subcordate; involucres 5 mm . long, bearing 4 crescent-shaped glands prolonged into short horns; capsule subglobose, $10-12 \mathrm{~mm}$. in diameter; seeds oblong-ovoid, terete, usually wrinkled. In waste places, N. J. to N. Car. Also in Cal. Native of Europe. May-Aug.
23. Euphorbia Darlingtònii A. Gray. Darlington's Spurge. (I. F. f. 2328.) Dark green, often minutely pubescent. Stem stout, 4-15 dm. tall, topped by a 5-8-rayed umbel, branched above; leaves oblong or oblanceolate, $3.5-10 \mathrm{~cm}$. long, mostly obtuse, sessile, often undulate, those of the stem scattered. those subtending the umbels verticillate; bracts ovate or nearly reniform; involucres campanulate, nearly 4 mm . long, bearing 5 reniform crenulate glands; capsule depressed-globose, minutely warty; seeds ovoid-globose. N. Y., Penn. and N. J. to N. Car. May-Sept.
24. Euphorbia obtusàta Pursh. Blunt-Leaved Spurge. (I. F. f. 2329.) Yellowish green. Stem 3-6 dm. high, topped by a 3-rayed umbel; branches simple or forked; leaves scattered, spatulate-oblong, obtuse, serrulate to below the middle; involucres 1 mm . long, bearing 4 stalked glands; capsule subglobose,
nearly 4 mm . in diameter, with elongated warts; seeds oblong, or orbicular-oblong, dark brown, faintly reticulated. In dry soil, Va. to Iowa, S. Car. and Tex. March-July.
25. Euphorbia platyphylla L. Broad-Leaved Spurge. (I. F. f. 2330.) Bright green. Stems I-5 dm. high, often reddish, topped by a usually 5 -rayed umbel; leaves scattered, oblong or spatulate-oblong, $2-3 \mathrm{~cm}$. long, acute, serrulate, slightly auricled; bracts triangular-ovate or reniform, mucronate; involucres campanulate, nearly 2 mm . long, bearing 4 glands; capsule subglobose, about 4 mm . in diameter, with depressed warts; seeds oblong or nearly orbicular, smooth, brown. Along the shores of the St. Lawrence River and the Great Lakes. Nat. from Europe. June-Sept.
26. Euphorbia Arkansàna Engelm. Arkansas Spurge. Olive green. Stem slender, $2-5 \mathrm{dm}$. tall, with few spreading branches above, topped by an umbel with 3 copiously dichotomous rays $2-3 \mathrm{~cm}$. long; stem-leaves cuneate or spatulate, $1-3 \mathrm{~cm}$. long, rather acute, serrulate above the middle; bracts ovate to tri-angular-ovate, $0.5-2 \mathrm{~cm}$. long, truncate or subcordate at the base, mucronate at the apex; involucres about I mm. high, with transversely elliptic glands less than I mm . wide, the lobes usually ciliate; capsules $2.5-3 \mathrm{~mm}$. wide, warty; seeds ovoid, closely reticulated, brown. Dry soil, Mo. to Colo., Ala. and Mex. May-Aug.
27. Euphorbia Missouriénsis (Norton) Small. Reticulate-seeded Spurge. (I. F. f. 233I.) Olive green. Stem 3-6 dm. high, topped by a compound 3-rayed umbel; leaves scattered, spatulate, $2-3.5 \mathrm{~cm}$. long; obtuse, serrate to below the middle, the upper slightly auricled at the base; bracts oblong or ovate, inequilateral, acute, serrate; involucres less than 2 mm . long, with 4 oblong glands, the lobes glabrous; capsule $3-3.5 \mathrm{~mm}$. in diameter, with elongated warts; seeds ovoid, purplish brown, distinctly reticulated. [E. Arkansana var. Missouriensis Norton. E. dictyosperma Ill. Fl., not F. \& M.] Minn. to Wash., south to Kans. and N. Mex. May-Aug.
28. Euphorbia Helioscòpia L. Sun Spurge. Wartweed. (I. F. f. 2332.) Bright green. Stem $1-3 \mathrm{dm}$. tall, often branched from the base, topped like the branches by a more or less compound 3-5-rayed umbel; leaves scattered, spatulate, obovate, oblong, or sometimes nearly orbicular, $\mathbf{I} \mathbf{- 1 2} \mathrm{cm}$. long, obtuse or retuse, serrulate, short-petioled; bracts oblong or ovate, serrulate, inequilateral; involucres oblong-campanulate, 2.5 mm . long, usually with 4 oblong stalked glands; capsule globose-ovoid, or somewhat depressed, 4 mm . in diameter, smooth, the lobes rounded; seeds ovoid, nearly 3 mm . long, reddish brown, strongly reticulate. In waste places in the Valley of the St. Lawrence and along the Great Lakes, extending south to N. H., N. Y. and Ohio. Nat. from Europe. June-Oct.

3I. Euphorbia Péplus L. Petty Spurge. (I. F. f. 2333.) Olive green. Stem I-3 dm. high, topped by a 3-5-rayed umbel; stem-leaves scattered, oblong or obovate, $\mathrm{I}-3 \mathrm{~cm}$. long, obtuse or retuse, entire, slender-petioled; bracts opposite, ovate or triangular-ovate, apiculate, sessile; involucres campanulate, less than 2 mm . long, bearing 4 crescent-shaped glands prolonged into slender horns; capsule globose-ovoid, $2-3 \mathrm{~mm}$. in diameter, slightly nodding, smooth, the lobes 2-keeled; seeds oblong or oblong-ovoid, whitish, nearly terete, marked with I-4 series of pits. In waste places, western N. Y. to N. J. and Penn. Adv. from Europe. June-Sept.
32. Euphorbia commutàta Engelm. Tinted Spurge. (I. F. f. 2334.) Yellowish green, often tinged with red. Stem usually decumbent, I-4 dm. long, topped by a 3 -rayed umbel; branches forked or umbellately branched; leaves scattered, spatulate to ovate, $\mathbf{I} .2-3.5 \mathrm{~cm}$. long, obtuse or mucronulate, entire, slender-petioled; bracts ovate-reniform; involucres campanulate, 2.5 mm . long, bearing 3 or 4 crescent-shaped glands prolonged into slender horns; capsule globoseovoid, 3 mm . in diameter, glabrous, the lobes rounded; seeds oblong, terete, irregularly pitted. On hillsides, Penn. to Minn., Fla. and Mo. March-July.
33. Euphorbia Ésula L. Leafy Spurge. Faitour's Grass. (I. F. f. 2335.) Bright green. Stems often clustered, mostly erect, z-6 dm. tall, topped by a many-rayed umbel; leaves few, all scattered, linear or oblong, $1.4-4 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. broad, entire, those subtending the umbel lanceolate or oblanceolate; bracts subreniform, mucronate; involucres campanulate, $2.5-3 \mathrm{~mm}$, long,
bearing 4 crescent-shaped glands; capsule nodding, smooth; seeds oblong, terete, smooth. In waste places, Mass. to N. Y. and Mich. Nat. from Europe. Summer.
34. Euphorbia lúcida L. Shining Spurge. (I. F. f. 2336.) Deep green. Stems stout, usually clustered, $2-5 \mathrm{dm}$. high, usually very leafy, topped by a 4-7-rayed umbel; branches simple or forked; leaves alternate, linear or linearoblong, $1.2-10 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. broad, entire, mostly apiculate, those subtending the umbel ovate, oval or obovate; bracts reniform; involucres campanulate, 3 mm . long, bearing 4 yellowish oblong crescent-shaped, 2 -horned glands; capsul2 globose-ovoid, 4 mm . in diameter, nodding, smooth, finely wrinkled; seeds oblong, ${ }^{2.5-3} \mathrm{~mm}$. long, nearly terete, whitish, smooth. In fields along the Susquehanna River, southern N. Y. and northern Penn. Nat. from Europe. [E. Nicaeensis Ill. Fl.] July-Sept.
35. Euphorbia Cyparíssias L. Cypress Spurge. (I. F. f. 2337.) Bright green. Stems clustered in large patches, 3 dm . high, or less, the branches topped by many-rayed umbels; leaves linear, or almost filiform, $1.2-2.5 \mathrm{~cm}$. long, $0.5-3 \mathrm{~mm}$. broad; involucres turbinate-campanulate, 2 mm . long, with 4 unappendaged crescent-shaped glands; capsule subglobose, 3 mm . in diameter, granular on the rounded lobes; seeds oblong, 2 mm . long, smooth. Escaped from gardens to waste places, N. E. to Kans. Nat. from Europe. May-Sept.
36. Euphorbia robústa (Engelm.) Small. Rocky Mountain Spurge. (I. F. f. 2338.) Glaucous. Stems clustered, $\mathbf{I}-3.5 \mathrm{dm}$. tall, topped by a $3-5$-rayed umbel; leaves scattered, ovate or oblong-ovate, r-1. 8 mm . long, obtuse or apiculate, entire, sessile; bracts opposite, triangular-ovate or subreniform; involucres campanulate, 3 mm . long, bearing 4 somewhat crescent-shaped unappendaged buff crenulate glands; capsule globose-ovoid, $4-4.5 \mathrm{~mm}$. long, its lobes rounded; seeds oblong or obovoid-oblong, terete, 2.3-2.5 mm. long, gray, minutely pitted. S. Dak., Mont. and Wyo. to Neb. and Ark. May-Oct.

## Family 9. CALLITRICHÀCEAE Lindl.*

Water-starwort Family.
Herbaceous aquatic or rarely terrestrial plants, with slender or capillary stems, opposite exstipulate entire spatulate or linear leaves, and minute perfect or monocious axillary flowers. Perianth none. Bracts 2, sac-like, or none. Stamen I ; filament elongated, filiform ; anthers cordate, 2 -celled, opening by lateral slits. Pistil I; ovary 4 -celled; ovules I in each cavity; styles 2, filiform, papillose nearly the whole length. Fruit compressed, lobed, the lobes more or less winged or keeled on the margins, separating at maturity into 4 flattish $\mathbf{I}$-seeded carpels. Seed anatropous, pendulous; endosperm fleshy ; embryo straight or nearly so, almost as long as the endosperm. Consists of the following genus :

## 1. CALLÍTRICHE L.

Characters of the family. [Greek, beautiful hair, from the hair-like stems.] About 20 species of wide distribution. Besides the following, about 7 others occur in southern and western N. Am.

Fruit short-peduncled; bracts wanting; terrestrial.
Fruit sessile ; aquatic, or some forms growing in mud.
Bracts present.
Fruit oval, flat on the face, longer than the styles. $\quad$ 2. C. palustris.
Fruit obovate, plano-convex, shorter than the styles.
Bracts none; leaves all linear, submersed.

1. C. Austini.
2. C. heterophylla.
3. C. bifida.
4. Callitriche Aùstini Engelm. Terrestrial Water-starwort. (I. F. f. 2339.) Tufted, the branches spreading on the ground or ascending, $1-5 \mathrm{~cm}$. long. Leaves spatulate or obovate, 3 -nerved, $3-4 \mathrm{~mm}$. long, about 2 mm . wide, obtuse, tapering into a short margined petiole, destitute of stellate scales; fruit about 0.5 mm . long and nearly 1 mm . broad, deeply notched at both ends, its lobes with

[^32]a narrow marginal wing or raised border, with a deep groove between them; styles persistent, not longer than the fruit, spreading or reflexed. In damp, shaded places, N. Y. and N. J. to Ohio, Mo., Tenn., Tex. and Mex. July-Sept.
2. Callitriche palústris L. Vernal Water-starwort. Water Fennel. (I. F. f. 2340.) Aquatic or growing in the mud; stems $5-25 \mathrm{~cm}$. long. Submerged leaves linear, I-nerved, retuse or bifid at the apex, $\mathbf{I}-2 \mathrm{~cm}$. long; emersed or floating leaves obovate; obtuse, truncate or retuse at the apex, narrowed into a margined petiole, dotted with stellate scales; aquatic forms occur with the leaves all linear; fruit 2 -bracted, I-2 mm. long, about one-half as broad, slightly notched at the apex, winged only toward the apex, or all around, separated by a deep groove. Mostly in cold or running water, apparently occurring nearly throughout the U. S. and Canada. Also in S. Am., Europe and Asia. July-Sept.
3. Callitriche heterophýlla Pursh. Larger Water-starwort. (I. F. f. 2341.) Similar to the preceding. Fruit smaller, usually slightly less than 1 mm . long, and about the same breadth, broadly notched at the apex, thick, almost ventricose at the base; lobes obtusely angled with a small intervening groove, wingless, or with a narrow wing or raised border on the margins. In ponds and slow streams, N. Eng. to Fla., N. W. Terr., Colo. and La. July-Sept.
4. Callitriche bífida (L.) Morong. Autumnal or Northern Water-starwort. (I. F. f. 2342.) Submerged. Leaves linear or linear-lanceolate, clasping at the base, retuse or bifid at the apex, I-nerved, $\mathbf{I}-\mathbf{I} .6 \mathrm{~cm}$. long, without stellate scales; fruit sessile, or rarely minutely pedunculate, orbicular or slightly narrower than long; i-2 mm. in diameter, its lobes separated by a deep groove and broadly winged on the margins; styles as long as the fruit, or shorter, soon deciduous. In flowing water, Quebec to Manitoba and Ore., south in the Rocky Mts. to Colo. Also in Europe and Asia. July-Sept.

## Order 20. SAPINDALES.

Mostly trees or shrubs (Limnanthaceae and Balsaminaceae herbs). Petals usually present and separate. Sepals mostly distinct. Stamens rarely more than twice as many as the sepals, when as many or fewer, opposite them. Ovary superior, compound. Ovules pendulous, with the raphe away from the axis of the ovary, or erect or ascending.
a. Flowers regular, or nearly so (except in Hippocastanaceae, which are trees or
shrubs with digitately compound leaves.

Petals none (or 3 in Empetrum); flowers monœecious or diœecious; leaves evergreen.
Stamens mostly 3; low heath-like shrubs.
Fam. 1. Empetraceae.
Stamens 4-7; our species an herb with broad leaves and spiked flowers.
Fam. 2. Buxaceae.
Petals present; leaves deciduous, except in Cyrillaceae and some Ilicaceae.
Low annual herbs, with pinnately divided leaves, the stamens twice as many as the petals.
Trees or shrubs, or rarely herbaceous vines.
Ovary 1-celled (in ours); fruit a small drupe. Fam. 4. Anacardiaceae.
Ovary 2-several-celled
Leaves simple, pinnately veined.
Seeds not arilled.
Fruit dry; flowers racemed, perfect. Fam. 5. Cyrillaceae. Fruit a small drupe; flowers not racemed, mostly polygamo-diœcious; ovules pendulous. Fam. 6. Ilicaceae.
Seeds arilled; ovules erect; capsule fleshy. Fam. 7. Celastraceae.
Leaves simple and palmately veined, or compound.
Leaves opposite.
Fruit a bladdery 3-lobed capsule. Fam. 8. Staphyleaceae.
Fruit of 2 winged samaras. Fam. 9. Aceraceae.
Fruit a leathery capsule; flowers irregular; leaves digitately compound.

Fam. 1o. Hippocastanaceae.
Leaves alternate; fruit various. Fam. ir. Sapindaceae.
b. Flowers very irregular, the posterior sepal large, saccate; succulent herbs, the capsule elastically dehiscent.

Fam. 12. Balsaminaceae.

## Family i. EMPETRÀCEAE Dumort.

Crowberry Family.
Low evergreen shrubs, with small narrow nearly sessile exstipulate leaves jointed to short pulvini, channeled on the lower side by the revolute margins, and small diœcious, monœcious, or rarely polygamous flowers. Calyx of 3 sepals. Corolla of 2 or 3 petals, or none. Staminate flowers with $2-4$ stamens, the filaments filiform, the anthers 2 -celled, longitudinally dehiscent, sometimes with a rudimentary pistil. Pistillate flowers with a 2 -several-celled sessile ovary, the single style cleft into as many stigma-bearing segments as there are ovary-cavities; ovules I in each cavity, amphitropous. Fruit a berry-like drupe, containing 2-several r-seeded nutlets. Embryo straight, terete, in copious endosperm. Three known genera, the following, and the monotypic Ceratzsla of the southeastern U. S.
Flowers axillary; petals 3 .
x. Empetrum.

Flowers in terminal heads; petals none.
2. Corema.

## 1. ÉMPETRUM L.

Depressed or spreading herbaceous shrubs, the branches usually densely leafy, the leaves linear-oblong. Flowers inconspicuous, solitary in the upper axils. Sepals and petals mostly 3. Staminate flowers with 3 stamens, the anthers introrse. Pistillate flowers with a globose 6-9-celled ovary, and a short thick style with $6-9$-toothed segments. Drupe black, or red, containing 6-9 nutlets. [Greek, on rocks, referring to the growth of these plants in rocky places.] Two known species, the following, and C. rubrum of southern S. Am.

1. Empetrum nigrum L. Black Crowberry. Heathberry. (I. F. f. 2343.) Glabrous, or the young shoots pubescent, the branches diffusely spreading, 5-25 cm. long. Leaves dark green, thick, obtuse, 4-7 mm. long, about 1 mm . wide, the revolute margins roughish; flowers very small, purplish; stamens exserted; drupe black (red in an arctic form), $4-6 \mathrm{~mm}$. in diameter. In rocky places, Greenland to Alaska, Me., N. Y., Mich. and Cal. Also in Europe and Asia. Summer.

## 2. COREMA Don.

Low, much-branched shrubs, with narrowly linear leaves crowded on the branches, and small diœcious or polygamous flowers in terminal heads. Corolla none. Staminate flowers with 3 or sometimes 4 long-exserted stamens, occasionally with a rudimentary or perfect pistil. Pistillate flowers with a $2-5$-celled (mostly 3 -celled) ovary and a slender 2 - 5 -cleft style, the stigmatic branches very slender, sometimes toothed. Drupe globose, usually with 3 nutlets. [Greek, a broom, in allusion to the bushy habit.] Two species, the following of the eastern U. S., the other of southwestern Europe, the Azores and Canaries.

1. Corema Conràdii Torr. Conrad's Broom Crowberry. (I. F. f. 2344.) Much branched, I.5-6 dm. high, the young twigs puberulent and densely leafy, the branches minutely scarred by the persistent pulvini. Leaves $4-6 \mathrm{~mm}$. long, rather less than I mm. wide, obtuse, glabrous when mature; flowers numerous in the terminal sessile heads, the pistillate ones almost concealed by the upper leaves, the staminate conspicuous by the exserted purple stamens; drupes nearly dry, less than 2 mm . in diameter. In rocky or sandy soil, Newf. to N. J., mostly near the coast, but occurring in one station on the Shawangunk Mountains in Ulster Co., N. Y. April-May.

## Family 2. BUXACEAE Dumort.

## Box Family.

Monœecious or diœcious trees, shrubs or perennial herbs, with simple mostly evergreen leaves, the sap not milky. Flowers regular, bracted. Petals none. Staminate flowers with $4-7$ distinct stamens, the anthers 2-celled; sometimes with a rudimentary pistil. Pistillate flowers with a

2-4-celled (mostly 3-celled) ovary, with 2 or I anatropous ovules in each cavity ; styles as many as the ovary-cavities, simple. Fruit a capsule or drupe, its carpels $1-2$-seeded. Embryo straight; endosperm fleshy, or almost wanting. About 6 genera and 30 species, only the following and the Californian Simmondsia native in N. Am.

## r. PACHYSÁNDRA Michx.

Monœecious perennial herbs, with matted rootstocks, the stems procumbent or ascending, leafy above. Leaves alternate, estipulate, petioled, persistent, broad, 3 -nerved. Flowers spicate, the pistillate and staminate in the same spike. Staminate flowers with 4 sepals; stamens 4 , opposite the sepals; filaments thick, longexserted. Pistillate flowers with 4 sepals or more; ovary 3 -celled, the cavities with a partition at the base; styles 3, spreading; ovules 2 in each cavity. Capsule of 3 2 -seeded carpels. [Greek, thick stamen.] Two species, the following of southeastern N. Am., the other Japanese.

1. Pachysandra procúmbens Michx. Alleghany Mountain Spurge. (I. F. f. 2345.) Somewhat pubescent; stems 3 dm . long or less. Leaves ovate, oval, or obovate, $5-10 \mathrm{~cm}$. long, coarsely dentate or some of them entire, cuneate or abruptly narrowed at the base into a petiole; spikes in the axils of the lower scales, $5-7.5 \mathrm{~cm}$. long, the staminate flowers forming most of the spike, the pistillate few toward its base; filaments white, 8-10 mm. long. In woods, W. Va. to Fla. and La. Flowers fragrant. April-May.

## Family 3. LIMNANTHÀCEAE Lindl.

## False Mermaid Family.

Annual herbs, with alternate petioled estipulate pinnately divided leaves. Flowers perfect, regular, axillary, long-peduncled. Sepals 2-5, valvate, persistent. Petals the same number as the sepals, alternating with as many small glands, the nearly perigynous stamens distinct. Filaments filiform ; anthers 2-celled, the sacs longitudinally dehiscent. Carpels as many as the sepals and opposite them, i-ovuled, nearly distinct, the single slender style arising from the centre, cleft above into as many stigmas as there are carpels ; ovule ascending. Fruit very deeply 2-5lobed, the carpels indehiscent. Embryo straight; endosperm none; cotyledons thick. Two North American genera, the following, and Limnanthes, of the Pacific States, with 5 or 6 species.
r. FLOÉRKEA Willd.

A diffuse glabrous herb, with small white solitary flowers. Sepals 2 or 3. Petals 2 or 3, oblong, entire. Stamens 4-6. Ovary 2-3-lobed nearly to the base, $2-3$-celled; stigmas 2 or 3. Mature carpels $\mathbf{1}-3$, indehiscent, fleshy. Seed erect. [In honor of H. G. Floerke, 1790-1835, a German botanist.] A monotypic genus.

1. Floerkea proserpinacoìdes Willd. False Mermaid. (I. F. f. 2346.) Slender, I-4 dm. long. Leaves thin, slender-petioled, $\mathbf{1} .25-7.5 \mathrm{~cm}$. long, the segments 5 or 3, distant, lanceolate, oblong or linear-oblong, entire or cleft; peduncles slender; flowers about 3 mm . broad; sepals ovate, acute, at length much exceeding the fruit; stamens about equalling the petals; ripe carpels nearly globular, about 3 mm . in diameter, tuberculate above. In marshes and along rivers, Quebec to Ont., Ore., Penn., Tenn., Mo., Utah and Cal. April-June.

## Family 4. ANACARDIACEAE Lindl.

## Sumac Family.

Trees or shrubs, with acrid resinous or milky sap. alternate or rarely opposite leaves, and polygamn-diœecious or perfect, mainly regular flowers. Calyx 3-7-cleft. Petals of the same number, imbricated in the bud, or rarely none. Disk generally annular. Stamens as many or twice as many as the petals, rarely fewer, or more, inserted at the base of the disk; fila-
ments separate; anthers commonly versatile. Ovary in the staminate flowers I-celled. Ovary in the pistillate flowers I - or sometimes 4-5celled ; styles I-3; ovules I in each cavity. Fruit generally a small drupe. Seed-coat bony or crustaceous; endosperm little or none; cotyledons fleshy. About 50 genera and 400 species, most abundant in warm or tropical regions, a few extending into the temperate zones.
Styles terminal; leaves compound in our species; fruit nearly symmetrical. Styles lateral; leaves simple; fruit gibbous.

1. Rhus.
2. Cotinus.

## 1. RHÚS L.

Leaves alternate, simple, 3 -foliolate, or odd-pinnate, estipulate. Flowers small, polygamous, in panicles. Calyx $4-6$-cleft or parted (commonly 5 -cleft), persistent. Petals equal, imbricated, spreading. Disk annular. Stamens (in our species) 5. Pistil I, sessile; ovary $\mathbf{I}$-ovuled; styles 3 , terminal. Drupe small, Iseeded, mostly subglobose, pubescent or glabrous. Seed inverted on a stalk that rises from the base of the ovary; cotyledons nearly flat. [Ancient Greek and Latin name; Celtic, red.] About 120 species, natives of warm and temperate regions, most abundant in South Africa. Besides the following, about 8 others occur in the southern and western parts of the U. S.
Fruit pubescent; stone smooth.
Leaflets 9-3I; flowers appearing after the leaves. Rachis of the leaf wing-margined. Rachis of the leaf nearly terete.

Foliage and twigs velvety-pubescent.
Foliage and twigs mostly glabrous and glaucous.
Leaflets 3 ; flowers appearing before the leaves. Leaflets $2-8 \mathrm{~cm}$. long, pubescent, crenate-dentate. 4. R. aromatzca. Leaflets $1.25-2.5 \mathrm{~cm}$. long, glabrate, with few rounded teeth.
5. R. trilobata.

Fruit glabrous; stone striate.
Leaflets $7-\mathrm{x}$, glabrous.
6. R.Vernix.

Leaflets 3, more or less pubescent beneath.
Vine climbing by aerial rootlets, or trailing, rarely suberect.
Low shrubs, mostly without aerial rootlets.
Leaflets very pubescent, crenately lobed; southern.
7. R. radicans.

Leaflets sparingly pubescent, entire, sinuate, or acutely lobed. Leaflets entire or acutely lobed; fruit $3^{-4} \mathrm{~mm}$. in diameter; northern.
9. R. microcarpa. Leaflets sinuate; fruit $5-6 \mathrm{~mm}$. in diameter; western. 10. R. Rydbergiz.

1. Rhus copalillna L. Dwarf, Black or Mountain Sumac. Upland Sumac. (I. F. f. 2347.) A shrub, or sometimes a small tree. Leaves pinnate, r.5-3 dm. long, the petiole and rachis more or less pubescent; leaflets 9-2I, ovatelanceolate or oblong-lanceolate, inequilateral, entire, or few-toothed toward the apex, dark green and glabrous above, paler and often pubescent beneath; flowers green, 3 mm . broad, in dense terminal panicles; pedicels and calyx finely pubescent; drupe compressed, 4 mm . in diameter, crimson, covered with short acid hairs. In dry soil, Me. and southern Ont. to Fla., Minn., Neb. and Tex. June-Aug.
2. Rhus hírta (L.) Sudw. Staghorn Sumac. (I. F. f. 2348.) A small tree, or often shrubby. Leaves pinnate, $2-4 \mathrm{dm}$. long; leaflets II-3I, lanceolate or oblong-lanceolate, $7.5-12 \mathrm{~cm}$. long, acuminate, rounded at the base, sharply serrate, dark green and nearly glabrous above, pale and more or less pubescent beneath; panicles terminal, dense; flowers green, 3 mm . broad; drupe globose, $3-4 \mathrm{~mm}$. in diameter. In dry or rocky soil, N. S. to Ga., Ont., S. Dak., Mo. and Miss. A form with laciniate leaflets has been found in New Hampshire. June.
3. Rhus glàbra L. Smooth Upland or Scarlet Sumac. (I. F. f. 2349.) A shrub or rarely a small tree, $6-60 \mathrm{dm}$. high, similar to the preceding species, but glabrous and somewhat glaucous. Leaflets 11-31, lanceolate or oblong-lanceolate, $5-10 \mathrm{~cm}$. long, acuminate, rounded and often oblique at the base, dark green above, whitish beneath, sharply serrate; pedicels sometimes slightly pubescent;
inflorescence and fruit similar to those of the two preceding; drupe covered with short reddish acid hairs. In dry soil, N. S. to Br. Col., Fla., Miss. and Ariz. This species and the two preceding sometimes have the whole or a part of the flowerclusters changed into small leaves. A form with laciniate leaflets occurs in southern Penn. and Del. June-Aug.

Rhus glabra boreàlis Britton, $n$. var. Inflorescence, and sometimes the foliage, softpubescent. Mich. and Minn.
4. Rhus aromática Ait. Fragrant or Sweet-scented Sumac. (I. F. f. 2350.) A shrub, 9-24 dm. high, ascending or diffuse. Leaves petioled, $5-10 \mathrm{~cm}$. long, aromatic; leaflets ovate or rhomboid, $2-8 \mathrm{~cm}$. long, $1.8-3.6 \mathrm{~cm}$. wide, the lateral ones sessile, the terminal short-stalked, the lateral rounded or truncate, the terminal cuneate at the base; flowers yellowish green, about 2 mm . broad, in clustered spikes appearing before the leaves; drupe globose, red. In rocky woods, Ont. and Vt. to Fla., Minn., Kans. and La. March-April.
5. Rhus trilobàta Nutt. Ill-scented Sumac. Skunk-bush. (I. F. f. 2351.) A glabrous or nearly glabrous shrub, 6-18 dm. high. Leaves petioled, unpleasantly odorous, $2.5-5 \mathrm{~cm}$. long; leaflets sessile or nearly so, puberulent when young, ovate or oval, obtuse, the terminal one cuneate at the base, all crenately few-lobed or toothed or sometimes entire; flowers as in the preceding species, and fruit similar. Ill. to S. Dak., Tex. and Cal. March.
6. Rhus Vérnix L. Poison Sumac. Poison Elder. (I. F. f. 2352.) A shrub or small tree. Leaves petioled, I.5-4 dm. long, glabrous or somewhat puberulent; leaflets thin, obovate, oval, or the lowest ovate, $5-10 \mathrm{~cm}$. long, $2.5-3.75 \mathrm{~cm}$. wide, green both sides, entire, short-acuminate, short-stalked; rachis terete; flowers green, about 2 mm . broad, in loose axillary panicles $7-20 \mathrm{~cm}$. long; drupe globose-oblong, 4 mm . in diameter, gray. In swamps, southern Ont. to R. I., Fla., Minn., Mo. and La. Very poisonous. June.
7. Rhus radicans L. Poison Ivy. Poison Oak. Climath. (I. F.f. 2353.) A woody vine, climbing by numerous aerial rootlets, the stem sometimes $7-10 \mathrm{~cm}$. in diameter. Leaves petioled; leaflets ovate or rhombic, $2.5-15 \mathrm{~cm}$. long, entire or sparingly dentate or sinuate, acute or short-acuminate, the lateral sessile or short-stalked, inequilateral, the terminal ones stalked; flowers green, 3 mm . broad, in loose axillary panicles $2-8 \mathrm{~cm}$. long; fruit similar to that of the preceding. Thickets and along fences, N. S. to Fla., Minn., Neb. and Ark. Very poisonous, as are the three following species. May-June.
8. Rhus Toxicodéndron L. Poison Oak. Low, erect, densely and finely pubescent. Leaflets ovate, mostly obtuse, crenate or crenately lobed, often to the middle, so as to resemble the leaves of an oak, the sinuses sharp; petals about 2 mm . long; fruit depressed-globose, $6-8 \mathrm{~mm}$. in diameter. In dry soil, Va. to Ga. and western N. Car.
9. Rhus microcàrpa (Michx.) Steud. Northern Poison Oak. Low and slender, puberulent, seldom over 4 dm . high, erect, or the stem sometimes trailing and the branches erect. Leaflets lanceolate to ovate-lanceolate, thin, acuminate, the middle one cuneate at the base, sharply toothed, lobed, or entire; fruit globose, small. Mich. [R. Toxicodendron microcarpa Michx.]
10. Rhus Rydbergii Small. Rydberg's Poison Oak. A shrub, less than 1 m . high. Leaflets broadly ovate to rhombic-ovate, rather thick, slightly pubescent on the veins beneath, $3-10 \mathrm{~cm}$. long, the margins sinuate-dentate; petals ovate, about 3 mm . long; fruit 5-6 mm. in diameter. Hillsides and open woods, S. Dak. to Br. Col., Kans. and Ariz. May-June.

## 2. CÓTINUS Adans.

Shrubs or small trees, with ovate oval or obovate entire leaves, and small polygamous slender-pedicelled flowers in large terminal panicles. Calyx 5 -parted, the segments imbricated, obtuse. Petals longer than the calyx imbricated. Stamens 5. Ovary obovoid; styles 3, lateral; stigmas very small. Drupe obliquely oblong or oval, compressed, gibbous, $\mathbf{1}$-seeded. Seed nearly as in thhus. [Greek name or the oleaster, or wild olive.] Two known species, the following of southeastern N. Am., the other of Europe and Asia.
r. Cotinus cotinoides (Nutt.) Britton. Wild or American Smoke-tree. Chittam-wood. (I. F.f.2354.) A small widely-branched tree, with maximum height of about 12 m . and trunk diameter of 4 dm . Leaves oval or slightly obovate, thin, glabrous or sparingly pubescent beneath, $7-15 \mathrm{~cm}$. long, $3 \cdot 5-5 \mathrm{~cm}$. wide, obtuse at the apex, the blade slightly decurrent on the petiole; flowers $2-3 \mathrm{~mm}$. broad, green; pedicels elongating to $2.5-3.75 \mathrm{~cm}$. and becoming very plumose in fruit; drupe reticulate-veined, 4 mm . long. Mo. and Ind. Terr. to Tenn. and Ala. April-May. Nearly related to the European C. Cotinus, which differs in its smaller coriaceous leaves, more pubescent, mostly rounded and obtuse at base; it occasionally escapes from cultivation.

## Family 5. CYRILLACEAE Lindl. Cyrilla Family.

Glabrous shrubs, or small trees, with simple entire alternate estipulate leaves, long-persistent or evergreen, and small regular perfect bracted racemose flowers. Sepals $4^{-8}$ (mostly 5), persistent. Petals the same number as the sepals, hypogynous, distinct, or slightly united by their bases, deciduous. Stamens $4-10$, in 1 or 2 series, distinct, hypogynous; anthers introrse, 2 -celled, the sacs longitudinally dehiscent. Ovary 2-5-celled; ovules I-4 in each cavity, anatropous, pendulous; style short or none ; stigma very small, or 2-3-lobed. Fruit dry, small, 1-5-seeded. Seeds oblong or spindle-shaped; endosperm fleshy; embryo central, cylindric. Three genera and 6 known species, natives of America.

## 1. CYRÍLLA Garden.

Racemes clustered at the ends of twigs of the preceding season. Sepals 5, firm, acute, shorter than the petals. Petals 5. white, acute, spreading. Stamens 5, opposite the sepals, the filaments subulate, the anthers oval. Ovary ovoid, sessile, mostly 2 -celled, sometimes 3 -celled; ovules $2-4$ in each cavity; style short, thick, 2-3-lobed. Fruit ovoid, 2-3-seeded, the pericarp spongy. [In honor of Domenico Cyrillo, professor of medicine at Naples.] Two species, of southeastern N. Am.
I. Cyrilla racemiflòra Walt. Southern Leatherwood or Ironwood. (I. F. f. 2355.) A shrub or small tree, the bark at the base spongy. Leaves oblanceolate, obovate or oval, cuneate-narrowed at the base, $5-10 \mathrm{~cm}$. long, $6-25 \mathrm{~mm}$. wide; racemes narrow, $5-15 \mathrm{~cm}$. long, bearing the very numerous small white flowers nearly to the base; pedicels $2-4 \mathrm{~mm}$. long, somewhat longer than the bracts, or shorter; fruit about 2 mm . long. Along streams and swamps, Va. to Fla. and Tex. Also in the West Indies and S. Am. May-July.

## Family 6. ILICÀCEAE Lowe.

## Holly Family.

Shrubs or trees, with watery sap, and alternate petioled simple leaves. Flowers axillary, small, white, mainly polygamo-diœecious, regular. Stipules minute and deciduous, or none. Calyx 3-6-parted, generally persistent. Petals 4-6 (rarely more), separate, or slightly united at the base, hypogynous, deciduous, imbricated. Stamens hypogynous, as many as the petals, or sometimes more ; anthers oblong, cordate. Disk none. Ovary i, superior, 3-several-celled; stigma discoid or capitate; style short or none; ovules i or 2 in each cavity. Fruit a small berry-like drupe, enclosing several nutlets. Seed pendulous; endosperm fleshy; embryo straight. Five genera and about 170 species, of temperate and tropical regions.

[^33]
## 1. ILEX L

Leaves minutely stipulate. Flowers cymose or solitary, perfect or polygamous. Calyx small, 4 - 5 -cleft or toothed. Petals 4-9, somewhat united at the base, oblong, obtuse. Stamens of the same number, adnate to the base of the corolla. Berry-like drupe globose, with $4-8$ bony or crustaceous nutlets. [Ancient name of the Holly Oak.] About 160 species, mostly natives of America. In addition to the following, some 5 others occur in the southeastern U. S.

Leaves, thick, evergreen, persistent.
Nutlets ribbed.
Leaves spiny-toothed. I. I. opaca.
Leaves toothed or entire, not spiny.
Leaves entire or few-toothed; calyx-lobes acute. 2. I. Cassine.
Leaves coarsely crenate; calyx-lobes obtuse. 3. I. vomitoria.
Nutlets not ribbed; leaves dotted beneath.
Leaves oblanceolate to elliptic, obtusish; drupe $4^{-6} \mathrm{~mm}$. in diameter.
4. I. glabra.

Leaves obovate to oblong, acute ; drupe $6-8 \mathrm{~mm}$. in diameter. 5. I. lucida. Leaves thin, deciduous.

Nutlets ribbed; peduncles x -flowered.
Leaves small, obovate or spatulate, crenate. 6. I. decidua.
Leaves large, ovate or lanceolate, sharply serrate. 7. I. monticola.
Nutlets not ribbed.
Flowers all short-pedicelled.
Leaves oval to oblong; twigs brown; fruit scarlet.
Leaves obovate; twigs gray; fruit orange-red.
Staminate flowers on long and slender pedicels.
8. I. verticillata.
9. I. Bronxensis.
10. I. laevigata.
r. Ilex opàca Ait. American Holly. (I. F. f. 2356.) A tree of slow growth, sometimes 15 m . high. Young twigs sparingly pubescent; leaves elliptic or obovate, $5-10 \mathrm{~cm}$. long, $2.5-4 \mathrm{~cm}$. wide, glabrous, spiny-tipped, rarely nearly or quite entire; petioles $4-8 \mathrm{~mm}$. long; staminate cymes 3 -IO-flowered, $1.25-\mathbf{2 . 5}$ cm . long; fertile flowers mostly solitary; calyx-lobes acute, ciliate; drupe globose or globose-oblong, red, rarely yellow, $8-10 \mathrm{~mm}$. in diameter. In moist woods, S . Me. to Fla., Penn., Mo. and Tex. April-June.
2. Ilex Cassìne L. Dahoon Holly. (I. F. f. 2357.) A shrub, or small tree. Twigs pubescent; leaves oblanceolate or oblong-obovate, $5-10 \mathrm{~cm}$. long, $1.25-2.5 \mathrm{~cm}$. wide, acute at the base, glabrous and dark green above, pale and usually pubescent beneath; petioles $6-8 \mathrm{~mm}$. long; staminate cymes several or many-flowered; peduncles and pedicels pubescent; fertile cymes commonly 3flowered; calyx-lobes ciliate; drupes red, globose, 4-6 mm. in diameter. In low woods, S. Va. to Fla., near the coast, west to La. May.
3. Ilex vomitòria Ait. Cassena. Yaupon. (I. F. f. 2358.) A shrub, or small tree. Petioles and young twigs puberulent; leaves ovate-oblong or elliptic, 1.25-3.75 cm. long, $8-18 \mathrm{~mm}$. wide, obtuse at both ends, crenate, glabrous, pale beneath, dark green above; petioles $2-4 \mathrm{~mm}$. long; staminate cymes severalflowered, short-peduncled; fertile cymes sessile, $\mathbf{I}-3$-flowered; drupe red, $4-6 \mathrm{~mm}$. in diameter. In low woods, Va. to Fla., Ark. and Tex. Also in Bermuda. May.
4. Ilex glàbra (L.) A. Gray. Inkberry. Evergreen Winter-berry. (I. F. f. 2359.) A shrub, 6-18 dm. high. Young twigs and petioles puberulent; leaves dark green and shining above, paler beneath, oblanceolate or elliptic... 2.5-5 cm . long, $\mathbf{r}-\mathbf{I} .8 \mathrm{~cm}$. wide, generally cuneate at the base, obtusish and few-toothed at the apex, or sometimes entire; petioles $4-8 \mathrm{~mm}$. long; sterile cymes severalflowered, slender-peduncled; fertile flowers generally solitary; drupe black. In sandy soil, E. Mass. to Fla., west to La., mainly near the coast. Reported from N. S. June-July.
5. Ilex lùcida (Ait.) T. \& G. Shining Inkberry. (I. F. f. 2350a.) A glabrous shrub, 5 m . high or less. Leaves acute at both ends, entire, or with a few small sharp teeth, $2-8 \mathrm{~cm}$. long, dark green and shining ahove. paler beneath, short-petioled, somewhat viscid when young; floweys clustered in the axils, or the staminate solitary, the cymes sessile; pedicels bractless, short: call.x-segments 6-9; drupe black; nutlets flat. Swamps, Va. to Fla. and La. April-May.
6. Ilex. decídua Walt. Swamp or Meadow Holly. (I. F. f. 2360.) A shrub, or small tree. Twigs light gray, glabrous; leaves $4-8 \mathrm{~cm}$. long, $8-16 \mathrm{~mm}$. wide, dark green, glabrous on the upper surface, paler and pubescent beneath, acute or cuneate at the base, blunt at the apex or sometimes emarginate; calyxlobes ovate, obtuse; drupe red, depressed-globose, $4^{-6} \mathrm{~mm}$. in diameter. In swamps and low grounds, D. C. and Va. to Fla., Kans. and Tex. May.
7. Ilex montícola A. Gray. Large-Leaved Holly. (I. F. f. 236i.) A shrub, or occasionally forming a slender erect tree. Leaves $5-15 \mathrm{~cm}$. long, $1.25-6 \mathrm{~cm}$. wide, acuminate or acute, glabrous on both sides or somewhat pubescent beneath, especially along the veins; petioles 8 --16 mm . long; calyx-lobes acute or acutish, ciliate, not hairy; drupes red, globose-ovoid, 4-6 mm. in diameter. Mountain woods, N. Y. and Penn. to N. Car. and Ala. May.

Ilex montícola móllis (A. Gray) Britton. Leaves proportionately broader, 2.75-3.25 cm . long, $2.5-5 \mathrm{~cm}$. wide, broadly ovate or oval, short-acuminate, densely soft-pubescent beneath, becoming glabrate with age; calyx-lobes downy-pubescent. In mountain woods, Penn. to Ga.
8. Ilex verticillàta (L.) A. Gray. Virginia Winter-berry. Black Alder. (I. F. f. 2362.) A shrub, 2-8m. high. Twigs nearly or quite glabrous, brown; leaves oval, elliptic or oblong-lanceolate, $5-7.5 \mathrm{~cm}$. long, about 2.5 cm . wide, acute or acuminate at the apex, acute or obtusish at the base, dark green and nearly glabrous above, pubescent beneath, sharply serrate; staminate cymes clustered, 2-10-flowered, the fertile 1-3-flowered; pedicels 2 -bracted; calyx-lobes obtuse, ciliate; drupes bright red (rarely white), clustered so as to appear verticillate, about 6 mm. in diameter. In swamps, N. S. to Fla., Ont., Wis. and Mo. June-July.

Ilex verticillata cyclophylla Robinson. Leaves smaller, broadly oval or nearly orbicular, thick. Northern N. Y. to Penn.
9. Ilex Bronxénsis. Bronx Winter-berry. Similar to the preceding species, but with light gray twigs, obovate, abruptly acuminate, thinner and more glabrous leaves, and larger orange-red fruit. In swamps, Me. to Mich. and N. J. [1. verticillata tenuifolia Torr.; not I. tenuifolia Salisb.]
io. Ilex laevigàta (Pursh) A. Gray. Smooth Winter-berry. (I. F. f. 2363.) A shrub, much resembling the preceding. Twigs glabrous; leaves oval or oblong, $2.5-5 \mathrm{~cm}$. long, mainly acute or acutish at each end, glabrous on both sides, or sometimes villous on the veins beneath, turning yellow in autumn, finely serrulate; staminate flowers solitary or occasionally 2 together, on pedicels $1-1.8 \mathrm{~cm}$. long; fertile flowers solitary, much shorter-pedicelled; calyx-lobes acute, glabrous; drupes larger than in I. verticillata, orange-red, ripening earlier. In swamps, Me. to Penn. and Va. Blooms earlier than the preceding. May-June.

## 2. ILICIOİDES Dumont.

A glabrous shrub, with slender-petioled oblong deciduous leaves, and small flowers. Calyx of the staminate flowers none, that of the pistillate minute, $4-5$-toothed. Petals $4-5$. Stamens 4 or 5 . free from the corolla; anthers ovoid-globose. Ovary 3-5-lobed, 3 - 5 -celled; ovules I in each cavity; stigmas 3-5, sessile. Drupe subglobose. Nutlets 4 or 5. [Greek, resembling holly.] A monotypic genus of eastern N. Am.
I. Ilicioides mucronàta (L.) Britton. Wild or Mountain Hollv. (I. F. f. 2364.) A shrub, $2-2.5 \mathrm{~m}$. high, with ash-colored bark. Leaves elliptic or obovate, $\mathbf{1 . 2 5 - 2 . 5} \mathrm{cm}$. long, acutish or mucronate at the apex, entire, or with a few small teeth; petioles 6-12 mm. long; flowers of both kinds solitary, or the staminate sometimes $2-4$ together; pedicels very slender, often 3.75 cm . long; drupe red, $6-8 \mathrm{~mm}$. in diameter, nutlets faintly ribbed. In swamps, N. S. to Ont., Wis., Ind, and Va. May.

## Family 7. CELASTRÀCEAE Lindl.

Staff-tree Family.
Trees or shrubs, often climbing. Leaves simple. Stipules, when present, small and caducous. Flowers regular, generally perfect, small. Pedicels commonly jointed. Calyx $4-5$-lobed or -parted, persistent, the lobes imbricated. Petals 4 or 5 , spreading. Stamens inserted on the disk. Disk flat or lobed. Ovary sessile, mostly 3-5-celled ; style short, thick; stigma entire or $3-5$-lobed; ovules 2 in each cavity, anatropous. Fruit (in our species) a somewhat fleshy dehiscent 2 -celled pod. Seeds arilled; embryo large ; cotyledons foliaceous. About 40 genera, and 350 species, widely distributed.
Leaves opposite.
Large erect or decumbent shrubs; fruit 3-5-lobed; aril red. . I. Euonymus.
Low spreading shrubs; fruit oblong; aril whitish.
2. Pachystima.

Leaves alternate; woody vine.
3. Celastrus.

## r. EUÓNYMUS L.

Shrubs, with petioled entire or serrate leaves, and perfect cymose axillary greenish or purple flowers. Calyx $4-5$-cleft, the lobes spreading or recurved. Petals 4 or 5 , inserted beneath the $4-5$-lobed disk. Stamens 4 or 5 , inserted on the disk. Ovary 3 -5-celled; style short or none; stigma 3-5-lobed. Capsule $3-5$-celled, $3-5$-lobed, angular, rounded or winged, the cavities $\mathbf{1}-2$-seeded, loculicidally dehiscent. Seeds enclosed in the red aril. About 65 species, of the north temperate zone. Besides the following, 2 others occur in Cal.
Pods tuberculate; low shrubs; flowers greenish pink.

Erect or ascending; leaves ovate-lanceolate, acuminate.
Decumbent, rooting at the nodes; leaves obovate, obtuse. Pods smooth; high shrubs or small trees.

Flowers purple; cymes 6-1 5 -flowered.
Flowers greenish yellow; cymes 3-7-flowered.

1. E. Americanus.
2. E. obovatus.
3. E. atropurpureus.
4. E. Europaeus.
I. Euonymus Americànus L. Strawberry Bush. (I. F. f. 2365.) A shrub, 6-24 dm. high, with 4 -angled and ash-colored twigs, divaricately branching. Leaves thick, $4-8 \mathrm{~cm}$. long, $1.25-2.5 \mathrm{~cm}$. wide, nearly sessile, crenulate, glabrous, or sparingly hairy on the veins beneath; peduncles $1.2-2.4 \mathrm{~mm}$. long, very slender, $\mathbf{I}$-3-flowered; flowers $\mathbf{I} \mathbf{- 1 . 2} \mathbf{~ c m}$. broad; petals separated, the blade nearly orbicular, erose or undulate, the claw short; pod slightly 3-5-lobed, not angular, depressed. In low woods, southern N. Y. to Fla., Neb. and Tex. June.
5. Euonymus obovàtus Nutt. Running Strawberry Bush. (I. F. f. 2366.) A low shrub, seldom rising over a foot from the ground. Branches 4 angled or slightly winged; leaves rather thin, mostly acute or cuneate at the base,
 mm . long ; peduncles $\mathbf{I}-4$-flowered; flowers smaller than in the preceding, about 6 mm . broad; petals generally 5 , nearly orbicular, crenulate or erose, with scarcely any claw; pod commonly 3 -celled, slightly lobed, depressed. In low woods, southern Ont. to Penn., Ind. and Ky. April-May.
6. Euonymus atropurpùreus Jacq. Burning Bush. Wahoo. (I. F. f. 2367.) A shrub or small tree, $2-8 \mathrm{~m}$. high. Twigs obtusely 4 -angled; leaves ovate-oblong or elliptic, $4-13 \mathrm{~cm}$. long, $2.5-8 \mathrm{~cm}$. wide, acuminate, puberulent, especially beneath, crenulate-serrulate, rather thin; petioles $8-16 \mathrm{~mm}$. long; peduncles slender, $2.5-5 \mathrm{~cm}$. long, bearing a trichotomous cyme; pedicels $6-12 \mathrm{~mm}$. long; flowers $\mathbf{I}-\mathbf{I} .2 \mathrm{~cm}$. broad; petals commonly 4, obovate, undulate; pod deeply 3-4-lobed, 1.2-I. 6 cm . broad. Ont. to Fla., Mont. and the Ind. Terr. June.
7. Euonymus Europaèus L. Spindle-tree. (I. F. f. 2368.) A glabrous shrub, $\mathbf{I}-3 \mathrm{~m}$. high, resembling the preceding. Leaves oblong, to ovate-lanceolate, acuminate, crenulate; peduncles mostly less than 2.5 cm . long. stouter; flowers about 1 cm . broad; petals + (rarely 5 ), oblong or obovate; pod smooth, deeply 4 -lobed. Escaped from cultivation, N. H., N. Y. and N. J. June.

## 2. PACHÝSTIMA Raf.

Low glabrous shrubs, with corky branches, coriaceous evergreen leaves, and small axillary, perfect brownish flowers. Calyx-lobes 4, broad. Petals 4, spreading. Stamens 4, inserted beneath the disk; filaments longer than the anthers. Ovary immersed in the disk, 2-celled; ovules 2 in each cavity, erect; style short; stigma slightly 2 -lobed. Capsule oblong, compressed, 2 -celled, at length loculicidally dehiscent, I-2-seeded. Seeds oblong with a white many-lobed aril at the base. Two species, natives of N. Am. P. Myrsinites occurs in the Rocky Mountains.
I. Pachystima Cánbyi A. Gray. Canby's Mountain Lover. (I. F. f. 2369.) A shrub $1-3 \mathrm{dm}$. high, with decumbent rooting branches. Leaves oblong, or slightly obovate, $1.2-2 \mathrm{~cm}$. long, $3-4 \mathrm{~mm}$. wide, obtuse at each end, very shortpetioled, pale green, serrate, the margins revolute; peduncles 1 - 3 -flowered, 2 bracted below the middle; pedicels slender and 2 -bracted near the base; calyxlobes oval, about equalling the petals; capsule about 8 mm . long and 4 mm . in diameter. On dry exposed rocks, Va. and W. Va. April-May.

## 3. CELÁSTRUS L.

Shrubs, mainly climbing, with thin deciduous leaves, and racemose or paniculate, small diocious or polygamous flowers. Calyx 5-lobed. Petals 5, inserted under the disk. Stamens in the sterile flowers 5 , inserted at the sinuses of the 5lobed disk. Ovary 2-4-lobed, 2-4-celled; style thick; stigma 2-4-lobed; ovules 2 in each cavity, erect. Capsule 2-4-celled, loculicidally dehiscent into as many valves. Seeds enclosed in a scarlet aril; embryo straight; endosperm fleshy; cotyledons flat, coriaceous. [Greek name of some evergreen tree.] About 30 known species, only I in N. Am.
I. Celastrus scándens L. Shrubby or Climbing Bittersweet. Waxwork. (I. F. f. 2370.) Ascending trees to a height of 8 m . or more, or trailing. Leaves ovate, oval or obovate, $5-10 \mathrm{~cm}$. long, $2.5-5 \mathrm{~cm}$. wide, acuminate or acute at the apex, crenulate; petioles $1.2-1.8 \mathrm{~cm}$. long; flowers greenish, about 4 mm . broad, in terminal compound racemes $5-10 \mathrm{~cm}$. in length; petals crenate, much longer than the calyx-lobes; capsule yellow, or orange, $\mathbf{I - 1 . 2} \mathbf{c m}$. in diameter, opening in autumn and exposing the showy red aril. In rich soil, Quebec to N. Car., Manitoba, Kans., the Ind. Terr. and N. Mex. June.

## Family 8. STAPHYLEÀCEAE DC.

## Bladder-nut Family.

Trees or shrubs, with mostly opposite odd-pinnate or 3 -foliolate stipulate leaves and regular perfect flowers in terminal or axillary clusters. Sepals, petals and stamens usually 5. Carpels mostly 3. Disk large, the stamens inserted at its base without. Anthers introrse, 2-celled. Fruit a dehiscent bladdery capsule in the following genus, indehiscent in some others. Seeds solitary or few in each carpel ; testa hard; endosperm fleshy; embryo straight. About 5 genera, and 22 species, widely distributed.

## I. STAPHYLEA L.

Shrubs, with axillary drooping racemes or panicles of white flowers. Pedicels jointed. Sepals imbricated. Petals the same number as the sepals and about equalling them. Ovary 2-3-parted, the lobes 1-celled; ovules numerous in each cavity, anatropous. Capsule $2-3$-lobed, $2-3$-celled. Seeds globose. [Greek, cluster.] About 6 species, of the north temperate zone; S. Bolanderi A. Gray, in Cal.
I. Staphylea trifòlia L. American Bladder-nut. (I. F. f. 2371.) A shrub, $2-4 \mathrm{~m}$. high, with smooth striped bark. Young leaves and petioles pubescent; mature foliage glabrate; stipules linear, $8-12 \mathrm{~mm}$. long, caducous; leaflets ovate or oval, $4-7 \mathrm{~cm}$. long, acuminate, finely serrate, the lateral ones sessile or nearly so, the terminal one stalked; stipels subulate; flowers campanulate, about 8 mm . long; pedicels slightly longer than the flowers; capsule about 5 cm . long, 2.5 cm . wide, much inflated, the 3 (rarely 4) carpels separate at the summit and dehiscent along the inner side. In moist woods and thickets, Quebec and Ont, to Minn., S. Car, and Kans. April-May.

## Family 9. ACERACEAE St. Hil. <br> Maple Family.

Trees or shrubs, with watery often saccharine sap, opposite simple and palmately lobed (rarely entire) or pinnate leaves, and axillary or terminal cymose or racemose regular polygamous or diœcious flowers. Calyx generally 5 -parted, the segments imbricated. Petals of the same number, or none. Disk thick, annular, lobed, sometimes obsolete. Stamens 4-12, often 8; filaments filiform. Ovary 2-lobed, 2-celled; styles 2, inserted between the lobes. Fruit of 2 long-winged samaras, joined at the base and I-seeded (rarely 2 -seeded). Seeds compressed, ascending ; cotyledons thin, folded. The family consists of the following genus and Dipteronia Oliver, of central Asia. There are about ioo species of Maples.

## I. ÀCER L.

[Ancient name of the maples.] Besides the following; some 5 others occur in southern and western North America.

Leaves simple, palmately lobed.
Flowers in dense sessile lateral clusters, unfolding before the leaves. Petals none; ovary tomentose; samaras divergent. I. A. saccharinum. Petals present; ovary glabrous; samaras incurved.

Leaves pale and glabrous or but slightly pubescent beneath.

> 2. A. rubrum.

Leaves densely whitish-pubescent beneath; southern.
3. A. Drummondii.

Flowers corymbose, unfolding with the leaves.
Flowers long-pedicelled, drooping; large trees.
Leaves pale and nearly glabrous beneath. 4. A. Saccharum.
Leaves green and pubescent, at least on the veins, beneath.
Flowers short-pedicelled, erect; shrub or small tree.

> 5. A. nigrum.
6. A. glabrum.

Flowers racemed, terminal, unfolding after the leaves. Racemes drooping; leaves finely serrate.
Racemes erect ; leaves coarsely serrate.
7. A. Pennsylvanicum.
8. A. spicatum.
9. A. Negundo.

## Leaves pinnate.

I. Acer sacchárinum L. Silver Maple. Soft or White Maple. (I. F. f. 2372.) A tree with flaky bark. Leaves I-I. 5 dm . long, deeply 5 -lobed, the lobes rather narrow, acuminate, coarsely and irregularly dentate, truncate or slightly cordate at the base, green above, silvery white and more or less pubescent beneath; flowers greenish or red; fruiting pedicels elongating; samaras at length $5-7 \mathrm{~cm}$. long, the wing often $\mathbf{I} .2 \mathrm{~cm}$. wide. Along streams, N. B. to Fla., S. Ont., Dak., Neb. and the Ind. Terr. Yields maple sugar in small quantities. Feb.~April.
2. Acer rùbrum L. Red, Scarlet or Water Maple. Swamp Maple. (I. F. f. 2373.) A tree with flaky or smoothish bark. Twigs reddish; leaves $7-10 \mathrm{~cm}$. long, cordate at the base, sharply $3-5$-lobed, the lobes irregularly dentate, acute or acuminate, green above, generally whitish beneath; flowers reddish or yellowish; petals narrowly oblong; stamens $3-6$; fruiting pedicels elongating ; samaras $1.8-2.5 \mathrm{~cm}$. long, the wing $6-8 \mathrm{~mm}$. wide. In swamps and low grounds. N. B. to Manitoba, Fla. and Tex. Foliage crimson in autumn. March-April.
3. Acer Drummóndii H. \& A. Drummond's Maple. (I. F. f. 2374.) Similar to the preceding. Leaves $7-15 \mathrm{~cm}$. long, thicker, 3 -lobed, or sometimes 5 -lobed, obtuse or cordate at the base, the lobes shorter, broader, acute or acuminate; young twigs and petioles more or less tomentose; fruiting pedicels $2.5-5 \mathrm{~cm}$. long; samaras $3.75-6.25 \mathrm{~cm}$. long, the wing $\mathbf{1}-\mathbf{2 c m}$. broad at middle. In swamps. southern Mo. to Ga., Fla. and Tex. Fruit scarlet, ripening in March or April.
4. Acer Sáccharum Marsh. Sugar or Rock Maple. Sugar-tree. (I. F. f. 2375.) A large tree. Leaves $7 \cdot 5-\mathbf{1 5} \mathrm{cm}$. long, dark green above, cordate or truncate at the base, 3-7-lobed, the lobes acuminate, irregularly sinuate, the sinuses rounded; flowers in sessile corymbs, greenish yellow; pewils none; samaras glabrous, slightly diverging, $2.5-3.75 \mathrm{~cm}$. long, the wing $6-10 \mathrm{~mm}$. wide. In rich
woods, Newf. to Manitoba, south to Fla. and Tex. Its sap is the main source of maple sugar. April-May.
5. Acer nìgrum Michx. Black Sugar Maple. (I. F. f. 2376.) Nearly or quite as large as the Sugar Maple, with rough, blackish bark. Leaves similar, but green both sides, thicker and generally more or less pubescent beneath, especially along the veins; lobes much broader and shorter, with few undulations or frequently entire, the basal sinus often narrow; samaras slightly more divergent. Ont. and Vt. to Ga., Minn., La. and Ark. April-May.
6. Acer glàbrum Torr. Dwarf or Rocky Mountain Maple. (I. F. f. 2377.) A shrub, or small tree. Leaves $2.5-7.5 \mathrm{~cm}$. long, often broader, glabrous on both sides, or puberulent when young, $3-5$-lobed, the lobes sharply serrate; flowers yellowish green, in numerous small sessile corymb-like racemes; pedicels short, glabrous; samaras glabrous, shining, $1.8-3 \mathrm{~cm}$. long, little diverging; wing $8-12 \mathrm{~mm}$. wide. Borders of streams and hillsides, western Neb. to Ariz., Nev. and Br. Col. May.
7. Acer Pennsylvánicum L. Striped or Goosefoot Maple. Moosewood. (I. F. f. 2378.) A small tree, the smoothish green bark striped with darker lines. Leaves often $1.5-2 \mathrm{dm}$. long, broadest above the middle, thin, glabrous above, sparingly pubescent beneath when young, slightly cordate or truncate at at the base, 3 -lobed near the apex, the lobes short and acuminate; racemes 7.5-10 cm . long: flowers greenish yellow, $6-8 \mathrm{~mm}$. broad; petals obovate; samaras glabrous, 2.5 cm . long, widely divergent, the wing $8-10 \mathrm{~mm}$. wide. In rocky woods, N. S. to Lake Superior, and along the mountains to Ga. and Tenn. May-June.
8. Acer spicàtum Lam. Mountain Maple. (I. F. f. 2379.) A shrub, or rarely a small tree, the bark green, not striped. Leaves $7.5-12.5 \mathrm{~cm}$. long, glabrous above, pubescent beneath, at least when young, 3-5-lobed, the lobes acute or acuminate; racemes compound, rather dense; flowers $2-3 \mathrm{~mm}$. broad, greenish yellow; petals linear-spatulate; samaras $\mathbf{I} .8-2 \mathrm{~cm}$. long, somewhat divergent, the wing $6-8 \mathrm{~mm}$. wide. Damp rocky woods, Newf. and James' Bay to Manitoba, south, especially along the mountains, to N. Car., Tenn. and Minn. May-June.
9. Acer Negúndo L. Box Elder. Ash-leaved Maple. (I. F. f. 2380.) A tree. Leaves petioled, $3-5$-foliolate; leaflets ovate or oval, pubescent when young, nearly glabrous when old, $5-13 \mathrm{~cm}$. long, $2.5-7.5 \mathrm{~cm}$. wide, dentate, slightly lobed or sometimes entire, acute or acuminate; flowers dioecious, drooping, very small, appearing a little before the leaves; samaras glabrous, slightly incurved, $2.5-3.75 \mathrm{~cm}$. long, the broad wing finely veined. Along streams, Vt. and Ont. to Manitoba, Fla. and N. Mex. Rare near the Atlantic Coast. April.

Acer Negúndo Texànum Pax. Branchlets and leaves densely pubescent. Kans. to Tex.

Acer Pseùdo-Plátanus L., the Sycamore Maple, with terminal drooping racemes of yellowish flowers with very woolly ovaries, and deeply 3 - 5 -lobed leaves, and Acer platanoides L., the Norway Maple, with terminal corymbs of greenish yellow flowers appearing with or before the sharply $5-7$-lobed leaves, are commonly planted, and have occasionally escaped from cultivation in the east.

## Family io. HIPPOCASTANÀCEAE T. \& G.

## Buckeye Family.

Trees or shrubs, with opposite petioled digitately 3-9-folioiate leaves, and conspicuous polygamous irregular flowers in terminal panicles. Calyx 5 -lobed or 5 -cleft in the following genus, the lobes unequal. Petals $4-5$, unequal, clawed. Disk entire, often I-sided. Stamens $5-8$; filaments elongated. Ovary sessile, 3 -celled; ovules 2 in each cavity; style slender. Capsule leathery, smooth or spiny, 3 -celled or by abortion J-2-celled, and often only I-seeded. Seeds large, shining; cotyledons very thick. The family consists of the following genus, containing about 15 species, natives of America and Asia, and Billia, of Mexico.

## I. AÉSCULUS L.

## Characters of the family. [Ancient name.]

Capsule spiny, at least when young; stamens exserted.
Flowers white, mottled with yellow and purple; leaflets abruptly acuminate.

1. AE. Hippocastanum.

## Flowers yellow.

A tree; leaflets 5-7.
A shrub; leaflets 7-9.
Capsule glabrous; stamens not exceeding the petals.
Corolla yellow, or purplish; calyx oblong; a tree.
Corolla red; calyx tubular; a shrub.
2. AE. glabra.
3. AE. arguta.
4. AE. octandra.
5. AE. Pavia.
r. Aesculus Hippocástanum L. Horse-chestnut. (I. F. f. 238r.) A large tree, the buds very resinous. Leaves long-petioled, glabrate when mature, or-with persistent tufts of hairs in the axils of the veins on the lower surface; leaflets 5-7 (occasionally only 3 on some leaves), obovate, $1-2 \mathrm{dm}$. long, cuneatenarrowed to the base, irregularly crenulate-dentate; inforescence rather dense, often 3 dm . long, the pedicels and calyx canescent; fruit globose. Escaped from cultivation, N. Eng. to southern N. Y. and N. J. Native of Asia. June-July.
2. Aesculus glàbra Willd. Fetid Buckeye. Ohio Buckeye. (I. F. f. 2382.) Bark rough and fetid. Leaves long-petioled; leaflets $7.5-15 \mathrm{~cm}$. long, oval, oblong or lanceolate, acuminate, narrowed at the base, glabrous or slightly pubescent on the veins beneath, finely serrate; inflorescence loose, pubescent, I1.5 dm . long; flowers pale yellow; calyx campanulate; petals $4, \mathrm{I}-\mathbf{I} .4 \mathrm{~cm}$. long, slightly unequal, their claws about equalling the calyx-lobes; stamens curved, exserted; fruit $2.5-3.7 \mathrm{~cm}$. in diameter, prickly when young, becoming smoothish. Woods, Penn. to Ala., Mich., Neb. and the Ind. Terr. April-May.
3. Aesculus argùta Buckl. Shrubby or Western Buckeye. (I. F. f. 2383.) A shrub, I-3 m. high, with smooth bark. Twigs, young petioles, leaves and inflorescence somewhat pubescent, becoming glabrate; leaflets narrow, 7-10 cm . long, about 2.5 cm . wide, long-acuminate, unequally serrate; inflorescence dense, I-I. 5 dm . long; flowers yellow, "the centre reddish;" calyx broadly campanulate, its lobes very obtuse; stamens exserted, curved; petals $\mathbf{I}-\mathbf{I} .2 \mathrm{~cm}$. long; fruit very spiny when young. Kans. and the Ind. Terr. to Tex. March-April.
4. Aesculus octándra Marsh. Yellow, Sweet or Big Buckeye. (I. F. f. 2384.) A large tree, rarely reduced to a shrub; bark dark brown, scaly. Leaflets 5 , rarely $7, \mathrm{x}-2 \mathrm{dm}$. long, $5-7.5 \mathrm{~cm}$. wide, oval, more or less pubescent beneath, acuminate, the lower ones oblique, the others cuneate at the base, all finely serrate; inflorescence rather loose, puberulent; petals 4, long-clawed, connivent, the 2 upper narrower and longer than the lower. Woods, Penn. to Ga., Iowa and Tex. April-May.

Aesculus octándra hybrida (DC.) Sarg. Purplish Buckeye. Flowers purplish or pink; leaflets pubescent beneath; bark light brown. W. Va. to Ga. and Tex.
5. Aesculus Pàvia L. Red Buckeye. (I. F. f. 2385.) A shrub, $\mathrm{I}-4 \mathrm{~m}$. high. Leaflets 5-7, stalked, oblong, lanceolate, or obovate, $7 \cdot 5-13 \mathrm{~cm}$. long, $2.5-3.75 \mathrm{~cm}$. wide, acute or short-acuminate, narrowed at the base, finely serrate, nearly glabrous on both sides when mature, shining; inflorescence loose; peduncles 1-3-flowered; flowers $2.5-4 \mathrm{~cm}$. long; calyx-lobes short; upper petals longer than the lower. In rich soil, Va. to Fla., Ky., Mo. and Ark. April-May.

Aesculus parviflora Walt., a low shrub with 5 -foliolate puberulent leaves and long thyrses of yellowish flowers, the stamens long-exserted, has been found as an escape from cultivation in southeastern Penn. It is a native of the Southern States.

## Family ir. SAPINDACEAE R. Br.

## Soapberry Family.

Trees or shrubs, with watery sap, rarely herbaceous vines. Leaves alternate (opposite in one exotic genus), mostly pinnate or palmate, without stipules. Flowers polygamo-diœcious, regular or slightly irrecular. Sepals or calyx-lobes 4 or 5, mostly imbricated. Petals 3-5. Disk theshy.

Stamens 5-10 (rarely fewer or more), generally inserted on the disk. Ovary I, 2-4-lobed or entire, 2-4-celled; ovules i or more in each cavity. Fruit various. Seeds globose or compressed ; embryo mainly convolute; endosperm none. About 120 genera, including over I,000 species, widely distributed in tropical and warm regions.

Trees or shrubs ; fruit a berry.<br>1. Sapindus.<br>2. Cardiospermum.

## 1. SAPÍNDUS L.

Leaves alternate, mostly odd-pinnate. Flowers regular, polygamo-diœcious, in racemes or panicles. Sepals 4-5, imbricated in 2 rows. Petals of the same number, each with a scale at its base. Disk annular, hypogynnus. Stamens 8-10, inserted on the disk; anthers versatile. Ovary commonly 3-lobed, with the same number of cavities; ovules I in each cavity, ascending; style slender; stigma 2-4-lobed. Fruit a globose or lobed berry with I-3 seeds. [Name, Sapo Indicus, Indian soap, from the soapy quality of the berries.] About 10 species, natives of warm and tropical Asia and America.
I. Sapindus Drúmmondi H. \& A. Soapberry. Wild China-tree. (I. F. f. 2386.) A tree. Leaves glabrous, or sparingly pubescent beneath, $\mathbf{r}-4.5 \mathrm{~cm}$. long: leafiets 7-I9, inequilateral, obliquely lanceolate, often falcate, entire, 3.5Io cm . long, acuminate at the apex and commonly acute at the base; panicles terminal, $\mathrm{I}-2 \mathrm{dm}$. long, dense; flowers white, about 4 mm . broad; berry globose, oval, $8-12 \mathrm{~mm}$. in diameter, very saponaceous. Kans. to Tex., La., Ariz. and northern Mex. Has been confused with the Southeastern S. marginatus Willd.

## 2. CARDIOSPÉRMUM L.

Vines, with alternate bipinnate or decompound leaves, and small axillary ten-dril-bearing corymbs of slightly irregular polygamo-diœcious flowers. Tendrils 2 to each corymb, opposite. Pedicels jointed. Sepals 4, the 2 exterior smaller. Petals 4, 2 larger and 2 smaller. Disk 1-sided, undulate. Stamens 8; filaments unequal. Ovary 3-celled; style short, 3-cleft; ovules I in each cavity. Capsule inflated, 3-lobed. Seeds arilled at the base; cotyledons conduplicate. [Greek, heart-seed.] About I5 species, of warm and temperate regions.

1. Cardiospermum Halicácabum L. Balloon Vine. Heart-seed. (I. F. f. 2387.) Slender, glabrous or slightly pubescent, 6-18 dm. long. Leaves petioled, $5-10 \mathrm{~cm}$. long; segments stalked, ovate or oblong, acute or acuminate, sharply serrate; peduncles commonly longer than the leaves; flowers white, $6-8 \mathrm{~mm}$. broad; capsule about 2.5 cm . long, globose-pyriform; seeds globose, nearly black. In waste places, N. J., D. C., Kans., and in ballast about the seaports; occasionally escaping from gardens. Native of tropical America. Summer.

Family 12. BALSAMINÀCEAE Lindl.

## Jewel-weed Family.

Succulent herbs, with alternate thin simple dentate petioled leaves, and showy very irregular axillary flowers. Sepals 3, the 2 lateral ones small, green, nerved, the posterior one large, petaloid, saccate, spurred, Petals 5 , or 3 with 2 of them 2 -cleft into dissimilar lobes. Stamens 5 , short; filaments appendaged by scales on their inner side and more or less united; anthers coherent or connivent. Ovary oblong, 5-celled; style short, or none ; stigma 5 -toothed or 5 -lobed ; ovules several in each cavity. Fruit in the following genus an oblong or linear capsule, elastically dehiscent into 5 spirally coiled valves, expelling the oblong ridged seeds. Endosperm none; embryo nearly straight; cotyledons flat. Later flowers small, cleistogamous, apetalous. About 220 species, mostly natives of tropical Asia. The family consists of the following genus and the monotypic Asiatic Hydrocera.

## x. IMPATIENS L.

Characters of family, as given above. [Name in allusion to the elastically bursting pods.]
Flowers orange or orange-yellow, mottled; spur incurved.

1. I. biflora. Flowers pale yellow ; spur.short, spreading.
2. I. aurea.
I. Impatiens biflòra Walt. Spotted Touch-me-not. Silver-leaf. (I. F. f. 2388.) Annual, glabrous, 6-15 dm. high. Leaves ovate or elliptic, pale and glaucous beneath, $3 \cdot 5-8 \mathrm{~cm}$. long, generally obtuse, coarsely toothed; peduncles 2-4-flowered; bracts linear; flowers horizontal, $\mathbf{1} .8-\mathbf{2 . 4} \mathrm{cm}$. long; saccate sepal conic, longer than broad, contracted into a slender spur of one-half its length, which is 2 -toothed at the apex. In moist grounds, N. S. to Ore., Alaska, Fla. and Kans. Spurs are occasionally developed on the 2 small exterior sepals, and spurless flowers have been observed. July-Oct.
3. Impatiens aùrea Muhl. Pale Touch-me-not. (I. F. f. 2389.) Similar to the preceding, but larger and stouter. Flowers pale yellow, sparingly dotted with reddish-brown, or sometimes dotless, $2.4-3 \mathrm{~cm}$. long; saccate sepal dilatedconic, about as broad as long, abruptly contracted into a scarcely incurved notched spur, less than one-third its length; bracts of the pedicels lanceolate to ovate, acute. In similar situations, Quebec to Ore., Ga. and Kans. July-Sept.

## Order 2I. RHAMNÀLES.

Shrubs, vines, or small trees, with nearly always alternate leaves. Flowers small, regular. Sepals mostly more or less united. Petals distinct or wanting. Stamens as many as the sepals or calyx-lobes, and alternate with them, opposite the petals when these are present. Ovary compound, superior ; ovules erect.
Shrubs, small trees, or vines; petals 4 or 5 , or none; fruit a drupe or capsule.
Fam. I. Rhamnaceae. Vines, climbing by tendrils, rarely shrubs; petals caducous; fruit a berry.

Fam. 2. Vitaceae.

## Family I. RHAIMNÀCEAE Dumort.

Buckthorn Family.
Erect or climbing shrubs, or small trees, often thorny. Leaves simple, stipulate, mainly alternate, often 3-5-nerved. Stipules small, deciduous. Inflorescence commonly of cymes or panicles. Flowers small, regular, perfect or polygamous. Calyx-limb 4-5-toothed. Petals 4-5, inserted on the calyx, or none. Stamens 4-5, inserted with the petals and opposite them ; anthers short, versatile. Disk fleshy. Ovary sessile, free from or immersed in the disk, $2-5$ - (often $3^{-}$) celled; ovules 1 in each cavity, anatropous. Fruit often 3-celled. Seeds solitary in the cavities, erect ; endosperm fleshy, rarely none ; embryo large ; cotyledons flat. About 45 genera and 575 species, of temperate and warm regions.
Ovary free from the disk; fruit a drupe.
Petals sessile, entire; stone of the drupe 2 -celled
Petals short-clawed or none; stones of the drupe 2-4.
Ovary adnate to the disk at its base; fruit dry.

[^34]
## x. BERCHEMIA Neck.

Climbing or erect shrubs, with alternate petioled ovate or ohlong pinnatelyveined leaves, and small greenish white flowers in axillary or terminal clusters, or rarely solitary. Petals 5 , sessile, concave or cucullate. Stamens 5 ; filaments filiform. Disk filling the calyx-tube, covering the ovary: Drupe oval, obtuse, compressed, its flesh thin and coriaceous, its stone z-celled. Sceds linear-oblone: cotyledons thin. [Name unexplained. I Alout ro species, the following in sout? eastern N. Am., the others in Asia and Africa.

1. Berchemia scándens (Hill) Trel. Supple-Jack. (I. F. f. 2390.) A glabrous high-climbing shrub, with tough terete branches. Leaves ovate or ovateoblong, $2.5-5 \mathrm{~cm}$. long, $1.25-2.5 \mathrm{~cm}$. wide, obtuse or somewhat truncate at the base, dark green above, paler beneath, their margins undulate; flowers about 3 mm . broad, mainly in small terminal panicles; petals acute; styles short; drupe $6-8 \mathrm{~mm}$. long, equalling or shorter than its slender pedicel, its stone crustaceous. In low woods, Va. to Fla., Ky., Mo. and Tex. March-June.

## 2. RHÁMNUS L.

Shrubs or small trees, with pinnately veined and (in our species) deciduous leaves, and small axillary cymose racemose or paniculate, perfect or polygamous flowers. Calyx-tube urceolate, its limb 4-5-toothed. Petals 4 or 5 , mainly emarginate and hooded, or none. Disk free from the 3-4-celled ovary. Style 3-4-cleft. Drupe berry-like, containing 2-4 nutlet-like stones. Seeds mainly obovoid; endosperm fleshy. [The ancient Greek name.] About 75 species, of temperate and warm regions. Besides the following, some 6 others occur in western N. Am.

Flowers diœcious or polygamous; nutlets grooved.
Petals present; flowers mainly 4 -merous.
Leaves broadly ovate; branches thorny; drupe with 3 or 4 nutlets.
I. R. cathartica.

Leaves ovate-lanceolate; drupe with 2 nutlets.
Petals none; flowers 5 -merous; drupe with 3 nutlets.
Flowers perfect; nutlets smooth.
Umbels peduncled; leaves acute; calyx campanulate.
Umbels sessile; leaves obtuse; calyx hemispheric.
2. R. lanceolata.
3. R. alnifolia.
4. R. Caroliniana. 5. R. Frangula.
I. Rhamnus cathàrtica L. Buckthorn. (I. F. f. 2391.) A shrub, $2-6 \mathrm{~m}$. high. Leaves glabrous, petioled, $4-8 \mathrm{~cm}$. long, about 2.5 cm . wide, regularly crenate or crenulate, with 3 or 4 pairs of veins, the upper running nearly to the apex; flowers greenish, about 2 mm . wide, clustered, unfolding a little later than the leaves; petals very narrow; drupe globose, black, about 8 mm . in diameter. In dry soil, escaped from hedges, N. E., the Middle States and Ont. Introduced from Europe. May-June.
2. Rhamnus lanceolàta Pursh. Lance-leaved Buckthorn. (I. F. f. 2392.) A tall shrub, with grayish bark. Leaves short-petioled, $2.5-8 \mathrm{~cm}$. long, r. 25.2 .5 cm . wide, glabrous or nearly so above, more or less pubescent beneath, finely serrulate; veins 6 or 7 pairs; flowers 2 or 3 together, greenish, about 3 mm . broad, appearing with the leaves; pedicels $2-4 \mathrm{~mm}$. long; drupe black, about 6 mm . in diameter, obovoid-globose. In moist soil, Penn. to Iowa, Neb., Ala. and Tex. May.
3. Rhamnus alnifòlia L'Her. Alder-leaved Buckthorn. Dwarf Alder. (I. F. f. 2393.) A small shrub. Leaves oval to elliptic, $5-10 \mathrm{~cm}$. long, $2.5-5 \mathrm{~cm}$. wide, mainly acute at the base, irregularly crenate-serrate; veins 6 or 7 pairs; petioles 6-12 mm. long; flowers solitary or $2-3$ together, green, about 3 mm . broad, appearing with the leaves; fruiting pedicels $6-8 \mathrm{~mm}$. long; drupe globose or somewhat obovoid, about 6 mm . in diameter. In swamps, N. B. to Br. Col., N. J., Ill., Neb., Mont. and Cal. May-June.
4. Rhamnus Caroliniàna Walt. Carolina Buckthorn. (I. F. f. 2394.) A tall shrub, or small tree. Leaves elliptic or broadly oblong, glabrous, or somewhat hairy on the veins beneath, 5-15 cm. long, $2.5-6.5 \mathrm{~cm}$. wide, obscurely serrulate or even entire; veins $6-10$ pairs; petioles $1.2-1.8 \mathrm{~cm}$. long; flowers 5 -merous, greenish, about 2 mm . broad, in umbels or solitary, unfolding after the leaves; calyx-lobes lanceolate, acuminate; petals present; drupe globose, sweet, about 8 mm . in diameter. In wet soil, Va. and Ky. to Kans., Fla. and Tex. May-June.
5. Rhamnus Frángula L. Alder Buckthorn. (I. F. f. 2395.) A shrub, the young twigs finely and sparsely puberulent. Leaves thin, elliptic or obovate, entire or very obscurely crenulate, glabrous on both surfaces, 4-7 cm. long, 2.54 cm . wide; petioles $4-8 \mathrm{~mm}$. long; umbels I-6-flowered; flowers 5 -merous; calyxlobes ovate, acute; fruiting pedicels $4-10 \mathrm{~mm}$. long; fruit $6-8 \mathrm{~mm}$. in diameter. In bogs, L. I. and N. J. Reported from Ont. Nat. from Europe. May-June.

## 3. CEANÒTHUS L.

Shrubs, with petioled leaves and cymose panicles of small perfect flowers. Calyx-limb 5-lobed. Petals 5, hooded, clawed, longer than the calyx-lobes, inserted under the disk. Stamens 5 ; filaments filiform, elongated. Ovary immersed in the disk and adnate to it at the base, 3 -lobed. Disk adnate to the calyx. Style short, 3 -cleft. Fruit dry, 3-lobed, separating at maturity into 3 nutlets. Seed-coat smooth; endosperm fleshy; cotyledons oval or obovate. [Name used by Theophrastus for some different plant.] About 35 species, of N. Am. and northern Mex.

Leaves ovate or ovate-oblong, pubescent.
Leaves oblong or oval-lanceolate.

1. C. Americanus.
2. C. ovatus.
3. Ceanothus Americànus L. New Jersey Tea. Red-root. (I. F. f. 2396.) Stems erect or ascending from a deep reddish root, puberulent, especially above. Leaves $2.5-7.5 \mathrm{~cm}$. long, $1.25-2.5 \mathrm{~cm}$. wide, acute or acuminate at the apex, obtuse or subcordate at the base, serrate all around, strongly 3 -nerved; peduncles elongated, often leafy, bearing dense oblong cymose panicles of small white flowers; fruit depressed, about 4 mm . high, nearly black. In dry open woods. Me. and Ont. to Manitoba, Kans., Fla. and Tex. May-July.
4. Ceanothus ovàtus Desf. Smaller Red-root. (I. F. f. 2397.) Similar to the preceding, but generally smaller and nearly. glabrous. Leaves $2.5-5 \mathrm{~cm}$. long, $6-18 \mathrm{~mm}$. wide, mainly obtuse at each end, but sometimes acute at the apex, serrate with prominently gland-tipped teeth; peduncles short, nearly always terminal, bearing dense short cymose panicles of white flowers; fruit nearly as in C. Americanus. In rocky places and on prairies, Ont. to Minn., S. Dak., Mass., D. C., Ill. and Tex. May-June.

Ceanothus ovàtus pubéscens T. \& G. Leaves, petioles and peduncles densely pubescent. Iowa to Kans. and Tex.

## Family 2. VITÀCEAE Lindl.

## Grape Family.

Climbing or erect shrubs, with copious watery sap, nodose joints, alternate petioled leaves, and small regular greenish perfect or polygamodiœcious flowers, in panicles, racemes or cymes. Calyx entire or 4-5toothed. Petals $4-5$, separate or coherent, valvate, caducous. Filaments subulate, inserted at the base of the disk or between its lobes; disk sometimes obsolete or wanting ; anthers 2-celled. Ovary 1, generally immersed in the disk, 2-6-celled; ovules $\mathrm{I}-2$ in each cavity, ascending, anatropous. Fruit a 1-6-celled berry (commonly 2-celled). Seeds erect; testa bony ; raphe generally distinct ; endosperm cartilaginous; embryo short. About 10 genera and 450 species, widely distributed.

## x. Vìtis L.

Woody vines, rarely shrubby, mostly with tendrils. Leaves simple, usually palmately lobed or dentate. Stipules mainly small, caducous. Flowers mostly diœecious, or polygamo-diocious, rarely perfect. Petals hypogynous or perigynous, coherent in a cap and deciduous without expanding. Ovary 2 -celled, rarely 3-4celled; style very short, conic; ovules 2 in cach cavity. Rerry globose or ovoid. few-seeded, pulpy, edible in most species. [The ancient Latin name.] About 40 species, natives of warm and temperate regions. In addition to the following, some IO or 15 others occur in the southern and western U.S.

Leaves woolly beneath.
Pubescence rusty-brown; berries large, musky.
I. V. Labrusia.
Pubescence at length whitish; berries small, black, not musky.
Berries with bloom; branches terete.
2. V. aestivalis.
Berries without bloom ; branches angular.
3. $V$. cinerea.
Leaves glabrate, sometimes slightly pubescent when young.
Leaves bluish-white glaucous beneath.
4. V. bicolor.

Leaves not glaucous beneath.
Leaves $3-7$-lobed; lobes acute or acuminate.
Lobes and sinuses acute; berries with bloom. 5. V. vulpina.
Lobes long-acuminate ; sinuses rounded; berries without bloom.
6. V. palmata.

Leaves sharply dentate, scarcely lobed.
Bark loose; pith interrupted by the solid nodes.
High-climbing; leaves large; berries sour.
Leaves somewhat shining above, the apex long-acuminate; inflorescence loose. 7. V. cordifolia.
Leaves dull, the apex short-acuminate or blunt; inflorescence compact.
Low; leaves small; berries sweet.
8. V. Baileyana.

Bark close; pith continuous through the nodes.
9. V. rupestris.
10. V. rotundifolia.
r. Vitis Labrúsca L. Northern Fox- or Plum-grape. Wild Vine. (I. F. f. 2398.) Young twigs, forked tendrils and petioles densely pubescent, especially when young; nodes solid, interrupting the pith. Leaves large, each opposite a tendril or a flower cluster, varying from merely dentate to deeply lobed with rounded sinuses; berries few, brownish-purple, about 1.8 cm . in diameter; seeds 3-6, about 8 mm . long ; raphe narrow. Thickets, N. Eng. to Ind., Ga. and Tenn. May-June. Fruit ripe Aug.-Sept.
2. Vitis aestivàlis Michx. Summer Grape. Small Grape. (I. F. f. 2399.) Twigs and petioles glabrous or pubescent. Leaves as large as those of $V$. Labrusca, dentate, or 3-5-lobed, sometimes becoming nearly glabrous; tendrils and flower-clusters intermittent (wanting opposite each third leaf); inflorescence generally long and loose; berries numerous, about $\mathbf{I} \mathrm{cm}$. in diameter, acid; seeds 2 or 3 , about 6 mm . long : raphe narrow. In thickets, southern N. Eng. to Fla., southern Ont., Wis. and La. May-June. Fruit ripe Sept.-Oct.
3. Vitis cinèrea Engelm. Downy Grape. (I. F. f. 2400.) Young shoots and petioles mostly floccose-pubescent ; tendrils intermittent. Leaves dentate, or somewhat 3 -lobed, often longer than wide; inflorescence loose ; berries $6-8 \mathrm{~mm}$. in diameter, pleasantly acid, $1-2$-seeded; seeds about 4 mm . long, the raphe narrow. IIl. to Neb., Kans. and Tex.
4. Vitis bícolor LeConte. Blue or Winter Grape. (I. F. f. 240I.) Tendrils intermittent; branches terete. Twigs bluish-glaucous, the bloom sometimes disappearing; internodes long; leaves usually 3 -lobed, cordate, sometimes 3 dm . long, the sinuses rounded, the lobes acute or acuminate; inflorescence compact; berries bluish-black with a bloom, sour, about 8 mm . in diameter; seeds about 4 mm . long, raphe narrow. Northern N. Y. to Mich. and N. Car.
5. Vitis vulpìna L. Riverside or Sweet Scented Grape. (I. F. f. 2402.) Glabrous, or pubescent on the veins of the lower surfaces of the leaves; branches rounded or slightly angled, greenish; tendrils intermittent. Leaves thin, shining, the terminal lobe commonly long; stipules $4-6 \mathrm{~mm}$. long, often persistent until the fruit is formed; berries bluish-black, $8-10 \mathrm{~mm}$. in diameter, rather sweet; seeds $2-4,4 \mathrm{~mm}$. long, the raphe narrow. Along rocky river-banks, N. S. to Manitoba, Md. and Ark. May-June. Fruit beginning to ripen in July.

Vitis Lóngii Prince, which differs from $V$. vulpina in its floccose-pubescent shoots and lower leaf-surfaces, the leaves more circular in outline, is reported from Kansas, and extends through western Tex. to N. Mex.
6. Vitis palmàta Vahl. Missouri Grape. (I. F. f. 2403.) Glabrous or nearly so, or with slight pubescence on the veins of the lower surfaces of the leaves; twigs bright red; bark separating in large flakes; tendrils intermittent, forked. Leaves dull, darker green than in $V$. vulpina, deeply 3 - 5 -lobed; stipules $3-4 \mathrm{~mm}$. long; inflorescence loose; berries black, $8-10 \mathrm{~mm}$. in diameter; seeds I or 2 , about 6 mm . long; raphe indistinct. River-banks, Ill. and Mo. June-July.
7. Vitis cordifolia Michx. Frost Grape. Chicken Grape. (I. F. f. 2404.) Twigs glabrous or slightly pubescent, terete or indistinctly angled; internodes long; tendrils intermittent; stem sometimes 3 dm . in diameter or more. Leaves 7.5 -10 cm. wide, thin, sometimes slightly 3 -lobed; tendrils forked, intermittent; stipules about 4 mm . long; berries black, shining, about 6 mm . in diameter, ripening after frost; seeds $\mathbf{I}$ or 2 , about 4 mm . long; raphe narrow. Moist thickets and along streams, N. Eng. to Neb., Fla. and Tex. May-June. Fruit ripe Oct.-Nov.
8. Vitis Baileyàna Munson. Bailey's Grape. (I. F. f. 2405.) Branches angled, the young twigs tomentose, the tendrils intermittent; internodes short. Leaves crenate-dentate, sometimes slightly 3 -lobed, as a rule smaller than those of $V$. cordifolia, the teeth mucronate; berries black, 8 -10 mm . in diameter; seeds about 4 mm . long, the raphe broad. In valleys, Va., W. Va. and N. Car.
9. Vitis rupéstris Scheele. Sand Grape. Sugar Grape. (I. F. f. 2406.) Bushy, sometimes climbing to a height of I or 2 metres, glabrous or somewhat floc-cose-pubescent on the younger parts; tendrils forked, intermittent or often wanting. Leaves pale green, shining, abruptly pointed, rarely slightly 3 -lobed, the sides often folded together; stipules $4-6 \mathrm{~mm}$. long; inflorescence compact; berries black, with a bloom, $6-8 \mathrm{~mm}$. in diameter, $2-4$-seeded; seeds about 4 mm . long; raphe very slender. Southern Penn. to Mo., D. C., Tenn. and Tex. April-June.
io. Vitis rotundifòlia Michx. Southern Fox-grape. Bullace Grape. (I. F. f. 2407.) Glabrous or nearly so; tendrils simple, intermittent, sometimes few. Leaves nearly orbicular, $5-7.5 \mathrm{~cm}$. wide, dark green, shining; inflorescence dense: berries few, purple, I-I. 8 cm . in diameter, without bloom, tough, musky; seeds several, flat, wrinkled, notched at the apex; raphe indistinct. In moist soil, Md. to Kans., Fla., Tex. and Mex. May. Fruit ripe Aug.-Sept.

## 2. AMPELOPSIS Michx.

Climbing woody vines, or some species bushy, the coiling tendrils not tipped by adhering expansions. Leaves simple, dentate or lobed, or pinnately or palmately compound. Flowers polygamo-diœcious or polygamo-monœcious. Disk adnate to the base of the ovary; ovary 2 -celled; ovules 2 in each cavity; style subulate. Berry 2-4-seeded, the flesh usually thin and inedible. [Greek, Vinelike.] About 15 species, of temperate and warm regions, the following in N. Am.

## Leaves coarsely serrate, or slightly 3 -lobed. <br> I. A. cordata. <br> Leaves $2-3$-pinnately compound. <br> 2. A. arborea.

## 1. Ampelopsis cordàta Michx. Simple-Leaved Ampelopsis. (I. F. f. 2408.)

 Glabrous, or the young twigs sparingly pubescent, climbing, the branches nearly terete; tendrils few or none. Leaves broadly ovate, $5-10 \mathrm{~cm}$. long, glabrous or pubescent along the veins, acuminate; panicles small, loose; disk cupshaped; berries 4-6 mm. in diameter, bluish, $1-2$-seeded; seeds about 4 mm . long. Swamps and river-banks, southern Va. to Fla., Ill., Kans. and Tex. May-June.2. Ampelopsis arbòrea (L.) Rusby. Pepper-vine. (I. F. f. 2409.) Glabrous or nearly so, bushy; tendrils often wanting. Leaves sometimes 2 dm . in length or more; leaflets ovate or rhombic-ovate, $\mathbf{I} .25-4 \mathrm{~cm}$. long, sharply serrate, obtuse or slightly cordate, or the terminal one cuneate at the base, glabrous or somewhat pubescent on the veins beneath; panicles short-cymose; berries black. depressed-globose, about 6 mm . in diameter, sometimes pubescent; seeds I-3. In rich moist soil, Va. to Mo., Fla. and Mex. Also in Cuba. June-July.

Ampelopsis heterophylla (Thunb.) Sieb. \& Zucc., a climbing eastern Asiatic vine, with deeply palmately 3 -5-lobed leaves and short-peduncled compound cymes, was found as a waif from cultivation at Lancaster, Pa., in 1890.

## 3. císsus $L$.

Mostly climbing vines with fleshy foliage. Leaves compound or simple, when compound the leaflets commonly separating in drying. Flowers mostly perfect. Petals usually 4, spreading. Disk cup-shaped, adnate to the base of the ovary, mostly 4-lobed. [Greek, ivy.] A large genus, mostly tropical.
I. Cissus incísa (Nutt.) Desmoul. Usually a large vine, fleshy throughout. Leaves 3 -foliolate or 3-parted; leaflets or segments ovate, cuneate at base, toothed,
or the middle one lobed; inflorescence umbel-like; berries obovoid, nearly black, 1-2-seeded, on recurved pedicels. Kans. and Mo. to Tex. and Fla.

## 4. PARTHENOCÍSSUS Planch.

Woody vines, the tendrils often tipped with adhering expansions (disks), or sometimes merely coiling, our species with digitately compound leaves. Flowers perfect, or polygamo-monœcious, in compound cymes or panicles. Petals 5, spreading. Stamens 5. Ovary 2 -celled; ovules 2 in each cavity; style short, thick. Berry 1-4-seeded, the flesh thin, not edible. About io species, natives of Eastern N. Am. and Asia. Besides the following, another occurs in Tex.
i. Parthenocissus quinquefòlia (L.) Planch. Virginia Creeper. False Grape. American Ivy. (I. F. f. 24Io.) Tendrils usually numerous, and provided with terminal adhering expansions, the vine sometimes supported also by aerial roots; leaflets oval, elliptic, or oblong-lanceolate, $5-15 \mathrm{~cm}$. long, narrowed at the base, coarsely toothed, at least above the middle, glabrous or somewhat pubescent; panicles ample, erect or spreading in fruit; berries blue, about $\mathbf{I} .2 \mathrm{~cm}$. in diameter, usually $2-3$-seeded; peduncles and pedicels red. In woods and thickets, Quebec to Manitoba, Cuba, Tex. and Mex. July. Fruit ripe in October.

Parthenocissus quinqueforlia laciniàta Planch. Tendrils mostly without terminal adhering disks, the vine not high-climbing ; leaves more deeply and sharply toothed ; fruiting panicles drooping. Ohio to Iowa, Kans. and Colo.

Parthenocissus tricuspidàta (Sieb. \& Zucc.) Planch., the Ampelopsis Veitchiiz of the gardeners, a Japanese vine, clinging to walls by its very numerous disk-tipped tendrils, has the leaves sharply 3 -lobed or sometimes 3 -divided ; it is freely planted for ornament.

## Order 22. MALVÀLES.

Herbs, shrubs or trees, with simple, mostly alternate leaves. Flowers regular, usually perfect. Sepals separate, or more or less united, valvate. Petals separate, very rarely wanting. Stamens usually very numerous. Ovary superior, compound, the placentae united in its axis. Disk inconspicuous or none.
Stamens in several sets; anthers 2-celled ; embryo straight.
Fam. r. Tiliaceae.
Stamens monadelphous ; anthers i-celled; embryo curved.
Fam. 2. Malvaceae.

## Family I. TILIÀCEAE Juss.

## Linden Family.

Trees, shrubs or rarely herbs, with alternate (rarely opposite) simple leaves, mostly small and deciduous stipules, and generally cymose or paniculate flowers. Sepals 5, rarely 3 or 4, valvate, deciduous. Petals of the same number, or fewer, or none, mostly imbricated in the bud. Stamens $\infty$, mostly 5-IO-adelphous. Ovary 1, sessile, 2-Io-celled; ovules anatropous. Fruit I-Io-celled, drupaceous or baccate. Cotyledons ovate or orbicular; endosperm fleshy, rarely wanting. About 35 genera and 245 species, widely distributed.

## 1. TÍLIA L.

Trees, with serrate cordate mainly inequilateral leaves, and cymose white or yellowish perfect flowers, the peduncles subtended by and partly adnate to broad membranous bracts. Sepals 5. Petals 5, spatulate, often with small scales at the base. Stamens $\infty$; filaments cohering with the petal-scales or with each other in 5 sets. Ovary 5 -celled; cells 2 -ovuled; style simple; stigma 5-toothed. Fruit dry, drupaceous, globose or ovoid, indehiscent, 1-2-seeded. Seeds ascending ; endosperm hard; cotyledons broad, 5 -lobed, corrugated. [The ancient Latin name.] About 12 species, natives of the north temperate zone, I in the mountains of Mex.

Leaves glabrous or nearly so on both surfaces. Leaves glabrous above, pubescent beneath. Leaves glabrous above, silvery-white beneath.

1. T. Americana.
2. T. pubescens.
3. T. heterophylla.
i. Tilia Americàna L. Bass-wood. American Linden. White-wood. (I. F. f. 24II.) A forest tree with spreading branches. Leaves ovate, $5-13 \mathrm{~cm}$. wide, coriaceous, sharply serrate with glandular teeth, abruptly acuminate or acute; floral bracts $5-10 \mathrm{~cm}$. long, strongly veined; cymes drooping, 6-20-flowered; flowers i-1. 4 cm . broad, fragrant; petals yellowish white, crenate, slightly longer than the pubescent sepals; scales similar to the petals, but smaller; fruit globose-ovoid, 8-10 mm . in diameter. In rich woods and along river-bottoms, N. B. to Ga., Manitoba, Neb. and Tex. May-June.
4. Tilia pubéscens Ait. Southern Bass-wood or White-wood. (I. F. f. 2412.) A small tree. Leaves generally smaller than those of T. Americana; floral bracts commonly broader and shorter ; fruit globose, $5-6 \mathrm{~mm}$. in diameter. In moist woods, L. I. to Fla., west to Tex., mostly along the coast. May-June.
5. Tilia heterophýlla Vent. White Bass-wood. Bee-tree. (I. F. f. 2413.) A forest tree. Leaves larger than in either of the preceding species (often 1.5 to 2 dm . long), dark green above, acute or acuminate; floral bracts 7.5-12.5 cm . long, narrowed at the base ; flowers slightly larger and often fewer than those of T. Americana; fruit globose, about $\mathbf{I} \mathrm{cm}$. in diameter. In woods N. Y. to Fla., Ala., Ill., Ky. and Tenn. June-July.

The European Linden, or Lime Tree, Tilia Europaèa L., is planted as án ornamental tree in parks and on lawns. It may be distinguished from any of our species by the absence of scales at the base of the petals. Its name, Lin, was the origin of the family name of Linnaeus.

## Family 2. MALVÀCEAE Neck.

Mallow Family.
Herbs or shrubs (sometimes trees in tropical regions), with alternate leaves. Stipules small, deciduous. Flowers regular, usually perfect, often large. Sepals 5 (rarely 3 or 4), more or less united, usually valvate ; calyx often bracted at the base. Petals 5, hypogynous, convolute. Stamens $\infty$, hypogynous, forming a central column around the pistil, united with the bases of the petals; anthers I-celled. Ovary severalcelled; styles united below, distinct above, and generally projecting beyond the stamen-column, mostly as many as the cavities of the ovary. Fruit capsular (rarely a berry), several-celled, the carpels falling away entire or else loculicidally dehiscent. Seeds reniform, globose or obovoid; embryo curved; cotyledons large, plicate or conduplicate. About 40 genera and 8 oo species, widely distributed.
Stamen-column anther-bearing at the summit.
Carpels 1 -seeded.
Flowers perfect.
Involucels of $6-9$ bractlets. I. Althaea.
Involucels of $1-3$ bractlets, or none.
Stigmas linear, on the inner side of the style-branches.
Carpets beakless; petals obcordate.
Carpels beaked; petals truncate.
Stigmas capitate, terminal.
Seed ascending.
Seed pendulous.
Flowers diœecious.
Carpels 2-several-seeded.
Involucels none.
Involucels of 3 bractlets.
Carpels continuous.
Carpels septate between the seeds.
2. Malva.
3. Callirrhoë.
5. Malvastrum.
6. Sida.
4. Nafaea.
7. Abutilon.
8. Sphaeralcea.
9. Modiola.

Stamen-column anther-bearing below the entire or 5 -toothed summit.
Carpels i-seeded.
10. Kosteletzkya.

Carpels several-seeded.
11. Hibiscus.

## x. ALTHAEA L.

Tomentose or pilose herbs, with lobed or divided leaves and solitary or racemose flowers. Involucels of 6-9 bractlets united at the base. Calyx 5-cleft. Petals 5. Cavities of the ovary numerous, I-ovuled; style-branches the same number as the ovary-cavities, stigmatic along the inner side ; carpels numerous, indehiscent, arranged in a circle around the axis. Seed ascending. [Ancient Greek, signifying to cure.] About 15 species, natives of the Old World.
I. Althaea officinàlis L. Marsh-mallow. (I. F. f. 24I4.) Perennial, herbaceous, erect, 6-12 dm. high, densely velvety-pubescent. Leaves broadly ovate, dentate and generally 3 -lobed, the lower ones often cordate ; petioles 1-2.5 cm . long; flowers in narrow racemes, pink, $2-4 \mathrm{~cm}$. broad; bractlets linear, shorter than the 5 ovate-lanceolate acute calyx-segments; carpels $15-20$, tomentose. In salt marshes, coast of Mass. and N. Y., and in Penn. Nat. from Europe. Summer.

Althaea cannábina L., with digitately 5 -parted leaves, has been found in waste places at Washington, D. C.

Althaea ròsea Cav., the Hollyhock, is occasionally found beyond the limits of cultivation in the Middle States.

## 2. MÁLVA L.

Pubescent or glabrate herbs, with dentate lobed or dissected leaves, and axillary or terminal solitary or clustered flowers. Calyx 5 -cleft. Bractlets of the involucels 3 (rarely none). Petals 5. Cavities of the ovary several or numerous, I-ovuled; style-branches of the same number, linear, stigmatic along the inner side. Carpels arranged in a circle, beakless, indehiscent. Seed ascending. [Greek, referring to the emollient leaves.] About 30 species, natives of the Old World. In addition to the following, another is naturalized in Cal.
Leaves with $5-9$ shallow angular lobes.

| etals 2-4 times the length of the calyx. | I. M. sylvestris. |
| :---: | :---: |
| Petals $\mathrm{I}-2$ times the length of the calyx. |  |
| Procumbent, low. | 2. M. rotundifolia. |
| Erect, tall. |  |
| Leaf-margins not crisped. | 3. M. verticillata. |
| Leaf-margins crisped, wrinkled. | 4. M. crispa. |
| s deeply 5 -7-lobed or pinnatifid. |  |
| Stem-leaves 1 -3-pinnatifid; carpels downy. | moschata. |
| Stem-leaves deeply lobed; carpels glabrous, | 6. M. Alcea. |

I. Malva sylvéstris L. High Mallow. (I. F. f. 2415.) Biennial, erect or ascending, pubescent with spreading hairs, or glabrate. Leaves orbicular, or reniform, $3-10 \mathrm{~cm}$. wide, with 5-9 shallow angular or rounded lobes, crenate-dentate, truncate or cordate at the base; flowers reddish purple, $2-4 \mathrm{~cm}$. broad, in axillary clusters; pedicels slender; carpels about io, flat on the back, rugose-reticulate. In waste places and along roadsides, sparingly adventive from Europe in the U. S., Can. and Mex. Summer.
2. Malva rotundifòlia L. Low, Dwarf or Running Mallow. Cheeses. (I. F. f. 2416.) Annual or biennial, procumbent and spreading; stems I-3 dm. long. Leaves orbicular-reniform, $2-8 \mathrm{~cm}$. wide, cordate, with shallow dentate-. crenate lobes; flowers clustered in the axils, pale blue, $8-15 \mathrm{~mm}$. broad; calyxlobes ovate, acute; carpels about 15 , rounded on the back, pubescent. In waste places, common throughout our territory, and widely distributed as a weed. Nat. from Europe. May-Nov.
3. Malva verticillàta L. Whorled Mallow. (I. F. f. 2417.) Annual, glabrous or nearly so, $\mathbf{1 - 2} \mathrm{m}$. high. Leaves nearly orbicular with shallow, angular crenate lobes; flowers white or whitish, sessile, clustered in the axils, about the size of those of $M$. rotundifolia; carpels rugose-reticulated. In waste places, Vt. Fugitive or adventive from Europe. Summer.
4. Malva críspa L. Curled Mallow. Similar to the preceding, but the margins of the leaves wrinkled and crisped, crenulate. In waste places, sparingly escared from gardens, N. S. to S. Dak. and N. J. Introduced from southern Europe or western Asia. Summer. [M. verticillata crispa L.]
5. Malva moschàta L. Musk Mallow. Musk Rose. (I. F. f. 2418.) Perennial, 3-6 dm. high, pubescent with long hairs, or glabrate. Basal leaves orbicular, 7-10 cm . wide, with broad rounded dentate lobes; stem-leaves deeply divided into linear or cuneate, pinnatifid or cleft segments; flowers $3-5 \mathrm{~cm}$. broad, pink or white, racemosely clustered at the summits of the branches; petals obcordate or emarginate, 5-8 times as long as the triangulate-ovate acute calyx-lobes; carpels 15-20, densely hairy, rounded on the back. In waste places, occasional in the Middle, Southern and Eastern States and in Canada. Adventive from Europe. Plant with a faint odor of musk. Summer.
6. Malva Álcea L. European Mallow. (I. F. f. 24I9.) Similar to the preceding, but the stem-leaves are only once 5-7-parted or cleft, the lobes dentate or incised; pubescence shorter and denser; flowers pink, purplish or white; petals obcordate; carpels glabrous, very finely rugose-reticulated. In waste places, occasionally escaped from gardens. Introduced from Europe. Summer.

## 3. CALLÍRRHOË Nutt.

Herbs with lobed or divided leaves, and showy perfect flowers. Bractlets of of involucels $\mathbf{I}-3$, separate, or none. Calyx deeply 5-parted. Petals cuneate, often toothed or fimbriate. Cavities of the ovary $\infty$, I-ovuled; style-branches of the same number as the cavities of the ovary, stigmatic along the inner side. Carpels 10-20, I-seeded, beaked, the beak separated from the cavity by a septum. Seed ascending. [A Greek mythological name.] A genus of about 7 species, natives of the central and southern U.S. and northern Mex.
Bractlets of the involucels none.

Flowers $2-3 \mathrm{~cm}$. broad; carpels very pubescent.
Flowers $3-5 \mathrm{~cm}$. broad; carpels scarcely pubescent. Bractlets of the involucels 3 .

Leaves triangular, crenate; carpels not rugose.
Leaves orbicular, palmatifid ; carpels rugose.

1. C. alceoides.
2. C. digitata.
3. C. triangulata.
4. C. involucrata.
I. Callirrhoë alceoìdes (Michx.) A. Gray. Light Poppy-Mallow. (I. F. f. 2420.) Perennial, $2-5 \mathrm{dm}$. high, strigose-pubescent. Basal leaves triangular, palmately lobed or incised, $5-9 \mathrm{~cm}$. long, slender-petioled; stem-leaves palmatifid, the divisions linear or cuneate; flowers corymbose or racemose at the summit, pink or white; pedicels slender ; calyx-lobes triangular, acuminate; petals dentate and somewhat fimbriate; carpels rugose-reticulate on the back. In dry soil, Ky. to Neb., Kans. and Tex. May-Aug.
5. Callirrhoë digitàta Nutt. Fringed Poppy-Mallow. (I. F. f. 2421.) Similar to the preceding. Divisions of the stem-leaves longer, narrowly linear, sometimes quite entire, sometimes deeply incised; flowers long-peduncled, reddish purple or lighter; petals fimbriate; calyx-lobes triangular to lanceolate, acuminate; carpels rugose-reticulate. In dry soil, Mo. and Kans. to Tex. April-July.
6. Callirrhoë triangulàta (Leavenw.) A. Gray. Clustered Poppy-MalLow. (I. F. f. 2422.) Perennial, 4-7 dm. high, pubescent with short hairs. Leaves triangular-hastate, the lower long-petioled, crenate or slightly lobed, 5-8 cm . long, the upper short-petioled or nearly sessile, smaller, 3-5-cleft or divided, the lobes narrow, dentate or crenate; flowers $2-5 \mathrm{~cm}$. broad, deep purple, in terminal panicled clusters; involucels of 3 linear or spatulate bractlets, nearly as long as the 5 -lobed calyx; carpels numerous, hairy, short-beaked. Prairies, Ind. to Minn.. N. C. and Tex. June-Aug.
7. Callirrhoë involucràta (T. \& G.) A. Gray. Purple Poppr-Mallow. (I. F. f. 2423.) Perennial, procumbent or ascending, 3-6 dm. long, pubescent with long hispid hairs. Leaves cordate-orbicular, the lobes dentate or incised. those of the upper leaves commonly narrower than those of the lower; stipulesovate, conspicuous; penduncles slender, $\mathbf{I}$-flowered; bractlets of the involucels 3 . linear, half the length of the lanceolate acute 3-5-nerved calyx-lobes; flowers red-purple, $2-6 \mathrm{~cm}$. broad. In dry soil, Minn. and Iowa to Tex., Utah, N. Mex. and northern Mex. April-Aug.

## 4. NAPAEA L.

Erect perennial herbs, with palmately-lobed leaves, and small white dioccious flowers in ample terminal corymbose panicles. Involucels none. Calya 5 -toothed.

Staminate flowers with 15-20 anthers borne at the summit of the stamen-column. Pistillate flowers with 8-10 styles, stigmatic along their inner surface, the stamencolumn present but destitute of anthers. Cavities of the ovary as many as the styles, $\mathbf{I}$-ovuled. Carpels 8 -Io, separating at maturity from the axis, beakless, but minutely tipped, imperfectly 2 -valved. Seed ascending. [Greek, a dell.] A monotypic genus of the east-central U. S.
I. Napaea dioìca L. Glade Mallow. (I. F. f. 2424.) Simple, or branching above, $\mathbf{1}-3 \mathrm{~m}$. high. Basal and lower leaves $\mathbf{1} .5-3 \mathrm{dm}$. broad, long-petioled, orbicular, 7-II-parted, the divisions acute, dentate and lobed; upper leaves smaller, short-petioled, 5-9-lobed, the lobes incisely cut, acute or acuminate; staminate flowers $12-18 \mathrm{~mm}$. broad, the pistillate somewhat smaller; petals obovate, 2-3 times the length of the calyx; carpels strongly 1 -nerved, slightly rugose-reticulate. In moist grounds, southern Penn. to Va., Tenn., Minn. and Iowa. July.

## 5. MALVÁStRUM A. Gray.

Herbs, with entire cordate or divided leaves, and solitary or racemose, shortpedicelled perfect flowers. Calyx 5-cleft. Bractlets of the involucels small, I-3 or none. Cavities of the ovary $5-\infty$, I-ovuled. Style-branches of the same number, stigmatic at the summit only, forming capitate stigmas; carpels indehiscent or imperfectly 2 -valved, falling away from the axis at maturity, their apices pointed or beaked. Seed ascending. [Greek, star-mallow.] About 75 species, natives of America and S. Africa. In addition to the following, about 12 others inhabit the southern and western U. S.
Leaves lanceolate-oblong or linear-oblong, dentate.
Leaves pedately 3-5-parted, the lobes incised.

1. M. angustum.
2. Malvastrum angústum A. Gray. Yellow False Mallow. (I. F.f. 2425.) Annual, pubescent with appressed hairs, 1.5-3 dm. high. Leaves oblong lanceolate, or linear-oblong, petioled, acute, finely dentate, $\mathbf{1 . 5 - 4 ~ c m}$. long; flowers yellow, $8-12 \mathrm{~mm}$. broad, mostly solitary in the axils of the upper leaves, shortpeduncled; bractlets of the involucre linear, shorter than the ovate-triangular pubescent acute calyx-lobes; petals about equalling the calyx; carpels 5, somewhat pubescent, reniform, 2 -valved at maturity. In dry ground, Tenn. and 111. to Iowa and Kans. Summer.
3. Malvastrum coccíneum (Pursh.) A. Gray. Red False Mallow. (I. F. f. 2426.) Perennial, $\mathbf{I}-2.5 \mathrm{dm}$. high, densely and silvery stellate-pubescent. Lower leaves $2-5 \mathrm{~cm}$. wide, ovate-orbicular, petioled, pedately $3-5$-parted; lobes cuneate to linear, incised; flowers red, $12-18 \mathrm{~mm}$. broad, in dense short terminal racemes; bractlets commonly none; petals much longer than the lanceolate calyx-lobes; carpels 10-15, rugose-reticulated, indehiscent, 1 -seeded (rarely 2 -seeded). Prairies, Manitoba to S. Dak., Neb., Tex., Br. Col. and N. Mex. May-Aug.

## 6. SİDA L.

Herbs, with serrate crenate or lobed leaves, and perfect flowers. Bractlets of the involucels none. Calyx 5 -toothed or 5 -cleft. Cavities of the ovary 5-0, rovuled; style-branches of the same number, stigmatic at the summit. Carpels indehiscent, or at length 2 -valved at the apex. Seed pendulous. [Greek, used by Theophrastus.] About 75 species, natives of the warmer parts of America, Asia, Africa and Australasia. Besides the following, some 17 others occur in the southern U. S.
Leaves linear, ovate or oblong, toothed.

Leaves ovate or oblong-lanceolate: flowers $4-8 \mathrm{~mm}$. broad.
Leaves linear or linear-oblong; flowers $12-25 \mathrm{~mm}$. broad. Leaves palmately lobed, or palmately veined.

Glabrous or nearly so, tall; flowers in terminal panicles.
Densely stellate-cunescent; low; flowers axillary.

1. S. spinosa.
2. S. Elliottii.
3. S. hermaphrodita.
4. S. hederacea.
I. Sida spinòsa L. Prickly Sida. (I. F. f. 2427.) Annual, finely pubescent, 3-6 dm. high. Leaves ovate to oblong-lanceolate, $2-5 \mathrm{~cm}$. long, petioled, truncate or cordate at the base, crenate-dentate; flowers axillary, short-peduncled, yellow; peduncles shorter than the petioles; calyx-teeth triangular, acute; carpels 5, dehiscent at the apex into 2 beaks; stipules linear; petioles of the larger
leaves with a small spine-like tubercle at the base. In waste places, Me. to N. J., Mich., Kans., Fla. and Tex., and in tropical Am. Summer.
5. Sida Ellióttii T. \& G. Elliot't's Sida. (I. F. f. 2428.) Perennial, glabrous or nearly so, $3-12 \mathrm{dm}$. high. Leaves short-petioled, linear or linear-oblong, $2-5 \mathrm{~cm}$. long, $4-5 \mathrm{~mm}$. wide, mostly obtuse, serrate-dentate; peduncles often longer than the petioles; flowers axillary, yellow; calyx-teeth broadly ovate, acute: carpels 8-10, dehiscent at the apex, slightly and abruptly pointed. In dry soil, southern Va. to Fla., Mo. and Chihuahua. Summer.
6. Sida hermaphrodita (L.) Rusby. Virginia Mallow. (I. F. f. 2429.) Perennial, $\mathbf{1}-3 \mathrm{~m}$. high. Leaves petioled, 7-15 cm. wide, ovate-orbicular, deeply 3-7-lobed or cleft, the lobes lanceolate or ovate, incised-dentate, acute or acuminate; flowers white, $\mathbf{I} .5-2.5 \mathrm{~cm}$. broad, numerous; pedicels, calyx, and petioles of the upper leaves finely pubescent; calyx-lobes acute; carpels about io, acute, dehiscent at the top. Along rivers, in rocky places, southern Penn. to Ohio, Va. and Tenn. Summer.
7. Sida hederácea Torr. Round-leaved Sida. Perennial, low, decumbent. Leaves reniform to broadly ovate, inequilateral, $\mathbf{1}-5 \mathrm{~cm}$. broad; flowers solitary or few in the axils; peduncles recurved in fruit; petals white to yellowish; calyx 5 -angled, the lobes ovate-lanceolate, acuminate; fruit short, conic, of 6-10 carpels. In moist, often saline, soil, Kans. to Tex., Mex., Cal., Utah and Wash.

## 7. ABUTILON Gaertn.

Herbs or shrubs; sometimes trees in tropical countries, mostly soft-pubescent, with cordate angular or lobed leaves and axillary flowers. Involucels none. Calyx 5 -cleft. Cavities of the ovary $5-\infty, 3-9$-ovuled. Style-branches the same number as the ovary-cavities, stigmatic at the apex; carpels 2 -valved, often rostrate, falling away from the axis at maturity. Seeds reniform, the upper ascending, the lower pendulous or horizontal. [Name given by the celebrated Arabian physician Avicenna (Ibn Sina), died 1037.] About 90 species, natives of warm and tropical regions. In addition to the following, some 15 others inhabit the southern U.S.
I. Abutilon Abùtilon (L.) Rusby. Velvet Leaf. Indian Mallow. (I. F. f. 2430.) Annual, stout, 1-2 m. high, densely velvety-pubescent. Leaves long-petioled, cordate, ovate-orbicular, 1-3 dm. wide, dentate, or nearly entire, acuminate, the point blunt; flowers yellow, $1-2 \mathrm{~cm}$. broad; peduncles shorter than the petioles; head of fruit 2 cm . in diameter or more; carpels $\mathbf{1 2 - 1 5}$, pubescent, dehiscent at the apex, each valve beaked by a slender awn. In waste places, frequent or common throughout our area, except the extreme north. Nat. or adventive from southern Asia. Aug.-Oct.

## 8. SPHAERÁLCEA St. Hil.

Herbs or shrubs. Bractlets 3, distinct, or united at the base. Cavities of the ovary $5-\infty, 2-3$-ovuled. Style-branches the same number as the ovary-cavities, stigmatic at the apex; carpels 2-valved, not septate between the seeds, separating from the axis at maturity. Seeds reniform. [Greek, globe-mallow.] About 30 species, natives of America and S. Africa. In addition to the following, about 14 others occur in the southwestern U. S.
Leaves nearly orbicular, 5 -7-lobed; flowers pink or white. $\quad$ 1. S. acerifolia. Leaves lanceolate, crenulate; flowers red. 2. S. cuspidata.

1. Sphaeralcea acerifolia Nutt. Maple-leaved Globe-mallow. (I. F. f. 2431.) Perennial, erect, 6-18 dm. high, finely stellate-pubescent and scabrous. Leaves palmately 5-7-lobed or cleft, cordate, the lobes ovate or lanceolate, dentate, acute; flowers $2.5-4 \mathrm{~cm}$. broad, short-pedicelled, clustered in the upper axils or in terminal spike-like racemes; bractlets of the involucels linear, shorter than the calyx: calyx-lobes triangular, acute; carpels stellate-pubescent and hairy, not beaked. Kankakee Co., Ill. ; Dak. to Nev. and Br. Col. Summer.
2. Sphaeralcea cuspidàta (A. Gray.) Britton. Sharp-fruiten Ginmemallow. (I. F. f. 243 ra.) Perennial, densely stellate-canescent; stems leafy, 3-12 dm. high. Leaves firm, crenulate, the lower with petioles as long as the blade, the others short-petioled, the larger 5.10 cm . long, sometimes hastately lobed toward the base; flowers $\mathbf{I}-2 \mathrm{~cm}$. broad, clustered in the axils, short-pedi-
celled; carpels 1-3-seeded, cuspidate, the tip often deciduous, wrinkled on the sides. Kans. to Tex., Colo., Ariz. and Mex. April-Aug.

## 9. MODİOLA Moench.

Prostrate or ascending herbs, with palmately cleft or divided leaves, and small axillary peduncled red flowers. Bracts of the involucre 3, distinct. Calyx 5-cleft. Cavities of the ovary $\infty, 2$-3-ovuled. Style-branches stigmatic at the summit; carpels $5^{-20}$, septate between the seeds, dehiscent into 2 valves with awn-pointed tips, and aristate on the back. [Latin, from the likeness of the fruit to the small Roman measure, modiolus.] A monotypic genus.
I. Modiola Caroliniàna (L.) Don. Bristly-fruited Mallow. (I. F. f. 2432.) Annual or biennial, more or less pubescent; stems 1.5-5 dm. long. Leaves nearly orbicular, $\mathbf{I}-6 \mathrm{~cm}$. wide, petioled, $3-5$-cleft, the lobes dentate or incised, or sometimes simply dentate; flowers $6-10 \mathrm{~mm}$. broad, red; peduncles at length elongated; fruit depressed-orbicular. In low grounds, Va. to Fla., west to Tex. and Cal., and in Cent. and S. Am. Summer.

## ro. KOStelétzkya Presl.

Perennial, scabrous or pubescent herbs or shrubs, with hastate or angular leaves, and showy, axillary or paniculate flowers. Bractlets several, linear. Calyx 5 -toothed or 5 -cleft. Stamen-column anther-bearing below for nearly its entire length. Ovary 5 -celled, the cavities I-ovuled; style-branches of the same number, stigmatic at the capitate summits. Capsule depressed, 5 -angled. Seeds reniform, ascending. [Named in honor of V. F. Kosteletzky, a botanist of Bohemia.] About 6 species, natives of warm and temperate America. In addition to the following, 2 others occur in the southern U. S.
I. Kosteletzkya Virgínica (L.) A. Gray. Virginia Kosteletzkya. (I. F. f. 2433.) Erect, 6-12 dm. high, somewhat stellate-pubescent and scabrous. Leaves ovate, or hastate, truncate or cordate at the base, $5-13 \mathrm{~cm}$. long, unequally dentate and often 3 -lobed below, acute, not velvety-pubescent; flowers pink, $3-6 \mathrm{~cm}$. broad, in loose terminal leafy panicles; bractlets 8 or 9 , linear, shorter than the lanceolate acute calyx-segments; carpels 5, hispid-pubescent. In salt or brackish marshes, N. Y. to Fla. and La. A form approaching K. althaeifolia of the Southern States occurs in eastern Md. Aug.

## ir. Hibíscus L.

Herbs, shrubs, or in tropical regions even small trees, with dentate or lobed leaves, and showy, mostly campanulate flowers. Bractlets numerous, narrow. Calyx 5 -cleft or 5 -toothed. Column of stamens anther-bearing below along much of its length. Ovary 5 -celled, the cavities 3 -several-ovuled; style branches 5 . stigmatic at the capitate summit. Capsule 5-valved. Seeds reniform. [An ancient name, used by Dioscorides for the Marsh Maliow.] About 180 species, widely distributed. In addition to the following, about 14 others occur in the southern and western U. S.
Tall perennial herbs.
Leaves white-pubescent beneath; seeds glabrous, or nearly so.
Leaves glabrate, or stellate-hairy above; bractlets not ciliate. 1. H. Moscheutos.

Leaves soft-hairy above; bractlets ciliate.
Leaves glabrous on both sides; seeds hairy.
Low hairy annual of waste places.
Tall woody shrub, escaped from gardens.
2. H. lasiocarpus.
3. H. militaris.
4. H. Trionum.
5. H. Syriacus.
I. Hibiscus Moscheùtos L. Swamp Rose-mallow. Mallow Rose. (I. F. f. 2434.) Erect, $\mathrm{I}-2.5 \mathrm{~m}$. high, forming numerous cane-like stems. Leaves ovate or ovate-lanceolate, $7-20 \mathrm{~cm}$. long, cordate or obtuse at the base, acute or acuminate at the apex, sometimes lobed at the middle, palmately veined, dentate or crenate; flowers $\mathrm{I}-2 \mathrm{dm}$. broad, pink, or white, sometimes with a crimson centre, clustered on stout pedicels at the summits of the stems; peduncles often adnate to the petioles; bractlets linear, not ciliate, shorter than the calyx; capsule ovoid, ${ }^{2-3} \mathrm{~cm}$. long, glabrous or sparingly pubescent; seeds glabrous. In brackish marshes, Mass. to Fla. and La., and on lake shores and in saline situations locally in the interior to W. Ont. Aug-Sept,
2. Hibiscus lasiocàrpus Cav. Hairy-fruited Rose-mallow. (I. F. f. 2435.) Resembles the preceding. Leaves broadly ovate, dentate or 3-7-lobed, mostly cordate or truncate at the base; pubescence of the lower surface white and densely stellate, that of the upper surface darker, with longer soft nearly simple hairs; bractlets linear, equalling the calyx or shorter, ciliate; capsule ovoid, densely and finely hairy; seeds nearly glabrous. In swamps, southern Ind. to Mo., Fla. and Tex. Aug.
3. Hibiscus militàris Cav. Halberd-leaved Rose-mallow. Sweatingweed. (I. F. f. 2436.) Erect, I-2 m. high, nearly glabrous. Leaves $\mathbf{1 - 1 . 5 ~ d m . ~}$ long, ovate in outline, acute, or acuminate, cordate or truncate at the base, the lower, or sometimes all, hastately lobed, the margins dentate-crenate; flowers pink with a darker eye, $5-8 \mathrm{~cm}$. long; peduncles jointed above the middle; bractlets linear, slightly shorter than the calyx, glabrous, or with a few scattered hairs; fruiting calyx inflated; capsule ovoid, enclosed by the calyx, glabrous; seeds silky. Along rivers, southern Penn. to Fla., Minn., Nev. and La. Aug.-Sept.
4. Hibiscus Triònum L. Bladder Ketmia. Flower-of-an-hour. (I. F. f. 2437.) Pubescent with spreading hairs. Leaves ovate or orbicular in outline, pedately $3-7$-lobed or divided, the lobes obtuse, dentate-crenate or cleft; flowers pale yellow with a purple eye, $2.5-6 \mathrm{~cm}$. broad, axillary; petals tinged with purple on the outer edge; bracts linear, ciliate, much shorter than the membranous beautifully nerved hispid-pubescent 5 -angled inflated calyx; capsule globose-ovoid, hairy; seeds roughened with short processes. In waste places, N. S. to Fla., S. Dak. and Kans. Adventive from southern Europe. Aug.-Sept.
5. Hibiscus Syriacus L. Shrubby Althaea. Rose-of-Sharon. (I. F. f. 2438.) A shrub 3-7 m. high. Leaves short-petioled, ovate, 5-13 cm. long, 3-5lobed or the upper merely dentate; flowers axillary, short-peduncled, pink or white with a crimson centre, $5-10 \mathrm{~cm}$. broad; bractlets linear; peduncles, bractlets and calyx stellate-pubescent; capsule ovoid, nearly 2.5 cm . long. Escaped from cultivation, N. J. to Ga. Introduced from W. Asia. Aug.-Sept.

## Order 23. PARIETÀLES.

Herbs, shrubs, or some tropical types trees, the flowers mostly complete, perfect and regular (irregular in Violaceae). Sepals distinct, or more or less united, imbricated or convolute. Petals-almost always present and distinct. Stamens usually numerous. Ovary compound, superior (inferior in Loasaceae) ; placentæ mostly parietal.
Sepals distinct, mostly persistent.
Endosperm little or none.
Trees or shrubs with alternate leaves, and large solitary axillary flowers.
Fam. I. Theaceae.
Herbs or low shrubs with opposite, rarely verticillate leaves.
Leaves punctate or black-dotted, estipulate. Fam. 2. Hypericaceae.
Leaves stipulate; minute or small marsh or aquatic herbs with axillary flowers.

Fam. 3. Elatinaceae.
Endosperm copious.
Flowers regular, but the 2 outer sepals smaller; stamens numerous, ovules orthotropous.

Fam. 4. Cistaceae.
Flowers irregular, some often cleistogamous; stamens 5 ; ovules anatropous.
Fam. 5. Violaceae.
Sepals more or less united into a gamosepalous calyx.
A fringed crown in the throat of the calyx ; our species vines; stamens 5 ; ovary free from the calyx.

Fam. 6. Passifloraceae.
No crown; our species herbs; stamens numerous ; ovary adnate to the calyx.
Fam. 7. Loasaceae.
Family I. THEACEAE DC.

## Tea Family.

Trees or shrubs with alternate or rarely opposite mainly estipulate leaves, and large, regular, mostiy perfect flowers, Sepals 5 (rarely $4^{--}$). imbricated. Calyx often 2-bracted at the base. Petals 5 (rarely 4-9),
hypogynous, imbricated, crenulate. Stamens $\infty$, numerous, hypogynous, more or less united at their bases. Ovary sessile, 2-several-celled ; ovules 2 or more in each cavity. Fruit a $3-5$-celled generally woody capsule. Endosperm little or none ; embryo large, with conduplicate cotyledons. About 16 genera and 160 species, natives of tropical and warm regions.
Stamens monadelphous.

1. Stuartia.

Stamens 5-adelphous.
2. Gordonia.

## 1. STUARTIA L.

Shrubs, with deciduous membranous serrulate leaves, and large showy axillary solitary flowers on short peduncles. Sepals 5, rarely 6, ovate or lanceolate. Petals of the same number, obovate. Ovary 5 -celled; styles I or 5 ; ovules 2 in each cavity, anatropous; capsule ovoid, 5-celled, loculicidally dehiscent. Embryo straight. Cotyledons oval, longer than the inferior radicle. [Named in honor of John Stuart, Marquis of Bute.] Six species, natives of N. Am. and Japan.
Style 1, compound ; stigma 5-lobed ; seeds marginless ; capsule subglobose.
I. S. Malachodendron. Styles 5, distinct; seeds wing-margined; capsule ovoid, 5-angled. 2. S. pentagyna.
I. Stuartia Malachodéndron L. Round-fruited Stuartia. (I. F. f. 2439.) A shrub, $2-4 \mathrm{~m}$. high, the branches pubescent when young. Leaves oval, acute or acuminate at each end, $5-8 \mathrm{~cm}$. long, pubescent beneath, glabrous above; petioles $4-10 \mathrm{~mm}$. long; flowers $7-10 \mathrm{~cm}$. broad, solitary or occasionally in pairs ; sepals ovate or orbicular, obtuse, silky-pubescent, united at the base; petals white, minutely crenulate ; filaments purple ; anthers blue; capsule $12-16 \mathrm{~mm}$. long, pubescent. In woods, Va. to Fla., west to La. April-May.
2. Stuartia pentagyna L'Her. Angled-fruited or Mountain Stuartia. (I. F. f. 2440.) A shrub resembling the preceding, Leaves oval, or ovate, larger, I-I. 5 dm . long, acuminate, pubescent beneath, mucronate-serrulate or rarely entire; flowers solitary, $5-8 \mathrm{~cm}$. broad; peduncles 6-14 mm . long; sepals lanceolate, acutish, hairy; petals cream color, crenulate; capsule acute, nearly 2 cm . long, densely pubescent. In woods, mountains of Ky. and N. Car. to Ga. and Ala. June.

## 2. GORDÒNIA Ellis.

Trees or shrubs, with coriaceous evergreen leaves, and large white solitary axillary flowers, often clustered at the ends of branches. Sepals 5, imbricated, rounded, concave. Petals 5, imbricated, obovate. Stamens $\infty, 5$-adelphous, each cluster cohering with the base of a petal. Ovary 1, 3-5-celled; style I; stigma 5rayed. Capsule woody, ovoid, 5 -valved, the axis persistent. Seeds compressed, with a short wing; cotyledons ovate, longitudinally plaited; hypocotyl short, superior. [Named for James Gordon, a London nurseryman.] About 16 species, natives of E. N. Am., Mex. and E. Asia.
I. Gordonia Lasianthus L. Loblolly Bay. Tan Bay. (I. F. f. 2441.) A tree. Leaves lanceolate, or oblong, acute and involute at the base, nearly sessile, $7-13 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide, serrulate, glabrous, shining; peduncles ascending; flowers $3-5 \mathrm{~cm}$. broad; sepals orbicular, silky, ciliate; petals slightly pubescent without; capsule ovoid-conic, pointed, $\mathbf{1 2 - 1 6 ~ m m}$. long, sometimes 6 -valved. In low woods, Va. to Fla. May-July.

## Family 2. HYPERICÀCEAE Lindl.

## St. John's-wort Family.

Herbs or shrubs, sometimes small trees in tropical regions, with opposite, or rarely verticillate, simple entire or rarely glandular-ciliate or dentate leaves, no stipules, and solitary or cymose-paniculate flowers. Foliage pellucid-punctate or black-dotted. Flowers regular and perfect. Sepals 5 or 4 , imbricated. Petals of the same number, hypogynous, generally oblique or contorted. Stamens $\infty$, hypogynous, often in sets of 3 or 5 ; anthers versatile or innate, 2-celled, longitudinally dehiscent. Ovary I-7-celled, composed of I-7 carpels; styles as many as the carpels; ovules
$\infty$, in 2 rows in each cavity, anatropous. Fruit mainly capsular with septicidal dehiscence; seeds mainly straight ; endosperm none. About io genera and 280 species, mainly of temperate and warm regions.

Sepals 4 , in unequal pairs; petals 4 .
Sepals and petals 5 .
Petals yellow.
Leaves normal, not reduced to scales.
Leaves reduced to minute appressed scales.
Flowers pink or greenish purple.

1. Ascyrum.
2. Hypericum.
3. Sarothra.
4. Triadenum.

## 1. ÁSCYRUM L.

Leafy glabrous low shrubs, with the aspect of Hypericum. Flowers bright yellow. Sepals 4, in 2 pairs, the exterior ones broad and round, the interior smaller and narrower. Petals 4 , oblique or slightly contorted, deciduous. Stamens $\infty$, distinct, or united in clusters. Ovary I-celled, with 2-4 parietal placentae; styles 2-4. Capsule 1-celled, 2-4-valved, dehiscent at the placentae. [Greek, not rough.] About 5 species, natives of eastern N. Am., the W. I. and Cent. Am.
Erect, 3-6 dm. high; leaves clasping; styles 3 or 4 .
Diffusely branched, $1-2.5 \mathrm{dm}$. high; leaves sessile; styles 2.
I. Ascyrum stáns Michx. St. Peter's-wort. (I. F. f. 2442.) Stems and branches 2 -edged or slightly winged; leaves erect or ascending, oval, or broadly oblong, $1.5-3.5 \mathrm{~cm}$. long, obtuse, thick; cyme terminal, few-flowered; pedicels 8 12 mm . long, 2 -bracted below the middle; flowers $1.5-2.5 \mathrm{~cm}$. broad; outer sepals 8-12 mm. long, cordate, the inner lanceolate, 6-12 mm. long; petals obovate, longer than the sepals; capsule ovoid, about 6 mm . long. In dry sandy soil, L. I. to eastern Penn., Fla., Tenn. and Tex. July-Aug.
2. Ascyrum hypericoides L. St. Andrew's Cross. (I. F. f. 2443.) Stems and branches flattened and 2-edged; leaves oblong or obovate, sessile, narrowed and 2-glandular at the base, $\mathbf{I}-4 \mathrm{~cm}$. long, thin, obtuse; flowers terminal or also axillary; pedicels $2-6 \mathrm{~mm}$. long, 2 -bracted near the summit; flowers $12-18 \mathrm{~mm}$. broad; outer sepals oval or ovate, sometimes cordate, $8-12 \mathrm{~mm}$. long, obtuse, the inner narrower and mainly shorter; petals oblong-linear, about equalling the outer sepals; styles 2; capsule ovoid, about 4 mm . long. In dry sandy soil, Mass. to Fla., Ill., Kans. and Tex. July-Aug.

## 2. HYPÉRICUM L.

Herbs or shrubs, with opposite punctate or black-dotted leaves, and mostly cymose yellow flowers. Sepals 5, equal or nearly so. Petals 5 , mainly oblique or contorted, convolute or imbricated in the bud. Stamens $\infty$, distinct, or more or less united in clusters, sometimes with interposed hypogynous glands. Ovary I-celled, with 3-5 parietal placentae which sometimes project far into the cavity, or 3-5-celled (rarely 6 -celled); ovules $\infty$, generally numerous; styles 3-6. Capsule 1-5-celled (rarely 6-celled). [The Greek name.] About 210 species, of wide geographic distribution. In addition to the following, 12 others occur in the southern and western United States and British America.

* Styles 5 ; large perennials ; pods 5 -celled.

Flowers $2-5 \mathrm{~cm}$. broad; pods $1.8-2 \mathrm{~cm}$. long.
Flowers $\mathrm{I}-2.5 \mathrm{~cm}$. broad; pods $6-12 \mathrm{~mm}$. long.

1. H. Ascyron.
2.) H. Kalmianum.

## * Styles 3 (rarely 4).

$\dagger$ Tall leafy shrubs; pods 3 -celled.
Flowers $12-16 \mathrm{~mm}$. broad; pods $8-12 \mathrm{~mm}$. long.
3. $H$. prolificum.
4. H. densiforum.

Flowers $8-12 \mathrm{~mm}$. broad; pods $4-6 \mathrm{~mm}$. long.
$\dagger \dagger$ Herbaceous, sometimes woody at the base.
$\ddagger$ Stamens numerous ( $15-40$ ) ; flowers $6-25 \mathrm{~mm}$. broad.
Capsules r-celled or incompletely 3-4-celled.
Capsules incompletely $3-4$-celled by the projecting placentr.
Leaves linear, $2-4 \mathrm{~mm}$. wide.
5. H. galioides.

Leaves oblong, $6-\mathrm{ro} \mathrm{mm}$. wide.
6. H. adpressum.

Capsules strictly r -celled; placentæ parietal.
Styles united into a beak, separate above; stigmas minute,

Leaves linear or linear-oblong; seeds transversely rugose.

$$
\begin{array}{ll}
\text { Nearly simple, erect; pod globose. } & \text { 7. H. sphaerocarpum. } \\
\text { Branched, decumbent; pod 3-sided. } & \text { 8. H. dolabriforme. }
\end{array}
$$

Leaves elliptic; seeds minutely pitted and striate. 9. H. ellipticum.
Styles separate; stigmas capitate; cyme naked. 10. H. virgatum.
Capsules completely 3 -celled; styles separate.
Leaves linear or oblong; sepals lanceolate. II. H. perforatum.
Leaves broadly oblong, oval or ovate-lanceolate.
Sepals ovate.
Petals $4^{-6} \mathrm{~mm}$. long.
12. H. maculatum.

Petals $15-20 \mathrm{~mm}$. long.
13. H. pseudomaculatum.

Sepals lanceolate; petals io-14 mm. long.
14. H. graveolens. $\ddagger \ddagger$ Stamens few (5-12); flowers $\mathrm{I}-6 \mathrm{~mm}$. broad.
Leaves spreading or ascending, 3-7-nerved.
Cyme leafy-bracted.
Cymes subulate-bracted.
Leaves ovate, oval, oblong or lanceolate, 5-7-nerved.
Leaves ovate, oval or oblong; capsule $2-5 \mathrm{~mm}$. long. Leaves obtuse; sepals linear-oblong, acutish or obtuse.
16. H. mutilum. Leaves acute, or only the lower obtuse; sepals long-acuminate.
17. H. gymnanthum.

Leaves lanceolate or oblong-lanceolate; capsule $8-10 \mathrm{~mm}$. long.
18. H. majus.
19. H. Canadense.

Leaves linear, obtuse, 3 -nerved.
Leaves linear, erect, i-nerved.
15. $H$. boreale.
20. H. Drummondii.

1. Hypericum Áscyron L. Great or Giant St. John's-wort. .(I. F. f. 2444.) Perennial, $6-18 \mathrm{dm}$. high, the branches angled. Leaves sessile, clasping, ovate-oblong or ovate-lanceolate, $5-13 \mathrm{~cm}$. long; cymes terminal, few-flowered; flowers bright yellow; pedicels $1-5 \mathrm{~cm}$. long; sepals ovate-lanceolate, $8-12 \mathrm{~mm}$. long, acute; petals obovate or oblanceolate; styles united below; stamens numerous, united in 5 sets; capsule ovoid, 5 -celled. Banks of streams, Quebec and Vt. to Manitoba, Conn., N. J., Ill. and Kans. Also in Europe and Asia. July-Aug.
2. Hypericum Kalmiànum L. Kalm's St. John's-wort. (I. F. f. 2445.) Shrubby, 3-6 dm. high, leafy; branches 4 -angled; twigs flattened and 2 -edged. Leaves oblong-linear or oblanceolate, sessile, or narrowed into a short petiole, obtuse, 2-6 cm. long, more or less glaucous beneath, generally with smaller ones clustered in the axils; cymes terminal, few-flowered; pedicels $4-20 \mathrm{~mm}$. long; sepals foliaceous, oblong, acute, $6-8 \mathrm{~mm}$. long; stamens very numerous, distinct; styles 5 (4-6), united below; capsule ovoid, 6 mm . long, 5-(4-6-) celled. Ont. and western N. Y. to Ill., Wis. and Mich. Aug.
3. Hypericum prolíficum L. Shrubby St. John's-wort. (I. F. f. 2446.) Shrubby, 3-9 dm. high; branchlets 2 -edged. Leaves linear-oblong or oblanceolate, narrowed at the base, or tapering into a short petiole, obtuse, often mucronulate, pale beneath, $2-8 \mathrm{~cm}$. long, with tufts of smaller ones in the axils; cymes terminal and sometimes also axillary; pedicels 12 mm . long or less; stamens numerous, distinct; capsules 3 -celled. Sandy or rocky soil, N. J. to Ky. and Ga. July -Sept.
4. Hypericum densifiòrum Pursh. Bushy or Dense-flowered St. John'swort. (I. F. f. 2447.) Erect, I-2 dm. high, shrubby; branchlets 2-edged. Leaves crowded, $2-5 \mathrm{~cm}$. long, with smaller ones clustered in the axils; cymes densely many-flowered, mainly terminal; pedicels $2-8 \mathrm{~mm}$. long; sepals narrow, not foliaceous; stamens numerous, distinct; capsule 3-celled. Pine-barrens of N. J. to Fla., Tenn., Ark. and Tex. July-Sept.
5. Hypericum galioídes Lam. Bed-straw St. John's-wort. (I. F. f. 2448.) Perennial, somewhat woody, 3-8 dm. high, the branches nearly terete. Leaves linear, linear-oblong or oblanceolate, with smaller ones clustered in their axils, obtusish, thick, spreading, narrowed below, $\mathbf{1 - 5} \mathrm{cm}$. long, involute in drying; flowers short-pedicelled, $6-10 \mathrm{~mm}$. broad; sepals resembling the uppermost leaves; stamens numerous, distinct; capsule $4-6 \mathrm{~mm}$. long. In low grounds, Del. to Fla., Tenn. and La. July-Sept.
6. Hypericum adpréssum Bart. Creeping St. John's-wort. (I. F. f. 2449.) Stems nearly simple, 3-6 dm. high, 2-edged above. Leaves oblong or
lanceolate, $2-5 \mathrm{~cm}$. long, obtuse, ascending, often with smaller ones fascicled in the axils; cyme terminal, several-flowered; pedicels about 2 mm . long; flowers 12-18 mm. broad; sepals lanceolate, acute; stamens numerous, distinct; capsule about 4 mm . long. In low grounds, Mass. to Ga., La., Mo. and Ark. July-Aug.
7. Hypericum sphaerocàrpum Michx. Round-podded St. John's-wort. (I. F. f. 2450.) Stems 4 -angled, 3-8 dm. high. Leaves oblong or linear-oblong, obtuse, $3-8 \mathrm{~cm}$. long, often with smaller ones in the axils; cymes terminal; flowers sessile or nearly so, $10-16 \mathrm{~mm}$. broad; stamens numerous, distinct; capsule 1-celled, $4-5 \mathrm{~mm}$. long; seeds larger than in related species, rough-pitted. On rocky banks, Ohio to Iowa, Ala., Kans. and Ark. July-Sept.
8. Hypericum dolabrifórme Vent. Straggling St. John's-wort. (I. F. f. 2451.) Straggling, I.5-5 dm. high; branchlets slightly angled. Leaves linear or linear-lanceolate, $1.5-4 \mathrm{~cm}$. long, with smaller ones clustered in the axils: cymes terminal, leafy; pedicels about I mm. long; flowers 2-2.5 cm. broad; sepals foliaceous, lanceolate or ovate, acute or acuminate, nearly or quite as long as the oblique pointed petals; stamens distinct; styles united below; capsule 6-8 mm. long. On dry hills, barrens of Ky. and Tenn. July-Aug.
9. Hypericum ellípticum Hook. Elliptic-leaved or Pale St. John’swort. (I. F. f. 2452.) Herbaceous, perennial; stem somewhat 4 -angled, 2-5 dm. high. Leaves thin, spreading, elliptic or oval, obtuse, sessile, narrowed at the base or partly clasping, $\mathbf{I} .5-3 \mathrm{~cm}$. long; cymes terminal, few-flowered, bracted; flowers pale yellow, nearly sessile, $\mathbf{I - I . 5} \mathrm{cm}$. broad; sepals oblong or oblanceolate, slightly shorter than the petals; styles united below; capsule ovoid-globose, about 4 mm . long; sepals and petals sometimes 4 . In swamps and along streams, N. S. to Manitoba, Conn., N. J., Penn. and Minn. July-Aug.
io. Hypericum virgàtum Lam. Virgate or Copper-colored St. John'swORT. (I. F. f. 2453.) Herbaceous, 3-7 dm. high, the stem and branches 4-angled. Lower leaves ascending or erect, oblong-lanceolate, acute or obtusish, $\mathbf{I} .5-3 \mathrm{~cm}$. long, sessile; cyme terminal, compound, bracted; pedicels $\mathrm{I}-4 \mathrm{~mm}$. long; flowers numerous, copper-yellow, $8-12 \mathrm{~mm}$. broad; sepals foliaceous, ovate or lanceolate, keeled; styles distinct; stigmas capitate; capsule ovoid, 4 mm . long, enclosed by the sepals. In low grounds, Del. to Ill. and Fla. July-Sept.

Hypericum virgàtum ovalifòlium Britton. Leaves oval or broadly elliptic, erect, appressed, very obtuse. Pine-barrens of N. J.
II. Hypericum perforàtum L. Common St. John's-wort. (I. F. f. 2454.) Perennial, herbaceous, 3-7 dm. high. Stems erect, with numerous barren shoots at base; leaves sessile, oblong or linear, $\mathbf{I}-\mathbf{2} \mathrm{cm}$. long, obtuse, more or less blackdotted; cymes terminal; flowers bright yellow, $\mathbf{I} .5^{-2.5} \mathrm{~cm}$. broad; sepals acute, shorter than the copiously black-dotted petals: stamens united at their bases into 3 sets; styles 3 ; capsule ovoid, 4-6 mm. long, glandular. In fields and waste places, common throughout our area except the extreme north, and in the Southern States. Nat. from Europe. June-Sept.
12. Hypericum maculàtum Walt. Spotted St. John's-wort. (I. F. f. 2455.) Herbaceous, perennial, 3-9 dm. high. Leaves sessile, partly clasping, oblong or ovate-lanceolate, obtuse, $2-8 \mathrm{~cm}$. long, copiously black-dotted; cymes terminal, many-flowered; pedicels about 2 mm . long; flowers crowded, $8-14 \mathrm{~mm}$. broad; sepals ovate, acute, shorter than the conspicuously black-dotted petals; stamens in 3 or 5 sets; styles 3 ; capsule ovoid, $4-6 \mathrm{~mm}$. long. In moist soil, Me. and Ont. to Minn., Fla., Kans. and Tex. July-Sept.

Hypericum maculatum subpetiolatum Bicknell. Leaves short-petioled, mostly narrowed at the base. Me. to Ga. and Ky.
13. Hypericum pseudomaculàtum Bush. Large Spotten St. John's. wort. Similar to the preceding, but the flowers much larger, the petals 15-20 mm . long. Mo.
14. Hypericum graveolens Buckley. Mountain St. John's-wort. (I. F. f. 2456.) Herbaceous, perennial. Stem 3-9 dm. high; leaves oval, ovate or ellipticoblong, sessile or clasping, obtuse, $2-8 \mathrm{~cm}$. long, sparingly black-dotted; cymes terminal; pedicels $2-8 \mathrm{~mm}$. long; flowers 2.5 cm . in breadth or more; sepals lancenlate, acute, much shorter than the sparingly dotted or dotless petals; stamens united
in sets; styles 3 ; capsule ovoid, somewhat 3 -lobed, $8-12 \mathrm{~mm}$. long. Mountains of Va., Tenn. and N. Car. June-Sept.
15. Hypericum boreàle (Britton) Bicknell. Northern St. John's-wort. (I. F. f. 2457.) Annual, or sometimes stoloniferous, 3-45 cm. high. Leaves elliptic, oval, oblong, or linear-oblong, $6-32 \mathrm{~mm}$. long, sessile or slightly clasping, obtuse, mostly 3-nerved, those of the lower part of the stem commonly much smaller; cymes leafy-bracted; flowers about 5 mm . broad; sepals obtuse; capsule oblong, obtuse or obtusish, apiculate, $4-5 \mathrm{~mm}$. long, purple, cross-wrinkled, longer than the sepals; seeds $3-5$ times as long as wide, pale, longitudinally furrowed and finely cross-lined. Wet soil, Newf. to Vt., N. J. and Penn. July-Sept.
16. Hypericum mùtilum L. Dwarf or Small-flowered St. John'swort. (I. F. f. 2458.) Annual, generally tufted, 1.5-8 dm. high. Branchlets 4 -angled; leaves oblong or ovate, sessile, clasping, obtuse, $8-32 \mathrm{~mm}$. long, 5 -nerved at the base; cymes many-flowered, subulate-bracted; pedicels $2-12 \mathrm{~mm}$. long; flowers $1-4 \mathrm{~mm}$. broad, light orange-yellow; sepals foliaceous, linear, lanceolate, or oblanceolate; stamens 5-12; styles 3 ; capsule ovoid, pointed, $2-4 \mathrm{~mm}$. long, somewhat longer than the sepals. In low grounds, N. S. to Man., Fla., Kans. and Tex. July-Sept.
17. Hypericum gymnánthum Engelm. \& Gray. Clasping-leaved St. John's-wort. (I. F. f. 2459.) Annual, erect, 2-9 dm. high. Leaves ovate, or the lower oval, cordate-clasping, often distant, $8-20 \mathrm{~mm}$. long, acute, or the lower obtuse, 3-7-nerved at the base; cymes terminal, loose, subulate-bracted; flowers numerous, $2-4 \mathrm{~mm}$. broad; sepals lanceolate, generally somewhat shorter than the ovoid capsule; styles 3 : stamens $\mathbf{1 0} \mathbf{- 1 2}$; capsule about 4 mm . long. In low grounds, N. J. and Del. to Minn., La. and Tex. July-Sept.
18. Hypericum màjus (A. Gray) Britton. Larger Canadian St. John's. wort. (I. F. f. 2460.) Annual, erect, 3-9 dm. high, the branches nearly upright. Leaves lanceolate, or oblong-lanceolate, sessile or somewhat clasping, $2-6 \mathrm{~cm}$. long, 5-7-nerved; flowers $6-10 \mathrm{~mm}$. broad; sepals lanceolate, acuminate; styles 3; capsule narrowly conic, acute, longer than the sepals; seeds minute, cross-lined and faintly longitudinally striate. In moist soil, Me. to Mich., N. J. and Neb. June-Sept.
19. Hypericum Canadénse L. Canadian St. John’s-wort. (I. F. f. 2461.) Annual, I.5-5 dm. high. Branches angular; leaves linear, $\mathbf{I}-5 \mathrm{~cm}$. long, obtuse, tapering to the base, 3 -nerved; flowers $4-6 \mathrm{~mm}$. broad; sepals lanceolate, acute ; stamens 5-10; styles 3 ; capsule narrowly conic, acute, $4-8 \mathrm{~mm}$. long, longer than the sepals; seeds striate. In wet sandy soil, Newf. to Man., Ga., Ky., and Wis. July-Sept.
20. Hypericum Drummóndii (Grev. \& Hook.) T. \& G. Drummond's St. JOHN's-wORT. (I. F. f. 2462.) Annual, bushy-branched, $2.5-8 \mathrm{dm}$. high, rigid. Leaves linear-subulate, $8-25 \mathrm{~mm}$. long, erect or narrowly ascending, i mm . wide, I-nerved; flowers scattered along the upper part of leafy branches, 4 mm . broad; sepals lance-linear, longer than the petals; stamens 10-20; styles 3; capsule ovoid, 4 mm . long, equalling or shorter than the sepals; seeds large, rugose. In dry soil, Va. to Ga., Ill., Iowa, Kans. and Tex. July-Sept.

## 3. SARÒTHRA L.

A low annual much-branched herb, the opposite leaves reduced to subulate scales, the mostly opposite branches erect-ascending, the very small yellow flowers alternate, very short-pedicelled or sessile along them in the axils of still smaller scales. Sepals 5, equal. Petals 5. Stamens 5-10. Styles 3, separate. Capsule elongated-conic, r-celled, much longer than the sepals; seeds minutely striate and pitted. [Greek, a broom.] A monotypic genus of E. N. Am.
I. Sarothra gentianoides L. Orange-Grass. Pine-weed. (I. F. f. 2463.) Erect, $\mathrm{I}-5 \mathrm{dm}$. high. Branches filiform, erect, wiry; leaves about 2 mm . long, appressed; flowers nearly sessile, $2-3 \mathrm{~mm}$. long, open in sunlight; sepals linear, about equalling the petals and much shorter than the acute purple pod; seeds very small, In sandy soil, Me, to Fla., Ont., Minn., Mo, and Tex. June-Oct.

## 4. TRIADENUM Raf.

Perennial marsh herbs, with entire oblong oval or ovate leaves, and pink or greenish purple flowers in terminal cymes, or also axillary. Calyx of 5 equal persistent sepals. Petals 5, not contorted. Stamens 9, or sometimes more, in 3 sets, the sets alternating with 3 large hypogynous glands. Ovary 3 -celled; styles 3 Capsule oblong-conic, much longer than the sepals. [Greek, three glands.] Two species, natives of E. N. Am.
$\begin{array}{ll}\text { Leaves sessile; flower-clusters peduncled. } & \text { 1. T. Virginicum. } \\ \text { Leaves short-petioled; flower-clusters nearly sessile. } & \text { 2. T. petiolatum. }\end{array}$
I. Triadenum Virgínicum (L.) Raf. Marsh St. John’s-wort. (I. F. f. 2464.) Nearly simple, 3-5 dm. high. Leaves sessile or cordate-clasping, ovate or oblong, $2-6 \mathrm{~cm}$. long, very obtuse, sometimes emarginate, glaucous beneath, blackdotted; flowers $12-16 \mathrm{~mm}$. broad, in leafy clusters; sepals acute, shorter than the straight petals; stamens 9 or more, united in 3 sets; styles 3, distinct; capsule oblong, 8 -10 mm. long, acute, red-purple. In swamps, Lab. to Fla., Man., Neb. and La. July-Sept.
2. Triadenum petiolàtum (Walt.) Britton. Larger Marsh St. John'swort. (I. F. f. 2465.) Similar to the preceding, but often more branched and taller; leaves generally longer, petioled, or the upper sessile, not clasping, pale beneath; flower-clusters sessile or very short-peduncled. In swamps, N. J. and Md. to Fla., Ark. and La. July-Aug.

## Family 3. ELATINACEAE Lindl. <br> Water-wort Family.

Low herbs, sometimes woody in tropical regions, with opposite or verticillate stipulate leaves, and small axillary regular perfect flowers. Sepals 2-5, imbricated. Petals the same number, hypogynous. Stamens the same number or twice as many. Ovary 2-5-celled; styles 2-5, stigmatic at the apex ; ovules $\infty$, anatropous. Capsule with septicidal dehiscence. Placentæ central. Seed-coat crustaceous, rugose or ribbed. About 25 species, of wide distribution.

Flowers 2-4-merous; glabrous aquatic or creeping herbs.
Flowers mainly 5 -merous; pubescent ascending or diffuse herbs.

1. Elatine.
2. Bergia.

## r. ElAtine l.

Small glabrous or glabrate aquatic or creeping herbs, with minute mainly solitary flowers. Sepals $2-4$, persistent, membranous, not ribbed. Styles or stigmas 2-4. Pod membranous, globose, 2-4-valved. Seeds $\infty$, straight, or slightly curved, striate longitudinally and transversely. [Greek, fir-like, with reference to the leaves.] About 9 species, of temperate and warm regions. In addition to the following, another occurs in Cal.
Petals and stamens 2 ; seeds distinctly sculptured.
Leaves obovate ; seeds with 9-10 longitudinal and 20-30 transverse striae.

1. E. Americana.

Leaves oblong or oval ; seeds with 6-7 longitudinal and 10-12 transverse striae.
2. E. brachysperma.
3. E. triandra.

Petals and stamens mostly 3 ; seeds little sculptured.
I. Elatine Americàna (Pursh) Arn. Water-wort. Mud-purslane. (I. F.
2466.) Tufted, aquatic or terrestrial, $1-4 \mathrm{~cm}$. long. Leaves obtuse, $2-6 \mathrm{~mm}$. f. 2466.) Tufted, aquatic or terrestrial, $1-4 \mathrm{~cm}$. long. Leaves obtuse, $2-6 \mathrm{~mm}$.
long, 2 mm . wide or less; flowers sessile, minute, rarely opening in the submerged forms; sepals, petals, stamens and stigmas 2 (rarely 3 in the terrestrial forms); capsule globose, nearly 1 mm . in diameter; seeds $0.5-\mathrm{I} \mathrm{mm}$. long, slightly curved. Margins of ponds and slow streams, Me. and Ont. to Va., Mo, and Tex. Also in Colo. and Ore. Summer.
2. Elatine brachyspérma A. Gray. Short-seened Water-wort. (I. F. f. 2467.) Terrestrial or sometimes submerged, spreading, tufted, $2-5 \mathrm{~cm}$. long. Leaves oblong, oval or lanceolate, narrowed at the base, $4-6 \mathrm{~mm}$. long, about

2 mm . wide, obtuse; flowers sessile, minute; capsule nearly as in the preceding; seeds short-oblong, nearly straight, about 0.5 mm . long. Margins of ponds, Ill. and Cal. Summer.
3. Elatine triándra Schk. Long-stemmed Water-wort. (I. F. f. 2468.) Flaccid, tufted, immersed or creeping; stems $5-10 \mathrm{~cm}$. long. Leaves oblong or oblanceolate, very thin, obtuse, $4-8 \mathrm{~mm}$. long, narrowed at the base; flowers minute, sessile; sepals commonly 2 ; petals, stamens and stigmas 3 ; seeds slightly curved, about the size of those of E. Americana. Ponds, Ill., S. Dak. and Neb. Also in Europe. Summer.

## 2. BÉRGIA L.

Herbs, or somewhat shrubby plants, more or less pubescent, with opposite leaves and small Яowers. Parts of the flower in 5's (very rarely in 4 's or 3 's). Pod crustaceous, 5 -valved. Seeds numerous, striate longitudinally and transversely. [In honor of Dr. P. J. Bergius, 1723-1790, professor of Natural History in Stockholm.] About 15 species, natives of warm and temperate regions.
I. Bergia Texàna (Hook.) Seub. Texas Bergia. (I. F. f. 2469.) Prostrate or ascending, diffusely branched; stems $1.5-2.5 \mathrm{dm}$. long. Leaves spatulate or obovate, $2-4 \mathrm{~cm}$. long, serrate, narrowed into a short petiole; stipules about 2 mm . long, ciliate-serrulate; flowers short-peduncled, about 3 mm . broad, solitary or 2-3 together in the axils; sepals ovate, acuminate, denticulate, slightly longer than the obtuse petals; capsule globose, 2 mm . in diameter, its dehiscence septifragal; seeds oblong, striate longitudinally and cross-barred. Southern Ill. to Tex., Nev. and Cal. Summer.

## Family 4. CISTACEAE Lindl.

## liock-rose Family.

Shrubs or low woody herbs, with simple leaves, and solitary racemose or paniculate flowers. Flowers regular, generally perfect. Sepals 3-5, persistent, when 5 the 2 exterior ones smaller, the 3 inner convolute. Petals 5 or 3 , or wanting, fugacious or persistent. Stamens $\infty$, hypogynous. Ovary I, sessile, I-several-celled; ovules orthotropous, stalked; style simple. Capsule dehiscent by valves. Seeds several or numerous; embryo slender; endosperm starchy or fleshy. Four genera and about 160 species, all but I or 2 natives of the northern hemisphere.

I'etals 5, yellow, fugacious, or wanting.
Leaves broad, lanceolate or oblong.
Leaves subulate or scale-like, imbricated; style long.
Petals 3, not yellow, persistent; flowers minute; style none.

1. Helianthemum.
2. Hudsonia.
3. Lechea.

## 1. HELIÁNTHEMUM Pers.

Woody herbs or low shrubs, more or less branching, mostly with showy yell.w flowers, and sometimes (in the following species) with other smaller apetalous cnes. Petals in the larger flowers large, fugacious. Stamens numerous. Placentæ or false septa 3. Ovules few or $\infty$; style jointed with the ovary; stigma capitate or 3-lobed. Embryo curved. [Greek, sun-flower.] About 125 species, of wide distribution. Besides the following, about 8 others occur in the Southern States and on the Pacific Coast.
Petaliferous flowers solitary, few or several: apetalous flowers in axillary sessile clusters.
Petaliferous flowers 5-12, in a short terminal cymose raceme, their capsules $3-4 \mathrm{~mm}$. long, little, if at all, overtopped by the short later axillary branches; capsules of the apetalous flowers about 1 mm . in diameter.

1. H. majus.

Petaliferous flowers solitary, rarely 2 , their capsules 6-8 mm. long, much overtopped by the later elongated axillary branches ; capsules of the apetalous flowers nearly 4 mm . in diameter.
2. H. Canadense.

Flowers all cymose at the summit of the stem, the petaliferous ones slender-pedicelled.
3. H. corymbosum.
I. Helianthemum màjus (L.) B.S.P. Hoary Frostweed. (I. F. f. 2470.) Hoary-canescent, erect, 3-6 dm. high. Leaves oblong-lanceolate or oblanceolate,
1.5-3.5 cm. long, stellate-canescent beneath, darker above, short-petioled; petaliferous flowers 5-12 in a terminal cymose raceme, their corollas $\mathbf{1 . 5 - 2 . 5} \mathrm{cm}$. broad, light yellow, their sepals densely canescent, the outer nearly as long as the inner, their capsules ovoid; apetalous flowers appearing later, minute, clustered, nearly sessile; seeds evenly reticulated. In dry soil, N. S. to S. Dak., Neb., N. Car. and Tex. June-July.
2. Helianthemum Canadénse (L.) Michx. Frost-wort. (I. F. f. 2471 .) Puberulent-canescent, erect, ascending, or sometimes diffuse, o.7-6 dm. high. Leaves oblong, linear-oblong or oblanceolate, nearly sessile, $\mathbf{I}-3 \mathrm{~cm}$. long, rough and dark green above, paler and canescent beneath, the margins commonly revolute in drying; petaliferous flowers solitary, or rarely 2, bright yellow, $2-3 \mathrm{~cm}$. broad, their sepals pilose, the outer shorter than the inner, their capsules ovoid or obovoid, rounded above. In dry rocky or sandy soil, Me. to Ont., Wis., N. Car. and Ky. Petaliferous flowers May-July.
3. Helianthemum corymbòsum Michx. Pine-barren Frostweed. (I. F. f. 2472.) Erect, I.5-3 dm. high, densely canescent. Leaves oblong, or the lowest obovate, $2-3 \mathrm{~cm}$. long, entire, slightly revolute in drying, pale beneath, dark green above, short-petioled; flowers in nearly naked, fastigiate cymes, the petaliferous I- 2 cm . broad, on pedicels $\mathbf{1 2 - 1 6 ~ m m . ~ l o n g ; ~ a p e t a l o u s ~ f l o w e r s ~ c l u s t e r e d , ~ n e a r l y ~}$ sessile; calyx of both kinds woolly-pubescent; outer sepals about equalling the inner; capsules of the larger flowers $4-6 \mathrm{~mm}$. broad, many-seeded; those of the apetalous ones smaller, few-seeded. In sandy soil, Va. (?), N. Car. to Fla. and La.

## 2. HUDSÒNIA L.

Low diffusely branched shrubs, with small subulate or scale-like, imbricated leaves, and numerous yellow flowers terminating short branches. Petals 5, obovateoblong. Stamens $\infty$. Style filiform, continuous with the ovary; placentæ 3; stigma minute. Capsule 3 -valved, included in the calyx. Seeds few; embryo slender, spirally curved. [Named for Wm. Hudson, 1730-1793, an English botanist.] A genus of 3 species, natives of eastern N. Am.

Flowers slender-pedicelled; leaves subulate.
Flowers nearly sessile; leaves scale-like.

1. H1. ericoides.
2. H. tomentosa.
i. Hudsonia ericoìdes L. Heath-Like Hudsonia. (I. F. f. 2473.) Bushybranched, greenish, softly-pubescent, . I-2 dm. high. Leaves subulate, $6-8 \mathrm{~mm}$. long, densely imbricated on the younger branches, more scattered on the older ones; pedicels $10-\mathbf{1} 6 \mathrm{~mm}$. long; flowers about 8 mm . broad; sepals acutish; stamens 12-18; capsule oblong, slightly pubescent; seeds about 3. In dry sandy soil, N. S. to Vt. and Va. May-June.
3. Hudsonia tomentòsa Nutt. Woolly Hudsonia. False Heather. Beach Heather. (I. F. f. 2474.) Densely tufted and intricately branched, hoary-pubescent, pale, $\mathbf{1}-2 \mathrm{dm}$. high. Leaves 2 mm . long, oval or oblong, imbricated and appressed; flowers sessile, or on pedicels less than 2 mm . long, slightly smaller than those of the preceding; sepals obtuse; stamens $9-18$; capsule ovoid, glabrous, usually I-seeded. Mostly in sands of the seashore and in pine-barrens, Va. to N. H., N. B., and on lake and river shores west to Slave Lake and the Lake of the Woods. May-July.

## 3. LECHEA L.

Perennial herbs, often woody at the base, with small entire leaves and minute panicled greenish or purplish flowers. Sepals 5 , the 2 outer smaller and narrower. Petals 3, ovate to linear, inconspicuous, persistent. Stamens 3-12. Stigmas 3, nearly sessile, laciniate. Capsule 3 -valved, 3 -celled, or by obliteration of the dissepiments I-celled, about 6-seeded. Embryo curved or spiral. [Named for Johan Leche, a Swedish botanist, died 1764.] About of 14 species, II natives of eastern N. Am., I Texan, I Cuban and I Mexican. The characteristic basal shoots appear late in the season.
Leaves of the basal shoots oblong to ovate, not more than 3 times as long as broad.
Outer sepals longer than the inner; panicle very leafy. I. L. minor.
Outer sepals equalling or shorter than the inner.
Pod oblong; pedicels slender, $2-4 \mathrm{~mm}$. long. 2. L. racemulosa.
Pod globose; pedicels about 1 mm . long.

$$
\begin{array}{ll}
\text { Erect, villous-pubescent. } & \text { 3. L. villosa. } \\
\text { Ascending, bushy-branched, tomentose-canescent. } & \text { 4. L. maritima. }
\end{array}
$$

Leaves of the basal shoots lanceolate or linear, usually more than 3 times as long as broad.

Stem-leaves narrowly linear; inner sepals $x$-nerved.
5. L. tenuifolia.

Stem-leaves oblong-linear; inner sepals 3 -nerved.
Plants green, more or less pubescent.
Pod oblong to ovoid, 2 mm . long; panicle dense; flowers secund, shortpedicelled.
6. L. moniliformis.

Pod obovoid, $\mathbf{r} \mathrm{mm}$. in diameter ; panicle loose, the branches ascending or spreading; flowers short-pedicelled.
7. L. Leggettii.

Pod globose, about 2 mm . in diameter; panicle-branches nearly erect, loosely flowered; flowers slender-pedicelled.
8. L. intermedia.

Pod oval, about 1 mm . in diameter; panicle-branches erect-ascending, densely flowered; flowers short-pedicelled.
9. L. juniperina.

Plant pale, canescent; pod globose, I mm. in diameter. Io. L. stricta.
I. Lechea minor L. Thyme-leaved Pin-weed. (I. F.f. 2475.) Pubescent with appressed hairs, 1.5-5 dm. Branches erect or ascending; stem-leaves oval or oblong, 8-14 mm. long, 4-6 mm. wide, ciliate; petioles 2 mm . long; leaves of the basal shoots oval or oblong, obtuse, $6-10 \mathrm{~mm}$. long, $5-6 \mathrm{~mm}$. wide; flowers close together, somewhat secund; outer sepals longer than the obovoid or globose pod. In dry open grounds, eastern Mass. to Mich., Fla. and La. Aug.-Sept.
2. Lechea racemulòsa Michx. Oblong-fruited Pin-weed. (I. F. f. 2476.) Pubescent with appressed hairs, 1.5-5 dm. high. Branches divergent or ascending; leaves of the stem oblong or linear-oblong, narrowed at the base, $8-18 \mathrm{~mm}$. long, 3-4 mm. wide; leaves of the basal shoots oval or oblong, $4-8 \mathrm{~mm}$. long, 3-6 mm . wide, obtuse; flowers on divergent pedicels $2-4 \mathrm{~mm}$. long; pod oblong or ellipsoid. In dry sandy and rocky soil, E. Mass. (?); L. I. to Ind., Fla. and Tenn. July-Aug.
3. Lechea villòsa Ell. Large or Hairy Pin-weed. (I. F. f. 2477.) Vil-lous-pubescent, 3-8 dm. high, leafy. Branches ascending; leaves of the stem ob-long-elliptic, obtuse, but pointed, $16-25 \mathrm{~mm}$. long, $6-10 \mathrm{~mm}$. wide; leaves of the basal shoots oval or oblong, obtuse, $6-8 \mathrm{~mm}$. long, 4-6 mm . wide; branches of the panicle ascending, the ultimate branchlets often recurved; flowers more or less secund-scorpioid, close together; outer sepals about equalling the inner; pod de-pressed-globose, I mm. in diameter. In dry soil, Mass. and Vt. to southern Ont., Neb., Fla. and Tex. July-Aug.
4. Lechea marítima Leggett. Beach Pin-weed. (I. F. f. 2478.) Densely tufted, branching from the base, stout, rigid, 1.5-3 dm. high, tomentose-canescent with whitish hairs; leaves of the stem linear or linear-oblong, $8-20 \mathrm{~mm}$. long, 2-4 mm . wide; leaves of the basal shoots oblong or ovate-oblong, mainly acute, 6-8 mm . long, 3-4 mm. wide, densely canescent; outer sepals shorter than the inner; pod globose, 1 mm . in diameter. Sands of the seashore and in sandy pine-barrens, Me. to Ga. Also at the Crawford Notch, White Mts., N. H.
5. Lechea tenuifòlia Michx. Narrow-Leaved Pin-weed. (I. F. f. 2479.) Densely tufted; stems slender, 1.2-5 dm. high, divaricately branched above, minutely strigose-pubescent. Branches slender; leaves of the stem narrowly linear, or sometimes nearly filiform, 4-14 mm. long, I mm. wide or less, acute, sessile, or very nearly so; leaves of the basal shoots linear, sessile, $6-8 \mathrm{~mm}$. long, about I mm . wide; pedicels 2 mm . long; flowers more or less secund, bracted by the upper leaves; outer sepals equalling or exceeding the inner; pod globose-oval, 1 mm . in diameter, or slightly more. In dry open places. eastern Mass. to Wis., Neb., Fla. and Tex. July-Aug.
6. Lechea monilifòrmis Bicknell, n. sp. Necklace-Like Pin-weed. Similar to L. Leggettii but with denser and more leafy and floriferous panicle of shorter branches and longer flowering branchlets; inflorescence more secund, the larger and more oblong fruiting calyx purplish; stem very pliant except when old, green, becoming purple and shining, glabrate below; leaves linear to oblong-linear, becoming 3.5 cm . long, often subfalcate, acute, tapering into a petiole $1-2 \mathrm{~mm}$. long; pedicels $1.5-3 \mathrm{~mm}$. long, appressed ; fruiting calyx $2-2.5 \mathrm{~mm}$. long with shorter outer sepals, 1.5 mm . broad; capsule often exserted, substipitate. Nantucket Island, Mass., borders of salt marshes and low thickets.
7. Lechea Leggéttii Britt. \& Holl. Leggett's Pin-weed. (I. F. f. 2480.) Erect, rather slender, strigose-pubescent, 2-5 dm. high. Branches slender; leaves of the stem linear or linear-oblong, $10-25 \mathrm{~mm}$. long, $\mathbf{I}-2 \mathrm{~mm}$. wide, sessile or nearly so; leaves of the basal shoots oblong-linear, $4^{-6} \mathrm{~mm}$. long, I mm . wide, acute; panicle open; inflorescence somewhat secund; pedicels $\mathbf{I}-2 \mathrm{~mm}$. long; outer sepals nearly equalling the inner. In open places, Mass. to Ind. and N. Car. July-Aug.
8. Lechea intermèdia Leggett. Large-podded Pin-weed. (I. F. f. 248I.) Erect, 2-6 dm. high, sparingly stribose-pubescent. Branches erect or nearly so, short; leaves of the stem oblong-linear, $12-28 \mathrm{~mm}$. long, $2-5 \mathrm{~mm}$. wide, acute, nearly sessile; leaves of the basal shoots oblong-linear, shorter; pedicels $2-4 \mathrm{~mm}$. long; outer sepals about equalling the inner; capsule subglobose or depressedglobose, about 2 mm . in diameter. In dry open places, Penn. and N. J. to N. B., northern N. Y. and Ont. July-Aug.
9. Lechea junipérina Bicknell. Maine Pin-weed. (I. F. f. 2482.) Tufted, I-5 dm. high, finely hoary to canescent. Branches short, ascending or erect, leafy, forming a dense narrow panicle; stem-leaves ascending or appressed, glabrous, except the midrib and margins, linear-oblong to oblanceolate, $10-20 \mathrm{~mm}$. long, 2-4 mm . wide; flowers crowded; pedicels $\mathbf{I}-3 \mathrm{~mm}$. long; fruiting calyx ovoid-ellipsoid, $\mathbf{I} .5 \mathrm{~mm}$. long; inner sepals elliptic, nerveless or faintly 3-nerved, often deep purple, the outer shorter, bright green; leaves of basal shoots oblong or elliptic, $4-6 \mathrm{~mm}$. long. Me., N. H. and N. S. Aug.
io. Lechea strícta Leggett. Bushy or Prairie Pin-weed. (I. F. f. 2483.) Erect, 3-4 dm. high, fastigiately branched, strigose-canescent, pale, bushy. Branches ascending or nearly erect; leaves of the stem linear-oblong, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long, $\mathbf{1 - 2}$ mm . wide; leaves of the basal shoots linear-oblong, much smaller, 1 mm . wide or less, acute; pedicels slender, $2-3 \mathrm{~mm}$. long; outer sepals shorter than or equalling the inner. In dry open places, Wis., Ill., Iowa and Minn. July-Aug.

## Family 5. VIOLÀCEAE DC.* <br> Violet Family.

Herbs, shrubs, or rarely trees, with basal or alternate, simple, lobed or entire stipulate leaves and solitary or clustered, perfect, mostly irregular flowers. Sepals 5. Petals 5, hypogynous, imbricated in the bud, the lower one larger or with a posterior spur. Stamens 5 ; anthers erect, connivent or syngenesious. Ovary simple, r-celled, with 3 parietal placentæ. Fruit usually a loculicidal capsule. Seeds anatropous. About 15 genera and 325 species, of wide distribution.

Sepals more or less auricled at base.
Sepals not auricled at base.
Petals nearly equal; anthers syngenesious.
Petals unequal; anthers only connivent.

1. Viola.
2. Cubelium.
3. Calceolaria.

## 1. VIOLA L.

Acaulescent and scapose or leafy-stemmed herbs, the flowers solitary or rarely 2; early flowers petaliferous, often sterile, usually succeeded by apetalous or cleistogamous flowers which are abundantly fertile. Petals spreading, the lowermost one spurred or saccate; stamens 5, the two inferior ones spurred. Capsule 3-valved, elastically dehiscent. About 175 species, of wide distribution.

# * ACAULESCENT; FLOWERS SCAPOSE. 

$\dagger$ Plants not stoloniferous.
$\ddagger$ Leaves mostly lobed or parted (except in one variety of $V$. palmata.)
Petals bearded; cleistogamous flowers produced freely
Plants always more or less pubescent.

1. V. palmata

Plants comparatively glabrous, or with only slight pubescence.

[^35]Leaves pedately divided into linear lobes.
Eastern coastal plain species; leaves thin. 2. V, Brittoniana.
Western prairie species; leaves thick.
3. $V$. pedatifida.

Leaves palmately lobed or cleft, the segments variously shaped.
Leaf-segments linear-lanceolate, obtuse; cleistogamous flowers on decumbent peduncles.
4. V. Bernardi.

Leaf-segments mostly ovate, coarsely incised; cleistogamous flowers on erect peduncles.
5. V. viarum.

Leaf-segments often falcate ; cleistogamous flowers on decumbent peduncles.
6. V. falcata.

Petals not bearded; cleistogamous flowers wanting.
7. V. pedata.
$\ddagger \ddagger$ Leaves merely crenate or dentate, or incised at base, none lobed.
Leaves ovate, reniform or orbicular, often broader than long, not incised at base.
Woodland species; peduncles of the cleistogamous flowers, horizontal or decumbent.
Plant densely hirsute or villous; keel petal cuspidate.
8. V. cuspidata.

Plants sparingly hirsute or glabrous; keel petal not cuspidate.
Leaves very thin, cordate-ovate, attenuate at apex. 9. V. obliqua.
Leaves thick, from ovate to reniform, obtuse or merely acute at apex. Petals dark violet-purple, narrow, the upper reflexed. 1. V. papilionacea.

Petals light blue, paler at base, broadly obovate.
11. V. pratincola.

Petals reddish-purple, nearly orbicular.
12. $V$. villosa.

Meadow or swamp species ; peduncles of the cleistogamous flowers erect (often horizontal in $V$. venustula).

Flowers pale violet-blue; leaves light green.
Capsule strongly 3 -angled; plant not northern. I3. V. cucullata.
Capsule very short, not angled; plant far northern. 14. V. septentrionalis.
Flowers deep purple, paler at base; leaves rather dark green.
Leaves attenuate at apex, crenate-serrate. ${ }^{\text {I5. V. venustula. }}$
Leaves obtuse or merely acutish at apex, the margin crenulate.
16. V. vagula.

Leaves lanceolate, oval or ovate-lanceolate, often incised at base.
Scapes shorter than the leaves.
Petals scarcely emarginate; leaf-blades sagittate-lanceolate.
17. V. sagittata.

Petals usually emarginate; leaf-blades ovate or deltoid-triangular.
18. V. emarginata.

Petals not emarginate; leaf-blades oblong-triangular.
19. V. dentata.

Scapes longer than the leaves.
Introduced European species; leaf-blades lanceolate.
20. V. lancifolia.

Native species; leaf-blades ovate-lanceolate or oblong.
Plants glabrous and succulent, densely tufted.
21. V. conjugens.

Plants pubescent, not succulent, mostly solitary.
22. V. fimbriatula.
$\dagger \dagger$ Plants stoloniferous.
Introduced species ; flowers deep violet-purple, sometimes white. 23. V. odorata.
Native species; flowers pale purple, violet-blue, yellow or white.

Flowers yellow.
Flowers pale blue or lilac.
Leaves glabrous, crenulate.
Leaves hirsute-pubescent, crenate.

## Flowers white.

Leaves from broadly ovate to orbicular; cleistogenes on deflexed peduncles.
Leaf-blades cordate-ovate, glabrate.
Upper and lateral petals twice as long as broad ; petioles not spotted.
27. V. blanda.

Upper and lateral petals three times as long as broad; petioles usually red-spotted.
28. V. alsophila.
24. V. rotundifolia.
25. V. palustris.
26. V. Selkirkii.
29. V. renifolia.

Leaf-blades reniform, pubescent.
Leaves from narrowly oval to linear; cleistogenes on erect peduncles. Leaf-blades oval or ovate, sometimes pubescent. 30. V. primulaefolia. Leaf-blades lanceolate linear-lanceolate, glabrous. 31. V. lanceolata.

## ** CAULESCENT, LEAFY-STEMMED; FLOWERS AXILLARY

Flowers yellow.
Leaves lanceolate, decurrent at base.
32. V. Nuttallii.

Leaves hastate, broadly ovate or reniform, not decurrent.

Leaves hastate-lanceolate or hastate-ovate. 33. V. hasiata.
Leaves broadly ovate or reniform.
Leaves broadly ovate or reniform.
Plant pubescent or villous; basal leaves early withering.
34. $V$. pubescens.

Plant sparsely pubescent or glabrate; basal leaves usually persistent. 35. V. scabriuscula.

Flowers blue, purple, white or cream-colored.
Stipules entire.
Stipules incised or pinnatifid.
Perennial ; stipules much smaller than the blades.
Petals cream-colored, the lower one purple-veined.
Petals blue or purple, rarely white.
Spur of corolla shorter than the petals.
Stems spreading; plant glabrous; leaves acutish.
38. V. Labradorica.

Stems spreading; plant puberulent; leaves rounded.
39. V. arenaria.

Stems prostrate; plant puberulent; leaves orbicular, often mottled.
40. V. multicaulis. Spur of corolla longer than the petals. 4I. V. rostrata. Annual; stipules nearly as large as the blades.

Flowers $16-25 \mathrm{~mm}$. broad; plant escaped from cultivation.
42. V. tricolor.

Flowers $8-16 \mathrm{~mm}$. broad; plant native, growing in dry ground.
43. $V$. Rafinesquiz.
I. Viola palmata L. Early Blue Violet. (I. F. f. 2484.) Pubescent, or rarely nearly glabrous; petioles greatly exceeding the blades, the latter cordateovate in outline, $5-13$-lobed, $3-15 \mathrm{~cm}$. long when mature, the earliest merely cre-nate-dentate; lobes variously shaped, the middle one commonly broadest; scapes rarely exceeding the leaves; sepals lanceolate, acute or acuminate; petals deep blue, sometimes pale, $\mathbf{1}-\mathbf{2} .5 \mathrm{~cm}$. long; capsules $8-\mathbf{1} 2 \mathrm{~mm}$. long, those from the cleistogamous flowers on horizontal or deflexed peduncles. In woodlands, Me. to Ont., Minn., Ga. and Ark. April-May.

Viola palmata dilatàta Ell. Leaves with most of the blades 3 -lobed, the middle lobe ovate, the lateral subfalcate or semicircular. Range of the type, but more common southward.

Viola palmata sorória (Willd.) Pollard. (I. F. f. 2489.) Leaves villous, the blades from ovate to hastate-reniform, rarely lobed, the margins crenate. ( $V$. sororia Willd.) Range of the type.
2. Viola Brittoniàna Pollard. Coast Violet. (I. F. f. 2485.) Nearly or quite glabrous; petioles much exceeding the blades, the latter pedately divided into linear or oblanceolate acute lobes; scapes exceeding the foliage, $\mathbf{r}-2 \mathrm{dm}$. high; sepals lanceolate, acuminate; flowers bright blue, $\mathbf{I} .5-2.5 \mathrm{~cm}$. broad; capsules oblong, $\mathbf{1 2} \mathrm{mm}$. long, those from the cleistogamous flowers on erect peduncles. Sandy soil near the coast, Mass. to N. Car. May-June. [ V. Atlantica Britton, not Pomel.]
3. Viola pedatífida Don. Prairie Violet. (I. F. f. 2486.) Glabrous or glabrate, with a short ascending rootstock; leaves with blades $2-8 \mathrm{~cm}$. wide, pedately 5-9-parted into linear, obtuse lobes, their margins and midveins ciliate; scapes usually exceeding the leaves; flowers deep blue, 2.5 cm . broad or more; sepals linear or lanceolate; capsules $\mathbf{1 0} \mathbf{- 1 2} \mathbf{~ m m}$. long, those from the cleistogamous flowers on short erect peduncles. Prairies, Ill. to Br. Col. and Ariz. MarchMay. Forms occur in which the leaves are merely slightly lobed.
4. Viola Bérnardi Greene. Bernard's Violet. Pubescent or glabrate from a nearly vertical rootstock; leaf-blades broadly ovate, flabelliform, lobed. or more often palmately cleft into $5-11$ variously shaped segments, the middle usually the largest, these again lobed or incised, all obtuse; scapes equalling or exceeding the foliage; flowers $2.5-4 \mathrm{~cm}$. wide, bright blue; sepals lanceolate, ciliate; petals broadly oval; capsules oval, those from the cleistogamous flowers on decumbent peduncles. Dry woods, Ill. and Wis. to Mo. May.
5. Viola viàrum Pollard, n. sp. Warside Violet. Glabrous, growing in large clumps from a stout rootstock which becomes greatly clongated in loose soil: leaves firm, thick-petioled, the blades rugose-veined, broadly owate or reniform in
outline, becoming $7-13 \mathrm{~cm}$. wide, some undivided, merely dentate or coarsely serrate, mostly cleft or divided to below the middle into 5 or 7 incised lobes, the base strongly decurrent; flowers blue; sepals lanceolate, acute; capsules abundant, those from the petaliferous flowers oval, prismatic, $8-16 \mathrm{~mm}$. long, on erect peduncles, those from the cleistogamous flowers oblong, smaller, ascending or erect. Open ground along roads, Mo. to Kans. and Ind. Terr. Type collected by J. B. S. Norton at Valley Park, Mo., July 15, I899.
6. Viola falcàta Greene. Falcate-leaved Violet. Plants solitary, with a long perpendicular rootstock; leaves few, sparsely pubescent, the blades I-2.5 cm . long when mature, broadly deltoid in outline, cleft or divided into several segments which are either simple or again lobed, the outer distinctly falcate; flowers similar to those of $V$. palmata; capsules from the apetalous flowers ovoid, usually hypogæous, on slender horizontal peduncles. In dry but rich woods, N. Car. to southern IIl. May-June.
7. Viola pedàta L. Bird's-foot Violet. (I. F. f. 2492.) Glabrous, from a short vertical rootstock; leaves numerous, the blades nearly orbicular in outline, $1.5-5 \mathrm{~cm}$. wide, pedately parted or divided into $5-$ I I linear, often toothed lobes, those of the earliest leaves broader and spatulate; flowers $\mathbf{I} .5-3.5 \mathrm{~cm}$. broad, lilac, blue, or rarely white, one or both of the upper petals frequently dark purple; stigma beardless, not rostrate; capsules I-I. 4 cm . long. Dry fields and hillsides, Me. and Ont. to Minn., Mo. and Fla. April-May.
8. Viola cuspidàta Greene. Cuspidate Violet. Low at flowering time, usually densely hirsute; leaves borne well above the flowering scapes, the blades from cordate-ovate to orbicular, crenate-serrate, rugose-veined, cucullate; flowers r6-18 mm. broad, deep blue; sepals lanceolate, obtuse; upper petals obovate, acute, the lowermost one truncate and cuspidate; capsules from the cleistogamous flowers on decumbent peduncles. Woods, Ind., Wis., Minn. to Br. Col. April-May.
9. Viola obliqua Hill. Thin-leaved Wood Violet. Slender, often solitary, from a horizontal or ascending rootstock; leaves dark green, long-petioled, the blades cordate-ovate, usually attenuate at apex, with a deep sinus at base, the margin irregularly crenate-dentate, $2.5-7.5 \mathrm{~cm}$. broad; blade not at all cucullate, but spreading at right angles to the petiole; scapes nearly equalling the foliage; flowers pale blue; capsules oblong-oval, 6 mm . long, those from the cleistogamous flowers on filiform deflexed peduncles. Rich soil in shade, N. Y. to Va. AprilMay. [V. affinis LeConte. Not V. obliqua of Ill. Fl.].
10. Viola papilionàcea Pursh. Meadow or Hooded Blue Violet. (I. F. f. 2487.) Usually glabrous, the foliage bright green; leaves with blades $5-13 \mathrm{~cm}$. long, usually cucullate, reniform or ovate, crenate, cordate at base; scapes exceeding the leaves at flowering time; flowers $1.5-2.5 \mathrm{~cm}$. broad, dark violet-purple, the two upper petals reflexed; keel petal narrow, this and the lateral ones copiously bearded with yellowish-white hairs; capsules oblong, those from the cleistogamous flowers on deflexed peduncles. [ $V$. obliqua of Ill. Fl., not of Hill.] Woodlands and meadows, N. S. to Minn., Ga. and Kan. April-June.
V. papilionàcea doméstica (Bicknell) Pollard. (I. F. App. f. 2487a.) Plant of much stouter habit; blades of the leaves usually broadly reniform, somewhat decurrent at base, often $10-13 \mathrm{~cm}$. wide; cleistogamous flowers very numerous, mostly subterranean. [ $V$. domestica Bicknell.] Cultivated soil around dwellings, N. Y. to Va. April-May.
ir. Viola pratíncola Greene. Entire-leaved Prairie Violet. Glabrous, from a stout ascending knotted rootstock; leaves light green, the blades cordatereniform, crenate, abruptly attenuate, becoming $6-10 \mathrm{~cm}$. broad; scapes mostly exceeding the leaves; flowers $\mathbf{1 . 5 - 2} \mathrm{cm}$. wide, light blue, the petals broad and rounded, paler at base, the lowermost purple-veined, the lateral conspicuously white-bearded; capsules from cleistogamous flowers oval, almost entirely subterranean. Prairies, Ind. to Minn. and Iowa. April-May.
12. Viola villosa Walt. Southern Wood Violet. (I. F. f. 2488.) Rootstock short, thick, oblique. Leaves commonly appressed to the ground, dark green, often purple-veined above, purplish beneath, silvery-hairy or glabrate, the blade reniform or orbicular, with a narrow sinus, usually obtuse, crenate, $2.5-6 \mathrm{~cm}$. wide; scapes exceeding the leaves; flowers reddish-purple, $12-16 \mathrm{~mm}$. wide; sepals lanceolate, obtuse; spur blunt; capsules $6-8 \mathrm{~mm}$. long, those from the cleistogamous
flowers on horizontal peduncles. Dry woods and hillsides, Penn. and. N. J. to Ga. and La. April-May.
13. Viola cucullàta Ait. Marsh Blue Violet. (I. F. App. f. 2487b.) Glabrous, the foliage pale green; leaves thin, from reniform to broadly ovate, obtuse, cucullate, the margins irregularly crenate-dentate; scapes equalling or exceeding the leaves; flowers pale blue or sometimes white, $\mathbf{1 . 5 - 2} \mathbf{~ c m}$. wide; capsules oblong, trigonous, those from the cleistogamous flowers on elongated slender peduncles usually longer than the leaves. Bogs and wet meadows, Me. and Ont. to Ga. and Mo. April-June.
14. Viola septentrionàlis Greene. Northern Blue Violet. Tufted, low, the leaves and petioles sparsely hirsute; blades light green, paler beneath, from reniform to suborbicular, strongly cucullate, all obtuse, crenulate; scapes about equalling the foliage; flower pale violet-blue, $1.5-2 \mathrm{~cm}$. wide, the petals broad and mostly obcordate; sepals small, linear, ciliate; capsules oval, very short, those from the cleistogamous flowers on slender erect peduncles. Rich woods, Ont. to northern N. Eng. May.
15. Viola venústula Greene. Small Blue Violet. Very small at flowering time, from a short oblique rootstock; leaves glabrous, rather dark green, deltoid-ovate or cordate-ovate, acute or attenuate, crenate-serrate, cucullate when young; scapes equalling or barely exceeding the leaves; flower $10-15 \mathrm{~mm}$. broad, deep violet-blue; petals broad, obtuse, the lateral ones bearded with white hairs; capsules small, nearly globose, those from the later cleistogamous flowers subterranean. Wet meadows, Prince Edward Island and Ont. to northern N. Eng. May.
16. Viola vágula Greene. Small Mottled Blue Violet. Low, rather succulent, from an erect rootstock; leaves dark green with some scattered pubescence, the blades 2.5 cm . broad, deltoid-cordate, the margin obscurely crenate; scapes surpassing the leaves; flowers 2.5 cm . wide; petals deep violet, white at base with purple veinings, obovate, the lowermost often obcordate, the lateral densely bearded; sepals oblong, obtuse; capsules oblong, those from the cleistogamous flowers on short ascending peduncles. Meadows, Ont. and Vt. May.

I7. Viola sagittàta Ait. Arrow-leaved Violet. (I. F. f. 2490.) Glabrous or with traces of pubescence; rootstock stout, ascending or erect; leaves with elongated petioles, the blades sagittate, lanceolate or oblong-lanceolate, usually acute, obscurely crenate-dentate above the middle, the auricles of the cordate or truncate base commonly laciniately toothed or incised; flowers very dark purple, rarely white; capsules $8-14 \mathrm{~mm}$. long, those from the cleistogamous flowers on erect peduncles. Wet meadows and marshes, Me. to Mich., Ga. and Tex. April-May.

I8. Viola emarginàta (Nutt.) LeConte. Triangle-leaved Violet. (I. F. App. f. 2490a.) Glabrous; leaves with elongated petioles; blades broadly ovate or deltoid-triangular, merely dentate below the middle, or sometimes even deeply cleft or incised, the base subcordate, somewhat decurrent; flowers bright blue or purple, the oblong petals usually distinctly emarginate; capsules obscurely angled, those from the cleistogamous flowers on erect peduncles. Fields and hillsides, N. Y. to Va. April-May.
19. Viola dentàta Pursh. Upland Violet. Robust, from a stout branching rootstock; leaves long-petioled, dark green, the blade glabrous or pubescent along the veins, at first cordate-oblong, later oblong-triangular, 7-15 cm. long, the base subcordate, decurrent upon the petiole, the apex acute or obtuse, the margins irregularly crenate-dentate, ciliate, sometimes incised below; scapes shorter than the leaves; flowers deep purple, $\mathbf{1 . 5 - 2} \mathrm{cm}$. wide; capsules obscurely 3 -angled, those from the cleistogamous flowers on erect peduncles. Dry rich soil in hilly regions, Penn. to Va. May.
20. Viola lancifòlia Thore. European Lance-leaved Violet. Tufted, glabrous, from a cluster of fibrous roots or a single thick root; leaves short-petioled, lanceolate or oblong-lanceolate, obtuse, crenate, $2-8 \mathrm{~cm}$. long, tapering at base; flowers $2.5-4 \mathrm{~cm}$. wide, purple; spur large and blunt, half the length of the petals; capsules small, those from the cleistogamous flowers on erect peduncles. Escaped from cultivation and established, Washington, D.C. Adventive from Europe. April-May.
21. Viola conjúgens Greene. Maryland Violet. Nearly glabrous, densely
tufted, from short knotted rootstocks; leaves rather succulent, deep green, the blades narrowly ovate or subsagittate, subcordate at base, obtuse, crenulate; flowers bright blue; $1.5-2.5 \mathrm{~cm}$. broad; petals obovate, densely white-bearded; capsules as in V. emarginata. Grassy places, Md. to Va. May.
22. Viola fimbriàtula J. E. Smith. Ovate-leaved Violet. (I. F. f. 2491.) Densely pubescent or villous, tufted; leaves with petioles usually shorter than the blades; the latter ovate-lanceolate, oval or oblong, obscurely crenate, the base truncate or subcordate, sometimes dentate or incised; flowers blue, $8-14 \mathrm{~mm}$. wide, the petals bearded; capsules oval, those from the cleistogamous flowers on erect peduncles. [V. ovata Nutt.] Dry soil, N. S. to Mo. and La. April-May.
23. Viola odoràta L. English or Sweet Violet. (I. F. f. 2493.) Stolons rooting at the nodes; leaves pubescent or glabrate, the blades orbicular or broadly ovate, cordate, obtuse, crenate, $2-5 \mathrm{~cm}$. wide; scapes equalling the foliage; flowers fragrant, $1-2 \mathrm{~cm}$. broad; sepals oblong, obtuse; petals beardless; capsules from cleistogamous flowers borne on short decumbent peduncles. Escaped from gardens, N. S. to southern N. Y. and N. J.; also in the South and on the Pacific Coast. Adventive from Europe. March-May.
24. Viola rotundifolia Michx. Round-leaved Violet. (I. F. f. 2494.) Stoloniferous in late summer; leaves glabrate, yellowish-green, paler beneath, the petioles somewhat pubescent; blades ovate or orbicular, cordate, crenate, $\mathbf{1}-5 \mathrm{~cm}$. wide at flowering-time, afterward becoming $10-13 \mathrm{~cm}$. wide and appressed to the ground; flowers yellow, $8-12 \mathrm{~mm}$. broad; sepals linear-oblong, obtuse; lateral petals bearded and marked with brown veins; capsules ovoid, those from the cleistogamous flowers racemose on short deflexed peduncles. Woods and rocky hillsides, Lab. and Ont. to Minn., south in the mountains to N. Car.
25. Viola palústris L. Marsh Violet. (I. F. f. 2495.) Glabrous; rootstock slender, horizontal; blades of the leaves thin, reniform to nearly orbicular, $2.5-4 \mathrm{~cm}$. wide, crenulate; scapes exceeding the foliage; flowers pale lilac or nearly white, marked with purple veins; petals $8-12 \mathrm{~mm}$. long, slightly bearded; spur short and blunt; capsule oblong, $6 \ldots 8 \mathrm{~mm}$. in length; cleistogamous flowers not produced. Wet soil, Lab. to Alaska and N. Eng., and in the Rocky Mts. Also in Europe and Asia. May-July.
26. Viola Selkírkii Pursh. Selkirk's Violet. (I. F. f. 2496.) Nearly glabrous; rootstock slender, creeping. Leaves dark green, the blades thin, $1-5 \mathrm{~cm}$. wide, broadly ovate or orbicular, deeply cordate, the margins crenate, the apex obtuse; basal sinus narrow, the auricles often overlapping; sepals lanceolate, acute; spur 5-8 mm. long, obtuse; petals beardless, pale violet-blue; capsules oblong, $4^{-6} \mathrm{~mm}$, long, those from the cleistogamous flowers on/erect or ascending peduncles. Moist woods, N. S. to Mass., Penn. and Minn Also in northern Europe and Asia. April-May.
27. Viola blánda Willd. Sweet White Violet. (I. F. f. 2497.) Glabrate, somewhat stoloniferous, from a very slender rootstock; blades of the leaves thin, light green, reniform to orbicular, $1-7 \mathrm{~cm}$. wide, crenate, cordate at base, with a shallow sinus, the apex obtuse; sepals lanceolate, acute; flowers white, fragrant, $6-12 \mathrm{~mm}$. broad; petals beardless, the lower and lateral ones marked with purple veins; capsules small, oval; cleistogamous flowers few. Swamps and wet meadows, Newf. to Br. Col. and N. Car. April-May.
28. Viola alsóphila Greene. Woodland White Violet: Strongly stoloniferous; leaves somewhat pubescent, bright green above, paler beneath, the petioles red-spotted; blades from ovate to orbicular, usually obtuse, with a deep narrow sinus; scapes mostly shorter than the leaves; flowers white, scarcely fragrant, I-2 cm . broad; petals very narrow, the two uppermost often twisted; capsules similar to those of $V$. blanda, but larger. [ $V$. blanda amoena (LeConte) B. S. P. Not V. amoena Symons.] Wet, hilly woods; N. Eng. to N. Car. and Ill. April-May.
29. Viola renifòlia A. Gray. Kidney-leaved Violet. (I. F. f. 2498.) Densely pubescent or even villous, from a slender horizontal rootstock; leaves with broad reniform or orbicular blades, $2-8 \mathrm{~cm}$. wide, the margins obscurely crenate, the basal sinus deep; scapes about equalling the foliage; sepals linear-oblong, acute; flowers 8 -10 mm . wide, white, the petals beardless and marked with brownish veins; capsules oval, 8 mm . long, those from the cleistogamous flowers on deflexed peduncles. Woods and thickets, N, S. to N. Y. and Minn, April-June.
30. Viola primulæfòlia L. Primrose-Leaved Violet. (I. F. f. 2499.) Glabrous or somewhat pubescent, producing long stolons in late summer; leaves with oval or ovate-oblong blades, the base usually decurrent upon the petioles, sometimes truncate or subcordate, the margins entire or crenulate; sepals lanceolate, acuminate; flowers white, $8-12 \mathrm{~mm}$. wide, the petals purple-veined, scarcely bearded; capsules oval, $6-10 \mathrm{~mm}$. long, those from the cleistogamous flowers nodding on short erect peduncles. Moist or wet ground, N. B. to Fla. and La. April-June.
31. Viola lanceolàta L. Lance-Leaved Violet. (I. F. f. 2500.) Glabrous, the stolons rooting freely at the nodes. Leaves lanceolate or linear-lanceolate, the blades $5-13 \mathrm{~cm}$. long, decurrent upon the petiole, the margins obscurely crenulate; scapes usually somewhat shorter than the leaves; sepals lanceolate, acuminate; flowers white, 8 -10 mm . wide, the petals beardless, the lower and lateral ones with purple veins; capsules oval, $6-10 \mathrm{~mm}$. long, those from the cleistogamous flowers nodding on short erect peduncles, frequently borne on the stolons. Wet meadows and along streams, N. S. to Minn., Fla. and Tex. April-June.
32. Viola Nuttàllii Pursh. Nuttall's Violet. (I. F. f. 250i.) Subcaulescent, later with ascending tufted leafy stems from a thick rootstock; leaves firm, nearly glabrous, the blades lanceolate or ovate-lanceolate, entire or irregularly crenate, tapering below into margined petioles, the apex obtuse; peduncles shorter than the leaves; sepals lanceolate, acuminate; flowers yellow, $1-2 \mathrm{~cm}$. wide; petals beardless, the lower and lateral ones often purple-veined; stigma bearded; capsule oval, 6 mm . long. Prairies, Manitoba to Mont., Kans. and Mu. May.
33. Viola hastàta Michx. Halberd-leaved Yellow Violet. (I. F. f. 2502.) Stem simple, erect, usually glabrous, I-3 dm. high; stem-leaves borne near the summit, short-petioled, hastate or hastate-ovate, $2-10 \mathrm{~cm}$. long, repand or denticulate, acute; basal leaves, when present, larger, more cordate; flowers yellow, $8-16 \mathrm{~mm}$. wide; lateral petals bearded; sepals linear-lanceolate, acute; spur short; capsule $8-10 \mathrm{~mm}$. long. Woods, in hilly regions, Penn. and Ohio to Ga. and Ala. April-June.
34. Viola pubéscens Ait. Hairy Yellow Violet. (I. F. f. 2503.) Stem simple, erect, pubescent or villous, I-5 dm. high; basal leaves ovate-reniform, long-petioled, early withering; stem leaves borne near the summit, short-petioled, the blades ovate or reniform, $5-13 \mathrm{~cm}$. wide, acute or abruptly attenuate, crenatedentate; sepals oblong-lanceolate; flowers bright yellow, 12-16 mm. wide; petals obscurely purple-veined; spur short; capsule oblong, glabrous or tomentose, IO-I6 mm . long. Dry woods, Quebec to S. Dak., Ga. and Iowa. April-May.
35. Viola scabriúscula (T. \& G.) Schwein. Smoothish Yellow Violet. (I. F. f. 2504.) Stems clustered, glabrate or glabrous, decumbent or ascending, I-4 dm. high; basal leaves broadly ovate, long-petioled, more or less persistent; stem leaves with blades from reniform to cordate-ovate, acute, crenate, dentate, $2.5-6 \mathrm{~cm}$. wide; sepals linear-lanceolate; flowers pale yellow, $10-16 \mathrm{~mm}$. broad; petals purple-veined; spur short; capsule oval, glabrous or tomentose, $6-10 \mathrm{~mm}$. long. Moist woods and thickets, N. S. to Manitoba, Neb., Ga. and Tex. AprilMay. Blooms earlier than the preceding.
36. Viola Canadénsis L. Canada Violet. (I. F. f. 2505.) Stems tufted, leafy, o.7-4 dm. high; leaves short-petioled, glabrous, the blades cordate-ovate, acute or acuminate, $2.5-6 \mathrm{~cm}$. long, serrate; stipules lanceolate, entire; flowers pale violet or white, $\mathbf{I}-\mathbf{2} \mathrm{cm}$. broad; lateral petals bearded, purple-veined; sepals linear, attenuate; capsule glabrous, oval, $6-8 \mathrm{~mm}$. long. Woods, in hilly districts, Newf. and Sask. to N. Car., Neb., N. Mex. and Ariz. May-July.
37. Viola striàta Ait. Pale or Striped Violet. (I. F. f. 2506.) Stems tufted, glabrous, becoming over 6 dm . long in late summer; leaves numerous, slender-petioled, the blades ovate or nearly orbicular, $2.5-6 \mathrm{~cm}$. wide, often slightly pubescent, the upper ones acute; stipules large, dentate or even laciniate; flowers long-peduncled, white or cream-colored, sometimes bluish, I-2 cm . broad; petals darker-veined, the lateral ones bearded; capsule ovoid, glabrous. Moist woods and thickets, N. Eng. and Ont. to Minn., Ga. and Mo. April-May.
38. Viola Labradórica Schrank. American Dog V'iolet. (I. F. f. 2507.) Stems tufted, glabrous, leafy; leaves slender-petioled, the blades reniform to orbicular, cordate, acutish or obtuse, $\mathbf{I}-4 \mathrm{~cm}$. wide; stipules ovate-linceolate, ciliate. entire or serrate; sepals linear-lanceolate, acuminate; flowers long-peduncled, light
blue or purple, rarely white, $\mathbf{1 2 - 1 6 ~ m m . ~ b r o a d ; ~ p e t a l s ~ t w i c e ~ a s ~ l o n g ~ a s ~ t h e ~ s l e n d e r ~}$ spur, the lateral ones slightly bearded; capsule glabrous, 4-6 mm. long; cleistogamous flowers short-peduncled, produced late in the season. Moist soil, Lab. to Minn., N. Car. and Ky. March-May.
39. Viola arenària DC. SAND Violet. (I. F. f. 2508.) Stems slender, tufted, decumbent or ascending, their surface and that of the long-petioled leaves finely puberulent; blades ovate, usually obtuse at apex, truncate or subcordate at base, $\mathbf{I}-2.5 \mathrm{~cm}$. long, the margins crenulate; stipules laciniate; sepals linear, acuminate; flowers violet-purple, $10-14 \mathrm{~mm}$. wide; spur 6 mm . long, blunt; capsule 6-8 mm. long. Sandy soil, Me. to Sask. and S. Dak. Also in Europe. May-June.
40. Viola multicaùlis (T. \& G.) Britton. Prostrate Blue Violet. (I. F. f. 2509.) Stems slender, tufted, 5-20 cm. long; leaves numerous, slender-petioled, finely puberulent; blades orbicular, crenulate, cordate with a narrow sinus, often mottled or dark-veined, $2.5-4 \mathrm{~cm}$. wide; stipules laciniate; peduncles exceeding the leaves; flowers violet-blue, $10-14 \mathrm{~mm}$. wide; petals bearded; sepals lanceolate, acuminate; capsule glabrous, $6-8 \mathrm{~mm}$. long; cleistogamous flowers borne on the shoots of late summer. Woods, Ky. to Fla. and Tex. Feb.-July.

4I. Viola rostràta Pursh. Long-Spurred Violet. (I. F. f. 25IO.) Stems numerous, erect; leaves glabrous, slender-petioled, the blades cordate-ovate or the lower reniform, acuminate, serrate, $\mathbf{I}-4 \mathrm{~cm}$. long; stipules laciniate, ciliate; flowers pale violet, darker veined, $1.5-2 \mathrm{~cm}$. wide; sepals linear-lanceolate; petals beardless; capsule glabrous, 8 mm . long. Rocky woods, Quebec to Mich., south in the mountains to Ga. June-July.
42. Viola trìcolor L. Pansy. Heart's-ease. (I. F. f. 25II.) Plant usually glabrous; stem branched, ascending, I-3 dm. high; upper leaves oval-lanceolate, crenate-dentate, $\mathbf{I}-2.5 \mathrm{~cm}$. long, the lower broader, often cordate; stipules large, foliaceous, laciniate or pinnatifid; flowers variously marked with yellow, purple or white, $1.6-2.5 \mathrm{~cm}$. broad; petals veined, the lower one largest; capsule angled, $6-10 \mathrm{~mm}$. long. Waste places, sparingly escaped from gardens. May-July.
43. Viola Rafinésquii Greene. Field Pansy. (I. F. f. 2512.) Stems very slender, glabrous, $7-23 \mathrm{~cm}$. high. Leaves ovate to oblong-lanceolate, obscurely crenate-dentate or entire, smaller than in the last; stipules similar; flowers yel-lowish-white or bluish-tinged, $10-16 \mathrm{~mm}$. wide; petals scarcely exceeding the linear sepals; 'capsule 4-6 mm. long. [ $V$. tenella Muhl.; not Poir.] Woods and fields, Me. to Ga., Mich. and Tex. March-May.

## 2. CUBELIUM Raf.

A perennial erect leafy-stemmed herb, the alternate leaves entire or obscurely dentate, the small greenish flowers I-3 together in the axils. Sepals 5, equal, not auricled. Petals nearly equal, erect, imbricated, the lower one broadest and somewhat gibbous below. Stamens 5, syngenesious, the sheath glandular at base; anthers sessile. Style hooked at the apex. Capsule somewhat lobed, 3-valved. A monotypic genus of N. Am.
I. Cubelium cóncolor (Forst.) Raf. Green Violet. (I. F. f. 2513.) Plant 3-9 dm. high, pubescent; leaves oblong-lanceolate, $7-12 \mathrm{~cm}$. long, acuminate, tapering to a short petiole; stipules linear, acute; flowers 8 mm . long, on short recurved peduncles; seeds large. Moist woods, Ont. to Mich., N. Car. and Kans. May-June.

## 3. CALCEOLÀRIA Loefl.

Herbs or rarely shrubs, with small axillary or racemose flowers. Sepals unequal, not auricled. Petals unequal, the lowermost one longest, gibbous or saccate at base, the upper pair shorter than the lateral ones. Anthers connivent, on distinct filaments, the lower glandular or spurred. Capsule elastically dehiscent into 3 valves. About 45 chiefly tropical American species.
I. Calceolaria verticillàta (Ort.) Kuntze. Nodding Violet. (I. F. f. 2514.) Stems clustered, glabrate or somewhat pubescent, erect or ascending, I-4 dm. high, from a woody base; leaves alternate, linear, $1.5-4 \mathrm{~cm}$. long, often fascicled; stipules subulate: flowers white, solitary, nodding, 4-6 mm. long. Dry ground, Kans, to Tex., Colo. and Mex. April-July.

## Family 6. PASSIFLORACEAE Dumort. Passion-flower Family.

Woody vines, climbing by tendrils, or erect herbs, with petioled usually palmately-lobed leaves, and perfect regular flowers. Calyx-tube persistent. Petals usually 5, inserted on the throat of the calyx, distinct, or in some species united. Stamens 5. Throat of the calyx crowned with a double or triple fringe. Filaments subulate or filiform, monadelphous, or separate. Ovary free from the calyx, i-celled; placentæ 3-5, parietal ; styles I-5. Fruit a berry or capsule, usually many-seeded. About 18 genera and 325 species, of warm and tropical regions, most abundant in S. Am.

## 1. PASSIFLÒRA L.

Climbing tendril-bearing vines, with alternate or rarely opposite leaves, and large axillary flowers, on jointed, often bracted, peduncles. Calyx-tube cupshaped or campanulate, $4-5$-lobed, the lobes narrow, imbricated in the bud, its throat crowned with a fringe called the corona. Petals 4 or 5 (rarely none), inserted on the throat of the calyx. Ovary oblong, stalked. Filaments monadelphous in a tube around the stalk of the ovary, separate above; anthers narrow, versatile. Fruit a many-seeded berry. Seeds pulpy-arilled, flat, ovate; endosperm fleshy. [Flower of the Cross, or Passion, as emblematic of the crucifixion.] About $25^{\circ}$ species, mostly of tropical Am., a few in Asia and Australia. Besides the following, about 7 others occur in the southern and southwestern States.
Leaves deeply $3-5$-lobed; lobes serrate; petals whitish; corona purple. r. P. incarnata. Leaves obtusely 3 -lobed above the middle, the lobes entire; flower yellowish.

> 2. P. lutea.

1. Passiflora incarnàta L. Passion-flower. Passion-vine. (I. F. f. 2515.) Stem glabrous, or slightly pubescent above. Petioles $1-5 \mathrm{~cm}$. long, with 2 glands near the summit; leaves nearly orbicular in outline, glabrous, or often somewhat pubescent, $7-13 \mathrm{~cm}$. broad, somewhat cordate at the base, the lobes ovate or oval, acute or acutish, finely serrate; flowers solitary, $3-5 \mathrm{~cm}$. broad; peduncles usually 3 -bracted just below the flowers; calyx-lobes linear; berry ovoid, nearly 5 cm . lang, glabrous, yellow. In dry soil, Va. to Mo., Fla. and the Ind. Terr. Fruit edible, called Maypops. May-July.
2. Passiflora lùtea L. Yellow Passion-flower. (I. F. f. 2516.) Glabrous or nearly so, climbing or trailing. Petioles $\mathbf{x - 3} \mathrm{cm}$. long; leaves much broader than long, more or less cordate at base, with 3 wide obtuse rounded lobes, the lobes entire; stipules $2-3 \mathrm{~mm}$. long; peduncles usually in pairs from the upper axils; flowers greenish-yellow, $\mathbf{I - 2} \mathrm{cm}$. broad; calyx-lobes linear; berry globoseovoid, $10-12 \mathrm{~mm}$. in diameter, glabrous, deep purple. In thickets, Penn. to Kans., Fla. and La. May-July.

## Family 7. LOASACEAE Reichenb. Loasa Family.

Herbs, often armed with hooked stinging or viscid hairs, with estipulate leaves, and regular, perfect, white yellow or reddish flowers. Calyxtube adnate to the ovary, its limb 4 - 5 -lobed, persistent. Petals 4 or 5 , inserted on the throat of the calyx. Stamens $\infty$, inserted with the petals; filaments filiform, commonly arranged in clusters opposite the petals; anthers introrse. Ovary 1 -celled (rarely $2-3$-celled), with $2-3$ parietal placentæ; ovules anatropous. Capsule usually i-celled, crowned with the calyx-limb. Seeds mostly numerous; endosperm scanty. About 13 genera and 200 species, all but 1 natives of America.

## r. MENTZELLIA. L.

Erect herbs, sometimes woody, with alternate leaves, and usually showy flowers. Calyx-tube cylindric, obconic, or club-shaped, its limb generally 5 -lobed.

Petals 5 or 10, spreading, convolute in the bud, deciduous. Stamens 20-300. Styles 3, more or less united; stigmas small, obtuse. Capsule dehiscent at the summit, few-many-seeded. Seeds flat and sometimes winged, roughened, or smooth. [In honor of C. Mentzel, a German botanist, died I701.] About 50 species, natives of America. Besides the following, some 25 others occur in western N. Am.

Flowers $1-2 \mathrm{~cm}$. broad, yellow.
Leaves, at least the lower, petioled; stem very rough ; calyx-lobes 6 mm . long.

$$
\begin{array}{ll}
\text { Leaves sessile; stem little rough; calyx-lobes } 4 \mathrm{~mm} \text {. long. } & \text { I. M. oligosperma. } \\
\text { 3. albicaulis. }
\end{array}
$$ Flowers $3-10 \mathrm{~cm}$. broad.

Flowers yellowish white, opening in the evening.
Flowers $3-5 \mathrm{~cm}$. broad; calyx-tube usually bractless. 2. M. nuda.
Flowers $7-10 \mathrm{~cm}$. broad; calyx-tube usually bracted.
4. M. decapetala.

Flowers bright yellow, opening in sunshine.
5. M. laevicaulis.
I. Mentzelia oligospérma Nutt. Few-seeded Mentzelia. (I. F. f. 2517.) Rough and viscid-pubescent, 3-9 dm. high. Leaves ovate or oval, coarsely dentate or sinuate, $2-8 \mathrm{~cm}$. long, the upper rounded or truncate at the base and sessile, the lower narrowed at the base; flowers axillary or somewhat cymose, opening in sunshine; petals 5 , oblong-cuneate, acute, about twice as long as the linear-lanceolate calyx-lobes; filaments 20-30, all filiform; capsule linear, 12-16 mm. long, few-seeded; seeds oblong, wingless. Prairies, Ill. to S. Dak., Kans., Colo., La. and Mex. May-July.
2. Mentzelia nùda (Pursh) T. \& G. Bractless Mentzelia. (I. F. f. 2518.) Rough with minute pubescence, slender, 3-15 dm. high, the stems lightcolored. Leaves lanceolate or oblong-lanceolate, acute, usually sharply and deeply dentate, or the upper pinnatifid, $2-8 \mathrm{~cm}$. long; petals 10 , about twice as long as the lanceolate calyx-lobes; calyx-tube usually not bracteolate; stamens 100 or more, the outer ones somewhat petaloid; capsule oblong, $1.5-2.5 \mathrm{~cm}$. long, about 6 mm . thick; seeds numerous, wing-margined. Plains, S. Dak. to Kans., Colo. and Tex. July-Aug.
3. Mentzelia albicaùlis Dougl. White-stemmed Mentzelia. (I. F. f. 2519.) Stem nearly white, shining, 1.5-5 dm. high. Leaves mostly lanceolate, sinuate-pinnatifid, sinuate-lobed, or the upper and lower sometimes entire, rough with short stiff hairs, $2-8 \mathrm{~cm}$. long; flowers few together at the ends of the branches, or also axillary, $\mathbf{I - 2} \mathrm{cm}$. broad, short-pedicelled or sessile; calyx-lobes linearlanceolate; capsule linear, 2.5 cm . long or less, many-seeded; seeds angled, tuberculate, wingless. Neb. to Br. Col., Cal. and N. Mex. May-July.
4. Mentzelia decapétala (Pursh) Urban \& Gilg. Showy Mentzelia. (I. F. f. 2520.) Roughish-pubescent, stout, seldom over 6 dm. high. Leaves oval, lanceolate or oblong, acute or acuminate, sinuate-pinnatifid, $5-15 \mathrm{~cm}$. long, the upper sessile, the lower petioled; flowers mostly solitary, terminal; petals 10, about twice as long as the lanceolate calyx-lobes; filaments all filiform, very numerous (200-300); capsule oblong, $3-5 \mathrm{~cm}$. long; seeds numerous, margined, not winged. Plains, Dak. and Mont. to Neb. and Tex. June-Sept.
5. Mentzelia laevicaùlis (Dougl.) T. \& G. Smooth-stemmed Mentzelia. (I. F. f. 252 I .) Stout, 6-12 dm. high, minutely pubescent, or the stems at length glabrate and whitish. Leaves sessile, lanceolate or ovate-lanceolate, sinuatepinnatifid, acute or acuminate, $2-8 \mathrm{~cm}$. long; flowers mostly solitary, terminal, $7-10 \mathrm{~cm}$. broad; calyx-tube bractless; petals 5 , or with 5 additional narrower inner ones, 2-3 times as long as the calyx-lobes; stamens very numerous; capsule oblong, about 2.5 cm . long; seeds numerous, winged, minutely tuberculate. Plains and dry soil, Neb., Mont. and Wyo. to Ore., Utah and Cal. June-July.

## Order 24. OPUNTIÀLES.

Fleshy plants, with continuous or jointed stems, leafless, or with small leaves, generally abundantly spiny, the spines developed from cushions of minute bristles (areblæ). Flowers mostly solitary, sessile, perfect,
regular, showy. Calyx-tube adnate to the ovary, its limb many-lobed. Petals numerous, imbricated in several rows, mostly distinct. Stamens numerous, inserted on the throat of the calyx. Filaments filiform; anthers small. Ovary i-celled; ovules numerous, anatropous, borne on several parietal placentæ. Style terminal, elongated; stigmas numerous. Fruit a berry, mostly fleshy, sometimes nearly dry. Seeds smooth, or tubercled, the testa usually crustaceous or bony; endosperm little, or copious. Only one family.

## Family I. CACTÀCEAE Lindl.

## Cactus Family.

About 20 genera, and 1000 species nearly all natives of America.
Stems subglobose, oval, ovoid or cylindric, tubercled, ribbed or angled; no proper leaves. Flowers borne on the turbercles or ribs, at or near the areolæ. Flowers borne close to fully developed clusters of spines. 1. Echinocereus. Flowers barne close to areolæ, from which the spines subsequently develop.
2. Echinocactus.

Flowers borne between the tubercles, distant from the areole. 3. Cactus. Plants jointed, the joints flattened, or cylindric; leaves present, mostly subulate and deciduous.
4. Opuntia.

## 1. ECHINOCERREUS Engelm.

Stems ovoid, cylindric or oval, ribbed, or tubercled, the ribs or rows of tubercles usually straight, vertical. Proper leaves none. Spine-bearing areolæ on the ribs or tubercles. Flowers borne on the ribs or tubercles, at or near the areolæ, close to fully developed clusters of spines. Calyx-tube with spine-bearing areolæ, or scaly, prolonged beyond the ovary. [Greek hedgehog-Cereus.] About 45 species, natives of America. Besides the following, some 20 others occur in the southwestern U. S.

Flowers greenish, about 2.5 cm . broad ; fruit 10-12 mm. long. I. E. viridiflorus. Flowers rose-purple, $5-8 \mathrm{~cm}$, broad ; fruit $18-20 \mathrm{~mm}$. long.
2. E. caespitosus.

1. Echinocereus viridifiòrus Engelm. Green-flowered Cereus. (I. F. f. 2522.) Stem subglobose to oval-cylindric, $2-20 \mathrm{~cm}$. high, simple, or sparingly branched, $2-5 \mathrm{~cm}$. in diameter. Ribs about 13 ; longer radial spines $\mathbf{1 2 - 1 8}$, with 2-6 setaceous upper ones, the lateral ones reddish brown, the others white or rarely purple; central spine stout, or wanting, purple and white; flowers greenish brown without, yellowish green within; fruit ellipsoid, greenish; seeds tubercled. Kans. to Wyo., Tex. and N. Mex.
2. Echinocereus caespitòsus Engelm. \& Gray. Tufted Cereus. (I. F. f. 2523.) Stems ovoid-globose to ovoid-cylindric, usually tufted, $2-15 \mathrm{~cm}$. high, 2-10 cm. in diameter; ribs 12 or 13; radial spines $20-30$, pectinate, white, the lateral ones the longer, $4-8 \mathrm{~mm}$. long; central spines wanting, or sometimes I or 2 short ones; fruit ovoid, green; seeds tubercled, black. Western Kans. (?), Ind. Terr. to Tex. and Mex.

## 2. ECHINOCÁCTUS Link \& Otto.

Stems globose, oblong or cylindric, leafless, tubercled, the tubercles arranged in straight or spiral rows, bearing clusters of spines arising from areolae. Flowers borne on the tubercles, at or near areolæ from which spines are subsequently developed. Calyx-tube prolonged beyond the ovary, usually covered with scales, its lobes numerous, the outer scale-like, the inner elongated. Petals numerous, similar to the inner sepals. Stamens numerous. Ovary exserted; style columnar. Berry usually covered with scales and often with tufts of minute bristles. [Greek, hedgehog-cactus.] About 200 described species, natives of America. Resides the following, some 30 others occur in the Western States.
I. Echinocactus Símpsoni Engelm. Simison's Cictus. Hfinemogthistle. (I. F. f. 2524.) Stems globose or with a narrowed base. 7-15 cm. high,
$7-10 \mathrm{~cm}$. in diameter. Tubercles ovoid, somewhat 4 -sided at base, $\mathbf{1 2 - 1 6 ~ m m . ~}$ long, arranged in spirals; central spines yellowish below, nearly black above, ro14 mm . long, the exterior ones slightly shorter, whitish; flowers greenish pink, $1.5-2 \mathrm{~cm}$. broad, borne to one side at the ends of the tubercles; petals oblong, crenulate, cuspidate; berry dry, $6-7 \mathrm{~mm}$. in diameter, bearing 2 or 3 scales near its summit. Kans. (?), Colo. to Utah and Nev. April-May.

## 3. CÁCTUS L.

Stems globose or ovoid, tubercled. Tubercles conic or cylindric, woolly and with clusters of spines at the apex. Leaves none. Flowers borne from areolæ at the bases of the tubercles. Calyx-tube prolonged beyond the ovary, which is often hidden between the tubercles. Petals in several rows. Ovary smooth, ovoid; style filiform. Berry emersed, crowned by the withering corolla. [Greek name of some prickly plant.] About 300 described species, natives of warm and tropical America. Besides the following, 35 or more occur in the southwestern States.
Flowers yellow or reddish; central spine 1. 1. C. Missouriensis. Flowers purple; central spines several. 2. C. viviparus.
I. Cactus Missouriénsis (Sweet.) Kuntze. Missouri Cactus. (I.F.f. 2525.) Stems globose, $2-5 \mathrm{~cm}$. high. Tubercles $\mathbf{1 2 - 1 6 ~ m m}$. long, arranged in about 8 spiral rows, slightly grooved; spines gray, IO-20 together, the stouter central one IO- 12 mm . long, or wanting; flowers about 2.5 cm . broad; petals abruptly mucronate; berry globose, scarlet, $6-8 \mathrm{~mm}$. in diameter, ripening the following spring; seeds black, globose, pitted, about 1 mm . in diameter. Plains and dry soil, S. Dak. to Kans., Tex. and Colo. May.

Cactus Missouriénsis símilis (Engelm.) Coult. Stems tufted; flowers 2-5 cm. long; seeds about 2 mm . long. Kans. and Colo. to Tex.
2. Cactus vivíparus Nutt. Purple Cactus. (I. F. f. 2526.) Stems 2-13 cm . high, $3-5 \mathrm{~cm}$. in diameter. Tubercles terete or nearly so, slightly grooved, bearing $3-8$ slender reddish-brown spines, $\mathbf{1}-2 \mathrm{~cm}$. long, surrounded by $\mathbf{1 2 - 2 5}$ somewhat shorter, whitish or greenish ones in a single row; flowers nearly 5 cm . long; petals lanceolate, narrow; sepals fringed; berry ovoid, $12-18 \mathrm{~mm}$. long, green; seeds light brown, obovoid, curved, pitted, about $\mathbf{1} .5 \mathrm{~mm}$. long. Prairies, Manitoba to Alberta, Kans. and Colo.

## 4. OPÚNTIA Mill.

Succulent plants, with jointed branching stems, the joints flat, or cylindric, and small mostly subulate deciduous leaves, the areolæ axillary, often spine-bearing. Flowers usually lateral. Calyx-tube not prolonged beyond the ovary, its lobes spreading. Petals numerous, slightly united at the base. Stamens very numerous. Ovary cylindric, exserted; style cylindric, longer than the stamens; stigma 2-7-rayed. Berry pear-shaped, often spiny. [Named from a town in Greece where some species grew.] About 150 species, natives of America. Besides the following, some 50 others occur in the western States.

Joints flattened, oval, oblong, obovate or orbicular: stems prostrate or ascending.
Fruit fleshy, juicy, spineless or sparingly spiny. Joints spineless, or with solitary stout spines. . I. O. Opuntia.
Joints spiny (No. 2 sometimes unarmed), the spines 1-15 at each areola. Spines white, gray or yellowish.

Joints $7-\mathrm{r} 3 \mathrm{~cm}$. long: longer spines $\mathrm{x}-4 \mathrm{~cm}$. long. 2. O. humifusa.
Joints $15-20 \mathrm{~cm}$. long; longer spines $2.5-6 \mathrm{~cm}$. long. 3. O. tortispina. Spines reddish brown to black; joints $15-20 \mathrm{~cm}$. long. 4. O. Camanchica. Fruit dry, with spine-bearing areolæ.

Joints orbicular or broadly obovate, flat. 5. O. polyacantha.
Joints little flattened, ovoid, or subglobose. 6. O. fragilis.
Joints cylindric, or nearly so: stem erect.
greenish or yellowish brown; spines, when present, solitary, stout, not deflexed, $6-35 \mathrm{~mm}$. long; flowers yellow, sometimes with a reddish center, $5-8 \mathrm{~cm}$. broad; fruit obovoid, edible, $2.5-4 \mathrm{~cm}$. long, red. In dry sandy soil, or on rocks, E. Mass. to Penn. and Fla. June-Aug.
2. Opuntia humifùsa Raf. Western Prickly Pear. (I. F. f. 2528.) Prostrate, similar to the preceding; joints obovate, suborbicular, or oval, usually deep green, $7-13 \mathrm{~cm}$. long; leaves subulate, spreading, $6-10 \mathrm{~mm}$. long; bristles reddish brown; spines few, mostly near the margins, I-4 together, deflexed, or the longer one spreading and $\mathbf{1 - 2 . 5} \mathrm{cm}$. long; flowers $6-10 \mathrm{~cm}$. broad; fruit clubshaped, not spiny, edible, $3-5 \mathrm{~cm}$. long. In dry sandy or rocky soil, S. Dak. to Minn., Ky., Mo., Kans. and Tex. Summer.
3. Opuntia tortispìna Engelm. Twisted-spined Cactus. (I. F. f. 2529.) Stems prostrate, the orbicular-obovate flattened joints $15-20 \mathrm{~cm}$. long. Spines $3-5$, white, angled, the longer ones $3-6 \mathrm{~cm}$. long, with 2-4 more slender and shorter ones; flowers sulphur-yellow, $6-8 \mathrm{~cm}$. broad; fruit ovoid, fleshy, unarmed, about 5 cm . long; seeds orbicular, slightly notched at the hilum. Plains, Neb. to Tex.
4. Opuntia Camánchica Engelm. Comanche Cactus. (I. F. f. 2530.) Prostrate, with obovate-orbicular flattened joints $15-20 \mathrm{~cm}$. long. Spines $1-3$, flattened, reddish brown to blackish, 3-8 cm . long, or with 3-6 additional shorter ones, the upper one suberect, the others deflexed or spreading; fruit oval, deep red, $3-5 \mathrm{~cm}$. long; seeds angular, margined, deeply notched at the hilum. W. Kans. (?), Colo. to Tex. and Ariz.
5. Opuntia polyacántha Haw. Many-spined Opuntia. (I. F. f. 2531.) Prostrate; joints obovate to orbicular, tubercled, $5-15 \mathrm{~cm}$. long, about I .2 cm . thick, the tubercles 4 mm . high, densely spiny and with cushions of fine bristles; spines $5-\mathrm{I} 2$, slender, $\mathrm{I}-5 \mathrm{~cm}$. long, whitish; leaves minute; flowers light yellow, $5-8 \mathrm{~cm}$. broad; fruit dry, very prickly, $2-3 \mathrm{~cm}$. long. Prairies and dry soil, S. Dak. to Br. Col., Neb., Mo. and N. Mex. May-June.
6. Opuntia frágilis (Nutt.) Haw. Brittle Opuntia. (I. F. f. 2532.) Decumbent or prostrate; joints ovate, $2-5 \mathrm{~cm}$. long, nearly terete. Leaves small, reddish; cushions composed of few bristles; central spines I-4, 1-4 cm. long, gray, darker at the apex, surrounded by $4-6$ smaller ones; flowers yellow, smaller than those of the preceding; fruit nearly 2.5 cm . long, becoming dry at maturity, provided with cushions of bristles usually bearing a few short spines. Prairies and dry soil, Wis. and Minn. to S. Dak., Utah, Kans. and N. Mex.
7. Opuntia arboréscens Engelm. Northern Tree-like Cactus. (I. F. f. 2533.) Erect, tree-like, I-8 m. high, I-2 dm. in diameter at the base, verticillately branched. Joints verticillate, mostly in 3 's and 4 's, cylindric, $5-15 \mathrm{~cm}$. long, the tubercles $1.5-2 \mathrm{~cm}$. long; leaves terete, $1-2 \mathrm{~cm}$. long; spines $8-30$, terete, in yellowish sheaths, diverging, the interior ones often 2.5 cm . long or more; flowers purple, $6-8 \mathrm{~cm}$. broad; fruit subglobose, tuberculate, dry, or nearly so, yellow, unarmed, about 2.5 cm . in diameter. W. Kans., Colo. to Tex., N. Mex. and Mex.

## Order 25. THYMELEÀLES.

Mostly shrubs or trees, with simple leaves and incomplete flowers. Calyx inferior, $4-5$-lobed or entire. Corolla mostly wanting. Stamens twice as many as the calyx-lobes, or fewer. Ovary I-celled. Ovule I, anatropous.
Leaves green ; seed pendulous.
Fam. 1. Thymeleaceae.
Leaves silvery-scurfy; seed erect.

> Fam. 2. Elaeagnaceae.

Family I. THYMELEÀCEAE Reichenb.
Mezereon Family.
Shrubs or trees (rarely herbaceous), with tough inner bark, and entire estipulate leaves. Flowers fascicled, capitate, racemose, or rarely solitary, regular, mostly perfect. Calyx-tube cylindric or urn-shaped. Petals
none in our genera. Stamens borne on the calyx, often in two series ; anthers erect, 2 -celled, the sacs longitudinally dehiscent. Ovary i-celled, 1-ovuled (2-celled and 2 -ovuled in some Asiatic and Australasian genera) ; ovule pendulous; stigma terminal, mostly capitate. Fruit a berry-like drupe in our plants. Seed-coat mostly crustaceous; embryo straight; cotyleduns fleshy ; endosperm little or none, or copious in some exotic genera. About 37 genera and 425 species, widely distributed, most abundant in Australia and South Africa.

Calyx-lobes 4, large; stamens included; style very short.

1. Daphne.

Calyx-limb almost wanting; stamens and style long, exserted.
2. Dirca.

1. DAPHNE L.

Shrubs, with alternate leaves, and small purple pink or white flowers in fascicles, heads or racemes, borne in the following species at the leafless nodes of twigs of the preceding season. Perianth tubular, its 4 lobes spreading. Stamens 8 , in 2 series on the perianth-tube, included, or the upper 4 slightly exserted; filaments very short. Disk none. Ovary sessile or nearly so, I-celled; stigma large, capitate. Drupe ovoid, or oblong, the calyx deciduous or persistent. About 40 species, natives of Europe and Asia.
I. Daphne Mezèreum L. Spurge Laurel. Lady Laurel. Mezereon. (I. F. f. 2534.) A shrub 3-12 dm. high, the young twigs somewhat pubescent. Leaves thin, deciduous, oblong-lanceolate or oblanceolate, $7-13 \mathrm{~cm}$. long, narrowed into short petioles; flowers in sessile fascicles of $2-5$, very fragrant; perianth-tube appressed-pubescent, rose-purple or white, 12 mm . long or less, the ovate acute lobes nearly as long; drupe red, oval-ovoid, 6-8 mm. long. Escaped from cultivation, Quebec to Mass. and N. Y. Native of Europe and Asia. April-May.

## 2. DIRCA L.

Shrubs, with tough fibrous bark, alternate thin short-petioled deciduous leaves, and yellowish flowers in peduncled fascicles of 2-4 from scaly buds at the nodes of twigs. of the preceding season. Perianth campanulate or funnelform, its limb undulately obscurely 4 -toothed. Stamens 8 , borne on the perianth, the alternate ones longer; filaments very slender. Disk obsolete. Ovary nearly sessile; stigma small, capitate. Drupe red, oval oblong. [Named from a fountain in Thebes.] Two known species, the following and D. occidentalis A. Gray, of Cal.
I. Dirca palústris L. Leather-wood. Moose-wood. (I. F. f. 2535.) A shrub, $6-18 \mathrm{dm}$. high, the twigs yeilowish green, glabrous. Leaves oval, or obovate, obtuse, glabrous, or very nearly so, and $5-8 \mathrm{~cm}$. long when mature; budscales 3 or 4 , oval, or oblong, very pubescent with brown hairs, deciduous; peduncle about 5 mm . long; flowers nearly sessile; perianth 4-6 mm . long; style longer than the stamens; drupe about 1 cm . long. In woods and thickets, N. B. to Minn., Va., Tenn. and Mo., and Fla. (according to Chapman). April-May.

## Family 2. ELAEAGNÀCEAE Lindl.

Oleaster Family.
Shrubs or trees, mostly silvery-scaly, or stellate-pubescent, with entire leaves, the flowers clustered in the axils or at the nodes of twigs of the preceding season, rarely solitary. Lower part of the perianth of perfect or pistillate flowers enclosing the ovary and persistent, the upper part 4-lobed or 4 -cleft, deciduous (obscurely 2 -lobed in the Old World Hippophoë) ; perianth of staminate flowers 4 -parted (2-parted in Hippophoë). Stamens 4 or 8 , those of perfect flowers borne on the throat of the perianth; filaments mostly short; anthers 2-celled, the sacs longitudinally dehiscent. Disk annular, or lobed. Ovary sessile ; ovule I, anatropous; style slender. Fruit drupe-like, the perianth-base becoming thickened and enclosing the achene or nut. Seed erect; embryo straight ; endosperm little or wanting. Three known genera and about 20 species, widely distributed.

Stamens as many as the perianth-parts; flowers perfect or polygamous; leaves alternate. 1. Elaeagnus. Stamens twice as many as the perianth-parts; flowers diœecious: leaves opposite.
2. Lepargyraea.

## 1. ELAEÁGNUS L.

Silver-scaly shrubs, some exotic species trees, with petioled leaves. Flowers solitary or $2-4$ together in the axils, pedicelled, not bracted. Perianth tubular below, constricted over the top of the ovary, the upper part deciduous, the lobes valvate. Stamens 4, borne on the throat of the perianth. Ripened perianth-base fleshy or mealy. [Greek, sacred olive.] About 20 species; only the following is known in N. Am.
I. Elaeagnus argéntea Pursh. Silver Berry. (I. F. f. 2536.) Stoloniferous, sometimes 4 m . high, the young twigs covered with brown scurf, becoming silvery. Leaves oblong, ovate or oval-lanceolate, densely silvery-scurfy on both sides, short-petioled, $2-10 \mathrm{~cm}$. long; flowers usually numerous, I to 3 in the axils, fragrant, silvery, $12-16 \mathrm{~mm}$. long; perianth silvery without, yellowish within, its lobes ovate, about 2 mm . long; fruit oval, silvery, $8-12 \mathrm{~mm}$. long, the stone 8 -striate. James Bay to the N. W. Terr., Quebec, Minn., S. Dak. and Utah. May-July.

## 2. LEPARGYRAEA Raf.

Shrubs, brown- or silvery-scurfy or stellate-pubescent, with petioled leaves. Flowers small, diœcious, or sometimes polygamous, subspicate or fascicled at the nodes of the preceding season, or axillary, the pistillate few or sometimes solitary. Pistillate flowers with a 4 -lobed perianth, bearing an 8 -lobed disk at its mouth which nearly closes it; style somewhat exserted. Staminate flowers with a 4 -parted perianth and 8 stamens alternating with as many lobes of the disk; filaments short. [Greek, silvery-scaly.] Only the following species, and L. rolundifolia of Utah.

Leaves ovate or oval, green above, silvery beneath; shrub thornless. I. L. Canadensis. Leaves oblong, silvery on both sides; shrub mostly thorny.
I. Lepargyraea Canadénsis (L.) Greene. Canadian Buffalo-berry. (I. F. f. 2537.) A thornless shrub, $\mathbf{I}-2.8 \mathrm{~m}$. high, the young shoots brownscurfy. Leaves ovate or oval, obtuse, $2-4 \mathrm{~cm}$. long, green and sparingly stellatescurfy above, densely silvery stellate-scurfy beneath; petioles $4-6 \mathrm{~mm}$. long; flowers yellowish; perianth about 4 mm . broad; fruit oval, red or yellowish, $4-6 \mathrm{~mm}$. long, the flesh insipid, the nut smooth. On banks, Newf. to Alaska, Me., N. Y., Mich. and Utah. April-June.
2. Lepargyraea argéntea (Nutt.) Greene. Buffalo-berry. RabbitBERRY. (I. F. f. 2538.) A shrub, 2-6 m. high, the twigs often terminating in thorns. Leaves oblong, or sometimes oblong-lanceolate, $2-5 \mathrm{~cm}$. long, obtuse at the apex, usually cuneate-narrowed at the base; densely silvery-scurfy on both sides: petioles $4-12 \mathrm{~mm}$. long; flowers fascicled at the nodes; fruit oval, or ovoid, scarlet, sour, 4-6 mm. long, edible. Manitoba and Minn. to Saskatch., Kans. and Nev. April-May.

## Order 26. MYRTÀLES.

Our species mostly herbs, many tropical and subtropical ones shrubs or trees. Leaves simple, often lobed or dissected. Petals usually present, distinct (wanting in some Haloragidaceae). Calyx gamosepalous, mostly superior or adnate to the compound ovary. Ovules usually numerous.

[^36]Petioles of the broad floating leaves inflated; flowers rather large, white.
Fam. 4. Trapaceae.
Leaves mostly sessile; petioles, if present, not inflated; flowers small, greenish; seeds with I coat.

Fam. 5. Haloragidaceae.

## Family I. LYTHRACEAE Lindl.

## Loosestrife Family.

Herbs, shrubs, or often trees in tropical regions, mostly with opposite leaves and perfect flowers. Stipules usually none. Calyx persistent, free from the ovary, the limb toothed. Petals as many as the primary calyx-teeth; inserted on the calyx, or none. Stamens inserted on the calyx. Anthers versatile. Ovary 2-6-celled or sometimes I-celled; style I ; ovules $\infty$, rarely few, anatropous. Capsule I-several-celled. Seeds without endosperm ; cotyledons flat, often auricled at the base. About 21 genera and 350 species, of wide distribution.
Calyx-tube campanulate or hemispheric; flowers regular.
Flowers small, axillary, solitary or few; low herbs.
Petals 4 in our species; capsule bursting irregularly. I. Ammannia.
Petals none; capsule indehiscent.
Petals 4; capsule septicidally dehiscent.
Flowers large, in axillary cymes; large aquatic shrub. Calyx-tube cylindric; flowers regular.
2. Didiples.
3. Rotala.

Calyx-tube tubular, oblique; flowers irregular.

## 1. AMMÁNNIA L.

Annual glabrous or glabrate herbs, mostly with 4 -angled stems, opposite sessile narrow leaves, and small axillary flowers. Calyx campanulate, globose or ovoid, 4 -angled, 4 -toothed, often with small accessory teeth in the sinuses. Petals 4 in our species, deciduous. Stamens 4-8. inserted on the calyx-tube. Ovary neariy globular, 2-4-celled, bursting irregularly. [Named for Johann Ammann, 1699-1741, a German botanist.] About 2 species, of wide distribution.
Flowers sessile, solitary, or 2-5 together.
Leaves linear-lanceolate, acuminate; style elongated.

> 1. A. coccinea.
> 2. A. Koehnei.
> 3. A. auriculata.

Leaves obovate or oblanceolate, obtuse; style very short.
Flowers pedicelled, in axillary cymes.
I. Ammannia coccínea Rottb. Long-Leaved Ammannia. (I. F. f. 2539.) Erect, 1.5-5 dm. high. Leares obtusely cordate-auriculate and dilated at the somewhat clasping base, entire, $2-8 \mathrm{~cm}$. long. $2-6 \mathrm{~mm}$. wide; flowers I-5 in each axil, sessile or nearly so; petals purple, fugacious; style very slender, usually more than one-half the length of the capsule. In swamps, Ind. and Iowa to S. Dak., Fla., Mex. and Brazil. July-Sept.
2. Ammannia Koèhnei Britton. Koehne's Ammanila. (I. F. f. 2540.) Erect, I.5-5 dm. high. Leaves obovate. oblanceolate, or somewhat spatulate, the upper ones clasping and more or less auriculate at the base, the lower narrowed and sessile or tapering into a short petiole; flowers I-3 together in the axils; sessile; petals fugacious; stamens very short. not exserted; style very short; capsule enclosed by the calyx. In swamps, N. J. to Fla. July-Sept.
3. Ammannia auriculàta Willd. Wright's Ammanila. (I. F. f. 2541.) Erect, 5-25 cm. high. Leaves sessile, linear-lanceolate or oblong, acute or acutish at the apex, auriculate at the base, $\mathrm{I}-4 \mathrm{~cm}$. long; cymes peduncled; pedicels $\mathrm{I}-3$ mm . long; petals purple; style slender; stamens exserted; capsule partly enclosed by the calyx. Neb. to Tex. and Brazil. Also in Asia and Africa. May-June.

## 2. DÍDIPLIS Raf.

Aquatic or marsh plants, with 4 -angled stems, opposite narrow entire leaves, and small axillary solitary green flowers. Calyx hemispheric or campanulate, 4-lobed, with no accessory teeth. Stamens 2-4, usually 4, inserted on the calyx-
tube; filaments very short. Ovary globose, 2-celled; style scarcely any; stigma obscurely 2 -lobed; ovules $\infty$. Capsule 2-celled. [Greek, twice double.] A monotypic genus of east-central N. Am.
I. Didiplis diándra (Nutt.) Wood. Water Purslane. (I. F. f. 2542.) Submersed or rooting in the mud, o.7-3 dm. long. Submersed leaves thin, elon-gated-linear or lanceolate, acute or acuminate at the apex, broader at the base, $1-2 \mathrm{~cm}$. long; emersed leaves linear-oblong, narrowed at the base; flowers about r mm. long; capsule about 1 mm . in diameter. Minn. and Wis. to Tex. and Mex., N. Car. and Fla. Resembling Callitriche in habit. June-Aug.

## 3. ROTÀLA L.

Low annual mainly glabrous herbs, usually with opposite leaves, 4 -angled stems, and axillary mainly solitary small flowers. Calyx campanulate or globose, 4-lobed. Stamens 4, short. Ovary free from the calyx, globose, 4-celled. Capsule globose, 4 -celled, the valves minutely and densely striate transversely. [Latin, wheel, from the whorled leaves of some species.] About 30 species, of wide distribution.
I. Rotala ramòsior (L.) Koehne. Rotala. (I. F. f. 2543.) Glabrous, $5-25 \mathrm{~cm}$. high. Leaves oblong or linear-oblong, $\mathrm{I}-3 \mathrm{~cm}$. long, blunt at the apex, narrowed and sessile at the base or tapering into a short petiole, not auricled; flowers solitary or rarely 3 in the axils, very small; petals minute; style almost none. In swamps, Mass. to Fla., Ill., Neb., Tex. and Mex. Also in Cal., Ore., S. Am. and the W. Indies. July-Sept.

## 4. DÉCODON J. F. Gmel.

Herbaceous shrubs, with verticillate or opposite, short-petioled entire leaves, and showy purple trimorphous flowers, in nearly sessile axillary cymes. Calyx broadly campanulate, or hemispheric, nerved, 5-7-toothed, with as many slender elongated accessory teeth in the sinuses. Stamens io, rarely 8, alternately longer and shorter, inserted on the calyx-tube, the longer exserted. Style filiform; stigma small. Capsule globose, 3 - 5 -celled, included in the calyx, loculicidally dehiscent. [Greek, ten-toothed, referring to the calyx.] A monotypic genus of eastern N. Am.
I. Decodon verticillàtus (L.) Ell. Swamp Loosestrife or Willowherb. (I. F. f. 2544.) Aquatic, somewhat woody, with angular recurved glabrous or slightly pubescent stems, 1-3 m . long, which root from the tip when they reach the water or mud. Leaves lanceolate, $5-13 \mathrm{~cm}$. long, glabrous above, somewhat pubescent beneath, acute at both ends; petioles $4-8 \mathrm{~mm}$. long; flowers nearly 2.5 cm . broad; petals cuneate at the base; capsule about 5 mm . in diameter. In swamps, Me. to Fla., Ont., Minn., Ky. and La. Stems clothed with ærenchyma at the base. July-Sept.

## 5. LỲTHRUM L.

Herbs or shrubs, with 4 -angled stems, entire leaves, and often dimorphous or trimorphous flowers. Calyx-tube $8-\mathbf{1 2}$-ribbed, straight, with 4-6 primary teeth and an equal number of accessory ones in the sinuses. Petals $4-6$, usually obovate, rarely wanting. Stamens $8-\mathbf{1 2}$, inserted on the calyx-tube. Ovary oblong. sessile, 2-celled; style filiform; stigma mostly capitate; ovules numerous. Capsules enclosed by the calyx, membranous, 2 -celled, 2 -valved, or bursting irregularly. [Greek, gore, from the purple flowers.] About 23 species, of wide distribution. Besides the following, about 4 others occur in the southern and western U.S.
Flowers axillary, solitary; stamens not more numerous than petals.
Leaves mostly alternate.
Leaves obtuse; stamens all included; annual.
Leaves acute; stamens of short-styled flowers exserted; perennial.
Leaves mostly opposite.
Leaves narrowly linear, narrowed at the base. 3. L. lineare.
Leaves ovate or oval, rounded or cordate at the base. 4. L. V'uneriaria.
Flowers in panicled spikes, terminal; stamens twice as many as petals.
5. L. Salicaria.

1. Lythrum Hyssopifòlia L. Hyssor Looskstrife. Grass Poly. (I. F. f. 2545.) Glabrous, pale green, $1.5-6 \mathrm{dm}$. high. Leaves sessile. mainly alter-
nate, the lowest sometimes opposite, oblong or linear-oblong, 8-20 mm. long; flowers not dimorphous, pink-purple, about I mm. broad; stamens included; calyx 5-6 mm. long in fruit. Borders of salt marshes, Me. to N. J. Also in Cal. and S. Am. Nat. from Europe. June-Sept.
2. Lythrum alàtum Pursh. Wing-angled Loosestrife. (I. F. f. 2546.) Perennial, glabrous, dark green, 3-12 dm. high, the stem angled and often slightly winged. Leaves sessile, alternate or the lowest opposite, lanceolate or oblong, rounded or cordate at the base, $\mathrm{I}-3 \mathrm{~cm}$. long; flowers short-pedicelled, deep purple, 6-10 mm . broad, dimorphous; ovary nearly sessile; calyx $5-6 \mathrm{~mm}$. long in truit. In low grounds, southern Ont. to Mass., Ky., S. Dak. and Kans. June-Aug.
3. Lythrum lirreàre L. Linear-leaved Loosestrife. (I. F. f. 2547.) Perennial, glabrous, rather pale green, $6-12 \mathrm{dm}$. high. Leaves sessile, $\mathbf{1 - 2 . 5} \mathrm{cm}$. long, $2-4 \mathrm{~mm}$. wide, nearly all opposite; flowers light purple or nearly white, dimorphous, about 3 mm . broad; stamens of the short-styled flowers exserted; ovary short-stalked; fruiting calyx 3-4 mm. long. Borders of salt marshes, N. J. to Fla. and Tex. July-Sept.
4. Lythrum Vulnerària Ait. Kennedy's Loosestrife. (I. F. f. 2548.) Spreading or ascending, perennial, glabrous, 3-12 dm long. Leaves short-petioled, or sessile, $8-18 \mathrm{~mm}$. long, $4-8 \mathrm{~mm}$. wide, rounded or cordate at the base, mostly obtuse; flowers usually short-peduncled, purple, about 8 mm . broad; stamens of the short-styled flowers exserted; fruiting calyx $8-10 \mathrm{~mm}$. long. St. Louis, Mo. (according to Koehne); Fla. to Mex. May-Aug.
5. Lythrum Salicària L. Spiked or Purple Loosestrife. (I. F. f. 2549.) Perennial, o.5-I m. high. Leaves opposite or sometimes verticillate in 3's, sessile, lanceolate, cordate or clasping at the base, $5-8 \mathrm{~cm}$. long; flowers purple, trimorphous, $\mathbf{1 2 - 1 6 ~ m m}$. broad, in terminal spikes; stamens $8-10$, alternately longer and shorter, even the longer ones little exserted; ovary short-stalked; fruiting calyx about 6 mm . long. In swamps and wet meadows, Cape Breton Island to Ont. and Del. Said to be naturalized from Europe. June-Aug.

## 6. PARSONSIA P. Br.

Herbs (or shrubs in tropical regions), with opposite or verticillate leaves. Flowers axillary, irregular and unsymmetrical. Calyx-tube elongated, I2-ribbed, gibbous or spurred at the base, oblique at the mouth, with 6 primary teeth and usually as many accessory ones. Petals 6, unequal. Stamens II (sometimes 12 in our species), inserted on the throat of the calyx, unequal; filaments short. Ovary with a curved gland at its base, unequally 2 -celled; style slender; stigma 2 -lobed. Capsule oblong, I-celled, laterally dehiscent. Seeds flattened. [In honor of James Parsons, M. D., a Scotch botanist.] About 180 species, natives of America. Besides the following 2 others occur in the Southern States.
I. Parsonsia petiolàta (L.) Rusby. Blue Wax-weed. Clammy Cuphea. TAR-WEED. (I. F. f. 2550.) Annual, very viscid-pubescent, I.5-5 dm. high. Leaves slender-petioled, ovate-lanceolate, scabrous, mostly rounded at the base and blunt-pointed at the apex, $2-4 \mathrm{~cm}$. long; flowers short-peduncled, purple, $6-8 \mathrm{~mm}$. broad; petals ovate, clawed; stamens sometimes 12; fruiting calyx swollen, about 8 mm . long; capsule dehiscent before the seeds are ripe, the placenta projecting through the lateral orifice. In dry soil, R. I. to Ill., Kans., Ga. and La. Introduced into S. Ont. July-Oct.

## Family 2. MELASTOMÀCEAE R. Br.

## Meadow-Beauty Family.

Herbs (many shrubs or trees in tropical regions), with opposite 3-9nerved leaves, and regular perfect often showy but rarely odorous flowers. Stipules none. Calyx-tube usually 4-5-lobed, the lobes imbricated. Petals as many as the lobes of the calyx, and inserted on its throat, imbricated. Stamens twice as many, or equal in number to the petals, often inclined or declined, the alternate ones sometimes shorter. Ovary 2-several-celled (often 4 -celled) ; style terminal, simple; ovules $\infty$, ana-
tropous. Capsule included in the calyx-tube, irregularly or loculicidally dehiscent. Seeds mainly small, with no endosperm. About I 50 genera and 2500 species, widely distributed in tropical regions, most abundant in S. Am. ; represented in N. Am. only by the following genus.

## 1. RHEXXIA L.

Perennial herbs, often somewhat woody at the base, sometimes tuber-bearing, with mostly sessile opposite 3 - 5 -nerved leaves, and terminal showy cymose or rarely solitary flowers. Calyx-tube urn-shaped or campanulate, constricted at the neck, its limb 4 -lobed, the lobes shorter than the tube. Petals 4 , obovate, oblique. Stamens 8, equal; anthers incurved or inverted in the bud. Ovary free from the calyx, glabrous, 4 -celled; style slender; stigma truncate. Capsule 4 -celled, 4 -valved. Placentæ 4, central. Seeds numerous, coiled or bent, rough. [Greek, breaking, applied originally to a different plant.] Ten known species, of eastern N. Am.
Stem cylindric, very pubescent. I. R. Mariana.

Stem square or angled, pubescent or glabrous.
Stem more or less pubescent; leaves ovate. 2. R. Virginica.
Stem glabrous.
Leaves oblong or lance-oblong; calyx with a few hairs above. 3. $R$. aristosa. Leaves ovate, bristly-ciliate; calyx glabrous.
4. R. ciliosa.
I. Rhexia Mariàna L. Maryland Meadow-Beauty. (I. F. f. 255 I.) Stem rather slender, 3-6 dm. high. Leaves spreading, short-petioled, oblong, or linear-oblong, narrowed at the base, $2-4 \mathrm{~cm}$. long, pubescent with scattered bristly hairs, 3 -nerved, the margins ciliate-serrulate; flowers loosely cymose, pedicelled, pale purple, about 2.5 cm . broad; pedicels and calyx-tube glandular-pubescent; petals rounded or short-aristate. In swamps, pine-barrens of L. I. to Fla., Ky., Mo. and Tex. June-Sept.
2. Rhexia Virgínica L. Meadow-Beauty. Deer-Grass. (I. F. f. 2552.) Stem more or less pubescent, 3-5 dm. high. Leaves mostly sessile, ovate or ovate-oval, acute or acutish, $2-5 \mathrm{~cm}$. long, usually with a few scattered hairs on both surfaces, mostly 5 -nerved, the margins ciliate-serrulate; flowers bright purple, cymose, short-pedicelled, $2.5-4 \mathrm{~cm}$. broad; calyx-tube and pedicels glandularpubescent; petals rounded or slightly retuse. In sandy swamps, Me. to Fla., Ill., Mo. and La. July-Sept.
3. Rhexia aristòsa Britton. Awn-petaled Meadow-beauty. (I. F. f. 2553.) Stem square, 4-6 dm. high. Leaves sessile, erect, obtusish at each end, I. 5-3 cm . long, $3-6 \mathrm{~mm}$. wide, 3 -nerved, serrate toward the apex with appressed subulate teeth, glabrous or nearly so beneath, but with a few scattered hairs above; flowers I-4 together, short-pedicelled, magenta-red, $2.5-4 \mathrm{~cm}$. broad; petals rounded, but obtusely pointed and aristate at the apex; anthers linear, minutely spurred on the back. In sandy swamps, pine-barrens of N. J., Del. and S. Car. Base of the stem coated with a spongy tissue when growing in water. July-Aug.
4. Rhexia ciliòsa Michx. Ciliate Meadow-beauty. (I. F. f. 2554.) Stem square, 3-6 dm. high. Leaves ascending, short-petioled, or sessile, acutish, r-2 cm . long, $8-12 \mathrm{~mm}$. wide, 3 -nerved, glabrous or nearly so beneath, pubescent with a few scattered hairs above; flowers very short-pedicelled, violet-purple, $2 \cdot 5^{-4} \mathrm{~cm}$. broad; petals rounded, sometimes apiculate; anthers oblong, not spurred on the back. In swamps, Md. to Fla., west to La. June-Aug.

## Family 3. ONAGRÀCEAE Dumort.*

## Evening-primrose Family.

Herbs, or rarely shrubs, with alternate or opposite leaves, no stipules or mere glands in their places, and generally perfect flowers. Calyx-tube adnate to the ovary, the limb 2-6-lobed (usually 4 -lobed). Petals $2-9$ (usually 4), convolute in the bud, rarely none. Stamens usually as many or twice as many as the petals. Ovary 1 -6-celled (usually + -celled);

[^37]styles united ; stigma capitate, discoid or 4 -lobed ; ovules generally anatropous. Fruit a capsule or small nut. Endosperm very little or none. Forty genera and about 350 species of wide geographic distribution, most abundant in America.
Floral whorls of 4 parts or more.
Fruit a many-seeded capsule, opening by valves or by a pore.
Calyx-tube not prolonged beyond the ovary.
Seeds naked.
Stamens 4, in I row.
Leaves opposite ; stems creeping or floating.
Flowers sessile; petals none, or very small; leaves petioled; capsules sessile, short, the top flat. 1. Isnardia.
Flowers long-stalked; petals conspicuous; leaves sessile; capsules elongated, curved, with a prominent 4 -lobed stylopodium.
2. Ludwigiantha.

Leaves alternate; stems erect or ascending. Stamens 8-12, in 2 rows.
3. Ludwigia.

Seeds furnished with a tuft of silky hairs.
4. Jussiaea.
5. Chamaenerion. Calyx-tube prolonged beyond the ovary.

Seeds furnished with a tuft of silky hairs.
6. Epilobium.

Seeds naked or sometimes tuberculate.
Stamens equal in length.
Stigma deeply 4 -cleft, its segments linear.
Ovules and seeds horizontal, inserted in 2 or rarely more rows, prismatic-angled.
7. Onagra.

Ovules and seeds ascending, not angled.
Buds erect ; petals yellow; ovules and seeds in 2 rows.
8. Oenothera.

Buds drooping ; petals white or pink ; ovules and seeds in I row.
9. Anogra.

Stigmas entire or slightly 4-toothed.
Calyx-tube longer than the ovary; stigma disk-like, entire.
16. Galpinsia.

Calyx-tube shorter than the ovary; stigma disk-like, slightly 4-toothed.
17. Meriolix.

Stamens unequal in length, the alternate ones longer.
Ovules and seeds many, clustered, on slender funiculi; capsules usually club-shaped.

Flowers yellow. 10. Kneiffia.
Flowers white, pink or reddish.
11. Hartmannia.

Ovules or seeds few, sessile, in I or 2 rows.
Plants normally acaulescent.
Capsules obtusely or retusely 4 -angled; seeds furrowed along the raphe. 12. Pachylophus.
Capsules sharply 4 -angled or winged; seeds with a tubercle at one end.
13. Lavauxia.

Plants caulescent.
Stems wiry, diffuse; capsules sharply 4 -angled.
14. Gaurella.

Stems stout, not diffuse; capsules 4-winged.
15. Megapterium.

Fruit indehiscent, nut-like.
Calyx-tube obconic; filaments with scales at the base ; ovary 4 -celled.
18. Gaura.

Calyx-tube filiform; filaments unappendaged ; ovary i-celled.
19. Stenosiphon.

Floral whorls of 2 parts.
20. Circaea.

## I. ISNARDIA L.

Succulent herbs. Stems creeping or floating; leaves opposite, relatively few, petioled. Flowers axillary, sessile, not yellow. Calyx-segments 4 , shorter than the tube or slightly longer. Filaments very short. Ovary very short; styles often almost wanting. Capsule obovoid or turbinate, straight. [In honor of Antoine Dante Isnard, a French botanist, and a member of the Academy of Sciences, died 1724.] About 4 species in N. Am. and Mex.
I. Isnardia palústris L. Marsh Purslane. (I. F. f. 2555.) Stems branching, I-5 dm. long; leaves oval, ovate or spatulate, $12-25 \mathrm{~mm}$. long, nar-
rowed into slender petioles; flowers solitary, about 2 mm . broad; bractlets at base of the calyx usually none; calyx-lobes triangular, acute; petals small, reddish, or often wanting; capsule 4 -sided, slightly longer than wide, about 3 mm . high. slightly exceeding the calyx lobes. In muddy ditches and swamps, N. S. to Manitoba, Ore., Fla., Cal. and Mex. Widely distributed in the Old World. June-Nov.

## 2. LUDWIGIÁNTHA Small.

Fleshy herbs. Stems prostrate, creeping; leaves opposite, sessile, numerous. Flowers yellow, on slender bracted peduncles. Calyx-segments narrow, longer than the tube. Petals conspicuous, surpassing the calyx-segments. Filaments elongated. Ovary relatively long; united styles filiform, elongated. Capsule clubshaped, curved at the base, about as long as the persistent calyx-segments. [Derivation as in the following genus.] A monotypic genus.
I. Ludwigiantha arcuàta (Walt.) Small. Curved-poded Ludwigiantha. (I. F. f. 2556.) Stems glabrous or nearly so, $8-30 \mathrm{~cm}$. long. Leaves oblanceolate, leathery, smooth, obtusish at the apex, narrowed at the base, $12-25 \mathrm{~mm}$. long; flowers axillary, solitary, bright yellow, $8-12 \mathrm{~mm}$. broad; calyx-lobes linearlanceolate, acuminate, shorter than the obovate petals; capsule club-shaped, somewhat curved, glabrous, 8 -10 mm. long. In swamps, Va. to Fla. May-July.

## 3. LUDWÍGIA L.

Perennial or annual herbs, with alternate usually entire leaves, and axillary or terminal flowers. Stems erect or ascending, sometimes angled, or winged. Calyxlobes generally persistent. Petals usually 4. Stamens usually 4. Ovary 4-5 celled. Capsule terete, ribbed or winged, septicidally dehiscent, or opening by an apical pore. [Named in honor of C. G. Ludwig, 1709-1773, Professor of Botany at Leipsic.] About 25 species, natives of warm and temperate regions, most abundant in N. Am. Besides the following about 10 others occur in the southern and southwestern States.

Flowers inconspicuous; petals none, or small, yellowish or greenish ; valves of the capsule separating from the terminal disk.
Capsules subglobose or top-shaped.
Bractlets at the base of the calyx minute, or none; capsule subglobose, finely pubescent.
I. L. sphaerocarpa

Bractlets at the base of the calyx linear, about equalling the capsule; capsule topshaped, glabrous.
2. L. polycarpa.

Capsules cylindric or obpyramidal.
Capsules cylindric.
3. L. glandulosa.

Capsules obpyramidal.
Capsules as long as broad, or broader, the angles winged.
4. L. alata.

Capsules several times longer than broad, the angles obtuse.
5. L. linearis.

Flowers showy, peduncled; petals large, bright yellow; capsules opening by an apical pore.
Plants hirsute; capsules bristly pubescent.
6. L. hirtella. Plants glabrous or nearly so; capsules glabrous.
7. L. alternifolia.

1. Ludwigia sphaerocàrpa Ell. Globe-fruited Ludwigia. (I. F. f. 2557.) Stem generally finely pubescent, 6-9 dm. high, the lower part clothed with ærenchyma when growing in water. Leaves sessile, those of the stem and branches lanceolate, acute at both ends, $5-10 \mathrm{~cm}$. long, scabrous and minutely denticulate, those of the stolons obovate; flowers sessile, greenish, about 3 mm . broad; calyx-lobes triangular-ovate, acute; petals commonly none; capsule about 4 mm . high, scarcely longer than the calyx-lobes. In swamps, eastern Mass. and southern N. Y. to Fla., west to La. July-Sept.
2. Ludwigia polycàrpa Short \& Peter. Many-fruiten Ludwigia. (I. F. f. 2558.) Stems glabrous, 3-9 dm. high. Leaves sessile, narrowly lanceolate, acute at each end, $5-10 \mathrm{~cm}$ long, rough-margined, those of the stolons spatulate; flowers sessile, about 3 mm . broad, greenish; calyx-lobes triangular-lanceolate. acute, sometimes serrulate; petals minute, greenish; capsulc glabrous, slightl- + sided, about 5 mm . high, often twice the length of the callux-lohes. In swamps, Ont. to Minn. and Mass., south to Ky., Neb. and Kans. July-Oct.
3. Ludwigia glandulòsa Walt. Cylindric-fruited Ludwigia. (I. F. f. 2559.) Stems glabrous, much branched, 3-9 dm. high. Leaves sessile or narrowed into short petioles, oblong-lanceolate, acute at each end, $5-10 \mathrm{~mm}$. long; flowers axillary, rarely 2 together, greenish, about 2 mm . broad; bractlets at base of calyx minute or none; calyx-lobes triangular-ovate, acute; petals none; capsule 4-grooved, $6-8 \mathrm{~mm}$. long, glabrous, $4-5$ times as long as the calyx-lobes. In swamps, southern Ill. and Mo. to Kans., Tex., east to Fla. and S. Car. July-Sept.
4. Ludwigia alàta Ell. Wing-stemmed Ludwigia. (I. F. f. 2560.) Stems 3-9 dm. tall, winged, often stoloniferous; leaves linear-oblanceolate to linearlanceolate, or sometimes nearly linear, $2.5-10 \mathrm{~cm}$. long, those of the stolons suborbicular or spatulate; flowers inconspicuous, about 4 mm . broad, white or greenish; calyx glabrous, its segments triangular-ovate, acute or acuminate; petals none; capsules $3-4 \mathrm{~mm}$. high, winged; seeds about 0.5 mm . long, faintly pitted, In marshes, N. Car. to Mo., Fla. and La. June-Sept.
5. Ludwigia lineàris Walt. Linear-Leaved Ludwigia. (I. F. f. 2561.) Stems branching, glabrous, 3-7.5 dm. high, often stoloniferous, lower part clothed with ærenchyma. Leaves narrowly linear, sessile, acute at each end, $2.5-5 \mathrm{~cm}$. long, about 2 mm . wide, the margins roughish, or those of the stolons obovate; flowers sessile, about 4 mm . broad; calyx-lobes triangular-ovate, acute, slightly shorter than the yellowish petals; capsule narrowed at the base, $6-8 \mathrm{~mm}$. long, 3-5 times as long as the calyx-lobes. In swamps, southern N. Y. to Fla., west to La. July-Sept.
6. Ludwigia hirtélla Raf. Hairy Ludwigia. (I. F. f. 2562.) Stems branching, 3-6 dm. high. Leaves oblong-lanceolate or ovate-lanceolate, sessile, obtuse at the apex, rounded at the base, $2.5-3 \mathrm{~cm}$. long; flowers solitary, peduncled, 12-20 mm. broad; calyx-lobes ovate-lanceolate, acute, somewhat shorter than the yellow petals; capsules cubic with a rounded base, about 5 mm . high, shorter than the calyx-lobes, opening by an apical pore. In swamps, pine barrens of N. J. to Fla., west to Tex. June-Sept.
7. Ludwigia alternifòlia L. Seed-box. Rattle-box. (I. F. f. 2563.) Stems branching, 6-12 dm. high. Leaves short-petioled, lanceolate, acute or acuminate at the apex, $5-12 \mathrm{~cm}$. long; flowers short-peduncled, solitary, $12-16 \mathrm{~mm}$. broad; calyx-lobes ovate, acuminate, about equalling the yellow petals which fall away when the plant is shocked; capsules cubic with a rounded base, slightly wing-angled, about 5 mm . high, opening by a pore. In swamps, N. H. to northern N. Y., Ont.(?), Mich., Fla., Kans. and Tex. Roots often tuberous. June-Sept.

Ludwigia alternifolia linearifolia Britton. Leaves linear, elongated; calyx-lobes linear-lanceolate; petals more persistent. W. Va.

## 4. JUSSIAEA L.

Perennial herbs, with alternate, usually entire leaves, and white or yellow, axillary flowers. Calyx-lobes acute, persistent. Petals 4-6 (rarely more). Stamens $8-12$, in 2 rows. Ovary 4-6-celled. Capsule linear, oblong or club-shaped, angular or ribbed, septicidally dehiscent. [In honor of Bernard de Jussieu, 16991777, founder of the Natural System of Botany.] About 35 species, of warm and temperate regions. Besides the following 7 others occur in the Southern States.

Creeping or floating; petals 5 ; capsule cylindric.
Erect; petals 4; capsule club-shaped, 4 -sided.

1. J. diffusa.
2. J. decurrens.
r. Jussiaea diffùsa Forskl. Floating or Creeping Jussiaea or Prim-ROSE-WILLOW. (I. F. f. 2564.) Stem 3-9 dm. long. Leaves oval, oval-lanceolate or obovate, slender-petioled, veiny, obtuse or acute at the apex, $2.5-10 \mathrm{~cm}$. long; peduncles slender; flowers yellow, $12-25 \mathrm{~mm}$. broad; calyx-lobes 5 , lanceolate; stamens 10 ; capsule ridged, $2.5-4 \mathrm{~cm}$. long; seeds in 1 row in each cavity. In ponds, Ky. and Ill. to Kans., Fla. and Tex. Also in trop. Am. and Asia. JuneAug.
3. Jussiaea decúrrens (Walt.) DC. Upright Primrose-willow. (I. F. f. 2565.) Stem angled, branching, 3-6 dm. high. Leaves lanceolate, acute or acuminate at the apex, decurrent on the stem, $2.5-10 \mathrm{~cm}$. long; flowers short-peduncled, yellow, 8-12 mm. broad; calyx-lobes 4, ovate-lanceolate; stamens 8; cap-
sule 2-3 times as long as the peduncle, 4 -sided, the angles somewhat winged; seeds in several rows in each cavity. In swamps, Md. to Ga., Fla., Ill., Ark. and Tex. July-Sept.

## 5. CHAMAENERION Adans.

Perennial herbs, with tufted stems, often woody at the base. Leaves mostly alternate, entire; flowers irregular, showy, in terminal racemes; calyx-tube not prolonged beyond the ovary; calyx-segments 4 , deciduous; petals 4 , entire; stamens 8 , declined; filaments dilated at the base; stigmas 4 -cleft. Capsule obtusely 4 -angled, elongated, opening loculicidally. Seeds with a tuft of hairs (coma) at the end. [Greek, ground rose-bay.] About 4 species, chiefly in the north temperate zone.
Bracts small; lateral nerves of the leaves confluent in marginal loops; style pubescent at the base.

1. C. angustifolium.

Bracts leaf-like; lateral nerves of the leaves obsolete; style glabrous. 2. C. latifolium.

1. Chamaenerion angustifòlium (L.) Scop. Great or Spiked Willowherb. Fire-weed. (I. F. f. 2566.) Erect, often finely pubescent above, $0.5-2.5 \mathrm{~m}$. high. Leaves lanceolate, $5-15 \mathrm{~cm}$. long, pale beneath, acute at the apex; flowers $1.5-3 \mathrm{~cm}$. broad, purple, or sometimes white, in elongated terminal spike-like racemes; capsules $5-7.5 \mathrm{~cm}$. long, finely canescent, at least when young; seeds about I mm. long, the coma long, whitish. In dry soil, Lab. to Alaska, N. Car., Kans., Ariz. and Cal. Also in Europe and Asia. June-Sept.
2. Chamaenerion latifòlium (L.) Sweet. Broad-leaved Willow-herb. (I. F. f. 2567.) Erect, often quite canescent above, 1.5-5 dm. high. Leaves $2.5-5 \mathrm{~cm}$. long, lanceolate or ovate-lanceolate, acutish at both ends, thick, those of the branches opposite, the veins inconspicuous; flowers purple, $2.5-5 \mathrm{~cm}$. broad, in mainly short leafy-bracted racemes; capsules $\mathrm{I}-3 \mathrm{~cm}$. long, canescent; seeds about 2 mm . long; coma elongated, whitish. Moist ground, Newf. to Alaska, Quebec, Colo. and Ore. Also in Europe and Asia. June-Aug.

## 6. EPILÒBIUM L.

Herbs, or sometimes shrubby plants, with alternate or opposite leaves, and solirary, spicate or racemose flowers. Calyx-tube prolonged beyond the ovary, the limb 4-parted, deciduous. Petals 4, often notched. Stamens 8: stigma clubshaped or 4 -lobed. Capsule narrow, elongated, 4 -sided, loculicidally dehiscent by 4 valves. Seeds with a tuft of hairs (coma) at the summit. [Greek, upon a pod, flower and pod appearing together.] About 65 species, of wide geographic distribution, most abundant in temperate regions. Besides the following, about 30 others occur in the western and northwestern parts of N. Am.

Stigma deeply 4-lobed; flowers large.
Stigma entire, or merely notched.
Seeds smooth or nearly so; arctic or alpine species.
Flowers white; leaves usually denticulate.
Flowers violet; leaves mostly entire.
Seeds papillose.
Leaves linear or lanceolate, entire or nearly so.
Plants crisp-pubescent or canescent.
Leaves sessile, mostly obtuse. 4. E. palustre.
Leaves petioled, very narrow, acute.
Plants glandular-pubescent throughout, or only above.
Densely glandular throughout ; leaves sessile. 6. F. strithom.
Glandular-pubescent above; leaves petioled. 7. E. faniculatum.
Leaves lanceolate or ovate, serrate.
Leaves lanceolate, acute or acuminate.
Seeds obconic, beakless; coma reddish
Seeds ellipsoid, short-beaked; coma white.
Leaves ovate, thin, obtuse.

1. E. hirsutum.
2. E. alpinum.
3. E. anagallidifolium.
4. E. lineare.
5. E. coloratum.
6. $\because \therefore$ adinw itwher.
xo. $E$. Hornemanni.
 Stout, 5-12 dm. high. softly hirsute-pubescent. Leaves lanceolate or whong-lanceolate, usually opposite, often clasping at the base, acute at the apex, sharply ser-
rulate, $2.5-7.5 \mathrm{~cm}$. long; flowers erect, rose-purple, about 2.5 cm . broad; petals pubescent at the base within; capsule stalked, $5-7.5 \mathrm{~cm}$. long. about 2 mm . thick; seeds about I mm. long; coma whitish. In waste places, eastern N. Eng., N. Y., Ont. and in ballast about the seaports. Adventive from Europe. June-Sept.
7. Epilobium alpinum L. Alpine Willow-herb. (I. F. f. 2569.) Slender, glabrous or nearly so, $8-30 \mathrm{~cm}$. high. Leaves pale, petioled, opposite, or the upper alternate, obtuse or obtusish at the apex, $\mathbf{1 2 - 2 0} \mathrm{mm}$. long; flowers few, nearly erect, $4-8 \mathrm{~mm}$. broad; stigma nearly entire; capsules slender-stalked, $2.5-5 \mathrm{~cm}$. long, about I mm. thick; seeds beaked. Lab. to Br. Col., N. H., Utah and Ore. Also in Europe. Summer.
8. Epilobium anagallidifolium Lam. Pimpernel Willow-herb. (I. F.f. 2570.) Low, usually tufted, $5-\mathrm{I} 5 \mathrm{~cm}$. high, resembling the next preceding species. Stems commonly pubescent in lines and nodding at the apex; leaves oblong or narrowly ovate, obtuse at the apex, short-petioled, $10-20 \mathrm{~mm}$. long; flowers few, clustered, nodding, about 5 mm . broad; stigma entire; capsule slenderpedicelled, about 2.5 cm . long, I mm. wide; seeds smooth, short-beaked, about I mm. long. Lab. and through arctic Am. to Alaska, south in the Rocky Mts. to Nev. Also in Europe and Asia. Summer.
9. Epilobium palústre L. Marsh or Swamp Willow-herb. (I. F. f. 2571.) Erect, usually simple, 1.5-4 dm. high, canescent above with incurved hairs. Leaves mostly opposite, lanceolate-oblong, obtuse or subtruncate at the apex, $2.5-5 \mathrm{~cm}$. long, erect or ascending, distinctly veined; flowers few, pink or whitish, usually nodding at first, $4-6 \mathrm{~mm}$. broad; fruiting pedicels slender; capsules $2.5-5 \mathrm{~cm}$. long, slightly more than 1 mm . thick; seeds about 1 mm . long, a little papillose translucent, the apex scarcely narrowed. In bogs, N. B. to Alaska, the White Mts., Ont., Colo. and Wash. Also in Europe and Asia. Summer.
10. Epilobium lineàre Muhl. Linear-Leaved Willow-herb. (I. F. f. 2572.) Slender, canescent throughout with incurved hairs, 3-6 dm. high. at length much branched. Leaves linear or linear-lanceolate, mostly short-petioled, opposite or alternate, acute at both ends, $2.5-5 \mathrm{~cm}$. long, the veins obscure; flowers erect, pink or whitish, $4-8 \mathrm{~mm}$. broad; stigma entire or slightly notched; pedicels mostly slender; capsules about 5 cm . long; seeds less than 2 mm . long, slightly papillose. In swamps, N. B. to Del., W. Va., Br. Col., the Ind. Terr. and Wyo. July-Sept. Sometimes produces bulblets near the base of the stem.
11. Epilobium stríctum Muhl. Downy or Soft Willow-herb. (I. F. f. 2573.) Erect, usually much branched, 3-9 dm. high, glandular-pubescent with whitish somewhat spreading hairs. Leaves broader than those of the next preceding species, lanceolate, obtuse or obtusish, $\mathbf{1} .8-4 \mathrm{~cm}$. long, mostly entire, evidently veined; flowers pink or whitish, about $4-5 \mathrm{~mm}$. broad; capsules nearly 2 mm . thick, short-pedicelled; seeds obconic, papillose. Bogs, Me. to W. Ont. and Minn., south to Va. and Ill. July-Sept.
12. Epilobium paniculàtum Nutt. Panicled Willow-herb. (I. F. f. 2574.) Annual, slender, 3-6 dm. tall, loosely branched, glandular-pubescent above. Leaves alternate, varying from linear to linear-lanceolate, $2.5-7.5 \mathrm{~cm}$. long, denticulate or nearly entire, attenuate into slender winged petioles; calyx often purple, its tube funnelform, $2-3 \mathrm{~mm}$. long, shorter than the lanceolate segments; petals cuneate, notched, $6-8 \mathrm{~mm}$. long, violet; capsules ascending, linear-fusiform, $2-3 \mathrm{~cm}$. long, curved; seeds obovoid, 2 mm . long, black, slightly papillose. Lake Huron to Br. Col., Colo., Ariz. and Cal. Summer.
13. Epilobilm coloràtum Muhl. Purple-Leaved Willow-herb. (I. F. f. 2575.) Erect, much branched, 3-9 dm. high, more or less canescent above with incurved hairs often arranged in lines. Stem and leaves often purplish; leaves generally slender petioled but sometimes sessile, lanceolate, acute or acuminate at the apex, sharply serrulate or denticulate, $5-15 \mathrm{~cm}$. long; flowers numerous, pink or white, 4-6 mm . broad, generally nodding; capsules short-pedicelled, finely pubescent, $2.5-5 \mathrm{~cm}$. long, about 2 mm . thick; seeds papillose, less than 2 mm . long. In low grounds, Me. to Ont., Wis., S. Dak., S. Car. and Kans. July-Sept.
14. Epilobium adenocaùlon Haussk. Northern Willow-herb. (I. F. f. 2570.) Closely resembling the next preceding species, but the inflorescence and capsules glandular pubescent. Leaves lanceolate or ovate-lanceolate, obtusish or sometimes acute, sparingly serrulate or denticulate, seldom over 6.5 cm . long;
flowers usually nodding at first; seeds abruptly short-beaked, about Imm . long, papillose. In moist grounds, N. B. to Ore., south to Mass., Penn., Iowa, Utah and Cal. July-Sept.
15. Epilobium Hornemánni Reichenb. Hornemann's Willow-herb. (I. F. f. 2577.) Erect, r.5-3 dm. high, simple or nearly so, slightly pubescent above. Leaves short-petioled, ovate or elliptic, mostly broadly obtuse at the apex, rather remotely denticulate, $1.2-3 \mathrm{~cm}$. long; flowers few, purple or violet, $6-7 \mathrm{~mm}$. broad; stigma entire; capsules $2.5-6 \mathrm{~cm}$. long, nearly glabrous, slender-pedicelled; seeds about 1 mm . long, papillose, nearly beakless. Moist places, White Mts. to Lab., west to Wis. and Br. Col., south in the Rocky Mts. to Colo., and to Cal. Also in Europe. Summer.

## 7. ÓNAGRA Adans.

Annual or biennial herbs, with mostly erect stems. Leaves alternate, undulate or toothed; buds erect. Flowers yellow, nocturnal, in terminal spikes. Calyxtube elongated. Ovary 4 -celled; ovules in 2 or more rows, horizontal. Capsule 4 -angled, more or less tapering, opening loculicidally. Seeds prismatic-angled. [Greek, the wild ass, said to refer to the similarity of its leaves to the ears of that animal.] About 12 species, chiefly North American.
Flowers relatively small; petals narrow, $2-4 \mathrm{~mm}$. wide. I. O. cruciata.
Flowers relatively large; petals broad, $12-50 \mathrm{~mm}$. wide.
Capsules $2-3 \mathrm{~cm}$. long or shorter, abruptly narrowed at the apex; pubescence not velvety.
Stems slightly hispid; capsules glabrous or sparingly pubescent.
2. O. biennis.

Stems very strigose; capsules copiously pubescent. 3. O. strigosa.
Capsules 3 cm . long or longer, gradually narrowed to the apex; pubescence velvety.
4. O. Oakesiana.

1. Onagra cruciàta (Nutt.) Small. Small-flowered Evening-primrose. (I. F. f. 2578.) Glabrous or sparingly villous. Stem erect, 6-12 dm. tall, usually simple; leaves narrowly oblong or oblanceolate (the upper ones often lanceolate), 4-10 cm. long, acute, serrate-denticulate, the lower ones slender-petioled, the uppermost nearly sessile; spikes $\mathbf{I}-3 \mathrm{dm}$. long, leafy-bracted; calyx-tube slender, $8-25$ mm . long, sparingly villous; petals linear, $\mathbf{1 0} \mathbf{- 1 2} \mathrm{mm}$. long, acutish; capsules $2.5-2.8 \mathrm{~cm}$. long, gradually narrowed from the base. Me. to N. Y. and Mass. Aug.-Oct.
2. Onagra biénnis (L.) Scop. Common Evening-primrose. Night Wil-Low-herb. (I. F. f. 2579.) Erect, generally stout, 3-25 dm. high, more or less hirsute pubescent. Leaves lanceolate, acute or acuminate, sessile or the lower petioled, repand-denticulate, $2.5-15 \mathrm{~cm}$. long; flowers spicate, leafy bracted, bright yellow, $2.5-5 \mathrm{~cm}$. broad; calyx-tube slender, much longer than the ovary; capsules oblong, narrowed above, erect, pubescent, $18-25 \mathrm{~mm}$. long, nearly terete; seeds nearly 2 mm . long. Usually in dry soil, Lab. to Fla., west to the Mississippi Valley. Nat. in the Old World. June-Oct.

Onagra biénnis grandiflòra (Ait.) Lindl. Stouter. Leaves larger, thicker and broader; flowers $5-10 \mathrm{~cm}$. broad. Range nearly that of the species; common southward.
3. Onagra strigòsa Rydb. Strigose Evening-primrose. Strigose and somewhat villous above with grayish hairs, $4-10 \mathrm{~cm}$. high. Leaves various, the basal obovate or spatulate, obtuse; stem-leaves oblanceolate to lanceolate, $5-10 \mathrm{~cm}$. long or the upper shorter, acute, undulate; spike leafy-bracted, many-flowered; calyx-segments with short free tips; corollas pure yellow. $3-4.5 \mathrm{~cm}$. broad; capsules $2.5-3 \mathrm{~cm}$. long. In rich soil, S. Dak. and Mont. to Neb. Summer. Nat. about eastern seaports.
 (I. F.f. 2580.) Resembling the next preceding species, dull green, pubescent with appressed velvety hairs. Stem 3-12 dm. tall, often simple; leaves narrow, the basal narrowly oblanceolate, $7.5-25 \mathrm{~cm}$. long, the cauline lanceolate or lincar-lanceolate, all acute, distantly dentate; flowers $2.5-3.3 \mathrm{~cm}$. broad; calyx-tube about 2.5 cm . long; capsule linear-pyramidal, gradually narrowed to the summit, $3^{-}$
3.7 cm . long, 4 -sided, curved; seeds about 2 mm . long. Shores of the St. Lawrence and along the Great Lakes, to Mass., southern N. Y. and Neb. Summer.

## 8. OENOTHERA L.

Usually low annual biennial or perennial caulescent herbs. Leaves alternate, sinuate or pinnatifid. Flowers yellow, axillary, or sometimes in terminal spikes, nocturnal; buds erect. Calyx-tube sometimes filiform; calyx-segments deciduous. Ovary 4 -celled, elongated; ovules in 2 rows, ascending. Capsules usually narrowly cylindric, sometimes slightly tapering, spreading or ascending. Seeds terete, crowned by a tubercle. [Greek, wine-scenting, the roots being once used for that purpose.] About 20 species, in N. Am. and western S. Am.
Flowers axillary.
Silvery-pubescent with appressed or ascending hairs; seeds striate.
I. OE, humifusa. Flowers in terminal bracted spikes.
2. OE. laciniata.
3. OE. rhombipetala.
I. OEnothera humifùsa Nutt. Seaside Evening-primrose. (I. F. f. 2581.) Spreading and decumbent, or ascending, branched from the base; stems $2-5 \mathrm{dm}$. long. Leaves acutish or sometimes obtuse at the apex, $1.2-5 \mathrm{~cm}$. long, repand-denticulate, the lower pinnatifid; flowers axillary, yellow, $12-20 \mathrm{~mm}$. broad; calyx-lobes somewhat spreading; capsule linear, $12-24 \mathrm{~mm}$. long, about 3 mm . thick, very pubescent; seeds striate longitudinally. On sea-beaches, N. J. to Fla. June-Sept.
2. OEnothera laciniàta Hill. Sinuate-Leaved Evening-primrose. (I. F. f. 2582.) Decumbent or ascending, sometimes branched, I-5 dm. high, glabrous or sparingly hirsute-pubescent. Leaves oval-lanceolate, oblong, or oblanceolate, acute or obtusish at the apex, sinuate-dentate or often pinnatifid, $2.5-5 \mathrm{~cm}$. long; flowers axillary (or on small plants sometimes solitary and terminal), $\mathbf{1 2 - 3 6} \mathrm{mm}$. broad; calyx-lobes reflexed; capsule linear, $2.5-3.5 \mathrm{~cm}$. long, about 2 mm . thick, more or less pubescent; seeds strongly pitted. In sandy dry soil, southern N. J. to Penn., Ill. and Neb., south to Fla., Tex. and Mex., extending into S. Am. MayJune. Naturalized in Vt.

O nothera laciniàta grándis Britton. Similar to the species, but the leaves more prominently toothed and the flowers $5-7 \mathrm{~cm}$. broad. Mo. and Kans., south to Tex.
3. OEnothera rhombipétala Nutt. Rhombic Evening-primrose. (I. F. f. 2583.) Erect, finely and densely appressed-pubescent, 6-12 dm. high. Leaves linearlanceolate, sessile and rounded at the base or the lower narrowed into petioles, acuminate at the apex, remotely denticulate, $5-10 \mathrm{~cm}$. long; flowers $2.5-5 \mathrm{~cm}$. broad; calyx-lobes canescent; petals rhombic-obovate; capsule columnar, curved, pubescent, $12-16 \mathrm{~mm}$. long, about 2 mm . thick; seeds obovoid, tuberculate at the top. On prairies, Minn. to Ind., Neb. and the Ind. Terr. June-July.

## 9. ÁNOGRA Spach.

Low annual or perennial canescent herbs, often with a papery bark. Leaves alternate, usually pinnatifid. Buds drooping; flowers white or pink, usually axillary, diurnal. Calyx-tube elongated. Ovary elongated; ovules numerous, in 1 row, ascending. Capsules elongated, spreading or ascending, loculicidal. Seeds terete. [Anagram of Onagra.] About 10 species, chiefly in southern N. Am.

Tips of the calyx-segments not free in the bud.
Tips of the calyx-segments free in the bud.
Throat of the calyx-tube villous within.
Throat of the calyx-tube glabrous within.

1. A. albicaulis.
2. A. coronopifolza.
3. A. pallida.
4. Anogra albicaùlis (Pursh) Britton. Prairie Evening-primrose. (I. F. f. 2584.) Diffusely branched; branches decumbent or ascending, more or less hirsute or puberulent, whitish and often shreddy, r-3 dm. long. Leaves oblanceolate or lanceolate, deeply pinnatifid or the lowest repand-dentate (rarely entire), $2.5-10 \mathrm{~cm}$. long; flowers $3.5-7.5 \mathrm{~cm}$. broad, white, becoming rose-color; petals obcordate or emarginate; calyx-segments lanceolate, acuminate, hirsute;
capsule linear, $2.5-3.5 \mathrm{~cm}$. long, about 2 mm . thick; seeds finely pitted. Prairies, N. Dak. and Neb. to N. Mex. and Sonora. April-June.
5. Anogra coronopifòlia (T. \& G.) Britton. Cut-leaved Evening-primROSE. (I. F. f. 2585.) Erect, branched, I.5-6 dm. high, more or less hispid or canescent. Leaves lanceolate or oblanceolate in outline, $\mathbf{I} .2-5 \mathrm{~cm}$. long, usually finely and deeply pinnatifid into linear-oblong lobes; flowers white, turning pink, r. $8-3 \mathrm{~cm}$. broad; calyx-segments linear; petals broadly obovate; capsule oblong, abruptly constricted at the top, straight, $8-20 \mathrm{~mm}$. long, about 4 mm . thick; seeds tuberculate. Prairies, S. Dak. to Colo., Utah, Kans. and N. Mex. June-Sept.
6. Anogra pállida (Lindl.) Britton. White-stemmed Evening-primrose. (I. F. f. 2586.) Erect, I.5-12 dm. high; stems white or pale, rarely with scattered hairs, the bark often shreddy. Leaves linear or oblong-linear, entire, repand or somewhat pinnatifid, $2.5-8.5 \mathrm{~cm}$. long; flowers white, turning pink, $2.5-3.5 \mathrm{~cm}$. broad; segments of the calyx linear; petals nearly orbicular; capsule linear, curved, $2.5-5 \mathrm{~cm}$. long, about 3 mm . thick; seeds smooth. Prairies, Minn. to Br. Col., Neb., Mex. and Cal. May-Aug.

## 10. KNEİFFIA Spach.

Usually slender annual or perennial caulescent shrubby herbs. Leaves mostly narrow, entire or shallowly toothed; buds erect. Flowers yellow, diurnal, in terminal spikes or racemes. Calyx-tube slender. Ovary usually club-shaped, 4angled; ovules numerous, on slender stalks, in many rows. Capsules club-shaped, or oblong by the wings, 4 -winged or rarely sharply 4 -angled. Seeds not angled, without a tubercle. [In honor of Prof. C. Kneiff, of Strassburg, who wrote on cryptogamic botany.] About Io species, mostly in temperate N. Am.
Stem-leaves filiform-linear; capsules 4 -angled or very slightly 4 -winged.
I. K. linifolia.

Stem-leaves never approaching filiform; capsules prominently winged.
Capsules club-shaped.
Pedicels and capsules pubescent.
Stems decumbent, spreading; body of the capsule becoming subglobose. 2. $K$, Alleni.

Stems erect or nearly so ; body of the capsule more or less elongated. Pedicel longer than the body of the capsule, the wings thick and pubescent. 3. K. Iongipedicellata. Pedicel shorter than the body of the capsule, the wings, thin and glabrous.
4. $K$. linearis.

Pedicels and capsules glabrous or glabrate. 5. K. pumila. Capsules oblong or nearly so.

Plants not glaucous, usually pubescent ; capsules less than 8 mm . long.
6. K. fruticosa.

Plants somewhat glaucous, glabrous; capsules more than ro mm. long. 7. K. glauca.

1. Kneiffia linifòlia (Nutt.) Spach. Thread-Leaved Sundrops. (I. F. f. 2587.) Erect, very slender, I.5-4.5 dm. high, finely pubescent ahove. Stemleaves filiform-linear, entire, $12-30 \mathrm{~cm}$. long; basal leaves tufted, oblanceolate or spatulate, about 2.5 cm . long; flowers in loose spike-like racemes, $6-8 \mathrm{~mm}$. broad; calyx-tube rather shorter than the ovary; stigma-lobes very short; capsule obovoid, puberulent, sharply 4 -sided, 4-6 mm. long. In dry soil, Ill. to Kians., Ga., La. and Tex. May-July.
2. Kneiffia Álleni (Britton) Small. Allen's Sundrobs. (I. F. f. 25S8.) Low, appressed-pubescent; stems decumbent, diffusely branched. o. S-6 dm. long, zigzag. Leaves oblanccolate to lanceolate, $1.2-3 \mathrm{~cm}$. long, undulate; flowers about 2.5 cm . broad; calyx villous, its tube 4-6 mm. long, its segments linear-oblong, as long as the tube; petals orbicular-obovate; capsules club-shaped, 6- 8 mm. long, the body winged, shorter than the pedicel; seeds obovoid to oblong. minutely pitted in rows. In sand, eastern L. I. June-Aug.
3. Kneiffia longipedicellata Small. Long-stmamen Stameors. (I. F. f. 2589.) Slender, puberulent; stems erect or assurgent, 3-8.5 dm. tall. Basal leaves spatulate or obovate-spatulate, $3.5-7.5 \mathrm{~cm}$. long: stem leaves tew, linear-hncoblate, $2.5-6.5 \mathrm{~cm}$. long, entire, sometimes undulate: flowers vellow, 2.55 cm . bread; calyx hirsute; petals emarginate; capsules narrowly obovod, the bedy about 10
mm . long, the angles with stout pubescent wings, the faces strongly ridged; seeas irregular, minutely papillose. N. Y. to W. Va. and Fla. May-Aug.
4. Kneiffia linàeris (Michx.) Spach. Narrow-Leated SuNdrops. (I. F. f. 2590.) Slender, pilose or neariy glabrous. Stems erect or ascending. I.5-5 dm. tall. finally angled; basal leaves spatulate or broadly oblanceolate. $5-8 \mathrm{~cm}$. long, entire or nearly so; cauline leaves linear or linear-lanceolate. $2.5-7.5 \mathrm{~cm}$. long, slightly toothed: flowers $I . S-3 \mathrm{~cm}$. broad: calyx slightly pubescent: petals shallowly notched at the apex and eroded: capsule. oblong-club-shaped. S-14 mm. long, the angles with papery glabrous wings. its faces ridged; seeds irregular, angled. Conn. to Tenn. and Ga. June-Sept.
5. Kneiffia pùmila L..) Spach. Small Sundrops. (I. F. f. 2591.) Erect, sometimes finely puberulent. $2-6 \mathrm{dm}$. high. Leaves oblanceolate or oblong, narrowed at the base and often petioled. entire or very nearly so, $2-5 \mathrm{~cm}$. long, the basal ones broader and shorter; flowers $8-25 \mathrm{~mm}$. broad; calyx-tube shorter than the orary; petals obcordate; capsule sessile or short-stalked. glabrous or nearly so, $6-12 \mathrm{~mm}$. long, the body obovoid. somewhat wing-angled. In dry soil, N. S. to Manitoba, N. J., Ga. and Kans. Tune-Aug.
6. Kneiffia fruticòsa (L.) Raimann. Common.Sundrops. (I. F. f. 2592.) Erect. usually branched. 3-9 dm. high. rarely glabrous. Leaves lanceolate, ovatelanceolate or oval-lanceolate. repand-denticulate, or rarely nearly entire. $2.5-10 \mathrm{~cm}$. long: flowers $2.5-5 \mathrm{~cm}$. broad: calyx-segments lanceolate; petals obcordate; capsule sessile or short-stalked. oblong. prominently winged. glabrous or pubescent, $6-8 \mathrm{~mm}$. long. In dry soil, N. S. to Ga., Minn. and La. June-Aug.

Kneiffia fruticòsa pilosélla (Raf.) Britton. Pubescent with long spreading hairs throughout. N. Y. to Ill, south to Ga.
7. Kneiffia glàuca (Michx.) Spach. Glatcous Sundrops. (I. F. f. 2593.) Erect. glabrous and glaucous. - $^{-9}$ dm, high. Leaves ovate or oval, repand-denticulate. $5^{-14} \mathrm{~cm}$. long: flowers bright rellow. $3 \cdot 5-7.5 \mathrm{~cm}$. broad, rery showy; petals broadly obovate, emarginate: calyx-lobes ovate-lanceolate, acuminate; capsule oblong, broadly 4 -winged. glabrous. $10-12 \mathrm{~mm}$. long. borne on a short stalk. In dry woods, mountains of Va. to Ga. and Ala. May-Sept.

## ir. HARTMÁNNIA Spach.

Annual or perennial herbs with branched stems. Leaves alternate, commonly pinnatifid or lyrate; buds drooping. Flowers white, red. or purple. diurnal, in terminal spikes or racemes. Calyx-tube funnelform. Ovary elongated; ovules numerous on slender stalks, in many rows. Capsules club-shaped. 4 -winged. Seeds not tuberculate. [In honor of Emanuel Hartmann. a resident of Louisiana.] About io species, in N. and S. Am.
I. Hartmannia speciòsa (Nutt.) Small. Showf Primrose. (I. F. f. 2594.) Erect. ascending or decumbent. branched, I.5-9 dm. high. puberulent or finely pubescent. Stem-leares lanceolate or linear-lanceolate, acutish. sinuate or pinnatifid. $5-7.5 \mathrm{~cm}$. long: basal leaves oral or oval-lanceolate, repand or pinnatifid at the base: flowers white or pink. $3.5-8 \mathrm{~cm}$. broad: petals emarginate; calyx-lobes ovate-lanceolate. acuminate; capsule club-shaped. strongly 4 -ribbed, 4 -winged, pubescent. $12-18 \mathrm{~mm}$. long. Prairies. Mo. and Kans. to La.. Tex., Ariz. and northern Mex. May-July. Extensively naturalized in Ill.. S. Car. and Ga.

## 12. PACHYLOPHUS Spach.

Perennial acaulescent or nearly acaulescent herbs. Leaves basal. pinnatifid or pinnately-toothed. Flowers basal. tufted. Calyx-tube linear-funnelform, the segments shorter than the tube. Petals white or pink. Capsules basal. woody, pyramidal, their angles retuse or obtuse, transversely wrinkled. Seeds sessile, in I or 2 rows, deeply furrowed along the raphe. [Greek. referring to the tuberculate edges of the valves of the capsule.] A monotypic genus of western N. Am.
I. Pachylophus caespitòsa (Nutt.) Raimann. Scapose Primrose. (I. F. f. 2595 .) Perennial or biennial from a woodr root. Leaves clustered at the base, narrowed into slender petioles. lanceolate. oblanceolate or oval, densely pubescent. sinuate-dentate, often densely ciliate with white hairs, repand or pinnatifid. $3.5-20 \mathrm{~cm}$. long; flowers few, white or rose, $3.5-8 \mathrm{~cm}$. broad; calv̦x pubescent. its
tube 5-18 mm. long, dilated at the mouth; capsule sessile, ovoid, strongly tuberculate on each side, the angles ribbed; seeds minutely tuberculate. Neb. and Mont. to the N. W. Terr., Nev., N. Mex. and Sonora. June-July.

## 13. LAVAÙXIA Spach.

Low usually perennial acaulescent herbs. Leaves mostly basal, pinnatifid. Flowers white, pink or pale yellow. Calyx-tube slender. Ovary short, 4-angled; ovules few. Capsules stout, their angles sometimes winged above. Seeds few. [In honor of Francois Delavaux, founder of the botanical garden at Nismes.] About 6 species, chiefly in southern N. Am.

Leaves membranous; capsules beaked, glabrate. Leaves leathery; capsules hardly beaked, pubescent.

1. L. triloba.
2. L. brachycarpa.
I. Lavauxia tríloba (Nutt.) Spach. Three-Lobed Primrose. (I. F. f. 2596.) Nearly glabrous throughout. Leaves runcinate-pinnatifid, or sinuate, sometimes ciliate, oblong-lanceolate in outline, $7-30 \mathrm{~cm}$. long; flowêrs white or pink, $2.5-6 \mathrm{~cm}$. broad; petals often 3 -lobed; capsule ovoid, 4 -wing-angled, retic-ulate-veined, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long; seeds finely and densely tuberculate. In dry soil, Ky. and Tenn. to Kans., Cal., Miss., Tex. and northern Mex. May-July.

Lavauxia tríloba Wàtsonii Britton. Annual; flowers smaller; fruit densely crowded. Perhaps a distinct species. Kans.
2. Lavauxia brachycàrpa (A. Gray) Britton. Short-podded Primrose. (I. F. f. 2597.) Softly canescent. Leaves basal, ovate to narrowly oblong, 7.j22 cm . long, lyrate-pinnatifid or sometimes nearly entire; petioles sometimes as long as the blade; flowers yellow, basal; petals undulate; capsules elliptic, 16-18 mm . long, leathery or corky, the angles very thin, the faces somewhat wrinkled. Mont. to Kans., Tex. and N. Mex. April-July.

## 14. GAURÉLla Small.

Low perennial herbs with wiry diffusely branched stems. Leaves nearly entire or distantly toothed. Flowers axillary, sessile. Calyx-tube slightly dilated at the throat, its segments slightly longer than the tube. Petals white or pink, spotted or striped with red. Ovary short; united styles stout, enlarged above. Capsules sessile, with a curved beak, the faces swollen. Seeds angled, delicately striate [Diminutive of Gaura.] A monotypic genus of the west-central U. S.

1. Gaurella guttulàta (Geyer) Small. Spotted Primrose. (I. F. f. 2598.) Stems I-2 dm. high, canescent with appressed hairs, the branches decumbent or ascending. Leaves lanceolate or linear-lanceolate, obtusish at the apex, $8-16 \mathrm{~mm}$. long, repand-denticulate or entire; flowers white or pink, $18-25 \mathrm{~mm}$. wide; petals obovate, entire; capsule canescent, 8 -10 mm. long, angled, not winged; seeds angled, slipper-shaped. Prairies, Neb. to N. Mex. June-Sept.

## 15. MEGAPTERIUM Spach.

Spreading perennial herbs with stout stems. Leaves alternate, entire or slightly toothed. Flowers few, but large and showy, axillary, yellow. Calyx-tube much elongated. Ovary 4-angled or 4-winged; united styles filiform; ovules few, sessile. Capsules broadly 4 -winged. Seeds crested. [Greek, broad-winged.] About 3 species, in N. Am. and Mex.
Corollas $7.5-15 \mathrm{~cm}$. broad; capsules $5-7.5 \mathrm{~cm}$. long, with suborbicular wings.

1. M. Missouriense.

Corollas $2.5-5 \mathrm{~cm}$. broad; capsules $1.8-3 \mathrm{~cm}$. long, with oblong wings.
$\begin{array}{ll}\text { Pubescent; capsules mostly less than } 2.5 \mathrm{~cm} \text {. long. } & \text { 2. M. Fremontii. }\end{array}$
Glabrous; capsules mostly over 2.5 cm . long. 3. M. Oklahomense.
I. Megapterium Missouriénse (Sims) Spach. Missol'Ri Primrose. (I. F. f. 2599.) Stems decumbent or ascending, densely canescont 1.5-0 dm. long. Leaves thick, linear-lanceolate or oblong-lanceolate, acuminate or acute at the apex, entire or remotely denticulate, $5-15 \mathrm{~cm}$. long; flowers $7.5-15 \mathrm{~cm}$. broad: calyxtube $5-15 \mathrm{~cm}$. long; capsule short-stalked, nearly orbicular, very boadly winged. In dry soil, Mo. and Neb. to Tex. May-July.
2. Megapterium Fremóntii (S. Wats.) Britton. Fremont's Primrose. (I. F. f. 2600.) Stems ascending, $5-\mathbf{I} 5 \mathrm{~cm}$. high, appressed-pubescent. Leaves lanceolate to somewhat oblancolate, acuminate at the apex, entire or very nearly so, silvery canescent, $3 \cdot 5-7.5 \mathrm{~cm}$. long; flowers $2.5-5 \mathrm{~cm}$. broad; calyx-tube 4-5 times the length of the ovary; capsule oblong, broadly winged, rounded at the summit. Kans. to Tex. Summer.
3. Megapterium Oklahoménse Norton. Glabrous. Stems or branches r.5-3 dm. long; leaves rather numerous, lanceolate or almost oblong, $3-9 \mathrm{~cm}$. long, remotely toothed or merely undulate; calyx-tube $8-10 \mathrm{~cm}$. long; calyxsegments purple-spotted; corollas $4-5 \mathrm{~cm}$. broad; capsules oblong, $2.5-3 \mathrm{~cm}$. long, the wings less than I cm. broad. On prairies and hillsides. Kans. and Oklahoma. Summer.

## 16. GALPÍNSIA Britton.

Perennial herbs or shrubby plants with much-branched stems. Leaves alternate. Flowers yellow, axillary. Calyx-tube slender, longer than the ovary. Ovary 4-celled, elongated; stigma disk-like, entire. Capsules elongated, narrowed at the base, more or less curved. Seeds sometimes tuberculate. [Anagram of Salpingia.] About 4 species, in the southern U. S. and Mex.
I. Galpinsia Hàrtwegi (Benth.) Britton. Hartweg's Primrose. (I. F. f. 2601.) Canescent or pubescent, much branched, 1.5-4 dm. high. Leaves linearoblong or lanceolate, obtuse or obtusish at the apex, I.3-5 cm. long, entire or slightly repand-denticulate; flowers $1.8-5 \mathrm{~cm}$. broad; calyx-lobes acuminate; petals rhombic-obovate, acutish; capsule nearly sessile, narrowly cylindric, 12-25 mm. long, 2-4 mm. thick; seeds obscurely tuberculate. Prairies, Neb. and Colo. to Tex. and northern Mex. May-Sept.

## 17. MERİOLIX Raf.

Biennial or perennial herbs with branched stems or sometimes shrubby. Leaves alternate, narrow, entire or sharply serrate. Flowers regular, axillary, yellow. Calyx-tube funnelform, shorter than the ovary; calyx-segments keeled on the back. Petals often blotched at the base. Stigma disk-like, 4 -toothed. Capsules linear, 4 -angled, sessile. Seeds longitudinally grooved. A monotypic genus.
I. Meriolix serruláta (Nutt.) Walp. Tooth-leaved Primrose. (I. F. f. 2602.) Erect, canescent or glabrate, I-5 dm. high. Leaves linear-oblong, or lanceolate, sharply dentate or denticulate, $2.5-7.5 \mathrm{~cm}$. long; flowers $12-18 \mathrm{~mm}$. broad; calyx-lobes ovate, acuminate, the tube funnelform, silvery canescent; petals obovate, crenulate; capsule linear-cylindric, canescent, $\mathbf{I} 5-3 \mathrm{~cm}$. long, about 2 mm . thick, slightly grooved longitudinally. In dry soil, Manitoba and Minn. to Tex. and N. Mex. May-July.

Meriolix serrulàta spinulòsa (T. \& G.) Small. More robust than the species. Leaves usually more spiny-toothed; flowers $2.5-5 \mathrm{~cm}$. broad; petals with a dark blotch at the base. Saskatch. to Mo. and Tex.

## 18. GAÙRA L.

Annual biennial or perennial herbs, with alternate narrow leaves, and white, pink or red flowers in terminal spikes or racemes. Calyx-tube narrow, prolonged beyond the ovary, the limb 4 -lobed (rarely 3 -lobed). Petals clawed, unequal. Stamens usually 8, declined, each with a small scale at the base. Ovary 4-celled; united styles declined; stigma 4 -lobed, surrounded by a cup-like border; ovules usually 4 , pendulous. Fruit nut-like, ribbed or angled, indehiscent or nearly so, I-4-seeded. [Greek, proud, some species being showy.] About 18 species, natives of N. Am. and Mex.

Fruit sessile or very nearly so; flowers spicate.
Flowers $3-4 \mathrm{~mm}$. broad; stigma little exserted beyond its cup.
Flowers $8-10 \mathrm{~mm}$. broad; stigma exserted beyond its cup.
Flowers red, turning scarlet; fruit canescent.
Flowers white, turning pink; fruit villous.
Fruit pedicelled; flowers racemose.
Fruit about 6 mm . long, the body nearly as thick as long.

1. G. parviflora.
2. G. coccinea.
3. G. biennis.
4. G. Michauxii.

Fruit ro-14 mm. long, the body much longer than thick.
Leaves mostly glabrous; fruit 14 mm . long, glabrous, its stout pedicel clubshaped.
5. G. sinuata.

Leaves densely villous; fruit ro mm. long, pubescent, its slender pedicel nearly filiform.
6. G. villosa.
I. Gaura parvifiòra Dougl. Small-flowered Gaura. (I. F. f. 2603.) Erect, villous-pubescent with whitish hairs, 6-15 dm. high. Leaves lanceolate or ovate-lanceolate, acute or acuminate, repand-denticulate, softly pubescent, 3.510 cm . long; spikes elongated; flowers pink, the ovary and calyx-tube slender; fruit contracted at the base, 4 -nerved, obtusely 4 -angled, glabrous or nearly so, $6-8 \mathrm{~mm}$. long. In dry soil, S. Dak. to Mo., La., Mex., Ore. and N. Mex. May-Aug.
2. Gaura coccínea Pursh. Scarlet Gaura. (I. F. f. 2604.) Erect or ascending, much branched, canescent or glabrate, I.5-6 dm. high. Leaves oblong, lanceolate, or linear-oblong, denticulate, repand or entire, acute or obtuse at the
 and narrowed above, canescent, $6-8 \mathrm{~mm}$. long. Prairies and dry soil, Manitoba and Minn. to Neb., Tex., Mont., Utah, Ariz. and in Mex. May-Aug.
3. Gaura biénnis L. Biennial Gaura. (I. F. f. 2605.) Erect, villous or downy-pubescent, 6-15 dm. high. Leaves lanceolate or oblong-lanceolate, acute or acuminate at each end, remotely denticulate, $5-10 \mathrm{~cm}$. long; spikes slender; flowers white, turning pink, 8 -10 mm . broad; fruit narrowed at each end, 4 -ribbed, villous, $6-8 \mathrm{~mm}$. long. In dry soil, Quebec and Ont. to Minn., Ga., Neb. and Ark. July-Sept.
4. Gaura Michaùxii Spach. Michaux' Gaura. (I. F. f. 2606.) Erect, glabrous or nearly so, paniculately branched above, 6-18 dm. high. Leaves linear or linear-oblong, acute or acutish at both ends, or obtuse at the apex, sinuate or denticulate, $2.5-8 \mathrm{~cm}$. long; racemes loosely flowered, long-peduncled; flowers pedicelled, white, turning reddish, $6-8 \mathrm{~mm}$. broad; fruit ovoid, 4 -angled above, borne on a pedicel of nearly or quite its own length. In dry fields, Va. to Ill., Kans., Fla. and La. July-Aug.
5. Gaura sinuàta Nutt. Wavy-Leaved Gaura. (I. F. f. 2607.) Erect or decumbent, glabrous, or rarely sparingly villous. Stem branched at the base, 3-9 dm. tall, usually naked above; leaves oblanceolate to lanceolate, or nearly linear, sinuate-toothed, $2.5-8 \mathrm{~cm}$. long, acute; calyx slightly pubescent, its tube funnelform, $2-4 \mathrm{~mm}$. long; petals $8-10 \mathrm{~mm}$. long; fruit 4 -ridged and 4 -grooved above the club-shaped pedicel. In dry soil, Kans. to Ark. and Tex. May-July.
6. Gaura villòsa Torr. Woolly Gaura. (I. F. f. 2608.) Erect or nearly so, canescent or villous. Stems 3-9 dm. tall, often naked above; leaves varying from lanceolate to oblanceolate or sometimes nearly linear, $2.5-7.5 \mathrm{~cm}$. long, sinu-ate-toothed or pinnatifid, acute or acuminate; calyx canescent, its tube funnelform, $2-4 \mathrm{~mm}$. long; petals $10-14 \mathrm{~mm}$. long; body of the fruit sharply 4 -angled, abruptly narrowed into a filiform pedicel. In dry soil, Kans. to Ark. and Tex. June-Sept.

## 19. STENOSİPHON Spach.

Erect perennial herbs, with alternate sessile narrow leaves, and white flowers in elongated terminal spikes. Calyx-tube filiform, much prolonged beyond the ovary, 4 -lobed. Petals clawed. Stamens 8 , declined, not appendaged by scales at the base. Ovary 1-celled; stigma as in Gaura. Fruit 8 -ribbed, indehiscent. r-celled, $\mathbf{I}$-seeded. Seed pendulous. [Greek, referring to the slender calyx-tube.] A monotypic genus of the south-central U. S.
x. Stenosiphon linifolium (Nutt.) Britton. Flax-leayen Stfunsiphon. (I. F. f. 2609.) Slender, glabrous, 6-15 dm. high. Leaves lanceolate, linearlanceolate or linear, acuminate or acute at the apex, entire, $2.5-5 \mathrm{~cm}$. long; spikes dense, narrow, sometimes 3 dm . long in fruit; flowers $8-12 \mathrm{~mm}$. broad: calyx-tule very slender, $8-10 \mathrm{~mm}$. long; fruit ovoid, pubescent, $2-3 \mathrm{~mm}$. longr, very much shorter than the linear-subulate bracts. Prairies, Neb. and Colo. to the Ind. Terr. and Tex. June-July.

## 20. CIRCAEA L.

Low slender perennial herbs, with opposite petioled leaves, and small white flowers in racemes. Calyx-tube slightly prolonged beyond the orary, its limb

2-parted. Petals 2, notched. Stamens 2, alternate with the petals. Ovary 1-2. celled; ovules usually I in each cavity. Fruit obovoid, indehiscent, bristly with hooked hairs. [Named for Circe, the enchantress.] About 5 species, of the northern hemisphere. Besides the following, another occurs on the Pacific Coast.
Fruit 2-celled; leaves mainly of an ovate type.

Hairs of the fruit stiff, copious.
Hairs of the fruit weak, few.
Fruit r-celled; leaves mainly of a cordate type.
r. C. Lutetiana.
2. C. intermedia.
3. C. alpina.
I. Circaea Lutetiàna L. Enchanter's Nightshade. (I. F. f. 26io.)

Finely pubescent, at least above; stem 3-6 dm. high. Leaves ovate, acuminate at the apex, rounded or rarely slightly cordate at the base, remotely denticulate, $5-10 \mathrm{~cm}$. long; pedicels $4-8 \mathrm{~mm}$. long, reflexed in fruit; bracts deciduous; flowers about 3 mm . broad; fruit broadly obovoid, nearly 4 mm . long, densely covered with stiff hooked hairs. In woods, N. S. to western Ont., S. Dak., Ga., Neb. and Kans. Also in Europe and Asia. June-Aug.
2. Circaea intermedia Ehrh. Resembling the preceding species in habit, glabrous or sparingly pubescent above; stems $2-5 \mathrm{dm}$. tall. Leaves ovate or ovatelanceolate, $4-8 \mathrm{~cm}$. long, repand or sharply denticulate, cuneate or cordate at the base: fruit obovoid, $3-3 \cdot 5 \mathrm{~mm}$. long, with very slender, weak, hooked hairs or glabrate. In woods, Me. and Vt. Also in Europe. Summer.
3. Circaea alpìna L. Smaller Enchanter's Nightshade. (I. F. f. 26if.) Smaller, 7-20 cm. high, weak, glabrate or pubescent above. Leaves ovate, acute or acuminate at the apex, more or less cordate at the base, coarsely dentate, 2.5-5 cm . long; flowers about 2 mm . broad; pedicels $3-4 \mathrm{~mm}$. long, reflexed in fruit; fruit narrowly obovoid, about 2 mm . long, covered with weak, soft, hooked hairs. In cold moist woods, Lab. to Alaska, Ga., Ind., Mich. and S. Dak. Also in Europe and Asia. July-Sept.

## Family 4. TRAPÀCEAE Dumort.

## Water-nut Family.

Aquatic herbs, with opposite pinnatifid submerged leaves, and clustered rhombic-ovate dentate floating ones with inflated petioles. Flowers perfect, axillary, solitary, short-peduncled. Calyx-tube short, the limb 4 -parted, the lobes persistent. Petals 4, sessile, inserted on the perigynous disk. Stamens 4, inserted with the petals; filaments subulate-filiform. Ovary 2-celled, conic above ; style subulate ; ovule I in each cavity. Fruit coriaceous or bony, large, 2-4-spinose or swollen at the middle, I-celled, r-seeded, indehiscent. Seed inverted. A single genus of 3 species, natives of Europe, tropical Asia and Africa.

## 1. TRÀPA L.

Characters of the family. [Latin, from Calcitrapa, the Caltrop.]
r. Trapa nàtans L. Swimming Water-nut. Water-chestnut. WaterCaltrop. (I. F. f. 26I2.) Rooting in the mud. Submerged leaves, pectinately dissected, $2-10 \mathrm{~cm}$. long, floating leaves in a rosette, their blades rhombic-ovate, sharply dentate above, broadly cuneate and entire below, about 2.5 cm . wide, glabrous and shining above, the conspicuous veins of the lower surface beset with short stiff hairs; flowers white, about 6 mm . broad; fruit $2-5 \mathrm{~cm}$. long, armed with 4 somewhat recurved spines. Nat. in ponds and streams, eastern Mass. and near Schenectady, N. Y. Native of Europe. June-July.

## Family 5. HALORAGIDACEAE K1. \& Garcke. <br> Water-milfoil Family.

Perennial or rarely annual herbs, mainly aquatic, with alternate or verticillate leaves, the submerged ones often pectinate-pinnatifid. Flowers perfect, or monœcious, or diœcious, axillary, in interrupted spikes, solitary or clustered. Calyx-tube adnate to the ovary, its limb entire or $2-4$ -
lobed. Petals small, 2-4, or none. Stamens i-8. Ovary ovoid-oblong, or short-cylindric, $2-8$-ribbed or winged, $1-4$-celled ; styles I-4; stigmas papillose or plumose. Fruit a nutlet, or drupe, compressed, angular, ribbed or winged; indehiscent, of 2-4 I-seeded carpels. Endosperm fleshy ; cotyledons minute. Eight genera and about Ioo species, of wide distribution.

| Stamen 1; ovary 1-celled. | 1. Hippuris. |
| :--- | :--- |
| Stamens 2-8; ovary 3-4-celled. | 2. Proserpinaca. |
| Fruit 3 -angled or 4-angled. | 3. Myriophyllum. |
| Fruit of 4 carpels. |  |

## 1. HIPPURIS L.

Aquatic herbs, with simple erect stems, and verticillate simple entire leaves. Flowers small, axillary, perfect, or sometimes neutral or pistillate only. Limb of the calyx minute, entire. Petals none. Style filiform, stigmatic its whole length, lying in a groove of the anther. Fruit a small I-celled I-seeded drupe. [Greek, mare's-tail.] Three known species, natives of the north temperate and arctic zones and of southern S. Am. Besides the following, the third occurs in arctic America.
Leaves linear or lanceolate, in verticils of 5-12. 1. FI. vulgaris.
Leaves obovate, oblong, or oblanceolate, in verticils of 4-6. 2. H. tetraphylla. $^{\text {4 }}$.
I. Hippuris vulgàris L. Bottle Brush. Mare's-tail. Joint-weed. (I. F. f. 26I3.) Stem glabrous, 2-5 dm. high. Leaves acute, sessile, $\mathbf{I}-25 \mathrm{~mm}$. long, more or less sphacelate at the apex; stamen with a short thick filament, and comparatively large 2 -celled anther, dehiscent by lateral slits; seeds ovoid; stigma persistent. Swamps and bogs, Greenland to Alaska, Me., Lake Superior, N. Mex. and Cal. Also in Patagonia, and in Europe and Asia. Summer.
2. Hippuris tetraphýlla L.f. Four-leaved Mare's-tail. (I. F. f. 26i4.) Stem I-4 dm. high; leaves not sphacelate at the apex or but slightly so, $8-14 \mathrm{~mm}$. long. Lab. and Quebec to Hudson Bay and Alaska. Also in northern Europe and Asia. Summer.

## 2. PROSERPINÀCA L.

Aquatic herbs, with simple stems. Leaves alternate, lanceolate, dentate or pectinate-pinnatifid. Flowers perfect. Tube of the calyx adnate to the triquetrous ovary, the limb 3-4-parted. Petals none. Stamens 3 or 4 . Styles 3 or 4 , cylindric or conic-subulate, stigmatic above the middle. Fruit bony, 3-4-celled, with I seed in each cavity. [Middle Latin, forward-creeping.] Two known species, natives of eastern N. Am., extending to the W. I.
Emersed leaves linear-lanceolate to oblong, serrate; fruit sharp-angled. r. P. palustris. Leaves all pectinate-pinnatifid; fruit obtusely angled.
2. P. pectinata.

1. Proserpinaca palústris L. Mermaid-weed. (I. F. f. 2615.) Glabrous, simple or sometimes branched, $2-5 \mathrm{dm}$. long. Emersed leaves, $2-5 \mathrm{~cm}$. long, $2-12$ mm . wide, sharply serrate, the submerged ones pectinate-pinnatifid into stiff linear acute segments which are often serrulate, bearing a minute black spine in their axils; flowers solitary or several together, sessile in the axils of the emersed leaves; fruit about 4 mm . long, the faces concave, smooth or rugose. In swamps, N. B. to Lake Huron, Fla., Iowa and Cent. Am. Also in Cuba. July.
2. Proserpinaca pectinàta Lam. Cut-leaved Mervaid-ween. (T. F. f. 2616.) Resembling the preceding, but usually smaller. Leaves all pectinate or pinnatifid, the segments shorter and rarely serrulate, more subulate, or capillary; calyx-lobes broader; fruit about 3 mm . long, the faces flat or slightly convex, often wrinkled or somewhat tuberculate, the angles obtuse. In sandy swamps near the coast, eastern Mass. to Fla. and La. Summer.

## 3. MYRIOPHÝLLUM L.

Aquatic herbs, with verticillate or alternate leaves, the sulmerged ones pinnatifid into capillary segments, and axillary commonls monecious 2 -bracted flowers, often interruptedly spicate. Upper flowers generally staminate with a very short calyx-tube, its limb $2-4$-lobed, or none; petals $2-4$; stamens $4-8$. Interme-
diate flowers often perfect. Lower flowers pistillate, the calyx 4-grooved and with 4 minute lobes, or none; ovary 2-4-celled; ovule I in each cavity, pendulous; styles 4, short, often plumose. Fruit splitting into 4 bony I-seeded indehiscent carpels. [Greek, myriad-leaved.] About 20 species, of wide distribution. In addition to the following, another occurs in the western U. S. The plants flower in summer.

Carpels smooth.
Flowers in emersed spikes.
Floral leaves shorter than the flowers.
Flowers in whorls.
Flowers alternate, or the lower sub-verticillate. Floral leaves longer than the flowers, pinnatifid. Floral leaves reduced to minute bracts.
Flowers on both emersed and submersed stems.
Flowers only on submersed stems.
Carpels rough or tuberculate.
Flowers on emersed spikes.
Floral leaves ovate or lanceolate, serrate.
Floral leaves linear, pectinate.
Flowers on submersed stems.

1. M. spicatum.
2. M. alterniflorum.
3. M. verticillatum.
4. M. tenellum.
5. M. humile.
6. M. proserpinacoides.
7. M. heterophyllum.
8. M. pinnatum.
9. M. Farwellii.
I. Myriophyllum spicàtum L. Spiked Water-milfoil. (I. F. f. 2617.) Submerged leaves in whorls of 4's and 5's, dissected into capillary divisions. Floral leaves ovate, or sometimes none ; spike $2-8 \mathrm{~cm}$. long ; petals 4 , deciduous ; stamens 8 ; fruit about 2 mm . long and 3 mm . thick; carpels rounded on the back, with a deep wide groove between them. In deep water, Newf. to the N. W. Terr., Fla., Iowa, Kans. and Cal. Also in Europe and Asia.
10. Myriophyllum verticillàtum L. Whorled Water-milfoil. (I. F. f. 2618.) Submerged leaves in crowded whorls of 3 's and 4's, the capillary divisions very slender, often minutely scabrate. Floral leaves much longer than the flowers; spike $5-15 \mathrm{~cm}$. long; petals of the staminate flowers 4 , purplish; stamens 8 ; fruit $2-3 \mathrm{~mm}$. long, and about 2 mm . thick, somewhat gibbous at the base. Quebec and Ont. to Fla., Minn. and Cal. Also in Europe and Asia.
11. Myriophyllum alterniflòrum DC. Loose-flowered Water-milfoil. (I. F. f. 2619.) Submerged leaves usually in whorls of 3 's to 5 's, occasionally scattered, the pinnate divisions capillary. Spikes short, $2-5 \mathrm{~cm}$. long; uppermost floral leaves ovate or linear, entire or minutely toothed, early deciduous; petals of the staminate flowers 4, longer than the stamens, pale rose-color, deciduous; stamens 8 ; fruit nearly 2 mm . long, slightly less than 2 mm . thick; carpels rounded on the back, with a deep groove between them. In deep water, eastern Mass. to Newf. and Greenland. Common in Europe.
12. Myriophyllum tenéllum Bigel. Slender Water-milfoil. (I. F. f. 2620.) Stems slender, scape-like, nearly leafless, $4-30 \mathrm{~cm}$. high. Rhizome creeping, sending up many sterile stems; flowers alternate, solitary; uppermost bracts obovate, often longer than the flowers, the lower oblong, often shorter, the lowest minute or none; petals 4, purplish; stamens 4; fruit I mm. long and about as thick at the top, sometimes enlarged at the base; carpels rounded or obtusely angled on the back, separated by a shallow groove. Sandy bottoms of ponds and streams. Newf. to N. J., Penn. and Mich.
13. Myriophyllum hùmile (Raf.) Morong. Low Water-milfoil. (I. F. f. 2621.) Typical form terrestrial, $2-4 \mathrm{~cm}$. high, rooting in mud. Leaves entire or pectinate. Floating forms with stems often 3 dm . long, with all or most of the leaves pectinate; these produce the typical form if they take root; petals 4 , purplish; stamens 4 ; fruit usually less than 2 mm . long and about as thick at base, its carpels separated by a shallow groove. In ponds, Me., R. I., to Md. and Ill.
14. Myriophyllum heterophýllum Michx. Various-Leaved Water-milFOIL. (I. F. f. 2622.) Floral leaves in whorls of 3's to 5's, linear, ovate or lanceolate, serrate or rarely entire, much longer than the flowers. Submerged leaves subverticillate or scattered, crowded, pectinate-pinnatifid, about 2 cm . long, the divisions capillary; flowering spike elongated; petals 4; stamens 4, rarely 6; fruit 2 mm . long, and slightly longer than thick; carpels 2 -keeled on the back. In ponds, Ont. and N. Y. to Fla., S. Dak., Tex. and Mex.
15. Myriophyllum pinnàtum (Walt.) B.S.P. Pinnate Water-milfoil.
(I. F. f. 2623.) Leaves in whorls of 3's-5's, or sometimes scattered, the floral ones linear, serrate or pectinate, $5-12 \mathrm{~mm}$. long, gradually passing into the submerged ones which are crowded, pinnately dissected, the divisions capillary; spikes 1-2 dm . long; petals purplish; stamens 4 , very rarely 6; carpels strongly 2 -keeled and scabrous on the back, separated by deep grooves; mature fruit about 2 mm . long. In ponds, R. I. to Fla., Kans., La., Tex. and Panama.
16. Myriophyllum Farwéllii Morong. Farwell's Water-milfoil. (I. F. f. 2624.) Diœcious (?). Specimens with submerged leaves only, in whorls of 3 's6 's, or scattered, narrow, pinnately parted, the divisions finely capillary in 5-7 opposite or subopposite pairs, with minute black spines in the axils; petals 4, purplish, oblong; pistillate flowers only seen; styles 4 , short; stamens 4 , minute, abortive; fruit about 2 mm . long and 1 mm . thick; carpels crossed longitudinally by 3 or 4 tuberculate or slightly toothed ridges, 2 on the back and commonly I on each margin; groove between the carpels shallow. In still water, Me. to Mich.
17. Myriophyllum proserpinacoides Gill. Chilian Water-milfoil. (I. F. f. 2625.) Diœcious. Leaves all alike and submerged, somewhat glaucous, pec-tinate-pinnatifid in crowded whorls of 4's and 5 's, $1.5-2 \mathrm{~cm}$. long; segments 20-25, capillary or sometimes linear-spatulate, about 5 mm . long; pistillate flowers axillary, about I mm. high, without petals; stigmas 4, white, plumose; young carpels glabrous: small white hair-like bracts are borne at the bases of the leaves and among the flowers. Haddonfield, N. J. Apparently established. Native of Chili.

## Order 27. UMBELLÀLES.

Herbs, shrubs or trees, almost always with petaliferous flowers. Calyx-segments and petals usually 5. Stamens 4 or 5. Ovary inferior, adnate to the calyx, compound; ovule 1 in each cavity.
Stamens 5: styles 2-5, rarely united; flowers umbellate, capitate or panicled.

Fruit a fleshy berry or drupe.
Fam. 1. Araliaceae.
Fruit dry when mature, splitting into two mericarps. Fam. 2. Umbelliferae. Stamens 4; style 1 ; stigma I ; shrubs and trees; flowers not umbellate.

Fam. 3. Cornaceae.

## Family i. ARALIÀCEAE Vent.

Ginseng Family.
Herbs, shrubs or trees, with alternate or verticillate (rarely opposite) leaves, and flowers in umbels, heads, or panicles. Calyx-tube adnate to the ovary. Petals usually 5, sometimes cohering together, inserted on the margin of the calyx. Stamens as many as the petals and alternate with them (rarely more), inserted on the epigynous disk; anthers introrse. Ovary inferior, i-several-celled; styles as many as the cavities of the ovary; ovules i in each cavity, pendulous, anatropous. Seeds flattened, or somewhat 3 -angled, the testa thin; endosperm copious, fleshy ; embryo small, near the hilum ; cotyledons ovate or oblong. About 52 genera and 450 species, widely distributed.
Herbs, shrubs or trees; leaves alternate, decompound; styles 5. I. Aralia. Herbs; leaves verticillate, digitately compound; styles 2 or 3 .
2. Panax.

## I. ARÀLIA L.

Leaves alternate, pinnately or ternately decompound. Flowers small, mostly perfect, in racemose corymbose or paniculate umbels. Flowers white or greenish. Petioles sheathing at the base. Stipules none or inconspicuous. Pedicels jointed below the flowers. Petals 5 , spreading, obtuse, or with short inflexed points, valvate or slightly imbricate. Stamens 5 . Disk depressed. ()vary 5-celled: styles 5. Fruit a small berry enclosing about 5 seeds. About 27 species, natives of N . Am. and Asia. Besides the following, 2 others occur in the western L. . .
Umbels numerous, panicled or racemose.
Spiny shrub or tree; leaflets thick, ovate.

1. A. spinosa.

Branching unarmed herb; leaflets thin, large, cordate.
2. A. racemosa,

Umbels 2-several, sometimes numerous, terminal or corymbose.
Plant glabrate; leaf and peduncle arising from the rootstock. Plant bristly or hispid; stem leafy, erect.
3. A. nudicauitis. 4. A. hispida.
I. Aralia spinòsa L. Hercules' Club. Angelica or Spikenard Tree. (I. F. f. 2626.) A shrub or tree. Leaves long-petioled, bipinnate; leaflets acute or acuminate, stalked, serrate, dark green above, glaucous and sometimes slightly pubescent beneath, $2.5-10 \mathrm{~cm}$. long; peduncles and pedicels pubescent; flowers white, 4 mm . broad; fruit ovoid, black, 5 -lobed, about 6 mm . long; styles distinct. In low grounds and along streams, Conn. to Fla., Ind., Mo. and Tex. June-Aug.
2. Aralia racemòsa L. American Spikenard. Indian-root. (I. F. f. 2627.) Herbaceous, $1-2 \mathrm{~m}$. high, glabrous, or slightly pubescent. Roots large and thick, aromatic; leaves ternately or rarely quinately compound, the divisions pinnate; leaflets broadly ovate or orbicular, thin, acuminate, $5-15 \mathrm{~cm}$. long, sharply serrate; peduncles and pedicels puberulent; flowers greenish, about 2 mm . broad; fruit nearly globular, dark purple or reddish-brown, about 6 mm . in diameter; styles united below. In rich woods, N. B. to Ga., S. Dak. and Kans. July-Aug.
3. Aralia nudicaùlis L. Wild or Virginian Sarsaparilla. (I. F. f. 2628.) Acaulescent or nearly so. Rootstock long; petioles erect, i.5-3 dm. long; primary divisions of the leaf ternate, slender-stalked, pinnately $3-5$-foliolate; leaflets oval or ovate, acuminate, finely serrate, $5-13 \mathrm{~cm}$. long; umbels commonly 3 , simple; involucre none; pedicels slender; flowers greenish, 3 mm . broad; fruit globose, purplish-black, about 6 mm . long. In woods, Newf. to Manitoba, N. Car., Neb. and Mo. May-June.

Aralia nudicaùlis prolffera A. C. Apgar. Leaves more divided and umbels compound. Western N. J.

Aralia nudicaùlis elongàta Nash. Leaflets longer and narrower, gradually acuminate, coarsely serrate, paler beneath. Catskill Mountains.
4. Aralia híspida Vent. Bristly Sarsaparilla. Wild Elder. (I. F. f. 2629.) Erect, 3-9 dm. high, the stem and petioles more or less hispid with slender bristles. Leaves bipinnate; leaflets ovate or oval, acute, irregularly serrate, 2-5 cm . long; umbels slender-peduncled, simple, corymbo-racemose at the summit of the stem; flowers white, 2 mm . broad; fruit dark purple, $6-8 \mathrm{~mm}$. in diameter, strongly 5 -lobed when dry. In rocky or sandy woods and clearings, Newf. to N. Car., Ont., Minn. and Ind. June-July.

## 2. PÀNAX L.

Erect perennial herbs, with aromatic roots, and a verticil of digitately compound leaves at the summit. Umbel terminal, simple. Flowers greenish or white, polygamous. Calyx-limb obscurely 5 -toothed. Petals 5, spreading. Stamens 5 . Fruit a small drupe-like somewhat flattened berry, enclosing 2 or 3 seeds. [Greek, all-healing.] About 7 species, natives of eastern N. Am. and Asia.

Leaflets 5 , ovate or obovate, stalked, acuminate.
Leaflets 3-5, oval to oblanceolate, sessile, obtuse.

1. $P$. quinquefolium. 2. P. trifolium.
I. Panax quinquefòlium L. Ginseng. (I. F. f. 2630.) Glabrous, 2-4 dm. high. Root fusiform, deep, simple or branched. Petioles $4-10 \mathrm{~cm}$. long; leaflets 5 (rarely 6 or 7), thin, ovate or obovate, $5-13 \mathrm{~cm}$. long, irregularly dentate; peduncle slender, $2-5 \mathrm{~cm}$. long; umbel 6-20-flowered; flowers greenish yellow, about 2 mm . broad; styles usually 2 ; fruit flattened, somewhat didymous, bright crimson, 1 cm . broad. In rich woods, Quebec to Ala., Minn., Neb. and Mo. July-Aug.
2. Panax trifòlium L. Dwarf Ginseng or Ground-nut. (I. F. f. 2631.) Glabrous, $0.7^{-2} \mathrm{dm}$. high. Root globose, deep, about I cm . in diameter, pungent to the taste; petioles $\mathrm{I}-5 \mathrm{~cm}$. long; leaflets $3-5$, oval to oblanceolate, sessile, obtuse, usually narrowed at the base, $2-4 \mathrm{~cm}$. long, dentate or serrate; peduncles $2.5-6$ cm . long; pedicels $2-3 \mathrm{~mm}$. long in fruit; flowers white, often monœcious, about 2 mm . broad; styles usually 3 ; fruit mostly 3 -angled (or when with 2 styles, didymous), yellow, about 4 mm . broad. In moist woods and thickets, N. S. to Ga., Ont., Minn., Iowa and Ill. April-June.

# Family 2. UMBELLÍFERAE B. Juss.* 

Carrot Family.
Herbs, with alternate decompound compound or sometimes simple leaves, the petioles often dilated at the base. Stipules none, or rarely present and minute. Flowers small, generally in compound or simple umbels, rarely in heads or capitate clusters, often polygamous. Umbels and umbellets commonly involucrate or involucellate. Calyx-tube adnate to the ovary, its margin truncate or 5 -toothed, the teeth seldom conspicuous. Petals 5 , inserted on the margin of the calyx, usually with an inflexed tip, often emarginate or 2-lobed, those of the outer flowers sometimes larger than those of the inner. Stamens 5, inserted on the epigynous disk; filaments filiform; anthers versatile. Ovary inferior, 2celled ; styles 2, filiform, persistent, often borne on a conic or depressed stylopodium ; ovules I in each cavity, pendulous, anatropous. Fruit dry, composed of 2 carpels (mericarps), which generally separate from each other at maturity along the plane of their contiguous faces (the commissure). Fruit either flattened laterally (at right angles to the commissure), or dorsally (parallel to the commissure), or nearly terete (not flattened). Carpels after parting from each other supported on the summit of a slender axis (the carpophore), each with 5 primary ribs in their pericarps (rarely ribless), and in some genera with 4 additional secondary ones, the ribs or some of them often winged. Pericarp membranous or corky-thickened, usually containing oil-tubes between the ribs, or under the ribs and on the commissural sides, sometimes irregularly scattered, sometimes none. Seeds I in each carpel, usually adnate to the pericarp ; seed-coat thin; endosperm cartilaginous; embryo small, placed near the hilum; cotyledons ovate, oblong or linear. About 170 genera and 1600 species, of wide distribution. The mature fruit is necessary for the certain determination of most of the genera and many of the species. The following key is wholly artificial.

## * Leaves simple, undivided, sometimes slightly lobed.

Leaves narrow, mostly spiny-toothed; flowers in dense heads.
Leaves ovate and perfoliate in our species; flowers yellow.
Leaves orbicular or ovate, slender-petioled, often peltate.
Ribs of the fruit simple; leaves I at a node.
Ribs anastomosing; leaves tufted at the nodes.
Leaves reduced to hollow jointed petioles or phyllodes.
Umbels simple, few-flowered; plant low.
Umbels compound ; plant tall.
4. Eryngium.
15. Bupleurum.
r. Ilydrocotyle.
2. Centella.
21. Liliaeopsis.
42. Oxypolis.
** Leaves, or some of them, pinnate, ternate, digitate, decompound or deeply lobed. Flowers in sessile or short-stalked capitate clusters opposite the leaves.

Flowers in simple umbels; leaves pedately lobed. Flowers in dense peduncled heads; leaves sometimes bristly. Flowers in more or less compound umbels.

1. Flowers white, greenish or pink.
a. Fruit, or its beak, bristly, papillose or tuberculate.

Leaves digitately 3 3-7-parted or lobed. 3 . Sanicula.
9. Torilis.

1. Hydrocotyle.
2. Eryngium.

Leaves pinnately or ternately decompound or dissected.
Fruit linear, ribbed, long-attenuate at the base. 8. W"ashingtonia.
Fruit linear, with a beak much longer than the body.
7. Scandix.

Fruit ovoid, small, tuberculate or bristly. Carpels flattened dorsally. Seed-face concave. Ir. Afiastrum. Seed-face flat.
17. Ammoselinum.

Carpels terete, or slightly flattened laterally. 43. Spermolepis. Fruit with 4 strong bristly wings.

Fruit dorsally flattened; calyx-teeth obsolete. 48. Daucus.
Fruit laterally flattened; calyx-teeth prominent.
9. Torilis.
b. Fruit smooth, ribbed or winged, rarely pubescent.

Fruit winged, at least on the lateral ribs, dorsally flattened.
Plants acaulescent, or nearly so; leaves bipinnate or dissected.
44. Peucedanum.

Plants tall, leafy-stemmed.
Leaves simply ternate or pinnate.
Leaf-segments ovate-lanceolate to oblong.
Leaf-segments very broad.
42. Oxypolis.
45. Imperatoria.

Leaves ternately or pinnately compound; segments broad.
Segments ovate or oval, not cordate.
Bracts of the involucels setaceous or none.
38. Angelica.

Bracts of the involucels connate at base.
39. Levisticum.

Segments large, cordate, pubescent.
47. Heracleum.

Leaves $2-3$-pinnately decompound; segments narrow.
37. Conioselinum.

Fruit winged or wingless, not flattened either dorsally or laterally,
All its ribs winged.
Ribs distinct, but not winged.
Leaves finely dissected; segments narrow. 32. EEthusa.
Leaf-segments broad.
Fruit with numerous oil-tubes between the ribs.
34. Ligusticum.

Fruit with solitary oil-tubes between the ribs.
35. Coelopleurum.

Leaves entire, or with a few narrow segments. 30. Cynosciadium. Fruit laterally flattened.

Fruit broader than long, the carpels globose, attached by a very narrow commissure.
10. Bifora.

Fruit linear or linear-oblong.

Leaves 3 -foliolate.
Leaves decompound or finely dissected.
Fruit long-beaked, smooth, ribless.
Fruit short-beaked or beakless, ribbed.
Fruit ovoid or oval.
Umbels opposite the leaves.
Umbels terminal or axillary.
Leaves finely dissected into filiform segments.
Ribs of the fruit equal, prominent. 29. Ptilimnium.
Lateral ribs much thickened. 16. Apium.
Ribs filiform, inconspicuous. 22. Carum.
Leaves pinnate or decompound; segments linear to ovate-oblong.
Plants acaulescent, or nearly so.
Calyx-teeth obsolete; fruit nearly orbicular. 12. Erigenia.

Calyx-teeth prominent ; fruit oblong.
14. Musineon.

Plants leafy-stemmed.
Oil-tubes of the fruit none.
Leaves biternate with broad segments.
25. EEgopodium.

Leaves decompound into small pinnatifid segments.
13. Conium.

Oil-tubes solitary between the ribs; leaves pinnate.
20. Cicuta.

Oil-tubes numerous.
Leaves pinnately compound; segments linear.
26. Eulophus.

Leaves pinnate; the segments sometimes pinnatifid.
Tall native marsh perennials.
Oil-tubes $1-3$ in the intervals between the prominent ribs. 27. Sium.

Oil-tubes numerous and close together along inner side of the pericarp; ribs filiform. 28. Berula. Introduced plant of dry ground.
24. Pimpinella.
2. Flowers yellow or purple.
Fruit dorsally flattened.

Plants acaulescent; leaves finely dissected. 44. Peucedanum.
Plants leafy-stemmed.
Leaves pinnate; segments ovate; fruit with thin lateral wings.
46. Pastinaca.

Leaves pinnately compound; fruit-wings thick and corky.
41. Polytaenia.

Fruit not flattened; ribs or some of them winged. 36. Thaspium.
Fruit laterally flattened; leaves decompound (except in Zizia). Leaf-segments oval or ovate, entire.
23. Taenidia.

Leaf-segments crenate, lobed or incised.
Leaf-segments broad, crenate or dentate. . 19. Zizia.
Leaf-segments deeply incised.
Plant native, western; ribs of the fruit filiform.
14. Musineon.

Plant sparingly escaped from cultivation; ribs prominent.
18. Petroselinum.

Leaf-segments filiform; fruit prominently ribbed.
33. Foeniculum.

## 1. HYDROCÓTYLE L.

Perennial herbs, prostrate and commonly rooting at the joints, with palmately lobed or veined, often peltate leaves, the bases of the petioles with 2 scale-like stipules, and small white flowers in umbels opposite the leaves. Bracts of the involucre few, or none. Calyx-teeth minute. Petals entire. Disk flat. Fruit laterally compressed, orbicular or broader than high. Carpels with 5 primary ribs, the lateral ones usually curved; no large oii-tubes, but an oil-bearing layer of tissue beneath the epidermis. [Greek, water-cup.] About 75 species of wide distribution. Besides the following another occurs on the Pacific Coast.
Leaves nearly orbicular, peltate.
Umbels simple, rarely slightly proliferous; pedicels slender. I. H. umbellata.
Umbels, at least some of them, proliferous; pedicels, or some of them, short.

Fruit notched at each end. Fruit not notched at either end.
Leaves nearly orbicular, cordate, or reniform, not peltate.
Leaves 5-13-lobed; umbels nearly sessile.
Leaves 3-7-cleft; umbels long-peduncled.
2. H. Canbyi.
3. H. verticillata.
4. H. Americana.
5. H. ranunculoides.

1. Hydrocotyle umbellàta L. Umbellate or Many-flowered MarshPENNYWORT. (I. F. f. 2703.) Glabrous: stem creeping, the subterranean branches tuberiferous. Petioles slender, $2-15 \mathrm{~cm}$. long; leaves sometimes cordate at the base, 1-4 cm. wide, crenately $7-1 \mathrm{r}$-lobed, the lobes mostly crenulate; pedicels slender, $4-12 \mathrm{~mm}$. long; mature fruit notched at both ends, $2-3 \mathrm{~mm}$. broad, not quite as long; intermediate ribs corky-thickened; dorsal rib obtuse. In swamps and low grounds, eastern Mass. to Fla. and the W. Indies, Minn., Tex. and Mex. Also in S. Am. June-Sept.
2. Hydrocotyle Canbyi C. \& R. Canby's Marsh-pennywort. (I. F. f. 2704.) Stems creeping, sometimes 3 dm . long, the subterranean branches tuberiferous. Leaves $\mathbf{I}-4 \mathrm{~cm}$. wide, with $7-1 \mathbf{I}$ shallow mostly crenulate lobes; peduncles elongated; inflorescence mostly proliferous; verticils 3 -IO-flowered; pedicels 2-S mm . long; fruit about 2 mm . long and 4 mm . broad, much flattencd, the intermediate ribs corky-thickened, the dorsal one very obtuse. In moist ground, N. J. to Md. June-Sept.
3. Hydrocotyle verticillàta Thunb. Whorlfi Marsh-prowywort. (I. F. f. 2705.) Similar to the two preceding. Inflorescence proliferous, $2-5 \mathrm{~cm}$. long; verticils 2-6-flowered; pedicels usually less than 1 mm . long: fruit about 2 mm . long, $3-4 \mathrm{~mm}$. broad, rounded or truncate at each end; intermediate ribs not corkythickened, the dorsal one acute. In moist soil, Mass. to Fla., west to southern Cal., and in Central and S. Am. June-Sent.
4. Hydrocotyle Americàna L. American Marsh-pennywort. (I. F. f. 2706.) Stems creeping, often bearing small tubers; leaves reniform, $2-5 \mathrm{~cm}$. wide, with shallow lobes; umbels sessile or very nearly so, $\mathbf{1}-5$-flowered; pedicels less than 2 mm . long; fruit slightly more than I mm . broad and nearly as high, the ribs all filiform. In wet places, N. S. to Minn., Penn. and N. Car. June-Sept.
5. Hydrocotyle ranunculoìdes L. f. Floating Marsh-pennywort. (I. F. f. 2707.) Stem usually floating, rooting from the nodes, $1.5-6 \mathrm{dm}$. long. Petioles elongated, weak; leaves reniform, $2-5 \mathrm{~cm}$. wide, $3-7$-cleft, the lobes crenate; peduncles much shorter than the petioles, recurved in fruit; umbels 5-10flowered; fruit nearly orbicular, about 3 mm . broad, the ribs obscure and filiform. In ponds and swamps, Penn. to Fla., near the coast, west to Tex.; Ore. to L. Cal. Also in Cent. and S. Am., Abyssinia and Italy. June-Sept.

## 2. CENTÉLLA L.

Perennial herbs (some African species shrubby), ours with prostrate stems rooting and sending up tufts of long-petioled leaves at the nodes, together with $1-3^{-}$ long-rayed umbellets of small white flowers, the true umbel sessile. Petiole-bases sheathing. Bracts of the involucels $2-4$, mostly prominent. Calyx-teeth none. Disk flat, or slightly concave. Styles filiform. Fruit somewhat flattened laterally, rather prominently ribbed, the ribs mostly anastomosing; oil-tubes none. [Latin, diminutive of centrum, a prickle.] About 20 species, of wide distribution, most abundant in S. Africa.
I. Centella Asiática (L.) Urban. Ovate-Leaved Marsh-pennywort. (I. F. f. 2708.) Stem $2-15 \mathrm{~cm}$. long. Petioles $0.5-3 \mathrm{dm}$. long, sometimes pubescent; blades ovate, rather thick, rounded at the apex, broadly cordate at the base, not peltate, $2-4 \mathrm{~cm}$. long, repand-dentate; pedicels much shorter than the leaves, $\mathbf{x}-5 \mathrm{~cm}$. long; umbellets capitate, $2-4$-flowered, subtended by 2 ovate bracts; flowers nearly sessile; fruit $4-5 \mathrm{~mm}$. broad, about 3 mm . high, prominently ribbed and reticulated. In wet grounds, Md. to Fla., west to Tex. Also in tropical Am., Asia, Africa and Australia. June-Sept.

## 3. SANÍCULA L.

Perennial or biennial mostly glabrous herbs, with palmately 3-7-foliolate or pinnatifid leaves and small flowers in compound generally few-rayed umbels. Umbellets globose. Involucre foliaceous; involucels small. Calyx-lobes mostly persistent. Petals obovate, or narrower, emarginate. Disk flat. Fruit somewhat flattened laterally, subglobose, covered with hooked bristles in our species. Carpels not ribbed; oil-tubes usually 5. [From the Latin, to heal.] About 20 species, natives of the north temperate zone, S. Am. and S. Africa. Besides the following, about 10 others occur in the southern and western U. S.
*Perennial; some staminate flowers in separate heads; styles longer than the bristles.
Petals and anthers greenish white: calyx-segments lanceolate, cuspidate; fruit 6 mm . long.
I. S. Marylandica.

Petals and anthers yellow ; calyx-lobes ovate, obtuse ; fruit 3 mm . long, or less.
2. S. gregaria.

* Biennial; staminate flowers never in separate heads; styles shorter than the bristles.
Leaves 3 -5-divided; pedicels of staminate flowers 2 mm . long; fruit less than 4 mm . long. 6 3. S. Canadensis.
Leaves 3 -foliolate; pedicels of staminate flowers 4 mm . long; fruit 6 mm . long, or more. 4. S. trifoliata.
I. Sanicula Marylándica L. Sanicle. Black Snake-root. (I. F. f. 2664.) Rather stout, $4-12 \mathrm{dm}$. high, topped by a $2-4$-rayed umbel. Leaves firm, bluish green, the basal long-petioled, the upper sessile, 5-7-parted; segments $4-15 \mathrm{~cm}$. long, obovate to oblanceolate, serrate or dentate, often incised; involucral leaves much smaller, 3 -cleft; involucel-bracts rarely 2 mm . long; pedicels of staminate flowers 4 mm . long; calyx 2 mm . long, parted into subulate segments; petals little exceeding the calyx; fruit sessile, ovoid, the slender recurved styles longer than the stout bristles; oil-tubes 5, large; seed furrowed dorsally. In rich woods, Newf. to Alberta, Ga. and Colo. May-July.

2. Sanicula gregària Bickniell. Clustered Snake-root. (I. F. f. 2665.) Stems erect, 3-9 dm. high, umbellate-branched, the branches slender. Leaves thin, bright green, 5-divided; segments stalked, obovate-cuneate to lanceolate, acute or acuminate, doubly serrate with bristle-tipped teeth, sharply incised, mostly less than 8 cm . long; basal leaves numerous, those of the stem only 1 or 2 , petioled; involucral leaves large, 3 -parted; pedicels of staminate flowers, $2-3 \mathrm{~mm}$. long, 3 or 4 times the length of the minute campanulate calyx; calyx-lobes ovate, obtuse; petals much surpassing the calyx; fruit stipitate, broadly obovoid, 3 mm . long, the slender styles recurved; bristles very small; oil-tubes 5 ; seed not furrowed. In woods and thickets, Vt. and Ont. to Minn., Va., Kans. and Neb. May-June.
3. Sanicula Canadénsis L. Short-Styled Snake-root. (I. F. f. 2666.) Rather dull green, 3-12 dm. high, widely branched, the umbellate fruit-bearing rays only $2-10 \mathrm{~mm}$. long. Stem leafy; leaves petioled, 3 -5-divided; segments cuneate-obovate to narrowly oblong, acute, mucronate-serrate, or incised, often small; involucral leaves small, those of the involucels bract-like; staminate flowers few; calyx 1 mm . long, parted into linear-lanceolate acute lobes which exceed the minute white petals; fruit short-stipitate, subglobose; the bristles slender; oil-tubes 5; seed dorsally furrowed. In woodlands, Vt. to Fla., S. Dak. and Tex. June-Aug.
4. Sanicula trifoliàta Bicknell. Large-fruited Snake-root. (I. F. f. 2667.) Stem slender, 3-8 dm. high. Umbels of 3-5 often irregular rays $8-25 \mathrm{~mm}$. long; leaves rather bright green, thin, slender-petioled, 3 -divided; segments stalked, broadly ovate, or obovate, or the lateral ones rhomboid, acute, coarsely doubly serrate, or incised, the teeth spinulose-cuspidate; staminate flowers few; calyx 1 mm . long, its linear rigid lobes incurved, subulate; petals white, about half as long as the calyx; larger oil-tubes 2, with numerous minute ones; seed not sulcate. In hilly woods, Vt, to Ont., N. Y. and Ind. June-July.

## 4. ERÝNGIUM L.

Herbs, with spiny-toothed lobed dentate or sometimes dissected, rarely entire leaves, and bracted heads or spikes of small white or blue flowers subtended by bractlets. Calyx-teeth rigid, pungent, or acute. Petals erect. Disk expanded. Fruit scaly or tuberculate, somewhat flattened laterally. Carpels nearly terete, their ribs obsolete or none, the oil-tubes usually 5. [Greek, a kind of thistle.] About 150 species, of wide distribution. Besides the following, about 18 others occur in southern and western N. Am.
Plants erect, tall; stem-leaves spiny or bristly-margined.

Leaves elongated-linear, parallel-veined.
Leaves elongated-linear, reticulate-veined.
Stem-leaves palmately incised-pinnatifid.
Plants prostrate, slender; leaves unarmed.

1. E. aquaticum.
2. E. Virginianum.
3. E. Leavenworthiii.
4. E. prostratum.
5. Eryngium aquáticum L. Rattlesnake-master. Button SnakeROot. (I. F. f. 2660.) Stout, 6-18 dm. high, glabrous. Leaves acuminate, mostly clasping at the base, the lower sometimes I m. long and 4 cm . wide; heads stoutpeduncled, globose-ovoid, $\mathbf{r - 2} \mathrm{cm}$. long, longer than the ovate or lanceolate cuspidate bracts; calyx-lobes ovate, acute; fruit scaly, about 2 mm . long. In wet soil or upland, Conn. to S. Dak., Fla., Kans. and Tex. June-Sept.
6. Eryngium Virginiànum Lam. Virginian Eryngo. (I. F. f. 266r.) Stem glabrous, 3-9 dm. high. Upper stem-leaves linear, acuminate, sessile and clasping at the base, $5-20 \mathrm{~cm}$. long, rarely laciniate; basal and lower leaves longpetioled, the blade linear-oblong, entire, or remotely denticulate: heads suloglobose, 8-14 mm. long, equalling or shorter than the lanceolate reflexed bracts; bractlets usually 3 -cuspidate; calyx-lobes lanceolate, cuspidate; fruit scaly. In marshes near the coast, N. J. to Fla., west to Tex. July-Sept.
7. Eryngium Leavenwórthii T. \& (i. Leavenworti's Ervngo. (I. F. f. 2662.) Stout, glabrous, 3-9 dm: high. Stem-leaves sessile, palmately pimatifid into spiny-toothed segments; basal and lowest leaves oblanceolate, mostly obtuse, spinose-denticulate; heads peduncled, ovoid-oblong, $=5 \mathrm{~cm}$. long, cqualling or longer than the spinose bracts; bractlets 3-7-cuspidate, these of the upper part of the heads large and resembling the bracts; calyx-lobes pinnatifid. In dry soil, Kans. to Tex. July-Oct.
8. Eryngium prostràtum Nutt. Prostratie Eryngo. (I. F. f. 26(iz.) Prostrate, rooting from the nodes, the branches very slender. Lower and basal leaves slender-petioled, oval or oblong, mostly obtuse, entire, or crenate-dentate; stemleaves smaller, often clustered at the nodes, ovate, few-toothed, or entire, or some of them 3 -parted; heads ovoid-oblong, dense, about 6 mm . long, mostly shorter than the lanceolate reflexed bracts; bractlets very small; fruit about 1 mm . long, tuberculate. In low grounds, Ky. to Mo., Fla. and Tex. Summer.

## 5. CHAEROPHÝLLUML.

Herbs, our species annuals, with decompound leaves and small umbels of white flowers. Involucre none or rarely of 1 or 2 bracts. Involucels of numerous small bractlets. Stylopodium small, conic. Fruit oblong or linear-oblong, flattened laterally. Carpels 5 -angled, slightly flattened dorsally, the ribs slender, obtuse; oil-tubes solitary in the intervals. Seed-face channeled. [Greek, pleasant leaf, from the fragrance.] About 30 species, only the following North American.
Fruit not beaked, its ribs slender, narrower than the intervals between them.
I. C. procumbens.

Fruit beaked, its prominent ribs mostly as broad as the intervals.
2. C. Teinturieri.
I. Chaerophyllum procúmbens (L.) Crantz. Spreading Chervil. (I. F.f. 2678.) More or less pubescent, slender, spreading, 1.5-5 dm. high. Lower leaves ternately decompound, the divisions ovate, pinnatifid, the ultimate segments obtuse; umbels $2-6$-rayed; rays $2-5 \mathrm{~cm}$. long in fruit; flowers few in the umbellets; bracts of the involucels ovate; fruit glabrous, $4-5 \mathrm{~mm}$. long. In moist ground, N. Y. and Ont. to Mich., N. Car. and Kans. April-June.

Chaerophyllum procúmbens Shórtii T. \& G. Fruit broader, ovate-oblong, pubescent, blunt, or scarcely narrowed at the summit. Penn. to Ky., La. and Ark.
2. Chaerophyllum Teinturièri Hook. Teinturier's Chervil. (I. F. f. 2679.) Similar to the preceding, much branched, often taller. Ultimate leafsegments acute or obtuse; rays of the umbels $2-8 \mathrm{~cm}$. long; fruit $6-8 \mathrm{~mm}$. long, less than 2 mm . wide, glabrous, or pubescent. In dry soil, Va. to Tenn., Kans., Fla. and Tex. March-May.

## 6. ANTHRÍSCUS Hoffm.

Annual or biennial herbs, with decompound leaves, and compound umbels of white flowers. Involucre commonly none; involucels of numerous bracts. Calyxteeth obsolete or minute. Stylopodium conic or depressed. Fruit linear in our species, beaked, laterally compressed. Carpels nearly terete, ribless except at the beak; oil-tubes none. Seed-face channeled. [Greek name of this or some allied plant.] About 10 species, natives of the Old World.
I. Anthriscus Cerefòlium (L.) Hoffm. Garden Chervil or Beakedparsley. (I. F. f. 2676.) Annual, glabrous, or finely pubescent above, 4-6 dm. high. Basal and lower leaves slender-petioled, the upper nearly sessile, all ternately decompound into small segments; umbels 3 -6-rayed, the rays divergent, $1-4 \mathrm{~cm}$. long in fruit; pedicels stout, 4-6 mm . long; bracts of the involucels linearlanceolate, acuminate, about 2 mm . long; fruit 6 mm . long, glabrous and ribless, tipped with a ribbed beak of one-third its length. Eastern and southern Penn. Nat. from Europe. May-June.

Anthriscus sylvéstris (L.) Hoffm. Wild Beaked-parsley, a tall annual with glabrous beakless fruit, has been found as a waif on Staten Island, and in ballast about the seaports.

Anthriscus Anthriscus (L.) Karst. Bur-CHERVIL, readily recognized by its shortbeaked muricate fruit, has been found as a waif in N. S., according to Macoun.

## 7. SCÁNDIX L.

Annual herbs, with dissected leaves. Flowers white, in compound umbels. Involucre none, or rarely of i bract. Involucels of several bracts. Petals mostly unequal, the outer larger. Fruit linear, or linear-oblong, flattened laterally, prolonged into a beak mostly much longer than the body; primary ribs prominent; secondary ribs none; oil-tubes solitary, or wanting. Seed-face sulcate. Stylopodium short. [Greek name of the plant.] About io species, of the Old World.
I. Scandix Pécten-Véneris L. Venus'- or Lady's-comb. Shepherd'sneedie. (I. F. f. 2683.) Pubescent; stem 1.5-5 dm. high. Leaves 2-3-pinnately dissected, the lobes acute, less than 1 mm . wide; involucels of several lanceolate bracts sometimes $2-3$-lobed at the apex; flowers nearly sessile; fruiting carpels $8-12 \mathrm{~mm}$. long, terminated by a straight flat beak $4-6 \mathrm{~cm}$. long, about 2 mm . wide, its edges with stiff ascending hairs. In waste places, N. J., D. C., and in ballast about the seaports. Fugitive from Europe. May-July.

## 8. WASHINGTÓNIA Raf.

Perennial herbs from fleshy clustered roots, with decompound leaves, and fewrayed umbels of white flowers. Involucre and involucels of few narrow bracts, or none. Stylopodium small, conic. Fruit narrow, linear or oblong-linear, shortbeaked, compressed, bristly along the ribs, attenuated at the base, Carpels 5 -angular, slightly flattened dorsally, the ribs acute, nearly equal; oil-tubes obsolete or none. [In honor of George Washington.] About 15 species, of N. Am., Asia and S. Am. Besides the following about 8 others occur in the western U. S. Pubescent; style and stylopodium I mm. long or less.

Style with stylopodium I mm. long; involucel-bracts mostly present.

## Stylopodium 0.5 mm . long; involucel-bracts few or none.

 Glabrate; style and stylopodium 2 mm . long.1. W. Claytoni.
2. W. divaricata.
3. W. longistylis.
I. Washingtonia Clàytoni (Michx.) Britton. Woolly Sweet-cicely. (I. F. f. 2680.) Erect, 4-9 dm. high, villous-pubescent. Lower leaves sometimes 3 dm . wide, the segments ovate or oval, incised-dentate; umbels long-peduncled, 2-6-rayed; rays divaricate, $2-5 \mathrm{~cm}$. long in fruit; involucels of several subulate bracts; fruit about 12 mm . long, about 2 mm . wide; stylopodium slender-conic. In woods, N. S. to S. Dak., Minn., N. Car., Ill. and Kans. May-June.
4. Washingtonia longístylis (Torr:) Britton. Smoother Sweet. cicely. (I. F. f. 2681.) Similar to the preceding but only slightly pubescent, the stems and petioles at length quite glabrous; bracts of the involucels lanceolate, $6-8 \mathrm{~mm}$. long, persistent. In woods, N. S. to the N. W. Terr., Ala., Tenn. and Kans. Roots more spicy than those of W. Claytoni. May-June.
5. Washingtonia divaricàta Britton. Western Sweet-cicely. (I. F. f. 2682.) Stem 6-9 dm. high; leaf-segments thin, ovate, acute, or acuminate, coarsely toothed and usually incised, $\mathbf{I}-6 \mathrm{~cm}$. long; umbels long-peduncled, 3-6rayed, the very slender divaricate rays $5-10 \mathrm{~cm}$. long in fruit; involucels of $\mathbf{1 - 3}$ subulate bracts, or none; pedicels very slender, $4-25 \mathrm{~cm}$. long; fruit about 12 mm . long, 2 mm . wide or rather more, beaked. Manitoba to S. Dak., Br. Col. and Cal. May-June.

## 9. TÓRILIS Adans.

Annual, hispid or pubescent herbs, with pinnately decompound leaves, and compound umbels of white or reddish flowers. Calyx-teeth prominent, acute. Bracts of the involucre few and small or none. Involucels of narrow bracts. Petals mostly 2-lobed. Stylopodium thick, conic. Fruit ovoid or oblong. Primary ribs 5, filiform. Secondary ribs 4, winged, each bearing a row of barbed or hooked bristles or tubercles. Oil-tubes solitary under the secondary ribs, 2 on the commissural side. [The Greek name.] About 20 species, of the northern hemisphere.

Umbels sessile or short-stalked, capitate, opposite the leaves.
Umbels compound, peduncled; rays slender.
i. T. nodosa.
2. T. Anthriscus.
r. Torilis nodòsa (L.) Gaertn. Knotted Henge-parslfy. (1. F. f. 2633.) Decumbent and spreading. Leaves bipinnate, the segments linear-oblong, acute; rays I-3, very short; fruit sessile, ovoid, about 3 mm . long, the outer with barbed prickles on the secondary ribs, the inner with tubereles. In waste places, Pa., Md. and Iowa. Also in the Southern States, Cal., the IV. Indies and S. Am. Adventive from Europe. May-Aug. [Caucalis nodosa (L.) Huds.]
2. Torilis Anthriscus (1..) (imel. Erect Itemie-farshey. (I. F. f. 2634.) Erect, 6-9 dm. high. Leaves bipinnate, or the uppermost simply pinnate, the segments lanceolate, obtuse, dentate or pinnatifid; umbels slemder-peduncled; pedicels $2-4 \mathrm{~mm}$. long in fruit; rays $3-8$, about 1 cm . lone: fruit ovoid-oblong, densely bristly, 3-4 mm. long. In waste places, N. I. to 1). C. and Ohio. Adventive from Europe. July-Scpt. [Caucalis Anthriscius (L.) Huds.]

## 10. BÍFORA Hoffm.

Glabrous annuals, with dissected leaves and few-rayed umbels of white flowers. Involucre and involucels of few small bracts. Fruit didymous, laterally flattened, with globose glabrous hard carpels. Carpels with 4 filiform secondary ribs. Stylopodium conic. Styles recurved. Oil-tubes none. [Latin, referring to the didymous fruit.] About 4 species, natives of N. Am. and Europe.
I. Bifora Americàna (DC.) A. Gray. American Bifora. Slender, roughish above, 2-4 dm. high. Ultimate leaf-segments narrowly linear, acutish. Rays $5-8,2.5 \mathrm{~cm}$. long or less; pedicels $\mathbf{I}-3 \mathrm{~mm}$. long; carpels about 2 mm . in diameter. Mo. (according to Drude); Ark. to Tex. and N. Mex. April-May.

Bifora rádians Bieb., has been collected in waste places and ballast, in R. I. and Penn. It differs from the preceding in its larger wrinkled fruit.

## ir. APIÁSTRUM Nutt.

Annual glabrous much branched herbs, with petioled finely dissected leaves, the leaf-segments linear or filiform. Flowers very small, white, in compound unequalrayed umbels. Involucre none; involucels of a few small bracts, or none. Calyxteeth obsolete. Fruit ovate, or suborbicular, laterally flattened, tubercled, not ribbed; pericarp thin; oil-tubes few, not clustered, 2 on the commissural side. Seed-face concave. Stylopodium small. [Greek, false celery.] Two species, the following, and one in Cal.

1. Apiastrum pàtens (Nutt.) Coult. \& Rose. Spreading Apiastrum. (I. F. f. 2672.) Erect, 3-6 dm. high, divergently branched above. Stem-leaves shortpetioled, biternately dissected; umbels terminal, or axillary, $\mathbf{I}-4 \mathrm{~cm}$. broad; rays 6-12 mm. long; pedicels $3-4 \mathrm{~mm}$. long in fruit; fruit ovate, slightly more than I mm. long, more or less tuberculate, usually densely so. Neb. and Mo. to Tex. and N. Mex. June.

## 12. ERIGENİA Nutt.

Low glabrous nearly acaulescent perennial herbs, arising from a deep tuber, with ternately decompound leaves, usually a single-leaved involucre, and small umbels of white flowers. Calyx-teeth obsolete. Petals flat, entire. Fruit nearly orbicular, notched at both ends, glabrous. Carpels incurved at top and bottom, with 5 slender ribs and I-3 small oil-tubes in the intervals. [Greek, springborn.] A monotypic genus.
I. Erigenia bulbòsa (Michx.) Nutt. Harbinger of Spring. (I. F. f. 2709.) Stem scapose, $0.7-2.5 \mathrm{dm}$. high. Basal leaves 2-4, ternately divided into thin oblong obtuse segments, the involucral one similar, smaller; petioles much dilated at the base; umbels mostly compound, of $1-4$ slender rays; involucels spatulate or sometimes foliaceous; pedicels $2-5 \mathrm{~mm}$. long in fruit; fruit about 2 mm . long and 3 mm . broad. Ont. to D. C., Ala., Minn. and Kans. Feb.-April.

## 13. CONIUM L.

Tall biennial glabrous herbs, with spotted stems, pinnately decompound leaves, and small white flowers in compound many-rayed umbels. Involucre and involucels of ovate acuminate bracts. Calyx-teeth obsolete; petals obcordate, or entire with a short inflexed point; fruit broadly ovate, glabrous, somewhat flattened laterally. Carpels strongly wavy-ribbed; large oil-tubes none, but a layer of oilsecreting tissue next the deeply concave seed. [Greek, hemlock.] Two species, one of them native of Europe and Asia, the other of Africa.

1. Conium maculàtum L. Poison Hemlock. (I. F. f. 2684.) Erect, much-branched, 6-I5 dm. high. Lower and basal leaves petioled, the upper sessile or nearly so, all pinnately dissected, the leaflets ovate in outline, thin, the ultimate segments dentate, or incised; petioles dilated and sheathing at the base; umbels $2-8 \mathrm{~cm}$. broad, the rays slender, $2-4 \mathrm{~cm}$. long; pedicels filiform, $4-6 \mathrm{~mm}$. long in fruit; flowers about 2 mm . broad; fruit 3 mm . long, about 2 mm . wide, its ribs very prominent when dry. In waste places, Quebec and Ont. to Del., Ind. and Mich. Also in Cal. and Mex. Nat. from Europe. June-July.

## 14. MUSÍNEON Raf.

Low perennial resiniferous herbs, with pinnately decompound leaves, and compound umbels of yellow or white flowers. Involucre none. Bracts of the involucels few, narrow. Calyx-teeth ovate. Stylopodium small, depressed. Fruit ovate or ovate-oblong, slightly compressed laterally. Carpels somewhat 5-angled, the ribs filiform, equal; oil-tubes usually 3 in the intervals. Seed-face concave. [A name of fennel.] Three known species, natives of N. Am.
$\begin{array}{ll}\text { Stem leafy, branching; fruit about } 4 \mathrm{~mm} \text {. long. } & \text { I. M. divaricatum. } \\ \text { Plant acaulescent, tufted; fruit about } 2 \mathrm{~mm} \text {. long. } & \text { 2. M. tenuifolium. }\end{array}$

1. Musineon divaricàtum (Pursh) Nutt. Leafy Musineon. (I. F. f. 2673.) Branched, glabrous, 1.5-3 dm. high. Leaves bipinnatifid, petioled, 5-15 cm. long, the rachis narrowly winged, the segments oblong or ovate, acutish, 3 - 5 -dentate; umbels mostly long-peduncled, $2.5-6 \mathrm{~cm}$. broad, $8-25$-rayed; rays $6-25 \mathrm{~mm}$. long; flowers yellow; fruit smooth, or very nearly so. Prairies, S. Dak. to Manitoba, the N. W. Terr. and Ore. May-June.
2. Musineon tenuifòlium Nutt. Scapose Musineon. (I. F. f. 2674.) Acaulescent from a woody root, tufted, glabrous, 5-15 cm. high. Leaves decompound into lincar acute incised segments; umbel $\mathbf{I}-2.5 \mathrm{~cm}$. broad, 5 -I8-rayed; rays $4-10 \mathrm{~mm}$. long; flowers greenish white (?); fruit oblong, nearly smooth, its ribs rather prominent when dry. In dry rocky places, S. Dak., Neb. and in the Rocky Mts. June-July.

## 15. BUPLEÙRUM L.

Annual or perennial herbs, with simple entire clasping or perfoliate leaves, and compound umbels of yellow or greenish yellow flowers. Involucre none in our species. Involucels of 5 ovate mucronate bracts. Calyx-teeth obsolete. Stylopodium conic. Styles short. Fruit oblong or oval, somewhat compressed laterally. Carpels angled, with slender equal ribs; oil-tubes none in our species. Seed-face concave. [Greek, ox-ribbed, referring to the leaves.] About 65 species of wide distribution. Besides the following another occurs in northwestern Am.
I. Bupleurum rotundifòlium L. Hare's Ear. Thorough-wax. (I. F. f. 2677.) Annual, rather stiff, glabrous, pale, 3-6 dm. high. Leaves broadly ovate, or oval, mostly obtuse, mucronate, $2-4 \mathrm{~cm}$. long, perfoliate, or the lowest narrowed into a petiole; umbels 3 - 6 -rayed, the rays seldom over 8 mm . long; bracts of the involucels about as long as the rays, yellowish; fruit glabrous, about 3 mm . long. In fields, N. H. to N. Car., S. Dak., Kans. and Ark. Also in the Southwest. Nat. from Europe. July-Aug.

Bupleùrum Odontìtes L., with narrowly linear leaves, also European, has been found in waste places in Mass.

## 16. ÀPIUM L.

Annual or perennial glabrous herbs, with pinnate or pinnately compound leaves, and white flowers in compound umbels. Calyx-teeth obsolete. Petals ovate, mostly inflexed at the apex. Stylopodium depressed, or short-conic. Fruit ovate, or broader than long, smooth, or tuberculate. Carpels mostly with prominent ribs, somewhat 5 -angled: oil-tubes mostly solitary in the intervals, 2 on the commissural side. Seed terete, or nearly so. [Latin name of these or some similar plants.] About 15 species, of wide distribution. Besides the following, 2 or 3 others occur in the southern and western U. S.

| Leaf-segments broad. | I. A. graveolens. |
| :--- | :--- |
| Leaf-segments very narrow. | 2. A. leptoplevllum. |

1. Apium gravèolens L. Celery. (I. F. f. 26S8.) Glahrous; stem 3-0 dm. high. Leaves pinnate; leaf-segments 3 or 5, thin, broadly ovate to oval, coarsely toothed and often incised; umbels 3-7-rayed; involucre and involucels small, or none; flowers small, short-pedicelled; fruit oval. scarcely i mm. long, the ribs somewhat winged; oil-tubes mostly solitary in the intervals and 2 on the commissural side. In waste places, escaped from cultivation in Va. and nat. in salt marshes on the coast of Cal. Native of Europe. May-July.
2. Apium leptophyllum (DC.) F. Muell. Fine-leaved Marsh Parsley. (I. F. f. 2689.) Slender, much branched, o.7-6 dm. high. Leaves ternately pinnatisected, the ultimate segments narrow, often incised; umbels $1-4 \mathrm{~cm}$. broad, opposite the leaves; fruit ovate, glabrous, about 2 mm . long, the ribs equal and prominent. In moist grounds, N. J.; "St. Louis, Mo." (Nuttall). Common in the Southern States. Widely distributed in tropical Am. and the Old World. June-Aug.

## 17. AMMOSELİNUM T. \& G.

Low annuals, with ternately divided finely dissected leaves, and small white flowers in terminal slender-rayed umbels. Involucels of a few linear or dissected bracts. Calyx-teeth obsolete. Fruit laterally flattened, strongly ribbed, the ribs tuberculate or spinulose-tuberculate; pericarp thick and dense; oil-tubes solitary in the intervals, and 2 on the commissural side. Styles and conic stylopodium short. [Greek, sand-parsley.] Two known species, of the southwestern U. S. and Mex.
I. Ammoselinum Pòpei T. \& G. Pope's Sand-parsley. (I. F. f. 2668.) Diffusely branched, I.5-4 dm. high, the branches, rays of the umbels and pedicels rough. Lower leaves slender-petioled, the upper sessile, or nearly so, all dissected into linear segments about 1 mm . wide; involucre usually of I dissected leaf or more; longer rays of the umbels 2.5 cm . long in fruit, or less, the shorter ones often Iflowered; fruit ovate, $4-5 \mathrm{~mm}$. long, narrowed above, 2 mm . wide, or a little more, the ribs rather strongly tubercled, or even spinulose. In sandy soil, Kans. to Tex., Mex. and Ariz. April-May.

## 18. PETROSELINUM Hoffm.

Annual or biennial herbs, with 1-3-pinnate leaves, and yellow or yellowish flowers in compound umbels. Calyx-teeth obsolete. Stylopodium short-conic. Fruit ovate. Carpels with 5 filiform ribs. Oil-tubes solitary in the intervals, 2 on the commissural side. [Greek, rock-parsley.] A genus of 5 European species.
I. Petroselinum Petroselìnum (L.) Karst. Parsley. (I. F. f. 2687.) Usually biennial, 3-9 dm. high, glabrous. Leaves bipinnate, the segments ovate, dentate, or incised, or those of the upper leaves linear-oblong and entire; umbels peduncled, $2.5-6 \mathrm{~cm}$. broad, 15-20-rayed; pedicels about 3 mm . long; involucre of 2-4 linear bracts; bractlets of the involucels subulate; fruit glabrous, about 4 mm . long, the ribs rather prominent when dry. Md. to Ont., escaped from cultivation. Introduced from Europe. Summer. [Apium Petroselinum L.]
19. ZÍZIA Koch.

Perennial herbs, with ternate or ternately compound leaves, or the basal ones undivided, and compound umbels of yellow flowers. Involucre none; involucels of several small bracts. Calyx-teeth prominent. Stylopodium none. Styles elongated. Fruit ovoid, or oblong, glabrous, or nearly so, somewhat compressed, the ribs filiform, wingless; oil-tubes solitary in the intervals, with a small one under each rib. Seed-face flat. [In honor of I. B. Ziz, a Rhenish botanist.] Three species.

Basal leaves 2-3-ternately compound.
Rays of the umbel numerous, stout; fruit 4 mm . long. I. 2. aurea.
Rays of the umbel 2-12, slender; fruit about 2 mm . long. $\quad$ 2. Z. Bebbii. Basal leaves cordate, undivided; fruit about 3 mm . long.
3. Z. cordata.

1. Zizia aùrea (L.) Koch. Early or Golden Meadow-parsnip. (I. F. f. 2690 .) Glabrous, $3-8 \mathrm{dm}$. high. Basal and lower leaves 2 -3-ternately compound, the segments ovate, or ovate-lanceolate, $2-5 \mathrm{~cm}$. long, sharply serrate; upper leaves shorter-petioled, ternate; rays $9-25$, stout, ascending, $2-5 \mathrm{~cm}$. long; fruit oblong. In fields, meadows and swamps, N. B. to Ont., S. Dak., Fla. and Tex. April-June.
2. Zizia Bébbii (Coult. \& Rose) Britton. Bebb’s Zizia. (I. F. f. 269i.) Slender, ascending, 3-6 dm. high. Basal and lower leaves 2-3-ternate, the segments ovate, oblong or oval, mostly obtuse, $\mathbf{I}-2.5 \mathrm{~cm}$. long, sharply serrate; stemleaves ternate, or biternate, their segments lanceolate, generally narrower than
those of the preceding; rays $\mathbf{2 - 1 2}$, slender, divergent, $2-8 \mathrm{~cm}$. long; fruit oval, or broader than long. Mountain woods, Va. and W. Va. to N. Car. and Ga. May.
3. Zizia cordàta (Walt.) DC. Heart-leaved Alexanders. (I. F. f. 2692.) Glabrous, or somewhat pubescent, 6-9 dm. high. Basal and lower leaves broadly ovate, or orbicular, undivided, deeply cordate, sometimes $\mathbf{I} .5 \mathrm{dm}$. long, crenate; stem-leaves ternate, or rarely quinate, the segments ovate, or oval, crenate, or lobed; rays $7-16$, ascending, $2-5 \mathrm{~cm}$. long; fruit ovate, or oval. In woods, Conn. to Minn., the N. W. Terr., Ga., Mo., Wyo. and Ore. May-June.

## 20. CICÙTA L.

Erect tall perennial glabrous herbs, with pinnate or pinnately compound leaves, and terminal umbels of white flowers. Involucre of few bracts, or none; involucels many-bracted. Calyx-teeth acute. Stylopodium short-conic; fruit ovate to oblong, glabrous, slightly flattened laterally. Ribs corky, the lateral ones strongest; oil-tubes solitary in the intervals, 2 on the commissural side. Seed nearly terete. [The ancient Latin name.] About 8 species, natives of the north temperate zone and Mex. Besides the following, about 4 others occur in western N. Am.

Leaf-segments lanceolate.
Leaf-segments narrowly linear.
I. Cicuta maculàta L. Water Hemlock. Musquash Root. (I. F. f. 2694.) Stout, $9-18 \mathrm{dm}$. high, the stem marked with purple lines. Roots several, tuberiform; leaves petioled, bipinnate, or tripinnate, the lower often 3 dm . long; leafsegments coarsely and sharply serrate, their veins apparently ending in the notches; umbellets many-flowered; pedicels unequal; fruit ovate, or oval, $2-3 \mathrm{~mm}$. long. In swamps, N. B. to Manitoba, Fla. and N. Mex. Poisonous. June-Aug.
2. Cicuta bulbífera L. Bulb-bearing Water Hemlock. (I. F. f. 2695.) Slender, $3-10 \mathrm{dm}$. high. Roots few, tuberiform. Leaves 2-3-pinnate, the upper ones less divided, smaller, and bearing clustered bulblets in their axils; leafsegments linear, sparingly serrate with distant teeth; fruit broadly ovate, slightly more than 2 mm . long. In swamps, N. S. to Del., Manitoba, Ind. and Neb. JulySept.

## 2I. DÉRINGA Adans.

A perennial glabrous herb, with 3-divided leaves, and irregular umbels of white flowers. Involucre and involucels none. Calyx-teeth obsolete. Stylopodium conic; fruit oblong, laterally compressed, glabrous. Carpels nearly terete, the ribs equal, obtuse; oil-tubes solitary in the intervals and also beneath each rib. Seedface flat or nearly so. [Said to be named for Deering or Dering.] A monotypic genus of eastern N. Am. and Japan.

1. Deringa Canadénsis (L.) Kuntze. Honewort. (I. F. f. 2696.) Erect, 3-9 dm. high. Lower and basal leaves long-petioled, 3-divided, the segments thin, ovate, acute or acuminate, sharply and irregularly serrate, incised, or sometimes lobed, $2-10 \mathrm{~cm}$. long, the lateral ones nearly sessile, the terminal one abruptly narrowed into a margined incised stalk; umbels 4-10-rayed; fruit narrowed at both ends, 4-6 mm. long, often curved. In woods, N. B. to S. Dak., Ga. and Tex. June-July.

## 22. CÀRUM L.

Glabrous herbs, with pinnate or pinnatifid leaves, and small white or yellowish flowers in terminal umbels. Calyx-teeth minute. Stylopodium conic; fruit ovate, or oblong, somewhat compressed, glabrous. Carpels somewhat 5 -angled, the ribs filiform, or inconspicuous; oil-tubes solitary in the intervals and 2 on the commissural side. Seed dorsally flattened, its face flat or slightly concave. [Cireek. caraway.] About 50 species, natives of temperate and warm regions. Besides the following, about 4 others occur in western N. Am.

1. Carum Càrui L. Caraway. Carvies. (I. F. f. 2603 .) Biennial or sometimes perennial, $3^{-6 ~ d m}$. high. Leaves pinnatisceted into linear or filiform segments; involucre of I-3 linear bracts, or none; involucels commonly none; umbels

7-10-rayed; rays I-5 cm. long in fruit; fruit oblong, usually slightly curved, about 4 mm . long, the ribs conspicuous when mature. Occasional in waste places, Newf. to S. Dak., Penn. and Colo. Adventive from Europe. May-July.

## 23. TAENÍDIA Drude.

A glabrous perennial herb, with $2-3$-ternate leaves and compound umbels of yellow flowers. Involucre and involucels none. Calyx-teeth obsolete. Stylopodium broadly conic. Fruit oval, more or less compressed. Carpels obscurely 5 -angled with slender equal distant ribs; oil-tubes numerous, $2-6$ in the intervals. Seed-face flat or slightly convex. A monotypic genus.
I. Taenidia integérrima (L.) Drude. Yellow Pimpernel. (I. F. f. 2670.) Erect, somewhat glaucous, 3-9 dm. high. Leaves $2-3$-ternate, the upper with short dilated petioles, the lower long-petioled; segments ovate, oval, or lanceolate, obtuse, or acutish and often mucronulate at the apex, entire, $1-2.5 \mathrm{~cm}$. long; rays $10-20$; pedicels slender; fruit oval, about 4 mm . long. In rocky or sandy soil, Quebec to N. Car., Ont., Minn., Kans. and Miss. May-June. [Pimpinella integerrima A. Gray.]

## 24. PIMPINÉLLA L.

Perennial herbs, mostly with ternately compound leaves and white flowers in compound umbels. Involucre and involucels none in our species. Stylopodium broadly conic. Fruit oval to ovate, compressed. Carpel-ribs slender. Oil-tubes 2-6 in the intervals. About 75 species, natives of the Old World.

1. Pimpinella Saxífraga L. Bennet. Pimpernel. (I. F.f. 2671.) Erect, 3-6 dm. high. Leaves pinnate; segments of the lower 9-19, sharply serrate, or incised, ovate, or nearly orbicular, $1.5-2.5 \mathrm{~cm}$. long; umbels $7-20$-rayed; rays $2-4 \mathrm{~cm}$. long in fruit; fruit oval. In waste places, N. Y., Penn., N. J. and Ohio. Adventive from Europe. June-Oct.

## 25. AEGOPÒDIUM L.

Perennial herbs, with 1-2-ternate leaves, and compound umbels of white fowers. Bracts of the involucre and involucels none, or rarely few and early deciduous. Calyx-teeth obsolete. Stylopodium thick, conic. Fruit ovate-oblong, glabrous, somewhat compressed. Carpels obscurely 5 -angled, the ribs equal, distant; oil-tubes none. [Greek, goat-foot.] Two species, of Europe and Asia.
I. AEgopodium Podagrària L. Goutweed. Goutwort. Herb-Gerard. (I. F. f. 2702.) Erect, glabrous, 4-7 dm. high. Basal and lower leaves biternate, the primary divisions stalked, the segments ovate, acute, or acuminate at the apex, rounded, or cordate at the base, sharply serrulate, $3-8 \mathrm{~cm}$. long; umbels long-peduncled, $9-25$-rayed; rays 2.5 cm . long in fruit or more; fruit about 4 mm . long, scarcely 2 mm . wide, the styles deflected. In waste places, Mass. to Penn. and Del. Adventive from Europe. June-Aug.

## 26. EÙLOPHUS Nutt.

Perennial glabrous herbs, with deep tuberous roots, ternately compound leaves, and long-peduncled compound umbels of white or pinkish flowers. Involucre generally of I bract, sometimes none. Involucels of several bracts. Calyx-teeth usually prominent. Stylopodium conic. Styles recurved. Fruit glabrous, linear to oblong in our species; ribs filiform, with I-5 oil-tubes in the intervals. Seedface concave. [Greek, well-plumed.] About 5 species, natives of N. Am.

1. Eulophus Americànus Nutt. Eastern Eulophus. (I. F. f. 2675.) Erect, 9-15 dm. high. Basal and lower leaves large, long-petioled; segments linear; umbels $7-10 \mathrm{~cm}$. broad, the rays $6-12$, very slender, $5-10 \mathrm{~cm}$. long; involucels of narrowly lanceolate acuminate bracts; pedicels almost filiform, $8-16 \mathrm{~mm}$. long in fruit; flowers whitish (?); fruit oblong, 4-6 mm. long. In dry soil, Ohio to Kans., 'Tenn. and Ark. July.
2. SİUM L.

Perennial marsh herbs, with simply pinnate stem-leaves, the lower and basal ones often pinnatisected, and large umbels of white flowers. Involucre and
involucels of numerous narrow bracts. Calyx-teeth minute. Styles short. Fruit ovate or oval, somewhat compressed. Carpels with prominent ribs; oil-tubes I-3 in the intervals. Sced-face flat. [Greek name of a marsh plant.] About 8 species, natives of the north temperate zone and South Africa.
Plant stout, $6-18 \mathrm{dm}$. high; leaf-segments 7-17.

1. S. cicutaefolium.
Plant weak, 3-9 dm. high; leaf-segments 3-7.
2. S. Carsoni.
3. Sium cicutaefòlium Gmel. Hemlock Water-parsnip. (I. F. f. 2685.)

Erect, stout. Lower leaves long-petioled, the uppermost nearly sessile; leaf-segments linear, or lanceolate, $3-13 \mathrm{~cm}$. long, $3-25 \mathrm{~mm}$. wide, acuminate, sharply serrate; or the lowermost pectinately dissected; umbels $8-20$-rayed; rays $1-4 \mathrm{~cm}$. long; fruit ovate, compressed, about 3 mm . long. In swamps, N. S. to Br. Col., Fla., La. and Cal. Very variable in leaf-form. July-Oct.
2. Sium Carsoni Durand. Carson's Water-parsnip. (I. F. f. 2686.) Stem slender, 3-6 dm. long. Leaf-segments 3-7, those of the upper leaves linear, or lanceolate, acute, or acuminate, $2-5 \mathrm{~cm}$. long, 3-6 mm. wide, sharply serrate; lower leaves often floating and very thin, the segments broader and laciniate, or dissected; umbels 7 -15-rayed; rays $\mathbf{1 - 2 . 5} \mathbf{c m}$. long in fruit. In streams, Me. to R. I. and Penn. July-Aug.

## 28. BÉRULA Hoffm.

A glabrous aquatic or marsh perennial, with pinnate leaves, serrate or sometimes incised leaf-segments, and terminal compound umbels of white flowers. Involucre and involucels of several narrow bracts. Calyx-teeth very small. Stylopodium conic; styles short. Fruit subglobose, slightly flattened laterally, glabrous, the ribs very slender, the pericarp thick and corky; oil-tubes numerous and close together along the inner side of the pericarp. Seed-face flat. [Latin name of the watercress.] A monotypic genus of the north temperate zone.
I. Berula erécta (Huds.) Coville. Cut-leaved Water-parsnip. (I. F.f. 270I.) Erect, rather stout, much branched, 1.5-9 dm. high. Leaflets 7-19, ovate, oval, or linear-oblong, deeply serrate, laciniate, or lobed, $\mathbf{I}-3.5 \mathrm{~cm}$. long, 4-10 mm . wide, those of the upper leaves commonly more laciniate than those of the lower; umbels numerous, short-peduncled, ro-20-rayed; rays $1-6 \mathrm{~cm}$. long in fruit; pedicels $3-6 \mathrm{~mm}$. long; fruit less than 2 mm . long, nearly orbicular, somewhat cordate at the base, the ribs inconspicuous. In swamps and streams, southern Ont. to Br. Col., south to Mass. (?), N. Y., Ill., Kans., in the Rocky Mts. to N. Mex. and to Cal. Also in Europe and Asia. July-Sept.

## 29. PTILÍMNIUM Raf.

Annual glabrous herbs, with dissected leaves, and compound umbels of white flowers. Bracts of the involucre filiform or dissected in our species. Calyx-teeth obsolete. Petals obovate, the apex inflexed. Stylopodium conic; fruit ovate, slightly compressed, glabrous. Carpels dorsally compressed, the dorsal and intermediate ribs prominent, slender, the lateral ones thick and corky; oil-tubes solitary in the intervals. Seed-face flat. [Greek, referring to the finely divided leaves.] Besides the following, another occurs in Texas and one in the East Indies.
$\begin{array}{ll}\text { Involucral bracts mostly pinnate; fruit } 2-3 \mathrm{~mm} \text {. long. } & \text { 1. P. capillaceum. } \\ \text { Involucral bracts short, entire; fruit } 1-1.5 \mathrm{~mm} \text {. long. } & \text { 2. P. Nuttallii. }\end{array}$

1. Ptilimnium capillàceum (Michx.) Raf. Mock Bishor-weed. (I. F. f. 2699.) Slender, 3-6 dm. high. Leaves finely dissected into filiform segments; involucral bracts or some of them pinnately parted; involucels of several linear bracts; umbels $5-10 \mathrm{~cm}$. broad, 5-20-rayed; fruit ovate, acute. In wet soil, especially brackish meadows, Mass, to Fla., west to Tex. June-Oct.
2. Ptilimnium Nuttàllii (DC.) Britton. Nutrati's Mock Bishop-iveed. (I. F. f. 2700.) Similar to the preceding, but generally stouter, 0-o dm. high, the branches nearly erect. Umbels 7-25-rayed; bracts of the involucre linear, entire, short, those of the involucels minute; fruit ovate-orbicular, obtusish. In swamps, Ill. to Kans., La. and Tex. May-Sept.

## 30. CYNOSCIÀDIUM DC.

Glabrous annuals, the lower and basal leaves mostly linear and entire, those of the stem mainly divided into few linear segments. Involucres and involucels of several subulate or narrowly linear bracts. Flowers small, white, in compound umbels. Calyx-teeth short, persistent. Fruit ovoid, or oblong, nearly terete, strongly ribbed, the lateral ribs the larger; oil-tubes solitary in the intervals and 2 on the commissural side of each carpel. Seed-face flat. Stylopodium conic. [Greek, dog-celery.] Two known species, natives of the southern U. S.
I. Cynosciadium pinnatum DC. Pinnate Cynosciadilm. (I. F. f. 2659.) Stem 3-6 dm. high. Lower and basal leaves petioled, the blade elongated-linear, entire, acuminate or acute at each end, $2-8 \mathrm{~cm}$. long; stem-leaves pinnately divided into 3-9 linear entire segments, the terminal segment much larger than the lateral ones, or some of them entire; bracts $4-6 \mathrm{~mm}$. long; umbels 4-Io-rayed; rays very slender; fruit about 4 mm . long, less than 2 mm . wide, crowned by the ovate calyx-teeth. In wet soil, Mo. to the Ind. Terr. and Tex. May-Aug.

OEnanthe aquática (L.) Poir., a tall usually aquatic herb with finely dissected leaves, the umbels mostly opposite them, the involucre wanting and the involucels of small bracts, has been found as a fugitive at Washington, D. C. [OE. Phellandrium Lam.]

## 3r. LILAEÓPSIS Greene.

Small creeping glabrous perennial marsh herbs, the leaves reduced to linear terete septate hollow petioles, with simple umbels of white flowers. Bracts of the involucre several, small. Calyx-teeth acute. Stylopodium conic. Fruit glabrous, globular, somewhat flattened laterally. Carpels nearly terete, the dorsal and intermediate ribs filiform, the lateral ones much larger and corky-thickened. the commissural faces each with a corky longitudinal projection; oil-tubes solitary in the intervals. Seed terete. [Greek, resembling the genus Lilaea.] A small genus of wide distribution.
I. Lilaeopsis lineàta (Michx.) Greene. Lilaeopsis. (I. F. f. 2658.) Rooting in the mud, $5-13 \mathrm{~cm}$. long. Petioles linear-spatulate, obtuse, generally 2-8 cm . long, but sometimes longer, about 3 mm . thick; peduncles somewhat exceeding the leaves; umbels 5 -Io-rayed, the rays $3-6 \mathrm{~mm}$. long; fruit about 2 mm . long. In salt and brackish marshes, and on river-shores, N. H. to Fla., west to Miss. June-Aug.

## 32. AETHUSA L.

Annual glabrous herbs, with pinnately dissected leaves, and compound umbels, both terminal and opposite the leaves. Involucre none, or of a single bract. Bracts of the involucels 1-5, setaceous, turned to one side. Calyx-teeth obsolete. Stylopodium broad, thick. Fruit globose-ovoid, glabrous. Carpels dorsally compressed, the ribs prominent, corky, acute, nearly equal; oil-tubes solitary in the intervals. Seed-face flat. [Greek, burning, from the sharp taste.] A monotypic genus of Europe and Asia.
I. AEthusa Cynàpium L. Fool's Parsley. (I. F. f. 2656.) Erect, leafy, dichotomously branched, 3-8 dm. high. Leaves 2-3-pinnate; petiole-bases dilated; ultimate segments linear, acutish; umbels long-peduncled, $5-8 \mathrm{~cm}$. broad in fruit, 8 -12-rayed; pedicels $2-8 \mathrm{~mm}$. long; fruit about 3 mm . long. In waste places, N . S. to N. J. and Minn. Poisonous. Adventive from Europe. June-Sept.

## 33. FOENÍCULUM Adans.

Erect glabrous herbs, with pinnately decompound leaves, the segments linear or capillary, and compound umbels of yellow flowers. Involucre and involucels none. Calyx-teeth obsolete. Stylopodium large, conic. Fruit linear-oblong, glabrous, terete, or nearly so. Carpels half-terete, dorsally flattened, prominently ribbed; oil-tubes solitary in the intervals. Seed-face flat, or slightly concave. [Latin, diminutive of foenum, hay, from its odor.] About 4 species, of the Old World.
I. Foeniculum Foenículum (L.) Karst. Fennel. (I. F. f. 2669.) Perennial, 6-I2 dm. high. Leaves dissected into capillary segments; petioles broad, clasping; umbels large, 9-25-rayed, the rays rather stout, somewhat glaucous, $2-8 \mathrm{~cm}$. long in fruit; pedicels $2-8 \mathrm{~mm}$. long; fruit about 6 mm . long. In waste
places, N. J. and Penn. to Va. and La. Escaped from gardens. Adventive from Europe. July-Sept.

Anethum gravéolens L., Dillweed, similar to Fennel, but with the fruit somewhat flattened dorsally, and the root annual or biennial has been found in waste places at Wilmington, Del.

## 34. LIGÚSTICUM L.

Perennial glabrous herbs, with aromatic roots, ternately compound leaves, and large compound umbels of white flowers. Involucre of several narrow mostly deciduous bracts. Involucels of numerous linear bracts. Calyx-teeth obsolete. Stylopodium conic. Fruit oblong or ovoid, scarcely flattened. Carpels dorsally compressed, the ribs prominent, acute, separated by broad intervals; oil-tubes 2-6 in the intervals. Seed-face flat or slightly concave. [Named from Liguria, where Lovage abounds.] About 20 species, natives of the northern hemisphere. Besides the following, some 7 others occur in western N. Am.
Leaves thin; fruit ovoid; southern species. I. L. Canadense.
Leaves fleshy ; fruit oblong; northern seacoast species.
2. L. Scoticum.
I. Ligusticum Canadénse (L.) Britton. Nondo. Angelico. (I. F. f. 2654.) Stout, o.6-1. 8 m . high. Leaves thin, the lower and basal petioled, often 3 dm . wide, their primary divisions ternate; segments ovate, or oval, $4^{-13} \mathrm{~cm}$. long, acute, rounded at the base, coarsely serrate, or those of the uppermost leaves linear-lanceolate and entire; umbels mostly twice-compound, sometimes 2.5 dm . broad; bracts of the involucre $2-6$, linear; pedicels $2-4 \mathrm{~mm}$. long in fruit; fruit ovoid, 4-6 mm. long, with prominent slightly winged ribs; oil-tubes 3 or 4 in the intervals; seed angled on the back. In rich woods, southern Penn. to Ga., Mo. and Ky. June-Aug.
2. Ligusticum Scóticum L. Scotch Lovage. Sea Parsley. (I. F. f. 2655.) Stem 2.5-9 dm. high. Leaves mostly biternate, the segments broadly obovate or oval, $2-10 \mathrm{~cm}$. long, shining, dentate; umbels $5-10 \mathrm{~cm}$. broad in fruit; pedicels $4-10 \mathrm{~mm}$. long; fruit oblong, $6-10 \mathrm{~mm}$. long, the ribs prominent and somewhat winged; seed rounded on the back. Along salt marshes, Conn. to Lab. and the lower St. Lawrence River. Also on the Pacific coast and the shores of northern Europe and Asia. July-Aug.

## 35. COELOPLEÙRUM Ledeb.

Stout and tall maritime perennials, with large 2-3-ternate leaves, inflated petioles, and compound umbels of greenish white flowers. Involucre of a few linear deciduous bracts, or none. Involucels of numerous linear bracts. Calyxteeth obsolete. Stylopodium depressed. Fruit oblong, scarcely flattened; dorsal and intermediate ribs prominent, corky-thickened, the lateral ones slightly broader, acute, but not winged; oil-tubes solitary in the intervals, I or 2 under each rib and $2-4$ on the commissural side. Seed loose in the pericarp, its face flat or slightly concave. [Greek, hollow-ribbed.] Two species, one widely distributed in the northern hemisphere, the other on our northwestern coast.
I. Coelopleurum Gmélini (DC.) Ledeb. Seacoast Angelica. (I. F. f. 2657.) Branching, 6-9 dm. high, the umbels and upper part of the stem puberulent. Lower leaves large, $2-3$-ternate, the segments thin, ovate, acute or acuminate, sharply dentate and incised, $3-6 \mathrm{~cm}$. long; umbels $7-1_{3} \mathrm{~cm}$. broad, 10-25-rayed; pedicels slender, $6-\mathbf{1 2} \mathrm{mm}$. long; fruit $5-7 \mathrm{~mm}$. long. Seacoast, Greenland to Mass., on the lower St. Lawrence River and the Pacific coast. Also on the coasts of eastern Asia. Summer.
36. THÁSPIUM Nutt.

Perennial herbs, with ternate or ternately compound leaves, or the basal ones sometimes undivided, and compound umbels of yellow or purple flowers. Involucre none, or of $1-3$ bracts. Involucels of several small hacts. Calyx-teeth prominent, acute. Stylopodium none. Style slender. Fruit ovoid or oblong, glabrous or nearly so, scarcely flattened. Carpels somewhat dorsally thattened. the ribs or at least some of them strongly winged; oil-tubes solitary in the intervals. Seed-face flat. [Name from the island Thapsus.] About 3 species, natives of eastern N. Am.

Leaves mostly ternate; segments crenate, thickish.
Leaves mostly biternate; segments incised or lobed, rather thin. Segments ovate, incised.
Segments pinnatifid into oblong lobes.

1. T. trifoliatum.
2. T. barbinode.
3. T. pinnatifidum.
I. Thaspium trifoliàtum (L.) Britton. Purple Meadow-parsnip. (I. F. f. 265 I.) Glabrous; stems 3-6 dm. high. Upper stem-leaves short-petioled, ternate, or rarely biternate, the segments ovate or ovate-lanceolate, $2-5 \mathrm{~cm}$. long; basal leaves long-petioled, sometimes undivided; umbels $2-5 \mathrm{~cm}$. broad; petals dark purple; fruit nearly 4 mm . long, all the ribs usually winged. In woods, $R$. I. to N. J., Tenn. and Mo. June-July.

Thaspium trifoliàtum aùreum (Nutt.) Britton. Flowers yellow. Range of the type.
2. Thaspium barbinòde (Michx.) Nutt. Hairy-Jointed Meadow-parsnip. (I. F. f. 2652.) Erect, 6-12 dm. high, pubescent at the joints and sometimes also on the shoots and rays of the umbels. Leaves petioled, mostly bipinnate; segments acute, incised-serrate or cleft, $2-5 \mathrm{~cm}$. long; umbels $2-5 \mathrm{~cm}$. broad; flowers light yellow; fruit nearly 6 mm . long, usually glabrous, 7 of the ribs commonly broadly winged. Along streams, Ont. to Minn., Kans., Fla., Ky. and Ark. MayJune.

Thaspium barbinòde angustifòlium Coult. \& Rose. Leaf-segments more sharply cleft into narrower lobes; fruit puberulent. Penn. to W. Va. and Ill.
3. Thaspium pinnatífidum (Buckl.) A. Gray. Cut-leaved Meadowparsnip. (I. F. f. 2653.) Divergently branched, 6-12 dm. high, more pubescent than the preceding. Leaves ternately pinnatifid into numerous oblong or linearoblong lobes, the basal ones long-petioled and very large; flowers light yellow; fruit $3-5 \mathrm{~mm}$. long, puberulent, all the ribs winged, but 7 of the wings broader than the other 3. In woods and copses, Ky. to N. Car. and Tenn. June.

## 37. CONiOSELİNUM Hoffm.

Perennial glabrous branching herbs, with decompound leaves, and compound umbels of white flowers. Involucre none, or of a few short bracts. Involucels of narrowly linear bracts. Calyx-teeth obsolete. Stylopodium depressed-conic. Fruit oval or oblong, dorsally flattened. Carpels with prominent approximate dorsal and intermediate ribs, the lateral ones broadly winged. Oil-tubes mostly 2 or 3 in the intervals, and $4^{-8}$ on the commissural side. Seed-face slightly concave, its back strongly convex. [Greek, hemlock-parsley.] Besides the following, some 3 others occur in western N. Am.
I. Conioselinum Chinénse (L.) B.S.P. Hemlock-parsley. (I. F. f. 2638.) Stem terete, 6-15 dm. high. Leaves decompound into linear-oblong acutish segments; petioles sheathing; umbels $5-8 \mathrm{~cm}$. broad, 9-16-rayed; rays $3-6 \mathrm{~cm}$. long; pedicels slender, $4^{-6} \mathrm{~mm}$. long; fruit broadly oval, about 4 mm . long. In cold swamps, Lab. to Mass., N. Y., N. Car., Minn., Wis. and Ind. Aug.-Sept.

## 38. ANGÉLICA L.

Tall perennial herbs, with compound leaves and large umbels of white flowers (in our species). Involucre none, or of a few small bracts. Involucels of several small bracts, or sometimes wanting. Stylupodium depressed. Fruit ovate or oval, dorsally compressed. Dorsal and intermediate ribs prominent, the lateral ones broadly winged. Oil-tubes solitary or several in the intervals, 2-10 on the commissural side. [Named for its supposed healing virtues.] About 30 species, of the northern hemisphere and New Zealand. Besides the following, some 13 others occur in southern and western N. Am.
Umbels glabrous, or nearly so; leaf-segments acute or acutish.
Oil-tubes ( (rarely 2-3) in the intervals; wings broader than the carpels

1. A. Curtisii.

Oil-tubes numerous and contiguous; wings narrower than the carpels.
2. A. atropurpurea. Umbels densely tomentose; leaf-segments obtuse.
3. A. villosa.
I. Angelica Curtísii Buckl. Curtis' Angelica. (I. F. f. 2635.) Plant 6-10 dm. high. Leaves biternate, the lower long-stalked, the divisions pinnate,
the upper mostly reduced to inflated petioles; segments sharply and irregularly dentate or incised, $5-10 \mathrm{~cm}$. long; umbels $7-15 \mathrm{~cm}$. broad, $9-25$-rayed; rays $4-8 \mathrm{~cm}$. long; pedicels $8-\mathbf{1 2} \mathrm{mm}$. long; fruit oval, glabrous, $4-6 \mathrm{~mm}$. long, emarginate at the base. In woods, Penn. to N. Car. and Ga. Aug.-Sept.
2. Angelica atropurpùrea L. Great or Purple-stemmed Angelica. (I. F. f. 2636.) Stout, I-2 m. high, glabrous, or the umbel slightly rough-hairy. Lower leaves often 6 dm . wide, biternate and the divisions pinnate, the upper ones smaller, all with broad dilated petıoles; segments oval or ovate, serrate and often incised, $3-5 \mathrm{~cm}$. long; umbels sometimes 2.5 dm . broad, $9-25$-rayed, the rays $5-10 \mathrm{~cm}$. long; fruit broadly oval, $6-8 \mathrm{~mm}$. long, slightly emarginate at the base. In swamps and moist ground, Lab. to Minn., Del. and Ill. June-July.

3 Angelica villosa (Walt.) B.S.P. Pubescent Angelica. (I. F. f. 2637.) Rather slender, 6-12 dm. high, the umbels and upper part of the stem tomentosecanescent. Lower leaves ternate or biternate, the divisions pinnate, the segments thick, oval, rather finely dentate, obtuse or obtusish, $2-5 \mathrm{~cm}$. long; upper leaves mostly reduced to sheathing petioles; umbels $5-10 \mathrm{~cm}$. broad, $7-30$-rayed; rays $2-4 \mathrm{~cm}$. long; fruit broadly oval, emarginate at the base, 6 mm . long, finely pubescent; lateral wings about as broad as the carpels; oil-tubes generally 3-6 in the intervals. In dry soil, Conn. to Fla., Minn., Tenn. and Mo. July-Aug.

Angelica sylvéstris L., of Europe, similar to the preceding; but with acute or acutish leaf-segments, their teeth acuminate, is reported as occurring on Cape Breton Island.

## 39. LEVÍsticum Koch.

A perennial herb, with decompound leaves, the segments broad, cuneate, and large umbels of whitish yellow flowers. Involucre and involucels of numerous narrow bracts. Fruit ovate-oblong, somewhat flattened dorsally; primary ribs winged; oil-tubes solitary in the intervals. A monotypic genus.

1. Levisticum Levísticum (L.) Karst. Lovage. Glabrous, tall. Leaves I-3-pinnately divided, the segments $5-10 \mathrm{~cm}$. long, acute, deeply cleft or those of the upper leaves entire; umbels 7 -10 cm. broad. In waste places, Vt., Conn. and N. Y. [Ligusticum Levisticum L.]

## 40. CYMÓPTERUS Raf.

Perennial subscapose herbs, with thick roots, pinnately decompound leaves, and white flowers (in our species) in peduncled umbels. Involucels of I to numerous bracts. Calyx-teeth rather prominent. Stylopodium depressed or wanting. Carpels dorsally flattened, with $3-5$ flat equal wings; oil-tubes several or solitary in the intervals. [Greek, wave-winged, referring to the fruit.] About 13 species, natives of western and central N. Am.

Involucre none.
Involucre prominent.
I. Cymopterus acaùlis (Pursh) Rydberg. Plains Cymopteris. (I. F. f. 2649.) Stem seldom over 2.5 cm . high. Leaves $0.7-2 \mathrm{dm}$. long, slender-petioled. pinnate or bipinnate into linear-oblong obtuse segments; umbels slender-peduncled. capitate, 2.5 cm . broad or less; rays $2-5 \mathrm{~mm}$. long; involucre none; involucel of : single palmately-lobed bractlet; fruit broadly oval, about 6 mm . in diameter; oil-tubes 4 or 5 in the intervals. In dry soil, Minn. and Wis. to Ark., the N. II: Terr., Br. Col. and Colo. April-May.
2. Cymopterus montanus T. \& G. Mountain Cymopteris. (I. F. f. 2650.) Similar to the preceding, somewhat glaucous, or very slighty pubescent. Leaves $2-15 \mathrm{~cm}$. high, pinnate, or bipinnate. the segments oblong, obtuse: peduncles stout, $2-15 \mathrm{~cm}$. high; involucre and involucels of broad membranous somewhat united veined bracts; umbels $2-5 \mathrm{~cm}$. broad in fruit; rays several. o is mm . long; fruit ellipsoid, $6-12 \mathrm{~mm}$. long, the carpels broadly ; 5 -winged; oiltubes $1-3$ in the intervals. Dry soil, S. Dak. to Wyo. and Tex. March-April.
41. POLYTAENIA DC.

Perennial, nearly glabrous herbs, with pinnately decompound leaves, and compound umbels of yellow flowers. Involucre none, or rarely of 1 or 2 linear bracts.

Involucels of a few subulate deciduous bracts. Calyx-teeth prominent, triangular. Petals obovate-cuneate, with a long incurved tip. Stylopodium none. Fruit oval or obovate, flattened dorsally, thick and corky; dorsal and intermediate ribs obscure, the lateral ones with thick wings which form a broad margin to the fruit, and are nerved toward the outer margin; oil-tubes $12-18$, contiguous, with numerous smaller ones irregularly disposed in the thick pericarp. Seed flat. [Greek, many-fillets, or oil-tubes.] A monotypic genus.
I. Polytaenia Nuttallii DC. Polytaenia. (I. F. f. 2644.) Stem slightly scabrous, leafy, 3-9 dm. high; roots fusiform. Leaves pinnate, the segments deeply pinnatifid or parted, $2-8 \mathrm{~cm}$. long, the lobes ovate, oblong or obovate; umbels 6 -12-rayed, $2.5-6 \mathrm{~cm}$. broad; rays scabrous, $\mathrm{I}-6 \mathrm{~cm}$. long; pedicels finely pubescent, $2-4 \mathrm{~mm}$. long; fruit glabrous, $6-10 \mathrm{~mm}$. long, 1 mm . thick, the margins obtuse, the central part of both carpels depressed when dry. Dry soil, Mich. and Wis. to Tenn., Kans., Tex. and La. April-May.

## 42. OXÝPOLIS Raf.

Perennial glabrous marsh herbs, from clustered tuberous roots, with pinnate or ternate leaves, or in one species the leaves reduced to hollow jointed phyllodes, and compound umbels of white flowers. Involucre none, or of a few linear bracts. Involucels of small bracts, or none. Calyx-teeth acute. Stylopodium thick, conic. Fruit glabrous, dorsally compressed, oval or obovate; dorsal and intermediate ribs slender, the lateral ones winged, strongly nerved along the inner margin of the wing, the carpels appearing as if equally 5 -ribbed. Oil-tubes solitary in the intervals, $2-6$ on the commissural side. Seed-face nearly flat. Four known species, natives of N. Am.
Leaves all reduced to hollow usually jointed phyllodes. I. O. filiformis. Leaves pinnate; leaflets linear or lanceolate.
2. O. rigida.
I. Oxypolis filifórmis (Walt.) Britton. Oxypolis. (I. F. f. 2639.) Stem hollow, 6-12 dm. high. Leaves $2.5-45 \mathrm{~cm}$. long; involucre of several linearsubulate bracts; umbels $4-10 \mathrm{~cm}$. braad, $6-15-\mathrm{rayed}$; rays $\mathrm{I}-5 \mathrm{~cm}$. long; pedicels $4^{-8} \mathrm{~mm}$. long; fruit oval, or slightly obovate, 4-6 mm. long; oil-tubes large. In ponds and swamps, southern Va. to Fla., west to La. Aug.-Sept. Plants collected in Delaware, referred to this species, differ in having broadly oval corky-winged fruit, an inconspicuous disk, slender conic stylopodium and smaller oil-tubes.
2. Oxypolis rígidus (L.) Raf. Cowbane. Hemlock. (I. F. f. 2640.) Rather slender, $6-12 \mathrm{dm}$. high. Leaves petioled, simply pinnate, the lower often 3 dm . long or more; leaflets thick, ovate-lanceolate, lanceolate or oblong, entire, or remotely dentate, $3-8 \mathrm{~cm}$. long; involucre of $1-4$ bracts, or none; umbels $5-10 \mathrm{~cm}$. broad, $7-25$-rayed; rays slender, $2-10 \mathrm{~cm}$. long; pedicels $4-18 \mathrm{~mm}$. long; fruit oval, $5-6 \mathrm{~mm}$. long, $3-4 \mathrm{~mm}$. broad; oil-tubes small. In swamps, N. Y. to Fla., Minn., Mo. and La. Aug.-Sept.

Oxypolis rígidus longifolius (Pursh) Britton. Leaflets elongated-linear, entire, 2-3 mm . wide ; fruit smaller. N. J. to S. Car. and Tenn.

## 43. SPERMÓLEPIS Raf.

Glabrous slender annuals, the branches often nearly filiform, with dissected petioled leaves, the leaf-segments narrowly linear. Flowers small, white, in un-equal-rayed umbels. Involucre none; involucels of a few narrow bracts, or none. Calyx-teeth obsolete. Fruit ovate, laterally flattened, tuberculate or bristly; pericarp thick; oil-tubes solitary in the intervals or also under the ribs, 2 on the commissural side. Stylopodium short, conic. Two species, of the southern U. S.

Fruit tubercled.
Fruit covered with hooked bristles.

1. S. divaricatus.
2. S. echinatus.
I. Spermolepis divaricàtus (Walt.) Raf. Rough-fruited Spermolepis. (I. F. f. 2697.) Similar to Apiastrum patens, but more slender and more widely branching. Rays of the umbels almost filiform, $\mathbf{I}-4 \mathrm{~cm}$. long, divaricate; pedicels 6-I2 mm . long; fruit ovate, densely tuberculate, I mm . long; the ribs rather prominent. Neb. to Tex., N. Car. and Fla. Also in ballast at Philadelphia. April-May.
3. Spermolepis echinàtus (Nutt.) Heller. Bristly-fruited Spermolepis. (I. F. f. 2698.) Resembling the preceding, but lower, seldom over 3 dm . high, the branches ascending or sometimes spreading. Rays very slender; fruit about I mm . long, covered with spreading hooked bristles the ribs obsolete, the commissure narrow. Ala. to Mo., Tex. and Cal. April-May.

## 44. PEUCÉDANUM L.

Perennial herbs, acaulescent or nearly so, from thick roots, with ternate, pinnate, or in our species bipinnate or finely dissected leaves, and compound umbels of white or yellow flowers. Involucre none. Involucels of several or numerous bracts. Calyx-teeth mostly obsolete. Stylopodium depressed or none. Fruit oval, oblong, or orbicular, dorsally compressed. Carpels with filiform dorsal and intermediate ribs, the lateral ones broadly winged; oil-tubes I-4 (rarely more) in the intervals, 2-10 on the commissural side. Seed-face flat or slightly concave. [Name Greek.] About 125 species, of wide distribution. In addition to the following, about 47 others occur in western N. Am.

Flowers white or pinkish.
Flowers yellow.
Fruit glabrous; involucel-bracts united. Plant pubescent. Plant glabrous.
Fruit finely pubescent; involucel-bracts linear, distinct.

1. P. nudicaule.
2. $P$. foeniculaceum.
3. P. Kingii.
4. P. villosum.
I. Peucedanum nudicaùle (Pursh) Nutt. White-flowered Parsley. (I. F. f. 2645.) Leaves and peduncles $0.7-2 \mathrm{dm}$. high. Root elongated. Leaves bipinnate, the segments oblong or ovate, generally pinnatifid into linear or linearoblong obtusish lobes; bracts of the involucels lanceolate, scarious-margined; umbel 4-8-rayed, the rays unequal, $\mathbf{1 - 4} \mathrm{cm}$. long in fruit; fruit oval or orbicular, glabrous, $4^{-6} \mathrm{~mm}$. long, the lateral wings narrower than the carpel, the dorsal and intermediate ones inconspicuous; oil-tubes generally solitary in the intervals. In dry soil, Minn. to Manitoba, Kans., the N. W. Terr. and N. Mex. March-May.
5. Peucedanum foeniculàceum Nutt. Fennel-leaved Parsley. (I. F. f. 2646.) Peduncles I-2.5 dm. high, usually exceeding the leaves. Leaves finely dissected into short linear or filiform acute lobes and segments; umbels unequally $3-12$-rayed, the rays $1-4 \mathrm{~cm}$. long; involucels tomentose; fruit broadly oval, about 6 mm . long, the lateral wings narrower than the carpel, dorsal and intermediate ones rather prominent; oil-tubes $\mathrm{I}-3$ in the intervals. Prairies, N. W. Terr. to S. Dak., Kans., Mo. and Tex. March-April.
6. Peucedanum Kíngii S. Wats. King’s Parsley. (I. F. f. 2647.) Scape 1.5-5 dm. high. Leaves long-petioled, pinnately or 2 -pinnately divided into narrowly linear segments 1 mm . wide or less; umbel unequally $4-20$-rayed; rays 1 4 cm . long; calyx-teeth short; fruit oblong, glabrous, $8-12 \mathrm{~mm}$. long, nearly 4 mm . wide, the carpels with narrow lateral wings, the dorsal and intermediate ribs also somewhat winged; oil-tubes 3-6 in the intervals, and 6-10 on the commissural side. Western Neb. to Utah. June-Aug.
7. Peucedanum villòsum Nutt. Hairy Parsley. (I. F. f. 2648.) Tomen-tose-pubescent ; peduncles $0.7-2 \mathrm{dm}$. long. Leaves fincly dissected into narrowly oblong obtuse lobes and segments; umbel 4-Io-rayed, the rays $8-20 \mathrm{~mm}$. long in fruit; bracts of the involucels lanceolate, separate or nearly so; fruit oval, $6-7 \mathrm{~mm}$. long, about 5 mm . broad, the lateral wings narrower than the carpel, the dorsal and intermediate ribs prominent; oil-tubes 3 or 4 in the intervals. Prairies and dry soil, Neb. and S. Dak. to the N. W. Terr., N. Mex. and Cal. April-May.

## 45. IMPERATÒRIA L.

Tall perennial herbs, with ternately divided or 2-pinnate leaves, and compound umbels of white flowers. Calyx-teeth obsolete. Fruit flattened dorsally, broadly oval, to nearly orbicular, the lateral ribs broadly winged all around, the intermediate and dorsal ribs slender, wingless: oil-tubes solitary in the intervals and 2 on the commissural side. Styles and stylopodium short. Seed-face flat. [Named for its supposed forceful medicinal properties.] About 10 species, of the Old World.
I. Imperatoria Ostrùthium L. Masterwort. (I. F. f. 2643.) Glabrous, or sparingly pubescent; stem stout, hollow, erect, 6-15 dm. tall. Leaves ternately divided into broad stalked segments which are often 3 -parted to the base, sharply serrate and often incised, the segments of the long-petioled lower leaves often I. 3 dm. broad; rays numerous, slender; involucre none, or of 1 or 2 lanceolate bracts; involucel-bracts few, narrow, deciduous; fruit about 4 mm . long. In fields, Penn. and Mich. Reported from Newf. Nat. or adventive from Europe. May-July.

## 46. PASTINÀCA L.

Tall branching herbs, with thick roots, pinnate leaves, and compound umbels of yellow flowers. Involucre and involucels commonly none. Calyx-teeth obsolete. Stylopodium depressed. Fruit oval, glabrous, much flattened dorsally; dorsal and intermediate ribs filiform, the lateral winged, those of the two carpels contiguous and forming a broad margin to the fruit; oil-tubes solitary in the intervals and 2-4 on the commissural side: Seed very flat. [Latin pastus, food.] About 7 species, natives of Europe and Asia.

1. Pastinaca sativa L. Wild Parsnip. (I. F. f. 2642.) Biennial or rarely annual, glabrous, or somewhat downy-pubescent, 6-15 dm. high. Lower and basal leaves petioled, pinnate, often 4.5 dm . long, the segments rather thin, ovate or oval, obtuse, sessile, lobed or incised and sharply dentate, $2-8 \mathrm{~cm}$. long; umbels 5-15 cm . broad, $7-15$-rayed, the rays $\mathrm{I}-5 \mathrm{~cm}$. long; pedicels $6-12 \mathrm{~mm}$. long in fruit; fruit broadly oval, 5-7 mm. long, the oil-tubes conspicuous. Roadsides and waste places, a common weed in nearly all parts of our area. Nat. from Europe. June-Sept.

## 47. HERACLEUM L.

Erect perennial herbs, with ternately compound leaves, and compound umbels of white flowers. Bracts of the involucre few and deciduous, or none. Involucels of numerous linear bracts. Calyx-teeth obsolete or small. Petals cuneate, or clawed; those of the outer flowers dilated and obcordate or 2-lobed. Stylopodium thick, conic. Fruit flattened dorsally, broadly oval, obovate or orbicular; dorsal and intermediate ribs filiform, the lateral ones broadly winged and the wings nerved near the outer margin; oil-tubes extending only to about the middle of the carpels, conspicuous, I in each interval, 2-4 on the commissural side. [Greek, to Hercules]. About 60 species, of the northern hemisphere, only the following in N. Am.
I. Heracleum lanàtum Michx. Cow-parsnip. (I. F. f. 264I.) Verystout, tomentose-pubescent, I-3 m. high, the stem ridged, often 5 cm . thick at the base. Leaves petioled, very pubescent beneath, the segments broadly ovate, or orbicular, cordate, stalked, lobed and sharply serrate, rather thin, $7-15 \mathrm{~cm}$. broad; petioles much inflated; umbels $1.5-3 \mathrm{dm}$. broad, 8 -30-rayed, the rays stout, $5-10 \mathrm{~cm}$. long; fruit $8-12 \mathrm{~mm}$. long, $6-9 \mathrm{~mm}$. broad, finely pubescent, emarginate at the summit. In moist ground, Newf. to Alaska, N. Car., Mo., Utah and Cal. June-July.

## 48. DAÙCUS L.

Biennial or annual, mostly hispid-pubescent herbs, with pinnately decompound leaves, and compound umbels of white or reddish flowers. lnvolucre of several foliaceous bracts in our species. Involucels of numerous entire or toothed bracts. Calyx-teeth obsolete. Petals obovate, the apex inflexed, those of the outer flowers often dilated and 2-lobed. Umbels concave in fruit. Fruit somewhat flattened dorsally. Primary ribs 5 , slender. Secondary ribs 4 , winged, each bearing a row of barbed prickles. Oil-tubes solitary under the secondary ribs, and 2 on the commissural side of each carpel. [The ancient Greek name.] About 25 species, of wide distribution.

## Stem retrorsely hispid; leaf-segments linear. $\quad$. D. pusillus. <br> Stem bristly pubescent; leaf-segments lanceolate. <br> 2. D. Carota.

r. Daucus pusillus Michx. American Carrot. Biennial, $3 \mathrm{~cm} .-6 \mathrm{dm}$. high, closely resembling the following species. Leaves finely dissected, the segments linear, acute; umbels $2-8 \mathrm{~cm}$. broad; pedicels very unequal. N. Car. to Fla., Mo., Mex. and Cal. April-June.
2. Daucus Caròta L. Wild Carrot. (I. F. f. 2632.) Usually biennial, 3-9 dm. high, the root fleshy, conic. Lower and basal leaves $2-3$-pinnate, the
segments dentate, lobed or pinnatifid; upper leaves less divided; bracts of the involucre parted into linear or filiform lobes; umbels $5-10 \mathrm{~cm}$. broad; rays numerous; flowers white, the central one of each umbel often purple, that of each umbellet occasionally so, all rarely pinkish; fruit $3-4 \mathrm{~mm}$. long. In fields and waste places, common throughout our area, often a pernicious weed. Nat. from Europe. The original of the cultivated Carrot. June-Sept.

## Family 3. CORNÀCEAE Link.

Dogwood Family.
Shrubs or trees, with simple opposite, verticillate or alternate, usually entire leaves, and regular flowers in cymes, heads or rarely solitary. Calyx-tube adnate to the ovary, its limb 4-5-dentate, or none. Petals generally 4 or 5 , sometimes wanting, valvate or imbricate, spreading, inserted at the base of the epigynous disk. Stamens as many as the petals or more numerous, inserted with them ; filaments subulate or flat. Ovary inferior, I-2-celled in our species; style I, short or elongated; ovules I in each cavity, pendulous, anatropous. Fruit a drupe. Seeds oblong: embryo nearly as long as the endosperm; cotyledons foliaceous. About 16 genera and 85 species, most abundant in the northern hemisphere.
Flowers pertect, 4-parted; ovary 2-celled.

Flowers polygamous or diœcious; petals minute or none; ovary 1-celled. | 1. Cornus. |
| :--- |
| 2. Nyssa. |

## 1. CÓRNUS L.

Flowers small, white, greenish or purple, in cymes, or heads, the latter involucrate with large white bracts in our species. Calyx-tube top-shaped or campanulate, its limb 4-toothed. Petals 4, valvate. Stamens 4. Ovary 2-celled; stigma truncate or capitate; ovules I in each cavity. Drupe ovoid or globular, the stone 2 -celled and 2 -seeded. [Greek, horn, from the toughness of the wood.] About 25 species, natives of the north temperate zone, Mex. and Peru. Besides the following, some 7 others occur in western N. Am.

> * Flowers capitate, with an involucre of 4-6 large white bracts. Low herbaceous shrubs; rootstocks slender.

Upper leaves verticillate; flowers greenish.
Leaves all opposite; flowers purple.
Tree or large shrub; flowers greenish yellow.

* F Flowers cymose, white, not involucrate.

Leaves opposite.
Leaves downy-pubescent beneath, at least when young; (sometimes glabrate in No. 5). Leaves broadly ovate or orbicular; fruit blue. Leaves ovate or ovate-lanceolate.

Fruit blue: stone pointed at the base. Fruit white.

Stone globose, broader than high.
Stone compressed, much broader than high.
Leaves glabrate, or minutely pubescent beneath.
Leaves ovate, short-pointed; twigs purple.
Leaves ovate-lanceolate, acuminate.
Fruit white; twigs gray. 9. C. candidissima. Fruit pale blue; twigs reddish.
Leaves alternate, clustered at the ends of the flowering branches.

1. C. Canadensis.
2. C. Suecica.
3. C. florida.
4. C. circinata.
5. C. Amomum.
6. C. asperifolia.
7. C. Baileyi.
8. C. stolonifera.
9. C. stricta.
10. C. alternifiolia.
11. Cornus Canadénsis L. Low or Dwarf Cornel. Bunch-berry. (I. F. f. 2710.) Flowering stems scaly, $7-30 \mathrm{~cm}$. high. Rootstock nearly horizontal; leaves verticillate at the summit, or sometimes I or 2 pairs of opposite ones below, sessile, oval, ovate, or obovate, pinnately veined, glabrous or minutely ap-pressed-pubescent, acute at each end, $2-8 \mathrm{~cm}$. long; peduncle $1-4 \mathrm{~cm}$. long; invo lucral bracts ovate, $8-12 \mathrm{~mm}$. long; flowers greenish, capitate; petals ovate, one of them with a subulate appendage; fruit globose, bright red, about 6 mm . in diameter; stone smooth, globose. In low woods, Newf. to Alaska, N. J., Ind., Minn., Colo, and Cal. Rarely the upper leaves are opposite. May-July.
12. Cornus Suècica L. Northern Dwarf Cornel. (I. F. f. 2711.) Flowering stems $5-25 \mathrm{~cm}$. high. Leaves 3-6 pairs, all opposite, sessile, ovate, or oval, entire, minutely appressed-pubescent above, the upper $1-4 \mathrm{~cm}$. long, the veins all arising from near the base; involucral bracts usually 4 , ovate, $6-12 \mathrm{~mm}$. long, obtusish; flowers dark purple, capitate; fruit globose, red, $6-8 \mathrm{~mm}$. in diameter; stone flattened. In cold, wet woods, Newf. to Quebec and Alaska. Also in northern Europe and Asia. July-Aug.
13. Cornus flórida L. Flowering Dogwood: (I. F. f. 2712.) A small tree, or large shrub, with very rough bark and spreading branches. Leaves petioled, ovate, or oval, rarely obovate, entire, pale and slightly pubescent on the veins beneath, dark green above, $7-15 \mathrm{~cm}$. long, acute at the apex, usually narrowed at the base; bracts of the involucre white or pinkish (rarely rose-red), very conspicuous, obovate, obcordate, or emarginate, strongly parallel-veined, $2.5-6 \mathrm{~cm}$. long; flowers greenish yellow, capitate; fruit ovoid, scarlet, $10-12 \mathrm{~mm}$. long, crowned with the persistent calyx; stone smooth, channeled. In woods, Me. and Ont. to Fla., Ky., Mo. and Tex. April-June.
14. Cornus circinàta L'Her. Round-leaved Cornel or Dogwood. (I. F. f. 2713 .) A shrub, $0.8-3 \mathrm{~m}$. high, the twigs warty, green and glabrous. Leaves petioled, broadly ovate, or orbicular, acute, or short-acuminate, pale beneath, slightly pubescent above, $5-15 \mathrm{~cm}$. long; flowers in rather dense cymes $3-7 \mathrm{~cm}$. broad, the pedicels usually somewhat pubescent; petals ovate; fruit globose, light blue, about 5 mm . in diameter; stone subglobose. In shady, often rocky situations, N. S. to Manitoba, Va., Ill. and Iowa. May-June.
15. Cornus Amòmum Mill. Kinnikinnik. (I. F. f. 2714.) A shrub, with purplish twigs, the youngest commonly pubescent. Leaves petioled, ovate, oval, or ovate-lanceolate, acuminate, usually finely pubescent with brownish hairs beneath, $2.5-13 \mathrm{~cm}$. long; flowers in flat cymes; petals narrowly oblong; fruit globose, light blue, 6-7 mm. in diameter, stone oblique, ridged. In wet soil, N. B. to Ont., Fla., S. Dak. and Tex. May-July.
16. Cornus asperifòlia Michx. Rough-leaved Cornel or Dogwood. (I. F. f. 2715.) A shrub, the twigs reddish brown, the youngest rough-pubescent. Leaves slender-petioled, ovate-oval, or elliptic, acuminate, pale and woollypubescent beneath, densely rough-pubescent above, $3-13 \mathrm{~cm}$. long; petioles and rays of the cyme rough-pubescent; cymes rather loosely-flowered, $5-8 \mathrm{~cm}$. broad; petals oblong-lanceolate; fruit globose, white, about 6 mm . in diameter; stone slightly furrowed, little compressed. In wet ground, Ont. to Fla., Iowa, Kans. and Tex. May-June.
17. Cornus Bàileyi Coult. \& Evans. Bailey's Cornel or Dogwood. (I. F. f. 2716.) A shrub with reddish twigs. Leaves slender-petioled, ovate or ovatelanceolate, acute or acuminate, rather densely woolly-pubescent beneath, $2.5-13 \mathrm{~cm}$. long; petals ovate-oblong; cymes compact, the rays pubescent; fruit white, about 6 mm . in diameter; stone flattened, slightly oblique. Lake shores and in moist ground, Penn. to Minn. and the N. W. Terr., Wyo. and Neb. May-June.
18. Cornus stolonífera Michx. Red-osier Cornel or Dogwood. (I. F. f. 2717.) A shrub, $\mathrm{I}-5 \mathrm{~m}$. high, usually stoloniferous, the twigs glabrous and bright reddish purple. Leaves slender-petioled, ovate, ovate-lanceolate or oval, acute or short-acuminate, white or whitish and sparingly pubescent or glabrous beneath; petals ovate-oblong; fruit white or whitish, globose, $6-8 \mathrm{~mm}$. in diameter. In moist soil, N. S. to Yukon Terr., Va., Ky., Neb., Ariz. and Cal. June-July.
19. Cornus candidíssima Marsh. Panicled Cornel or Dogwood. (I. F. f. 2718.) A shrub with gray smooth twigs. Leaves petioled, lanceolate or ovatelanceolate, long-acuminate at the apex, acute at the base, minutely appressedpubescent on both sides, pale beneath, $3-10 \mathrm{~cm}$. long; cymes somewhat paniculate; petals lanceolate; fruit globose, white, about 6 mm . in diameter; stone subglobose. In rich soil, Me. to N. Car., Minn. and Neb. May-June.
io. Cornus strícta Lam. Stiff Cornel or Dogwood. (I. F. f. 2719.) A shrub, $2.5-5 \mathrm{~m}$. high, resembling the preceding; twigs purplish or reddish brown. Leaves petioled, ovate, or ovate-lanceolate, acute or acuminate, sparingly appressed-pubescent on both sides, $3-8 \mathrm{~cm}$. long, the margins often minutely denticulate, green above and beneath; cymes rather loosely flowered, their rays
nearly or quite glabrous; fruit pale blue, about 6 mm . in diameter; stone globose, nearly smooth. In swamps, Va. to Ga. and Fla. April-May.
if. Cornus alternifolia L.f. Alternate-leaved Cornel or Dogwood. (I. F. f. 2720.) A shrub, or small tree, with smooth greenish bark. Leaves slen-der-petioled, oval or ovate, acuminate, $5-10 \mathrm{~cm}$. long, pale and appressed-pubescent beneath, the margins minutely denticulate; cymes pubescent; petals lanceolate; fruit globular, or slightly depressed, blue, about 8 mm . in diameter; stone somewhat obovoid, channeled, scarcely flattened. In woods, N. S. to Ga., Ont., Minn., W. Va. and Ala. May-July.
20. NYSSA L.

Trees or shrubs, with alternate petioled leaves. Flowers small, greenish, polygamo-diœcious, in capitate clusters, short racemes, or the fertile ones sometimes solitary, borne at the summit of slender axillary peduncles, appearing with the leaves. Staminate flowers numerous, the calyx 5 -parted, the petals minute and fleshy, or none; stamens 5-15; filaments slender; disk entire or lobed; pistil none or rudimentary. Pistillate flowers 2-14, or solitary, bracted; calyx-limb 5 -toothed, or truncate; petals minute and fleshy, or none; stamens several, or commonly abortive; ovary I-celled, with I pendulous ovule; style slender, recurved. Drupe ovoid or oval, the stone bony, compressed, I-seeded. [Name of a water nymph.] About 7 species, natives of N. Am., eastern and central Asia. Besides the following, another occurs in the Southern States.
Leaves usually entire ; pistillate flowers $2-14$; fruit $6-14 \mathrm{~mm}$. long.
Leaves mostly acute or acuminate; stone little flattened.
Leaves mostly obtuse; stone much flattened.

1. N. sylvatica.
2. N. biflora.

Leaves usually dentate; pistillate flower solitary; fruit $16-30 \mathrm{~mm}$. long.
3. N. aquatica.
I. Nyssa sylvática Marsh. Pepperidge. Sour Gum. Tupelo. (I. F.f. 2721.) A large tree, with rough bark. Leaves obovate or oval, entire, glabrous and shining above, more or less pubescent beneath, $5-10 \mathrm{~cm}$. long; staminate flowers capitate; pistillate flowers larger, 2-14 together; fruit ovoid, nearly black, 8-14 mm. long, acid; stone ovoid. In rich moist soil, Me. and Ont. to Fla., Mich. and Tex. Leaves rarely angulate-toothed on young trees. April-June .
2. Nyssa biflòra Walt. Southern Tupelo. Water Tupelo. (I. F. f. 2722.) Similar to the preceding, the base swollen. Leaves mostly smaller and narrower, obtuse or sometimes acute, $2.5-13 \mathrm{~cm}$. long, glabrous when mature; pistillate flowers only $\mathbf{1}-3$ together; fruit oval; or subglobose, $6-12 \mathrm{~mm}$. long, acid; stone oval or oblong, distinctly flattened and furrowed. In swamps and along ponds, N. J. to Va., Fla. and Ala. April-May.
3. Nyssa aquática L. Large Tupelo. Cotton or Tupelo Gum. (I. F. f. 2723.) A large tree. Leaves slender petioled, ovate or oval, angular-dentate, or entire, acute, or acuminate, downy-pubescent beneath, especially when young, becoming glabrate on both sides, o.7-2.5 dm. long; fruit oval. dark blue when ripe; stone narrowly obovate, flattened, spongy, with several sharp longitudinal ridges. In swamps, Va. to Fla., Mo. and Tex. April.

## Series 2. Gamopetalae.

## Petals partly or wholly united, rarely separate or wanting.

This series is also known as Sympetalae and has been called Monopetalae. The coherence of the petals is sometimes slight or they are quite separate, as in Clethraceae, Pyrolaceae, some Ericaceae, Primulaceae, Styracaceae, Asclepiadaceae, Oleacear, Cucurbitaceae and Galax in Diapensiaceae. From this condition the coherence varies through all stages to the tubular or funnelform corollas of some Convolvulaceae, Caprifoliaceae and Compositae. In American species of Frawinus (Oleaceae) and in Gilaux (Primulaceae), there is no corolla.

## Order I. ERICÀLES.

Flowers complete, regular. Calyx toothed, lobed, or divided, superior, except in Vacciniaceae. Corolla mainly gamopetalous. Stamens free from the corolla, or adnate only to its base (except in Diapensia and

Pyxidanthera of the Diapensiaceae), as many as its lobes and alternate with them, or twice as many. Ovary compound.

Stamens free from the corolla, or merely adnate to its base. not united into a tube.
Ovary superior; fruit a capsule, or rarely drupaceous.
Corolla essentially polypetalous.
Ovary 3 -celled; shrubs; leaves deciduous. Fam. r. Clethraceae.
Ovary 4-5-celled; low, mostly evergreen perennials.
Fam. 2. Pyrolaceae.
Corolla distinctly gamopetalous (except in Monotropa and Hypopitys of the Monotropaceae and Ledum of the Ericaceae).
Herbaceous saprophytes without green leaves. Fam. 3. Monotropaceae. Shrubs with normal, often evergreen leaves. Fam. 4. Ericaceae.
Ovary inferior, adnate to the calyx, forming a many-seeded berry or drupe in fruit.
Fam. 5. Vacciniaceae.
Stamens borne at the sinuses of the corolla, or united in a ro-lobed tube.
Fam. 6. Diapensiaceae.

## Family 1. CLETHRACEAE Klotsch.

White-alder Family.
Shrubs or trees with alternate deciduous serrate or serrulate petioled leaves in our species, and small white fragrant flowers in terminal usually elongated racemes. Calyx 5-cleft, or 5 -parted, persistent, the segments imbricated, Petals 5, slightly united at the base, imbricated, deciduous. Stamens IO; filaments slender; anthers sagittate, inverted in anthesis, the sacs opening by large apical pores ; pollen-grains simple. Disk obsolete. Ovary 3-angled or 3-lobed, 3-celled, pubescent; ovules numerous; style slender; stigmas 3 in our species. Capsule 3-celled, loculicidally 3 -valved, the valves at length 2-cleft. Only the following genus, comprising about 30 species, of N. Am., Japan, Mex. and S. Am.

## 1. CLETHRA L.

Characters of the family. [Greek, alder, from the resemblance of the foliage.] Besides the following, another species occurs in the southern States.

Leaves obovate, acute or obtuse; filaments glabrous. 1. C. alnifolia.
Leaves oval or ovate, acuminate; filaments hirsute.
2. C. acuminata.
r. Clethra alnifòlia L. Sweet Pepperbush. White Alder. (I. F. f. 2724.) A shrub, $\mathrm{I}-3 \mathrm{~m}$. high, the twigs minutely canescent. Leaves narrowed or cuneate at the base, sharply serrate, at least beyond the middle, glabrous or nearly so on both sides, $2.5-7.5 \mathrm{~cm}$. long; petioles 2-12 mm. long; bracts short, deciduous; pedicels, calyx and capsule canescent; calyx-lobes obtuse, nerved; flowers about 8 mm . broad, of spicy fragrance; style longer than the stamens; capsule subglobose, about 3 mm . in diameter, about the length of the calyx. In wet soil, Me. to northern N. J. and Fla., mostly near the coast. July-Aug.
2. Clethra acuminàta Michx. Mountain Sweet Pepperbush. (I. F. f. 2725.) A shrub or small tree, similar to the preceding. Leaves green above, pale and sometimes pubescent beneath, serrulate with sharp-pointed teeth, $5-18 \mathrm{~cm}$. long, sometimes 1 cm . wide; petioles $8-25 \mathrm{~mm}$. long; racemes spreading or recurved, $5-20 \mathrm{~cm}$. long, the rachis, pedicels and calyx densely pubescent or canescent; bracts longer than the flowers, caducous. In mountain woods, Va. and W. Va. to Ga. July-August.

## Family 2. PYROLÀCEAE Agardh.

## Wintergreen Family.

Low mostly evergreen perennials, with branched rootstocks. Leaves petioled. Flowers nearly regular, white or pink. Calyx 4-5-lobed. Corolla deeply $4-5$-parted, or of 5 petals. Stamens twice as many as the divisions of the corolla, the anthers introrse in the bud, inverted at an-
thesis, opening by pores or short slits; pollen-grains in 4's. Ovary 4-5celled; style often declined; stigma 5 -lobed, or 5 -crenate ; ovules numerous, anatropous. Fruit a loculicidally dehiscent capsule. Seeds numerous, minute, the loose cellular coat much larger than the almost undifferentiated embryo. Three genera and about 20 species, natives of the northern hemisphere.

Flowers racemose; Ieaves basal.
Flowers solitary or corymbose; leaves opposite or whorled. Stem leafy at base; flower solitary; style long.
Stem horizontal; branches erect, leafy; style very short.

1. Pyrola.
2. Moneses.
3. Chimaphila.

## 1. PÝROLA L.

Acaulescent or nearly so. Leaves basal, persistent (one northwestern species leafless). Flowers white, yellowish, pink, or purple, racemose, on erect scapes. Calyx 5-parted, persistent. Petals 5, concave, sessile. Stamens 1o, declined, or straight and connivent; filaments subulate, glabrous; anthers erect in the bud, emarginate or 2-beaked at the base, mostly reversed at flowering, each sac opening by a basal but apparently apical pore. Ovary 5 -celled; stigma 5-lobed. Disk usually obsolete, rarely present and Io-lobed. Capsule subglobose, 5 -lobed, 5 -celled, loculicidally 5 -valved from the base, the valves cobwebby on the margins when opening, the apex and base intruded. [Latin, diminutive of Pyrus, pear, from the similar leaves.] About 15 species, natives of the northern hemisphere. Besides the following, 3 others occur in western N. Am.
Style and stamens declined (slightly so in No. 6).
Petals very obtuse; leaves rounded at the apex.
Leaves rounded, truncate or narrowed at the base.
Flowers white or greenish white; plants of dry woods. Calyx-lobes oblong or lanceolate; leaves shining.

1. P. rotundifolia. Calyx-lobes ovate or triangular, short; leaves dull.

Blades orbicular, coriaceous, mostly shorter than petioles.
2. P. chlorantha.

Blades oval, membranous, longer than their petioles.
3. P. elliptica.

Flowers pink or purple; bog plant. Leaves reniform, cordate; flowers pink.
Petals and leaves acute, the latter small.
Style straight ; stamens connivent.
Style short; disk none; raceme regular.
Style elongated; disk ro-lobed; flowers in a 1 -sided raceme.
4. P. uliginosa.
5. P. asarifolia.
6. P. oxypetala.
7. P. minor.
8. $P$. secunda
I. Pyrola rotundifòlia L. Round-leaved Wintergreen. (I. F. f. 2726.) Scape 1.5-5 dm. high, 6-20-flowered. Blades orbicular or oval, spreading, coriaceous, crenulate, $4-8 \mathrm{~cm}$. long, often shorter than their petioles; flowers white, noddirg, very fragrant, $14-18 \mathrm{~mm}$. broad; pedicels $4-6 \mathrm{~mm}$. long, mostly longer than their bracts; calyx lobes about one-third the length of the petals; capsule $4^{-6} \mathrm{~mm}$. in diameter. In dry woods, N. S. to S. Dak., Ga. and Ohio. Also in Europe. June-July.

Pyrola rotundifòlia pùmila Hornem, Scape $7-15 \mathrm{~cm}$. high; leaves seldom 2.5 cm . long; calyx-lobes oblong, mostly obtuse. Greenland and Lab. to the N. W. Terr.
2. Pyrola chlorántha Sw. Greenish flowered Wintergreen. (I. F.f. 2727.) Scape 1-3 dm. high, 3-10-flowered. Blades mostly obtuse at both ends, obscurely crenulate, or entire, $\mathbf{1 . 2 - 2 . 5 \mathrm { cm } \text { . long; flowers nodding, slightly odorous, }}$ greenish white, $10-14 \mathrm{~mm}$. broad; pedicels 4-6 mm . long, mostly longer than their bracts; calyx-lobes about one-fourth the length of the petals; anther-sacs shortbeaked; capsule about 6 mm . in diameter. In dry woods, Lab). to lir. (ol., 1). C., Ill., Neb. and Colo. Also in Europe. June-July.
3. Pyrola ellíptica Nutt. Shin-leaf. (I. F. f. 272S.) Scape 1-2.5dm. high, 7-15-flowered. Blades dark green. obtuse at the apex. plicate-crenulate with very low teeth, $3 \cdot 5-4.5 \mathrm{~cm}$. long; flowers greenish white, nodling, $12-16 \mathrm{~mm}$. broad, very fragrant; calyx-lobes ovate-triangular, acute or acuminate, about onefourth as long as the petals; anther-sacs scarcely beaked; capsule about 6 mm . in
diameter. In rich, mostly dry woods, N. S. to Br. Col., D. C., Ill., Mich. and in the Rocky Mts. to N. Mex. June-Aug.
4. Pyrola uliginòsa Torr. Bog Wintergreen. (I. F. f. 2729.) Scape 1.5-4 dm. high, $7-15$-flowered. Blades broadly oval, or orbicular, dull, rather thick, obscurely crenulate, obtuse at both ends; flowers $10-16 \mathrm{~mm}$. broad; calyxlobes oblong or ovate-lanceolate, one-fourth to one-third the length of the petals; anther-sacs beaked; capsule about 5 mm . in diameter. In swamps and bogs, N . S. to Br. Col., N. Eng., central N. Y., Mich. and in the Rocky Mts. to Colo. June.
5. Pyrola asarifòlia Michx. Liver-Leaf Wintergreen. (I. F. f. 2730.) Similar to the preceding. Blades usually wider than long, coriaceous, shining above, obtuse, crenulate, $2.5-4 \mathrm{~cm}$. long, usually shorter than their narrowly margined petioles; flowers racemose, nodding, purple, or rose, $12-16 \mathrm{~mm}$. broad; calyx-lobes lanceolate, acute or acuminate, about one-third the length of the petals: anther-sacs slightly beaked; capsule about 6 mm . in diameter. In wet woods and swamps, N. B. to the N. W. Terr., Mass., N. Y., Minn. and Colo. June-July.
6. Pyrola oxypétala Austin. Sharp-petaled Wintergreen. (I. F. f. 2731.) Scape slender, $2-2.5 \mathrm{dm}$. high, about 9 -flowered. Blades ovate, coriaceous, dull, narrowed at the base, obscurely crenulate, $14-20 \mathrm{~mm}$. long, shorter than their petioles; flowers racemose, ascending, greenish, $8-10 \mathrm{~mm}$. broad; bracts shorter than the pedicels; calyx-lobes triangular-ovate, acute, about one-third the length of the elliptic-lanceolate acuminate connivent petals; anther-sacs slightly horned. Hills, Deposit, Delaware Co., N. Y. June.
7. Pyrola mìnor L. Lesser Wintergreen. (I. F. f. 2732.) Blades rather thin, broadly oval to orbicular, crenulate, obtuse, rounded, slightly narrowed, or subcordate at the base, $\mathbf{1 - 2} \mathrm{cm}$. long; flowers racemose, nodding, white or pinkish, $6-8 \mathrm{~mm}$. broad; pedicels $2-5 \mathrm{~mm}$. long; calyx-lobes mostly triangular-ovate and acute; stamens not declined; petals oval or orbicular, obtuse; capsule about 5 mm . in diameter. In woods, Greenland and Lab. to Alaska, N. Eng., Ont. and Ore., south in the Rocky Mts. to N. Mex. Also in Europe and Asia. June-Aug.
8. Pyrola secúnda L. Serrated or One-sided Wintergreen. (I. F. f. 2733.) Scapes slender, I-2.5 dm. high. Blades ovate, or often oval, mostly thin, acute, or rarely obtuse, crenulate-serrulate, $2-5 \mathrm{~cm}$. long, longer than their petioles; flowers many, at first erect, soon drooping, greenish white, $6-8 \mathrm{~mm}$. broad; pedicels short; calyx lobes ovate, obtuse, or obtusish, very short; petals oval, obtuse, with a pair of tubercles at the base, campanulate-connivent; stamens not declined; capsule about 4 mm . in diameter. In woods and thickets, Lab. to Alaska, D. C., Neb., along the Rocky Mts. to Mex. and to Cal. Also in Europe and Asia. June-July.

Pyrola secúnda pùmila Paine, is a low northern form, the scape $5-10 \mathrm{~cm}$. high. $3-8$-flowered, the leaves orbicular or broadly oval, $1-2.5 \mathrm{~cm}$. long.

## 2. MONESES Salisb.

Leaves petioled, crenulate, opposite, or verticillate in 3's. Flower solitary, drooping, white or pink, at the summit of a slender scape. Calyx $4-5$-parted, persistent. Petals 4 or 5, broadly ovate or orbicular, sessile. Stamens 8 or 10, similar to those of Pyrola. Ovary globose, 4-5-celled; style straight; stigma 4-5-lobed; ovules numerous. Capsule subglobose. 4-5-lobed, 4-5-celled, loculicidally 4-5valved from the summit, the valves glabrous on the margins. Seeds minute, the testa reticulated, produced at each end. [Greek, single-delight, from the single flower.] A monotypic genus.
I. Moneses unifiòra (L.) A. Gray. One-flowered Wintergreen. (I. F. f. 2734.) Stem $5^{-15} \mathrm{~cm}$. high. Blades orbicular or ovate, obtuse, rather thin, $8-24 \mathrm{~mm}$. long; flower $12-20 \mathrm{~mm}$. broad; calyx-lobes ovate, obtuse, about onefifth the length of the petals; capsule erect, $6-8 \mathrm{~mm}$. in diameter, about as long as the peristent style and stigma. In woods, Lab. to Alaska, Conn., Penn., Mich., in the Rocky Mts. to Colo. and to Ore. Also in Europe and Asia. June-Aug.

## 3. CHIMÁPHILA Pursh.

Perennial herbs, with decumbent stems, ascending leafy branches, the leaves opposite, or verticillate, coriaceous, evergreen. short-petioled and serrate, and white or purplish flowers in terminal corymbs. Pedicels mostly bracteolate. Calyx

5-cleft, or 5 -parted, persistent. Petals 5, concave, nearly orbicular, sessile. Stamens 10, similar to those of Pyrola. Ovary globose, 5 -lobed, 5 -celled; ovules numerous; style short, obconic; stigma large, orbicular, 5 -crenate. Capsule erect, globose, 5 -lobed, 5 -celled, loculicidally 5 -valved from the top, the valves not woolly on the margins. Seeds numerous, minute, the testa reticulated, produced at each end. [Greek, winter-loving, from its evergreen leaves.] About 6 species, natives of N. Am., Mex. and Asia. Besides the following, another occurs on our Pacific Coast.
Leaves lanceolate, mottled with white.
Leaves spatulate or cuneate-oblanceolate, bright green. 2. C. umbellata. $^{\text {. }}$
I. Chimaphila maculàta (L.) Pursh. Spotted Wintergreen. (I. F. f. 2735.) Stem sending up both sterile and flowering branches $8-25 \mathrm{~cm}$. high. Leaves acute or acuminate, sharply serrate, $2.5-7.5 \mathrm{~cm}$. long, $6-24 \mathrm{~mm}$. wide below the middle; flowers few, white or pinkish, $12-20 \mathrm{~mm}$. broad; peduncle and pedicels puberulent; filaments villous at the middle; capsules erect, depressedglobose, about 8 mm . in diameter. In dry woods, Me. and Ont. to Minn., Ga. and Miss. June-Aug.
2. Chimaphila umbellàta (L.) Nutt. Pipsissewa. Prince's Pine. (I. F. f. 2736.) Similar to the preceding, the branches commonly stouter, sometimes 3 dm . high, usually more leafly. Leaves obtuse or acutish, sharply serrate, shining, 2.56 cm . long, $6-25 \mathrm{~mm}$. wide above the middle ; flowers several, white or pinkish, commonly smaller than those of the preceding, usually marked by a deep pink ring; filaments ciliate; capsule $6-8 \mathrm{~mm}$. in diameter. In dry woods, N. S. to Br. Col., Ga., Mex. and Cal. Also in Europe and Asia. June-Aug.

## Family 3. MONOTROPÀCEAE Lindl.

## Indian-pipe Family.

Humus-plants or saprophytes, with mostly simple, leafless scaly scapes. Calyx 2-6-parted; sepals erect, imbricated, deciduous. Corolla gamopetalous or polypetalous (wanting in the California Allotropa); lobes or petals 3-6. Stamens 6-12, hypogynous; anthers 2-celled or confluently r-celled, attached to the filaments by their backs or bases; pollen-grains simple. Disk obsolete or 8-12-lobed. Ovary 4-6-lobed, i-6-celled; stigma capitate or peltate ; ovules numerous, anatropous. Capsule 4-6lobed, or terete, I-6-celled, loculicidally 4-6-valved, many-seeded. Seeds minute, the testa reticulated. About 9 genera and 12 species, mostly of the northern hemisphere.
Corolla gamopetalous, persistent.

Corolla globose-ovoid; anthers 2-awned.
Corolla campanulate; anthers awnless.
Corolla polypetalous, deciduous.
Flower solitary.
Flowers racemose.

1. Pterospora.
2. Monotropsis.
3. Monotropa.
4. Hypopitys.

## I. PTERÓSPORA Nutt.

Scape slender, from a thick base of fibrous roots. Flowers and capsules racemose, pendulous. Calyx deeply 5 -parted. Corolla globose-ovoid, with 5 reflexed lobes. Stamens io, included; filaments subulate, glabrous; anthers introrse, horizontal in the bud, the sacs longitudinally dehiscent. Ovary 5 -lobed, 5 -celled; style short, columnar; stigma capitate, 5 -lobed. Capsule depressed-globose, 5 -lobed, 5 -celled, 5 -valved, the apex and base intruded. Seeds horizontal, globose-ovoid, with a terminal reticulated wing. [Greek, wing-seeded.] A monotypic genus.
I. Pterospora Andromedèa Nutt. Giant Bird's-nest. Pine-inofs. (I. F. f. 2737.) Roots astringent, forming a rounded mass sometimes 5 cm . in diameter. Scape purplish or brown, 1.5-14 dm. high, grooved, covered with viscid hairs; scales lanceolate, or linear, numerous and crowded at the base; flowers white, 4-8 mm . broad; pedicels at first spreading, soon recurved, $6-20 \mathrm{~mm}$. long, viscid; sepals oblong, about one-half the length of the corolla; capsule $S-12 \mathrm{~mm}$. in diameter. In rich woods, Quebec and N. H. to Penn., Br. Col. and Cal., south in the Rocky Mts. to Ariz. June-Aug.

## 2. MONOTROÓPSIS Schwein.

Scape slender; plant glabrous. Sepals 5, oblong to linear. Corolla oblong. campanulate, persistent, 5 -saccate at the base, 5 -lobed, the lobes not reflexed. Stamens 10, included; filaments glabrous; anthers horizontal in the bud, introrse, the sacs confluent, opening by large terminal pores. Disk io-crenate. Ovary globose, 5 -celled; style short, thick; stigma 5-angled. Capsule ovoid, 5 -celled. Seeds numerous. [Greek, resembling Monotropa.] Two species, of southeastern N, Am.
I. Monotropsis odoràta Ell. Sweet Pine-sap. Carolina Beech-drops. (I. F. f. 2738.) Plant light purplish brown; scapes usually several, 5-10 cm. high. Scales ovate-oblong, obtuse, appressed, $4-8 \mathrm{~mm}$. long; flowers few, pink, spicate, fragrant, 2 -bracteolate at the base, spreading or erect, the spike at first recurved, becoming erect, $2.5-5 \mathrm{~cm}$. long, sepals mostly oblong-lanceolate, acute, about as long as the corolla and the bractlets. In woods, Md. to N. Car. Feb.-May.

## 3. MONÓTROPA L.

Scapose succulent white yellowish or red herbs, with a solitary nodding flower, the capsule becoming erect. Sepals 2-4, deciduous. Petals 5 or 6 , not saccate at the base, tardily deciduous. Stamens 10-12; filaments subulate-filiform; anthers short, peltate, horizontal, opening at first by 2 transverse chinks, becoming transversely 2 -valved. Disk 10-12-toothed, confluent with the base of the ovary. Ovary 5 -celled; style short, thick; stigma funnelform, its margin obscurely crenate. Capsule 5 -celled, 5 -valved, many-seeded. Seeds minute, the testa produced at each end. [Greek, once-turned.] Two species, of N. Am., Mex., Colombia, Japan and the Himalayas.
I. Monotropa uniflòra L. Indian Pipe. (I. F. f. 2739.) Scapes white, glabrous, usually clustered, $\mathbf{1 - 2 . 5 ~ d m}$. high from a mass of brittle roots, turning dark in drying. Flower inodorous, nodding, oblong-campanulate, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long; petals $4-6$, puberulent within, white, rather longer than the usually 10 stamens; filaments pubescent; ovary ovoid, acute, narrowed into the short style; capsule obtusely angled, $10-16 \mathrm{~mm}$. high, $8-10 \mathrm{~mm}$. in diameter. In moist rich woods, Anticosti to Fla., Br. Col. and Cal. Also in Japan and the Himalayas. Whole plant occasionally pink or red. June-Aug.

## 4. HYPÓPITYS Hill.

Scapes pubescent, at least above, bearing white yellowish or red flowers in a nodding one-sided raceme which soon becomes erect. Roots a mass of fleshy fibres. Terminal flower usually 5 -parted, the lateral ones $3-4$-parted. Sepals commonly as many as the petals. Petals saccate at the base. Stamens 6-10; filaments subu-late-filiform; anther-sacs becoming confluent, opening by 2 unequal valves, the larger one spreading or reflexed, the smaller erect. Disk 8-10-toothed. Ovary 3-5celled; stigma funnelform, its margin glandular-ciliate. Capsule 3-5-celled, 3-5valved, erect. [Greek, referring to its growth under firs.] A monotypic genus.
r. Hypopitys Hypópitys (L.) Small. Pine-sap. False Beech-drops. (I. F. f. 2740.) Plants usually slightly fragrant; scapes $\mathbf{I}-3 \mathrm{dm}$. high. Bracts ovate-lanceolate, imbricated at the base, scattered above; raceme 3-15-flowered, $2.5-13 \mathrm{~cm}$. long; pedicels $6-20 \mathrm{~mm}$. long; flowers oblong-campanulate, $8-14 \mathrm{~mm}$. long, bracteolate at the base, the bractlets closely resembling the sepals; filaments pubescent; capsule globose-oblong, $4^{-6 ~ m m}$. high. In dry woods, Anticosti to Fla., Br. Col. and Ariz. Also in Europe and Asia. June-Oct.

## Family 4. ERICACEAE DC.

Heath Family.
Shrubs, perennial herbs, or trees, with simple estipulate leaves, and mostly perfect flowers. Calyx free from the ovary, 4-5-parted or 4-5cleft, mostly persistent. Corolla regular, or rarely somewhat 2-lipped, usually 4-5-toothed, -lobed or -parted. Stamens hypogynous, usually as many or twice as many as the corolla-lobes, teeth or petals; anthers 2-celled, attached to the filaments by the back or base, the sacs often
prolonged upwardly into tubes. Ovary 2-5-celled; stigma peltate or capitate; ovules usually numerous, anatropous. Fruit a capsule, berry or drupe. Seeds usually numerous and minute, or sometimes only I in each cavity; endosperm fleshy; embryo central; cotyledons short; radicle terete. About 55 genera and 1050 species of wide distribution.

* Fruit a septicidal capsule ; corolla deciduous ; anthers unappendaged. Corolla of separate petals.

1. Ledum.

Corolla gamopetalous (polypetalous in No. 6).
Corolla somewhat irregular (except in No. 5); seeds flat, winged.
Corolla funnelform to campanulate; stamens exserted.
Corolla funnelform, slightly 2 -lipped; leaves deciduous. 2. Azalea.
Corolla 2-lipped, lower lip divided to the base ; leaves deciduous.

Corolla campanulate; leaves evergreen.
Corolla urn-shaped; stamens not exserted.
Corolla regular; seeds angled or rounded.
Corolla polypetalous.
Corolla gamopetalous.
Stamens 5; capsule 2-3-celled.
Stamens io; capsule 5-celled.
Corolla saucer-shaped, io-saccate.
Corolla ovoid.
3. Rhodora.
4. Rhododendron.
5. Menziesia.
6. Dendrium.
7. Chamaecistus.
8. Kalmia.
9. Phyllodoce.

* Fruit a loculicidal capsule, berry or drupe ; corolla deciduous; anthers often awned.
$\dagger$ Fruit a dry capsule; calyx not accrescent, mostly small.
Low heath-like shrubs; leaves subulate, very small. 10. Cassiope.
Shrubs, or trees; leaves linear to broadly oval.
Anther-sacs opening by a terminal pore or chink.
Sepals or calyx-lobes imbricated, at least in the bud.
Capsule dehiscent into a single layer of 5 valves. . 1 r. Leucothoë. Capsule dehiscent into 2 layers, the outer 5 -valved, the inner io-valved.

12. Chamaedaphne.

Sepals or calyx-lobes valvate, or separate, in the bud.
Anthers 2-awned on the back.
Corolla urn-shaped or cylindric ; leaves not glaucous.
13. Pieris.

Corolla globose; leaves narrow, glaucous beneath. i4. Andromeda. Anthers awnless.
15. Xolisma.

Anther-sacs longitudinally dehiscent.
Corolla ovoid-cylindric, 5 -toothed; tall shrub or tree. 16. Oxydendron. Corolla salverform, 5-lobed; trailing shrub. 17. Epigaea. $\dagger \dagger$ Fruit a drupe, or a capsule enclosed by the fleshy accrescent calyx.
Fruit consisting of the fleshy calyx surrounding the capsule.
18. Gaultheria.

Fruit a drupe with 4 or 5 nutlets.
Nutlets coalescent; leaves persistent. 19. Arctostaphylos.
Nutlets separate; leaves deciduous. 20. Mairania.

*     * Fruit a septicidal capsule ; corolla withering-persistent ; anthers appendaged. 21. Calluna.

## 1. LÈDUM L.

Erect evergreen resinous shrubs, with scaly buds, the foliage fragrant when crushed. Leaves alternate, thick, short-petioled, oblong or linear, revolute-margined. Flowers white, in terminal umbels or corymbs. Pedicels bracted at the base, the bracts deciduous. Calyx 5 -toothed, persistent. Petals 5, obtuse, spreading, imbricated. Stamens 5 or 10 (rarely 5 to 7), exserted; filaments filiform; anthers small, attached by their backs to the filaments, globose-didymous, the sacs opening by terminal pores. Disk annular, 8-10-lobed. Ovary ovoid, scaly, 5 -celled: ovules numerous; style filiform; stigma 5 -lobed. Capsule oblong, 5 -celled, 5 -valved from the base. [Greek, ledon, the plant now called Cistus l.iden.] Three species. natives of the north temperate and sub-arctic zones. Besides the following, another occurs on the Pacific coast.
$\begin{array}{ll}\text { Leaves linear, } 2-4 \mathrm{~mm} \text {. wide ; stamens } 10 . & \text { 1. L. palustre. } \\ \text { Leaves oblong, } 6-16 \mathrm{~mm} \text {. wide ; stamens } 5-7 . & \text { 2. L. Groenlandicum. }\end{array}$
I. Ledum palústre L. Narrow-leaved Labrador Tea. (I. F. f. 2741.) A shrub, 1.5-6 dm. high, the twigs rusty-tomentose. Leaves dark green and
somewhat rugose above. densely tomentose with brown wool beneath, $12-40 \mathrm{~mm}$. long; flowers $6-10 \mathrm{~mm}$. broad; pedicels very pubescent, $12-25 \mathrm{~mm}$. long in fruit; capsule scurfy, about 4 mm . high and 2 mm . in diameter, nodding; calyx-teeth less than I mm. long, ovate, obtusish. In bogs, Newf. to Alaska. Also in northern Europe and Asia. Summer.
2. Ledum Groenlándicum OEder. Labrador Tea. (I. F. f. 2742.) A shrub, $3-12 \mathrm{dm}$. high, similar to the preceding. Leaves $2.5-5 \mathrm{~cm}$. long, slightly rugose above, densely brown-tomentose beneath; flowers $8-\mathrm{IO} \mathrm{mm}$. broad; pedicels $2-2.5 \mathrm{~cm}$. long and recurved in fruit; capsule canescent, nodding, 6-7 mm. long, 2-3 mm . in diameter. In bogs and swamps, Greenland to Br . Col., Mass., N. J. and Wis. May-June.

## 2. AZÀLEA L.

Mostly tall shrubs, with alternate leaves. Flowers large, in terminal umbels developed from cone-like scaly buds. Calyx 5 -parted. Corolla funnelform, the tube mostly narrow, the limb nearly regularly 5 -lobed or somewhat 2 -lipped. Stamens 5 (rarely 10). exserted, usually declined; anthers attached to the filaments by their backs, the sacs opening by terminal pores; style declined, exserted. Ovary 5-celled; ovules numerous. Capsule oblong or linear-oblong, 5-celled, 5 valved from the summit, many-seeded. [Greek, dry, from its habitat.] About 40 species, natives of N. Am. and Asia. Besides the following, 2 others occur on the Pacific coast.
Flowers expanding before or with the leaves.
Flowers pink or white.
Leaves strigose on the midrib beneath; corolla-tube hirsute. 1. A. nudiflora.
Leaves canescent beneath; corolla-tube glandular.
Flowers orange, yellow or red; leaves canescent beneath.
Flowers expanding later than the leaves.
Leaves shining, glabrous beneath.
Leaves strigose on the midrib beneath. 4. A. arborescens.
Leaves strigose on the midrib beneath.
5. A. viscosa.
I. Azalea nudifiòra L. Wild Honeysuckle. Pinkster-flower. Purple or Pink Azalea. (I. F. f. 2743.) A shrub. $0.6-2.8 \mathrm{~m}$. high. Leaves oblong to obovate, acute at both ends, short-petioled. glabrous or with a few scattered hairs above when old. $5-10 \mathrm{~cm}$. long, the margins ciliolate; pedicels strigose, 8I4 mm . long; flowers faintly odorous, the limb somewhat 2-lipped, $3.5-5 \mathrm{~cm}$. broad, shorter than the narrow tube, stamens much exserted; capsule strigose, 16-18 mm . long, erect. In dry woods and thickets, Me. to Ill., Fla. and Tex. Reported from Canada. April-May.
2. Azalea canéscens Michx. Mountain Azalea. (I. F. f. 2744.) A shrub, 12-45 dm. high. Leaves oval. elliptic or sometimes obovate, wider and shorter than those of the preceding. pale beneath and stiff-hairy or pubescent on the veins. varying to nearly glabrous, the margins ciliolate serrulate; pedicels glandular; flowers very fragrant; corolla-limb often 5 cm . broad, about equalling the rather stout. slightly viscid tube; stamens slightly exserted; capsule glandular, 1216 mm . long. In woods, Mass. and N. Y. to Fla. and La. April-May.
3. Azalea lùtea L. Flame Azalea. (I. F. f. 2745.) Similar to the two preceding. Leaves obovate or oval, glabrous, or with some scattered hairs above, the margins ciliolate-serrulate; pedicels short, pilose or glandular; flowers slightly fragrant; corolla-tube about the length of the nearly regular limb, glandular-pilose, the limb often 5 cm . broad; stamens long-exserted; capsule about 16 mm . high. In dry woods, N. Y. and Penn. to Ga. May-June.
4. Azalea arboréscens Pursh. Smooth or Tree Azalea. (I. F. f. 2746.) A shrub, $2-6 \mathrm{~m}$. high, glabrous or nearly so. Leaves obovate. oblanceolate or oval, acute or sometimes abruptly acuminate, petioled. firm, bright green above, light green beneath, $5-10 \mathrm{~cm}$. long, fragrant in drying, the margins ciliate; flowers white, or tinged with pink, fragrant. the limb nearly regular, $3.5-5 \mathrm{~cm}$. broad, about as long as the slender glandular tube; stamens and style red, long-exserted: capsule densely glandular, $12-16 \mathrm{~mm}$. long. In woods, Penn. to N. Car. and Tenn. June-July.
5. Azalea viscòsa L. Swamp Pink or Honeysuckle: White Azalea. (I. F. f. 2747.) A shrub, I-2 m. high, the twigs hairy. Leaves obovate-oblong
to oblanceolate, 5-10 cm. long, short-petioled, narrowed at the base, glabrous or with a few scattered hairs above, ciliolate, green on both sides; flowers white, fragrant; pedicels glandular; corolla $3.5-5 \mathrm{~cm}$. long, the limb $2.5-5 \mathrm{~cm}$. broad, more or less 2-lipped; much shorter than the slender, very viscid, densely glandular tube; capsule $10-14 \mathrm{~mm}$. high, glandular-bristly. In swamps, Me. to Ohio, Fla. and Tex. June-July.

Azalea viscòsa híspida (Pursh) Britton. Pedicels bristly-hispid; flowers, at least the limb, pink; leaves glaucescent beneath; shrub 2-5 m. high. Borders of ponds, Shawanzunk Mts. to Penn. and Montauk Point, N. Y.

Azalea viscòsa glaùca Michx. Leaves white-glaucous beneath, $2.5-5 \mathrm{~cm}$. long, shrub $3^{-18} \mathrm{dm}$. high. Mass, to Va.

Azalea viscòsa nítida (Pursh.) Britton. Leaves about 2.5 cm . long, bright green on both sides; low shrub. Mass. to Va.

## 3. RHODÒRA L.

A shrub, with oval or oblong short-petioled alternate leaves. Flowers umbellate or short-corymbose, short-pedicelied, rose-colored, purple, or nearly white, from terminal scaly buds. Calyx minute. Corolla 2-lipped, the upper lip unequally $2-3$-lobed, the lower divided to the base, the segments recurved. Stamens Io, about equalling the corolla; anthers attached by their backs to the filaments. Ovary 5-celled; ovules numerous; style slightly exserted; stigma capitate. Capsule linear-oblong, 5 -celled, 5 -valved from the summit, many-seeded. [From the Greek, rhodon, a rose.] A monotypic genus.
I. Rhodora Canadénsis L. Rhodora. (I. F. f. 2748.) Stems 3-9 dm. high; twigs sparingly strigose. Leaves obtuse and mucronulate, entire, dark green and glabrous, or nearly so, above, pale, glaucous and slightly pubescent, at least on the veins, beneath, $2.5-5 \mathrm{~cm}$. long, $6-14 \mathrm{~mm}$. wide; flowers expanding with or before the leaves; pedicels very short, hairy; corolla $2.5-4 \mathrm{~cm}$. broad; capsule puberulent, glaucous, $10-14 \mathrm{~mm}$. high. In bogs and on wet hillsides, Newf. to N. J., Quebec, central N. Y. and Penn. May.

## 4. RHODODÉNDRON L.

Leaves alternate, persistent, coriaceous. Flowers purple, rose-colored or white, corymbose or umbellate, from scaly cone-like buds. Calyx 5-lobed or 5-parted. Corolla campanulate, 5-lobed, nearly regular. Stamens 5-10 (usually io), little exserted, declined or equally spreading. Anthers attached by their backs to the filaments, the sacs opening by terminal pores. Style slender; stigma capitate or $5-20$-lobed; ovules numerous. Capsule mostly woody, $5-20$-valved from the summit. Seeds numerous. [Greek, rose-tree.] About roo species, natives of the northern hemisphere. Besides the following, some 5 others occur in the southern and western parts of N. Am.

$$
\begin{array}{ll}
\text { Arctic-alpine shrub, 5-30 cm. high; leaves small, lepidote. } & \text { 1. R. Lapponicum. } \\
\text { Tall shrubs or low trees; leaves large, glabrous. } \\
\text { Leaves usually acute at both ends; calyx-lobes oblong, obtuse. } & \text { 2. R. maxim?um. } \\
\text { Leaves mostly obtuse at both ends; calyx-lobes short, acute. } & \text { 3. R. Cataviviense. }
\end{array}
$$

1. Rhododendron Lappónicum (L.) Wahl. Lapland Rose Bay. (I. F. f. 2749.) Depressed or prostrate. Leaves oval, elliptic or oblong, obtuse and mucronulate, $8-18 \mathrm{~mm}$. long, $4-8 \mathrm{~mm}$. wide, short-petioled; flowers few, on short pedicels with scurfy scales; calyx-lobes oblong, obtuse, pubescent; corolla purple. 5 -lobed, $14-18 \mathrm{~mm}$. broad, the lobes oblong, obtuse; capsule ovoid-oblong. +-6 mm . high. Summits of the higher mountains of N. Eng. and the Adirondacks of N. Y.; Quebec to Greenland and Alaska. Delles of the Wisconsin River. Also in Europe and Asia. Summer.
2. Rhododendron máximum L. Great Laurei. Rose Biy. (I. F. f. 2750.) A tall shrub, or sometimes a tree. Leaves oblong, lancoolate-oblong or broadly oblanceolate, dark green on both sides, $\mathbf{I - 2}$ dm. long. $2.5-6.5 \mathrm{~cm}$. wide. drooping in winter; petioles stout, $12-25 \mathrm{~mm}$. long; pedicels viscid-pubescent. $2.5-5 \mathrm{~cm}$. long; corolla $3.5-5 \mathrm{~cm}$. broad, about 2.5 cm . long, rather deeply $5-\mathrm{cleft}$ into oval obtuse lobes, rose-color, varying to white, sprinkled with yellowish or
orange spots within; capsule oblong, puberulent, $\mathbf{1 0 - 1 4} \mathrm{mm}$. high. In woods and along streams, N. S. to Ont., Ohio and Ga. June-July.
3. Rhododendron Catawbiénse Michx. Mountain Rose bay. Catawba or Carolina Rhododendron. (I. F. f. 275 I.) A shrub, i-6 m. high. Leaves oval or broadly oblong, mucronate, $7 \cdot 5-13 \mathrm{~cm}$. long, $3 \cdot 5-5 \mathrm{~cm}$. wide, dark green above, pale or glaucous beneath; petioles stout, $12-35 \mathrm{~mm}$. long; pedicels rather stout, becoming glabrous; corolla lilac-purple, $3 \cdot 5-5 \mathrm{~cm}$. long, $5-6.5 \mathrm{~cm}$. broad, 5 -lobed, the lobes rounded; capsule linear-oblong, puberulent, $16-20 \mathrm{~mm}$. high. Mountain slopes and summits, Va. and W. Va. to Ga. May-June.

## 5. MENZIESIA J. E. Smith.

Shrubs, with alternate entire deciduous leaves, and small nodding greenish purple slender-pedicelled flowers, in terminal corymbs or umbels, developed from scaly buds. Calyx 4 -toothed or 4 -parted, persistent. Corolla urceolate-cylindric, or nearly globose, 4 -toothed or 4 -lobed. Stamens 8 ; filaments subulate, flattish, anthers linear-oblong, attached by their backs to the filaments, the sacs opening by terminal pores or chinks. Disk obscurely 8 -crenate. Ovary mostly 4 -celled; ovules numerous; style filiform; stigma 4 -lobed or 4 -toothed. Capsule 4 -celled, 4 -valved, many-seeded. Seeds slender, the testa membranous, prolonged at both ends. Parts of the flower rarely in 5's. [Named in honor of Archibald Menzies, surgeon and naturalist, died 1842.] About 7 species, natives of N. Am. and Japan.
Filaments glabrous; seeds pointed at each end. 1. M. pilosa. Filaments pubescent below; seeds long-appendaged at each end.
2. M. glabella.
r. Menziesia pilòsa (Michx.) Pers. Alleghany Menziesia. (I. F. f. 2752.) Shrub 6-18 dm. high; twigs chaffy and with stiff hairs. Leaves oval, oblong or obovate, rough-hairy above, pale; glaucescent and sometimes chaffy on the veins beneath, $2.5-5 \mathrm{~cm}$. long, the margins ciliate; petioles $4-10 \mathrm{~mm}$. long, pubescent; flowers few, drooping; pedicels filiform, glandular, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long; calyx-lobes short and broad, hirsute-ciliate; corolla 4-6. mm . long; capsule ovoid, about 4 mm . high, erect, glandular-bristly. In mountain woods, Penn. to Ga. May-June.
2. Menziesia glabélla A. Gray. Smoorh Menziesia. (I. F. f. 2753.) Similar to the preceding. Leaves obovate, obtuse and glandular-mucronulate at the apex, pale, glaucous and glabrous or nearly so beneath, sparingly pubescent above, $18-36 \mathrm{~mm}$. long, the margins ciliolate; flowers $\mathrm{I}-5$ in the umbels, becoming erect; pedicels $\mathbf{1 2 - 2 5} \mathrm{mm}$. long, glandular; corolla about 4 mm . long; capsule oblong or obovoid, erect, about 4 mm . high, glabrous. Minnesota Point, Lake Superior, west to Ore. and Br . Col. May-June.

## 6. DÉNDRIUM Desv.

A glabrous evergreen shrub, with coriaceous entire small mostly opposite leaves, and numerous small white or pinkish flowers, in terminal corymbs. Bracts coriaceous, persistent. Calyx 5 -parted, the segments rigid, acute, persistent. Petals 5, sessile, spreading. Stamens 10 , exserted; filaments filiform, glabrous; anthers small, globose, didymous, attached by their backs to the filaments, the sacs opening longitudinally. Disk ro-lobed. Ovary 2-5-celled; ovules numerous; style slender, straight; stigma simple, truncate. Capsule ovoid, $2-5$-valved from the top. [Greek, a tree.] A small genus of eastern N. Am.
I. Dendrium buxifòlium (Berg.) Desv. Sand Myrtle. (I. F. f. 2754.) A shrub with box-like foliage, widely branching, $1-4.5 \mathrm{dm}$. high. Leaves crowded, oblong or oval, thick, obtuse, dark green and shining above, lighter and blackdotted beneath, short-petioled, somewhat revolute-margined, 6-14 mm. long, the midrib prominent; flowers in short corymbs, about 4 mm . broad; anthers purple; pedicels $6-10 \mathrm{~mm}$. long in fruit; capsule acute, slightly over 2 mm . high. In dry, sandy pine-barrens, N. J. to Fla. April-June.

## 7. CHAMAECÍSTUS OEder.

A low giabrous straggling shrub, with small linear-oblong petioled obtuse entire evergreen leaves, and small flowers on terminal erect pedicels. Calyx 5 -parted, the segments ovate-lanceolate, persistent. Corolla broadly campanulate, with 5 obtuse lobes. Stamens 5, included; filaments adnate to the corolla; anthers globose-
didymous, dorsally attached to the filaments, longitudinally dehiscent. Disk obscurely 5 -lobed. Ovary globose; style short; stigma capitate; ovules numerous. Capsule subglobose, $2-3$-valved, the valves 2 -cleft. Seeds ovoid, the testa granular. [Greek, ground cistus.] A monotypic genus.
I. Chamaecistus procúmbens (L.) Kuntze. Alpine or Trailing Azalea. (I. F. f. 2755.) Tufted, diffuse; branches $5-10 \mathrm{~cm}$. long. Leaves mostly opposite, crowded, dark green above, paler beneath, $4-8 \mathrm{~mm}$. long, the midrib very prominent on the lower side, the margins strongly revolute; petioles $\mathbf{I} \mathrm{mm}$. long or less; flowers I-5 from terminal coriaceous buds; pedicels $6-8 \mathrm{~mm}$. long; corolla pink or white, about 4 mm . high, longer than the purplish sepals; capsule about 2 mm . in diameter. Summits of the White Mts.; Mt. Albert, Quebec; Lab. and Alaska. Also in northern Europe and Asia. July-August.

## 8. KÁLMIA L.

Erect shrubs, with entire evergreen coriaceous leaves. Flowers in umbels or corymbs, or solitary, or $2-3$ together in the axils. Calyx 5 -parted or 5 -divided, the segments imbricated in the bud. Corolla saucer-shaped, the limb strongly ro-keeled in the bud, 5 -lobed, with io pouches below the limb, the keels extending from the pouches to the lobes and sinuses. Stamens Io, shorter than the corolla; anther-sacs opening by large terminal pores; filaments erect in the bud, soon curving outward, placing the anthers in the pouches of the corolla, straightening elastically when the flower is fully expanded. Disk 10-crenate. Ovary 5 -celled; ovules numerous; stigma depressed-capitellate. Capsule subglobose, obscurely 5 -lobed, 5 -celled, 5 valved from the summit. Seeds small, subglobose. [Dedicated by Linnaeus to his pupil, Peter Kalm, 1715-1779, who travelled in America.] Seven known species, 6 of N. Am., the other Cuban.
Flowers in mostly compound umbels or corymbs; twigs terete.
Leaves oblong, mostly obtuse; flowers $6-10 \mathrm{~mm}$. broad.

1. $K$. angustifolia.

Leaves elliptic or oval, acute; flowers $16-25 \mathrm{~mm}$. broad.
Flowers in simple terminal umbels; twigs 2-edged.
Flowers mostly solitary in the axils; leaves and twigs hirsute.
2. $K$. latifolia.
3. $K$. glauca.
4. $K$. hirsuta.
I. Kalmia angustifòlia L. Sheep-laurel. Lambkill. (I. F. f. 2756.)

Leaves mostly opposite, or verticillate in 3's, obtuse or sometimes acute, narrowed at the base, petioled, glabrous, dark green above, light green beneath, 2.5-6.5 cm . long, 6-22 mm. wide; flowers purple or crimson, in lateral compound or simple corymbs; pedicels filiform, $\mathbf{1 2 - 2 4} \mathrm{mm}$. long, recurved in fruit; sepals ovate, acute, canescent, persistent; capsule depressed-globose, 5 -lobed, canescent, $3-4 \mathrm{~mm}$. in diameter, the apex impressed; filiform style long-persistent. In moist soil, Newf. to Hudson Bay, south to Ga. and Mich. June-July.
2. Kalmia latifòlia L. American or Mountain Laurel. Calico-bush. (I. F. f. 2757.) Often forming dense thickets, becoming a tree; branches very stiff. Leaves alternate, or some of them opposite, or rarely verticillate in 3's, petioled, glabrous, flat, green on both sides, persistent, $5-13 \mathrm{~cm}$. long, $12-35 \mathrm{~mm}$. wide; flowers pink to white, numerous and showy in compound terminal corymbs; pedicels bracted and 2 -bracteolate at the base, $\mathbf{1 2 - 3 5} \mathbf{~ m m}$. long, glandular, erect, even in fruit; capsule depressed-globose, 5 -lobed, glandular, $4-6 \mathrm{~mm}$. in diameter; calyx and style long-persistent. In woods, N. B. to Ont., Ohio, Fla. and La. May-June.

Kalmia latifolia myrtifolia Rand. Low, compactly much branched; leaves not over 4 cm . long and $6-8 \mathrm{~mm}$. wide. Mass.
3. Kalmia glaùca Ait. Pale or Swamp Laurel. (I. F. f. 275S.) Glabrous, I.5-6 dm. high. Leaves opposite or sometimes in 3's, nearly sessile, oblong or linear-oblong, green above, white-glaucous beneath, $12-50 \mathrm{~mm}$. long, 4-12 mm . wide, the margins revolute; flowers few ( $\mathrm{I}-13$ ). purple, ro- 18 mm . broad; pedicels filiform, $\mathbf{1} \mathbf{2}-35 \mathrm{~mm}$. long, erect, even in fruit; sepals ovate, scariousmargined, persistent; capsule depressed-globose. glabrous, about 5 mm . in diameter. In bogs, Newf. to Alaska, Conn., N. J., Penn., Mich. and Cal. Summer.
4. Kalmia hirsùta Walt. Hairy Laurel. (I. F. f. 2750.) Branching, 3-6 dm . high, the branches ascending. Leaves oblong or oblong-lanceolate, nearly sessile, villous-hirsute, becoming glabrate in age, dark green above, lighter beneath. 6-12 mm. long; flowers rose-purple. $10-18 \mathrm{~mm}$. broad; pedicels slender, nearly or
quite glabrous; sepals acute, hirsute or ciliate, longer than the capsule, at length deciduous; capsule depressed, about 3 mm . in diameter, glabrous. In moist pinebarrens, Va. to Fla. May-Aug.

## g. PHYLLÓDOCE Salisb.

Low branching shrubs, with small crowded linear obtuse evergreen leaves. Flowers long-pedicelled, nodding, mostly pink, blue or purple, in terminal umbels. Pedicels bracted at the base. Calyx 5-parted, persistent. Corolla contracted at the throat, 5 -toothed. Stamens 10, included; anthers attached to the filaments by their backs, oblong, obtuse, the sacs dehiscent by oblique chinks. Disk obscurely lobed. Ovary 5-celled; ovules numerous; style included; stigma obscurely 5 -lobed, or capitate. Capsule subglobose or globose-oblong, 5 -valved to about the middle. Seeds minute, the testa coriaceous. [Greek, a sea nymph.] Three species, of arctic and alpine regions of the northern hemisphere.

1. Phyllodoce coerùlea (L.) Gren. \& Godr. Mountain Heath. (I. F. f. 2760.) A shrub, I-I. 5 dm . high. Leaves yew-like, 6-10 mm. long, articulated with the branches, crowded above, the margins acutish, scabrous or serrulateciliolate; pedicels erect, very glandular, elongating in fruit; corolla $8-10 \mathrm{~mm}$. long, about 4 mm . in diameter, pink or purple; sepals acuminate, glandular; capsule erect, about 4 mm . high. Summits of the higher mountains of Me. and N. H.; Mt. Albert, Quebec; Lab. to Alaska. Also in Europe and Asia. July-Aug.

## ro. CASSİOPE D. Don.

Low tufted heath-like evergreen shrubs, with small sessile imbricated or crowded, entire apparently veinless leaves, and solitary peduncled white or pink nodding flowers. Sepals 4 or 5 , not bracted at the base. Corolla campanulate, $4-5$-lobed or $4-5$-parted. Stamens $8-10$, included; filaments glabrous; anthers attached to the filaments near the apex, the sacs opening by large terminal pores and tipped with a recurved awn. Disk Io-crenate. Ovary 4-5-celled; ovules numerous; stigma simple. Capsule globose or ovoid, 4-5-valved, each valve 2 -cleft at the apex. Seeds minute, numerous. [Name from Cassiope, mother of Andromeda.] About Io species, of the colder parts of the northern hemisphere. Besides the following, 3 others occur in northwestern N. Am.
Peduncle terminal; corolla 5-cleft; leaves subulate, crowded.
Peduncles lateral; corolla 5-lobed; leaves thick, 4 -ranked.

1. C. hypnoides.
I. Cassiope hypnoìdes (L.) D. Don. Moss-plant. Cassiope. (I. F. f. 276 I .) Glabrous, $2.5-7.5 \mathrm{~cm}$. high. Leaves imbricated, acute, flat above, convex beneath, $2-4 \mathrm{~mm}$. long; flowers $6-8 \mathrm{~mm}$. broad; peduncles erect, $8-24 \mathrm{~mm}$. long; corolla nearly white; style conic; capsule globose, about 3 mm . in diameter, $2-3$ times as long as the ovate calyx-lobes. Summits of the higher mountains of N. Eng. and the Adirondacks; Quebec and Lab. to arctic Am. Also in arctic Europe and Asia. Plant with the aspect of a moss. Summer.
2. Cassiope tetragòna (L.) D. Don. Four-angled Cassiope. (I. F. f. 2762.) Tufted, I-3 dm. high. Leaves imbricated, thick, ovate or ovate-oblong, closely appressed, channeled on the back, usually puberulent when young, $2-3 \mathrm{~mm}$. long; peduncles slender, $10-24 \mathrm{~mm}$. long; flowers $6-8 \mathrm{~mm}$. broad; style slightly thickened below; capsule nearly globular, $2-3 \mathrm{~mm}$. in diameter. Lab., Greenland and Hudson Bay to Alaska and Ore. Also in Asia. Summer.

## 1I. LEUCÓTHOE D. Don.

Shrubs, mostly tall, with alternate petioled leaves, and small usually white bracted flowers in racemes, jointed with their pedicels, or the pedicels jointed with the rachis. Sepals 5, distinct. Corolla cylindric or ovoid-urceolate, 5 -toothed. Stamens 10, included: anthers attached to the filaments near their bases, oblong, the sacs opening by terminal pores, obtuse, 2 -mucronate or $\mathbf{1}-2$-awned at the apex. Disk 1o-lobed. Ovary 5 -celled; stigma capitate or 5 -lobed; ovules numerous. Capsule depressed-globose, often 5 -lobed, 5 -valved, the valves membranous, entire. Seeds numerous, minute. [Name mythological.] About 35 species, natives of N, and S. Am, and eastern Asia,

Racemes in the axils of persistent leaves of the previous season.
Shoots puberulent; petioles $4-8 \mathrm{~mm}$. long; sepals imbricated in flower.

1. L. axillaris.

Shoots glabrous; petioles $8-16 \mathrm{~mm}$. long; sepals not imbricated in flower.
2. L. Catesbaei.

Racemes terminating the branches; flowers appearing with or before the leaves.
Racemes mostly recurved; capsule 5 -lobed.
3. L. recurva.

Racemes erect or spreading; capsule not lobed.
4. L. racemosa.
I. Leucothoë axillaris (Lam.) D. Don. Downy Leucothoë. (I. F. f. 2763.) Leaves evergreen, oval to oblong-lanceolate, glabrous above, sparsely beset with minute hairs beneath, acute or acuminate, serrulate, $5-\mathbf{1 5} \mathrm{cm}$. long, 12-35 mm. wide; racemes many-flowered, dense; bracts ovate, concave, borne near the bases of the short pedicels; anthers awnless; corolla about 6 mm . long; stigma depressed, 5 -rayed. In moist woods, Va. to Fla. and Ala. April.
2. Leucothoë Catesbaei (Walt.) A. Gray. Catesby's Leucothoë. (I. F. f. 2764.) Similar to the preceding. Leaves lanceolate or ovate-lanceolate, evergreen, acuminate, sharply serrulate with bristle-pointed teeth, $7 \cdot 5-15 \mathrm{~cm}$. long, 18-35 mm. wide; racemes dense, many-flowered; bracts borne at the bases of the short petioles; corolla narrowly cylindric, about 5 mm . long; capsule depressed, strongly 5 -lobed, about 4 mm . in diameter. Along streams, Va. to eastern Tenn. and Ga. April.
3. Leucothoë recurva (Buckl.) A. Gray. Mountain Leucothoë. (I. F. f. 2765.) Widely branched, $6-30 \mathrm{dm}$. high, similar to the following species. Leaves deciduous, ovate or oval, often acuminate, pubescent on the veins beneath, $5-10 \mathrm{~cm}$. long; calyx 2 -bracteolate, the bracts persistent; corolla about 6 mm . long; anthersacs I-awned; capsule depressed, about 4 mm . in diameter and 2 mm . high; seeds winged. In dry woods, mountains of Va. to Ala. April-May.
4. Leucothoë racemòsa (L.) A. Gray. Swamp Leucothoë. (I. F. f. 2766.) Leaves oblong to ovate, mostly acute at each end, deciduous, short-petioled, glabrous, or with some short hairs above, pubescent, at least on the veins beneath, serrulate, $2.5-7.5 \mathrm{~cm}$. long, $\mathbf{1 2 - 2 5} \mathrm{mm}$. wide; calyx 2 -bracteolate at the base, the bractlets firm, persistent; pedicels about 2 mm . long, jointed with the rachis; corolla nearly cylindric, 6-8 mm, long; anther-sacs 2 -awned; stigma capitate; capsule depressed-globose, slightly grooved, 3 mm . in diameter; seeds smooth, wingless. In swamps and moist thickets, Mass. to Penn., Fla. and La. April-June.

## 12. ANDRÓMEDA L.

A glabrous shrub. Leaves coriaceous, linear or oblong, entire, revolute-margined, evergreen, short-petioled, white-glaucous beneath. Flowers white, drooping, in terminal umbels. Calyx 5-parted, persistent. Corolla globose-urceolate, 5 -toothed, the teeth recurved. Stamens IO, included; filaments bearded; anthers attached to the filaments at about the middle, ovate, obtuse, the sacs opening by large terminal pores, each with a reflexed awn. Disk 1o-lobed. Ovary 5 -celled; style columnar; ovules numerous. Capsule subglobose, 5 -angled, 5 -valved, manyseeded. Seeds oval, the testa smooth, coriaceous, shining. [Named for Andromeda of mythology.] A monotypic genus.
I. Andromeda Polifòlia L. Wild Rosemary. Marsh Holy Rose. MOORWORT. (I. F. f. 2767.) A shrub, 3-9 dm. high, the foliage acid. Leaves mucronulate, narrowed at the base, $2.5-6.5 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide; petioles about 2 mm . long; umbels few-flowered; bracts small, ovate, persistent; pedicels S-12 mm . long; calyx-lobes triangular-ovate, acute; corolla $4^{-6 \mathrm{~mm}}$. in diameter; cap. sule about 4 mm . in diameter, about as long as the style. In bogs, Newf. to Alaska, N. J., Penn., Mich. and Br. Col. Also in Europe and Asia. May-June.

## I3. PİERIS D. Don.

Shrubs or small trees. Leaves alternate, persistent or tardily deciduous. Flowers mostly white, in bracted racemes or umbels, the pedicels commonly 1-3bracteolate. Calyx 5-parted, the segments ovate, acute, valsate in the bud, persistent. Corolla urceolate-cylindric, 5 -toothed, the teeth recurved. Stamens io, included; filaments often pubescent or ciliate; anthers oblong or owoid. the sais opening by large oval pores. Disk 1o-lobed. Ovary 5-celled; ovules numerous;
style columnar; stigma truncate. Capsule globose or ovoid, 5 -angled, 5 -celled. Seeds linear-oblong, not winged, clavate or falcate, the testa smooth, membranous. [Name from one of the Muses.] About 12 species, natives of eastern N. Am., Cuba, eastern Asia and the Himalayas.

Leaves coriaceous, evergreen, serrulate; flowers racemose.
Leaves coriaceous, evergreen, entire; flowers in axillary umbels.
Leaves membranous, deciduous, entire; flowers in lateral umbels.

1. P. fleribunda.
2. P. nitida.
3. P. Mariana.
I. Pieris floribúnda (Pursh) Benth. \& Hook. Mountain Fetter-bush. (I. F. f. 2768.) Branches nearly erect, bristly or strigose-pubescent, leafy. Leaves oblong to ovate-lanceolate, glabrous above, black-dotted beneath, acute or acuminate, $3.5-7.5 \mathrm{~cm}$. long, $12-25 \mathrm{~mm}$. wide; petioles $4-8 \mathrm{~mm}$. long, very bristly, at least when young: flowers white, about 7 mm . long; calyx-segments ovate-lanceolate, acute; corolla slightly 5 -angled, 5 -saccate at the base; filaments unappendaged; capsule globose-ovoid, about 4 mm . high, longer than the slender style. Mountains of Va. to Ga. May.
4. Pieris nítida (Bartr.) Benth. \& Hook. Fetter-bush. (I. F. f. 2769.) A glabrous shrub, 6-18 dm. high, the branches acutely angled. Leaves shortpetioled, oblong, oval, oblong-lanceolate, or obovate, acuminate or acute, somewhat black-dotted beneath, revolute, bordered by an intra-marginal nerve; flowers nodding or spreading; pedicels $4-8 \mathrm{~mm}$. long; calyx-segments rigid, purplish, valvate in the bud; corolla white or red, ovoid-cylindric, narrowed at the throat, $6-8 \mathrm{~mm}$. long; filaments 2 -spurred; capsule globose, about as long as the calyxsegments. In wet woods, Va. to Fla., Cuba and La. April-May.
5. Pieris Mariàna (L.) Benth. \& Hook. Stagger-bush. (I. F. f. 2770.) Branches nearly erect, glabrous or nearly so, black-dotted. Leaves oval or oblong, glabrous above, sparingly pubescent on the veins and black-dotted beneath; $5-7.5 \mathrm{~cm}$. long; flowers nodding on the nearly leafless branches of the preceding season; calyx-segments acuminate, deciduous; corolla ovoid-cylindric, white, or faintly pink, $10-12 \mathrm{~mm}$. long; filaments pubescent on the outer side, usually with 2 setose appendages; capsule ovoid-pyramidal, 3-4 mm. high, truncate, about as long as the sepals. In sandy soil, R. I. to Fla., Tenn. and Ark. May-July.

## 14. XOLÍSMA Raf.

Tall shrubs, or small trees, with terete twigs, alternate short-petioled leaves, and small mostly white flowers in clusters. Calyx $4-5$-lobed or $4-5$-cleft. Corolla globose, or urceolate, pubescent, 4-5-toothed, the teeth recurved. Stamens 8 or Io, included; filaments flat, incurved, pubescent; anthers attached to the filaments near their bases, truncate, the sacs opening by terminal pores. Disk 8-ro-lobed. Ovary 4-5-celled; style columnar; stigma truncate; ovules numerous, pendulous. Capsule 4-5-angled, 4-5-valved, its apex intruded. Seeds elongated, the testa membranous, loose, reticulated. [Name unexplained.] About io species, natives of eastern N. Am., the W. Indies and Mex.
I. Xolisma ligústrina (L.) Britton. Privet Andromeda. (I. F. f. 2771.) A shrub I-4 m. high. Leaves obovate, oblong, oval or ovate, deciduous, minutely serrulate or entire, acute or abruptly acuminate, usually quite glabrous above, 2.5-6.5 cm . long; racemes mostly leafless, in terminal panicles; bracts small, caducous; pedicels $2-6 \mathrm{~mm}$. long, pubescent; calyx-lobes triangular-ovate, acute; corolla nearly globular, 3 mm . in diameter; capsule depressed-globose, obtusely 5 -angled, about 3 mm . in diameter. In swamps and wet soil, Canada (?), Me to N. Y., Fla., Tenn. and Ark. May-July.
15. CHAMAEDÁPHNE Moench.

An erect shrub, with stiff terete branches, alternate evergreen short-petioled narrow leaves, and white short-pedicelled secund flowers, solitary in the axils of the small upper leaves. Calyx of 5 distinct persistent sepals, bracted at the base. Corolla oblong-cylindric, narrowed at the throat, 5 -toothed, the teeth recurved. Stamens io, included; filaments subulate, glabrous: anther-sacs tapering upward into tubular beaks, opening by terminal pores. Disk io-toothed. Ovary 5 -celled, 5-grooved; stigma simple. Capsule depressed-globose, the epicarp 5-valved, sep-
arating at length from the Io-valved endocarp. [Greek, ground or low Daphne.] A monotypic genus.
I. Chamaedaphne calyculàta (L.) Moench. Leather-Leaf. Dwarf CASSANDRA. (I. F. f. 2772.) Leaves oblong or oblanceolate, densely covered on both sides with minute scurfy scales, at least when young, $\mathbf{I} .2-3.5 \mathrm{~cm}$. long, the margins obscurely denticulate; upper leaves gradually smaller, the uppermost reduced to floral bracts; pedicels 2 mm . long or less; corolla about 6 mm . long; capsule 4 mm . in diameter, about twice as long as the ovate sepals. In bogs and swamps, Newf. to Alaska, N. J., Ga., Ill., Mich. and Br. Col. Also in Europe and Asia. April-June.

## 16. OXYDÉNDRUM DC.

A tree, with alternate petioled deciduous sour leaves, and numerous white flowers, in terminal panicled racemes. Pedicels 2-bracteolate. Sepals 5, slightly imbricated in the bud, persistent. Corolla ovoid-cylindric, minutely canescent, narrowed at the throat, tardily expanding, 5 -toothed. Stamens io; filaments wider than the linear anthers; anther-sacs opening by long chinks. Ovary ovoid, 5 -celled, ovules numerous, near the base of the cavities; stigma simple. Disk io-toothed. Capsule ovoid-pyramidal, 5-angled, 5-valved. Seeds ascending or erect, elongated, the testa reticulated, loose and extended at each end beyond the linear nucleus. [Greek, sour-tree.] A monotypic genus.
I. Oxydendrum arbòreum (L.) DC. Sour-wood. Sorrel-tree. (I. F. f. 2773). A smooth-barked tree. Leaves oblong, oval or oval-lanceolate, sharply serrulate, or entire, green and glabrous, finely reticulate-veined, acuminate, I-I. 5 dm . long, $2.5-7.5 \mathrm{~cm}$. wide; racemes long and slender, erect or curving, panicled, the rachis and short pedicels canescent; flowers $6-8 \mathrm{~mm}$. long; capsule $4-6 \mathrm{~mm}$. long, canescent, tipped by the persistent style, the pedicels curving. In woods, Ohio and Penn. to Va., Fla. and Miss. June-July.

## 17. EPIGAEA L.

Prostrate slightly woody branching shrubs, with alternate evergreen entire leaves. Flowers rather large, perfect, heteromorphous or diœcious, bracted, sessile, white or pink, fragrant, clustered at the ends of the branches. Sepals 5, oblong, persistent, dry, much imbricated. Corolla salverform, the limb 5 -lobed (rarely 4or 6-lobed). Stamens 10; filaments filiform; anthers attached to the filaments below the middle. Disk Io-lobed. Ovary ovoid, hirsute, 5 -lobed, 5 -celled; ovules numerous; style columnar; stigma 5 -lobed. Capsule depressed-globose, hirsute, slightly 5 -lobed, at length loculicidally 5 -valved. [Greek, on the earth.] Two species, the following of eastern N. Am., the other of Japan.

1. Epigaea rèpens L. Trailing Arbutus. Mayflower. Ground LauReL. (I. F. f. 2774.) Twigs hirsute; branches I.5-4 dm. long. Leaves oval or nearly orbicular, thick, cordate or rounded at the base, mostly glabrous above, hirsute beneath, green both sides, $2.5-7.5 \mathrm{~cm}$. long, $12-35 \mathrm{~mm}$. wide; petioles hirsute, $0.6-5 \mathrm{~cm}$. long; flowers $10-16 \mathrm{~mm}$. long and nearly as broad when expanded; corolla-tube somewhat longer than the sepals. In sandy or rocky woods, Newf. to the N. W. Terr., Fla., Ky. and Mich. Often forms patches. March-May.

## 18. GAULTHÈRIA L.

Shrubs, with alternate evergreen leaves, and small axillary, white, red or pink flowers. Calyx 5-parted or 5 -cleft, persistent. Corolla urn-shaped or campanulate, 5 -toothed or 5 -lobed. Stamens 10, included, inserted at the base of the corolla; filaments dilated above the base; anther-sacs opening by a terminal pore, commonly awned. Stigma obtuse, entire. Disk ro-toothed. Ovary 5-celled, 5lobed. Calyx becoming fleshy and at length surrounding the capsule, forming a berry-like fruit. [Named after Dr. Gaultier, of Quebec.] About roo species. mostly of the Andes. Besides the following, 3 others occur on the Pacific Coast.
I. Gaultheria procúmbens L. Spring or Crefping Wintergreen. Checkerberry. (I. F. f. 2775.) Nearly glabrous, aromatic; stems slender. creeping or subterranean; branches erect, $5-15 \mathrm{~cm}$. high. Leaves mostly clustered at the ends of the branches, oval, oblong or obovate, narrowed at the base, short-
petioled, the margins serrate with low bristle-tipped teeth, dark green and shining above, pale beneath, $2.5-5 \mathrm{~cm}$. long; flowers usually solitary in the axils, on recurved peduncles $4-8 \mathrm{~mm}$. long, 2 -bracteolate under the calyx; corolla ovoidurceolate, white, 5 -toothed, $4-6 \mathrm{~mm}$. long; fruit depressed-globose, slightly 5 -lobed, bright red, $8-12 \mathrm{~mm}$. in diameter, mealy, very spicy. In woods, Newf. to Manitoba, Ga. and Mich. June-Sept.

## 19. ARCTOSTÁPHYLOS Adans.

Shrubs, some western species small trees. Leaves alternate, petioled, firm or coriaceous, evergreen. Flowers small, nodding, pedicelled, white or pink, in terminal clusters. Calyx 4-5-parted, persistent. Corolla 4-5-lobed, the lobes recurved, imbricated in the bud. Stamens io, rarely 8, included; filaments short; anthers short, erect, introrse, with 2 recurved awns on the back, the sacs opening by a terminal pore. Disk 8-ro-lobed. Ovary 4-10-celled; ovules solitary in the cavities; style slender. Fruit a drupe, with 4 -Io seed-like nutlets coherent into a solid stone. [Greek, bear-berry.] About 20 species, the following of the northern hemisphere, the others of western N. Am.
I. Arctostaphylos Ùva-Úrsi (L.) Spreng. Red Bearberry. Kinnikinic. (I. F. f. 2776.) Trailing or spreading, branches $1.5-6 \mathrm{dm}$. long, the twigs puberulent. Leaves spatulate, obtuse, entire, glabrous or minutely puberulent toward the base, $12-25 \mathrm{~mm}$. long, 4-10 mm . wide, finely reticulate-veined; petioles about 2 mm . long; flowers few in short racemes; pedicels $2-4 \mathrm{~mm}$. long; corolla ovoid, constricted at the throat, white, about 4 mm . long; drupe globose, red, glabrous, insipid, rather dry, 6-10 mm . in diameter, usually containing 5 coalescent nutlets. In dry, sandy or rocky soil, Lab. to Alaska, N. J., Penn., Ill., Neb., Colo. and Cal. Also in Europe and Asia. May-June.
20. MAIRÀNIA Neck.

A low shrub, with shreddy bark, alternate thin deciduous leaves clustered toward the ends of the branches, and small white clustered pedicelled flowers. Calyx $4-5$-parted. Corolla 4-5-toothed, the short teeth spreading or recurved. Stamens 8 or 1o, included; anther-sacs with 2 recurved dorsal awns. Ovary 4-5-celled; ovules I in each cavity. Drupe globose, with 4 or 5 separate I-seeded nutlets. A monotypic genus.
I. Mairania alpina (L.) Desv. Alpine or Black Bearberry. (I. F. f. 2777.) Tufted or depressed-prostrate; branches $5-12 \mathrm{~cm}$. high, the twigs glabrous or nearly so. Leaves obovate, crenulate, conspicuously reticulate-veined, ciliate at least when young, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long, $6-14 \mathrm{~mm}$. wide; flowers few, appearing from scaly buds before or with the leaves; corolla white, ovoid, constricted at the throat; drupe black (or bright red, according to Macoun), juicy, 6-10 mm. in diameter. Mountains of N. Eng.; Quebec to Newf., Alaska and Br. Col. Also in northern Europe and Asia. Summer.

## 21. CALLÙNA Salisb.

A low evergreen shrub, with minute linear opposite imbricated leaves, and small white or pink flowers, in terminal one-sided dense spike-like racemes. Sepals 4, scarious, obtuse, longer than and concealing the corolla. Corolla campanulate, 4-parted, slightly twisted, persistent. Stamens 8; filaments short; anthers oblong, attached to the filaments by their backs, opening by a longitudinal slit, each sac with a dorsal reflexed appendage. Disk 8-lobed. Ovary depressed-globose, 8 -angled; style slender. Capsule somewhat 4 -sided, 4 -celled, 4 -valved, few-seeded. Seeds ovoid, pendulous, not winged. [Greek.] A monotypic genus.
I. Calluna vulgàris (L.) Salisb. Ling. Heather. Moor. Besom. (I. F. f. 2778.) Straggling, the branches ascending, I-4 dm. high. Leaves sessile, about 1 mm . long, imbricated in 4 rows, usually 2 -auricled at the base, 3 -angled, grooved on the back; calyx with 4 bracts at the base; corolla about 3 mm . long. Sandy or rocky soil, Newf. to N. J. Nat. or adventive from Europe. July-Sept.

## Family 5. VACCINIÀCEAE Lindl.

## Huckleberry Family.

Shrubs, or small trees, with alternate leaves, and small perfect flowers, the pedicels commonly bracted. Calyx-tube adnate to the ovary, the limb 4 - 5 -lobed or $4-5$-cleft. Corolla $4-5$-lobed, or rarely divided into separate petals, deciduous. Stamens twice as many as the corolla-lobes, epigynous, or inserted at the base of the corolla ; filaments mostly short ; anthers dorsally attached, 2 -celled, the connective entire or 2 -awned. Ovary inferior, 2-Io-celled, crowned by the epigynous disk; style filiform ; ovules anatropous. Fruit a berry or drupe in our genera, globose; cells i-several-seeded, or the drupe containing several nutlets. Seeds compressed; testa bony; endosperm fleshy; embryo central; radicle near the hilum. About 20 genera and 300 species of wide distribution.

[^38]Corolla open-campanulate, 4-5-lobed.
Flowers 4 -parted; leaves small, coriaceous, persistent; low shrub.
2. Vitis-Idaea.

Flowers 5 -parted; leaves large, thin, deciduous; tall shrubs.
Flower not jointed with its pedicel; anthers exserted. 3. Polycodium.
Flower jointed with its pedicel; anthers included; berry black. 4. Batodendron. Corolla cylindric, subglobose or urceolate.

Erect shrubs; ovary entirely inferior; berries normally not white.
5. Vaccinium.

Low trailing shrub; ovary half inferior; berry snow-white.
Corolla deeply 4 -cleft or 4 -divided, the lobes reflexed.
6. Chiogenes.
7. Oxycoccus.

## 1. GAYLUSSÀCIA H.B.K.

Branching shrubs, with alternate leaves, and small white or pink flowers in lateral bracted racemes. Pedicels mostly 2-bracteolate. Calyx-tube obconic, or turbinate, the limb 5 -lobed or 5 -toothed, persistent. Corolla urn-shaped, or tubular-campanulate, the tube terete or 5 -angled, the limb 5-lobed. Stamens Io, equal; filaments short; anther-sacs tapering upward into tubes, awnless, opening by terminal pores or chinks. [Named for the celebrated chemist, Gay-Lussac.] About 40 American species. Besides the following, 3 others occur in the Southern States.

Leaves pale and glaucous beneath, resinous; fruit blue with a bloom. 1. G. frondosa. Leaves green both sides, resinous; fruit mostly black.

Bracts small, deciduous, mostly shorter than the pedicels.
Bracts oval, large, persistent, longer than the pedicels.
Leaves thick, evergreen, serrate, not resinous; bracts scale-like.
2. G. resinosa.
3. G. dumosa.
4. G. brachycera.
I. Gaylussacia frondòsa (L.) T. \& G. Blue Tangle. Tangleberry. Dangleberry. (I. F. f. 2779.) An erect shrub, 6-12 dm. high. Leaves oval to obovate, obtuse or retuse, entire, $3.5-6.5 \mathrm{~cm}$. long, the upper surface green, glabrous; petioles about 2 mm . long; flowers few, greenish pink; bracts linear-oblong. shorter than the filiform pedicels, deciduous; corolla globose-campanulate. 3 mm . long; filaments glabrous; fruit globose, about 8 mm . in diameter, sweet. In moist woods, N. H. to Fla., Ohio and La. May-June.
2. Gaylussacia resinòsa (Ait.) T. \& G. Black or High-bu'sil HuckieBERRY. (I. F. f. 2780 .) A shrub, 3-9 dm. high, the young shoots commonly pubescent. Leaves oval or oblong, rarely obovate, entire, mucronulate, glabrous or nearly so, firm, $2.5-5 \mathrm{~cm}$. long; petioles about 2 mm . long: flowers few, pink or red, in one-sided racemes; corolla ovoid-conic, 5 -angled, hecoming campanulatecylindric, $4-5 \mathrm{~mm}$. long; filaments ciliate; fruit (rarely white) about 6 mm . in diameter, sweet but seedy. In woods and thickets, Newf. to (ia., Manitoba, Wis. and Ky. May-June.

Gaylussacia resinosa glaucocarpa Robinson. Fruit blue, with a bloom, larger than that of the type. Me. to N. Car.
3. Gaylussacia dumòsa (Andr.) T. \& G. Dwarf or Bush Huckleberry. (I. F. f. 278 I.) A shrub, 3-6 dm. high, the branches usually leafless below, the young twigs pubescent or hirsute, glandular. Leaves oblong-obovate or oblanceolate, obtuse, mucronate, entire, firm or coriaceous, shining when old, $2.5-3.5 \mathrm{~cm}$. long, sessile or nearly so; flowers white, pink or red, in rather loose racemes; bracts foliaceous, pubescent; corolla campanulate, $4-5 \mathrm{~mm}$. long; filaments pubescent; calyx puberulent; fruit $6-8 \mathrm{~mm}$. in diameter, watery, rather insipid. In sandy swamps, Newf. to N. Y., Fla. and La. May-June.

Gaylussacia dumòsa hirtélla (Ait.) A. Gray. Pedicels and calyx hirsute. Va. to Fla. and La.
4. Gaylussacia brachýcera (Michx.) A. Gray. Box-huckleberry. (I. F.f. 2782.) A low shrub, I.5-4 dm. high, the branches angular, the twi $\xi$ s glabrous or nearly so. Leaves coriaceous, glabrous, persistent, oval or oblong, $12-25 \mathrm{~mm}$. long, with low teeth, the margins somewhat revolute; petioles 2 mm . long or less; flowers few, white or pink, in short racemes; bracts and bractlets caducous; pedicels short; corolla cylindric-ovoid, about 4 mm . long; filaments ciliate; fruit (according to A. Wood) light blue. In dry woods, Penn. to Va. May.

## 2. VÌtis-IDAÈA Tourn.

A low evergreen shrub, with creeping stems, alternate oval or obovate coriaceous leaves, and small white or pink nodding flowers, secund in small terminal clusters. Calyx 4-toothed. Corolla open-campanulate, 4-lobed. Stamens 8; anithers upwardly prolonged into tubes. Ovary 4-celled, inferior. Fruit a dark red acid many-seeded berry. [Ancient name.] A monotypic genus.
I. Vitis-Idaea Vìtis-Idaèa (L.) Britton. Mountain Cranberry. (I. F. f. 2795.) Branches erect, I-2 dm. high. Leaves thick, crowded, green and somewhat shining above, paler and black-dotted beneath, glabrous, or minutely ciliate toward the base, short-petioled, entire or sparingly serrulate, $6-16 \mathrm{~mm}$. long, the margins revolute; bracts reddish, short-oblong; bractlets 2 ; berries $8-10 \mathrm{~mm}$. in diameter. In rocky places, Essex Co., Mass., coast of Me., higher mountains of N. Eng. to Lab., west to Lake Superior, Br. Col. and Alaska. Also in northern Europe and Asia. [Vaccinium Vitis-Iaaea L.]

## 3. POLYCÒDIUM Raf.

Shrubs with alternate deciduous leaves, and purplish or yellowish green flowers in leafy-bracted racemes. Calyx 5-toothed. Corolla open-campanulate, 5 -lobed. Stamens 10; anthers upwardly prolonged into tubes. Ovary 5 -celled, inferior. Berry green, nearly black, or yellow, globose to pyriform. Four or five species of eastern N. Am. [Greek, many bells. $]$
I. Polycodium stamíneum (L.) Greene. Deerberry. Buckberry. (I. F. f. 2796.) Divergently branched. 6-15 dm. high. Leaves oval, oblong or rarely obovate, acute or sometimes acuminate, petioled, entire, firm, green above, pale beneath, $2.5-10 \mathrm{~cm}$. long, $12-35 \mathrm{~mm}$. wide; corolla purplish or yellowish green, deeply cleft, 4-6 mm. long. 6-10 mm . broad; berry globose or pear-shaped, green or yellow, $8-\mathrm{IO} \mathrm{mm}$. in diameter, inedible. In dry woods and thickets, Me. to Ont., Minn., Fla., Ky. and La. April-June. [Vaccinium stamineum L.]

## 4. BATODENDRON Nutt.

Shrubs or small trees, with firm deciduous leaves, and white flowers in leafybracted racemes. Calyx 5 -toothed. Corolla campanulate, 5 -lobed. Stamens Io; style exserted. Berry black, globose, many-seeded. Two or three N. Am. species. [Greek, blackberry tree.]
I. Batodendron arbòreum (Marsh.) Nutt. Farkleberry. (I. F. f. 2797.) Divergently branched, reaching a maximum height of about 9 m . Leaves obovate or oval, short-petioled. shining and bright green above, duller, and sometimes sparingly pubescent beneath, entire or glandular-denticulate, $2.5-5 \mathrm{~cm}$. long, 12-25 mm . wide; flowers slender-pedicelled; bracts persistent; berry about 6 mm . in diameter. inedible. In dry sandy soil, N. Car. to Ky., Ill., Ind. Terr., Fla. and Tex. May-June. [Vaccinium arboreum Marsh.]

## 5. VACCÍNIUM L.

Shrubs (some species small trees) with alternate leaves, and small white pink or red flowers, in racemes or clusters, or rarely solitary in the axils. Calyx-tube globose, hemispheric or turbinate, not angled, adnate to the ovary, the limb 4-5toothed or $4-5$-lobed, persistent. Corolla gamopetalous, urn-shaped, or cylindric, rarely subglobose, its limb $4-5$-toothed or $4-5$-lobed. Stamens twice as many as the lobes of the corolla; anthers upwardly prolonged into tubes, opening by terminal pores or chinks. Ovary $4-5$-celled, or 8 -Io-celled by false partitions; ovules several or numerous; stigma small. Fruit a many-seeded berry. [Latin, blueberry.] About 125 species of wide distribution. Besides the following, some II others occur in southern and western N. Am.

Fiowers solitary. or $2-4$ together, on drooping pedicels; low shrubs.
$\begin{array}{ll}\text { Most or all the flowers } 4 \text {-parted, and stamens } 8 \text {. } & \text { I. V. uliginosum. } \\ \text { Flowers all or nearly all } 5 \text {-parted, and stamens io. }\end{array}$
Flowers all or nearly all 5 -parted, and stamens io.
Shrub $7-15 \mathrm{~cm}$. high; leaves obovate or cuneate. 2. V. caespitosum.
Shrubs o.3-4 m. high; leaves oval or oblong; northern species.
Leaves serrulate, green both sides; berries purple-black.
3. $V$. membranaceum.

Leaves entire or nearly so, pale beneath; berry blue with bloom.
4. V. ovalifolium.

Flowers fascicled or racemose, short-pedicelled; leaves deciduous.
Corolla cylindric or nearly so, $2-3$ times as long as thick.
Flowers appearing before the leaves; berry black. ${ }^{\text {5. }}$. V. virgatum. Flowers appearing with the leaves; berry blue with a bloom.
6. V. corymbosum.

Corolla urn-shaped, oblong or oblong-cylindric, 1-2 times as long as thick.
Leaves not glaucous; glabrous or pubescent beneath.
Leaves mostly entire, pubescent beneath.
Shrub $1-5 \mathrm{~m}$. high; leaves oval, large, fruit black.
7. $V$. atrococcum.

Shrub r. 5-6 dm. high; leaves oblong, small; fruit blue.
8. V. Canadense.

Leaves serrulate, nearly or quite glabrous; low shrub; fruit blue.
9. V. Pennsylvanicum.

Leaves pale and glaucous beneath, mostly glabrous both sides.
Fruit black; shrub $1.5-5 \mathrm{dm}$. high; leaves oblong or oblanceolate.
10. V. nigrum.

Fruit blue; shrubs $3-18 \mathrm{dm}$. high ; leaves oblong, oval, or obovate.
Leaves firm, mostly entire; berry about 6 mm . in diameter.
11. V. vacillans.

Leaves thin, sharply serrulate; berry $8-12 \mathrm{~mm}$. in diameter.
12. V. pallidum.
I. Vaccinium uliginòsum L. Great Bilberry. Bog Whortleberiry. Bleaberry. (I. F. f. 2783 .) Much branched, I.5-6 dm. high. Leaves thick, glabrous or nearly so, dull, pale or glaucous beneath, obovate, oblong, or oval, obtuse, or retuse, entire, nearly sessile, finely reticulate-veined, $10-25 \mathrm{~mm}$. long; flowers mostly shorter than the pedicels; calyx sometimes 5 -lobed; corolla pink, ovoid or urn-shaped, $4-5$-toothed; berry blue with a bloom. about 6 mm . in diameter, sweet. Mountains of N. Eng. and the Adirondacks; Lab. and Quebec to the shores of Lake Superior and Alaska. Also in Europe and Asia. June-July.
2. Vaccinium caespitòsum Michx. Dwarf Bilberry. (I. F. f. 2784.) Nearly glabrous throughout. Leaves $\mathbf{1 2 - 2 5} \mathbf{m m}$. long, green and shining both sides, nearly sessile, serrulate; flowers longer than their pedicels: corolla obovoid or obovoid-oblong, pink or white, rarely 4 -toothed: stamens rarely 8 ; borry blue with a bloom, sweet, about 6 mm . in diameter. Me., N. H., N. B. to Lab., west to Alaska, south in the Rocky Mts. to Colo. June-July.
3. Vaccinium membranàceum Dougl. Thin teayen Buberry. (I. F. f. 2785.) Nearly glabrous, 3-15 dm. high, the twigs slightly angled. Leaves thin, not shining, acutish to acuminate, short-petioled. $2.5-5 \mathrm{~cm}$. long; flowers with their pedicels becoming erect in fruit; corolla depressed-globose or globoseurceolate, greenish or purplish, mostly 5 -toothed; berry rather acid. In moist woods, Mich. to Mont., Ore. and Br. Col. June-July.
4. Vaccinium ovalifòlium J. E. Smith. Tall or Oval-leaved Bilberry. (I. F. f. 2786.) A straggling shrub, 9-36 dm. high; twigs glabrous, sharply angled. Leaves short-petioled, glabrous, green above, glaucous beneath, rounded at both ends, or somewhat narrowed at the base, thin, sometimes mucronulate, $2.5-5 \mathrm{~cm}$. long; flowers on rather short recurved pedicels; corolla globose-ovoid; berry 8-10 mm . in diameter. Woods, Quebec to Mich., Ore. and Alaska. June-July.
5. Vaccinium virgàtum Ait. Southern Black Huckleberry. (I. F. f. 2787.) A shrub, $9-36 \mathrm{dm}$. high, the branches slender, the young twigs puberulent. Leaves narrowly oval-oblong, broadest at the middle, mucronate, shortpetioled, entire, green and glabrous above, pale or glaucous beneath, thick when old, $2.5-6.5 \mathrm{~cm}$. long, $12-25 \mathrm{~mm}$. wide, veins pubescent; flowers equalling or longer than their pedicels; calyx 5 -lobed; corolla $6-8 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. thick, white or light pink; stamens $\mathbf{1 0}$; berry with or without bloom, 4-6 mm . in diameter. In swamps, Va. to Fla. and La. April-May.

Vaccinium virgàtum tenéllum (Ait.) A. Gray. Low, mostly less than 6 dm . high; leaves smaller, narrower, $12-35 \mathrm{~mm}$. long; flowers white, or nearly so, $4-6 \mathrm{~mm}$. long. Va. to Ark., Fla. and Ala.
6. Vaccinium corymbòsum L. High-bush or Tall Blueberry. (I. F. f. 2788.) A shrub, $2-4.5 \mathrm{~m}$. high; twigs terete, greenish brown. Leaves oval or oblong, mostly acute at each end, usually entire, sometimes ciliate, glabrous above, paler and often pubescent beneath, short-petioled, $2.5-7.5 \mathrm{~cm}$. long, $12-35 \mathrm{~mm}$. wide; flowers equalling or longer than their pedicels; bracts deciduous; calyx 5 lobed ; corolla white or faintly pink, $6-12 \mathrm{~mm}$. long, 3-6 mm. thick, 5 -toothed (rarely 5 -lobed); stamens io; berry $6-8 \mathrm{~mm}$. in diameter, pleasantly acid. In swamps, thickets and woods, Newf. to Va., Minn. and La. May-June.
7. Vaccinium atrocóccum (A. Gray) Heller. Black Blueberry. (I. F. f. 2789.) Similar to the two preceding; branches minutely warty, young twigs pubescent. Leaves dark green above, light green beneath, usually acute at both ends, mucronate, thick, $3.5-7.5 \mathrm{~cm}$. long, $12-35 \mathrm{~mm}$. wide; flowers appearing with the leaves, about the length of their pedicels; calyx 5 -lobed; corolla short-cylindric or ovoid, pink or red, 4-6 mm. long, about 3 mm . thick, 5 -toothed, constricted at throat; berry without bloom, sweet, $6-10 \mathrm{~mm}$. in diameter. In swamps and wet woods, N. B. and Ont. to N. J. and Penn. May-June.
8. Vaccinium Canadénse Richards. Canada Blueberry. (I. F.f. 2790.) Pubescent. Leaves acute, narrowed at the base, $2.5-3.5 \mathrm{~cm}$. long, $8-\mathrm{I} 2 \mathrm{~mm}$. wide; flowers few in the clusters, which are sometimes numerous on naked branches, appearing with the leaves; corolla oblong-campanulate, greenish white, about 4 mm . long and 3 mm . thick; berry with a bloom (rarely white), sweet, $5-6 \mathrm{~mm}$. in diameter. In moist places, Lab. to the N. W. Terr., Va., Ill. and Mich. May-June.
9. Vaccinium Pennsylvánicum Lam. Dwarf, Sugar or Low-bush Blueberry. (I. F. f. 2791.) Similar to the preceding species, but with green warty branches and nearly or quite glabrous throughout. Leaves oblong or oblonglanceolate, slightly pubescent on the veins beneath, acute at both ends, $1.8-3.6 \mathrm{~cm}$. long, $6-12 \mathrm{~mm}$. wide; flowers few in the clusters, longer than the very short pedicels; corolla oblong-campanulate, slightly constricted at the throat, $4-5 \mathrm{~mm}$. long, about 3 mm . thick, white or pinkish; berry with a bloom, very sweet, $6-10 \mathrm{~mm}$. in diameter. In dry, rocky or sandy soil, Newf. to the N. W. Terr., N. J., Ill. and Mich. May-June.

Vaccinium Pennsylvánicum angustifolium (Ait.) A. Gray. Leaves narrower, 2-3 mm . wide. Mts. of Me., N. H. and Adirondacks; Quebec to Lake Superior and arctic Am.
10. Vaccinium nigrum (Wood) Britton. Low Black Blueberry. (I. F. f. 2792.) Similar to $V$. Pennsylvanicum and often growing with it, the twigs glabrous. Leaves acute, finely serrulate, very nearly sessile, $12-25 \mathrm{~mm}$. long, 6-12 mm . wide, green above; flowers few in the clusters, longer than their pedicels; corolla globose-ovoid, little constricted at the throat, white or cream color, about 4 mm . long, 3 mm . thick; berry without bloom, about 6 mm . in diameter. In dry rocky soil, Me. to N. J., Penn. and Mich. Blooms earlier than V. Pennsylvanicum. May.
ir. Vaccinium vacíllans Kalm. Low Blueberry. Blue Huckleberry. (I. F. f. 2793.) A stiff shrub, I.5-12 dm. high, with glabrous yellowish-green warty
branches. Leaves usually mucronulate, finely reticulate-veined beneath, 2.5-6.5 cm . long, $\mathbf{1 2 - 3 0 ~ \mathrm { mm }}$. wide; flowers several or few in the clusters which are sometimes racemose on naked branches; corolla oblong-cylindric, somewhat constricted at the throat, pink, 4-6 mm. long, 3-4 mm. thick; berry with a bloom, sweet. In dry soil, Me. and N. H. to Ont., Mich., N. Car. and Mo. May-June.
12. Vaccinium pállidum Ait. Pale or Mountain Blueberry. (I. F. f. 2794.) A shrub, 6-24 dm. high, with glabrous green warty twigs. Leaves oval, ovate or oblong, acute or acuminate, short-petioled, light green above, sometimes pubescent on the veins beneath, $2.5-7.5 \mathrm{~cm}$. long; flowers about equalling their slender pedicels; corolla oblong-cylindric to urceolate, slightly constricted at the throat, greenish-pink, $4-5 \mathrm{~mm}$. long, 3-4 mm. thick; berry delicious. In woods, mountains of Va. to S. Car. May-June.

## 6. CHIÓGENES Salisb.

Creeping evergreen shrubs, with alternate 2 -ranked oval or ovate small leaves, and solitary axillary small white flowers, on short recurved peduncles. Calyxtube 2 -bracted at the base, its limb 4 -cleft. Corolla short-campanulate, 4 -cleft, its lobes rounded. Stamens 8, included ; filaments short, nearly orbicular, roughish; anthers not awned nor prolonged into tubes, each sac 2 -cuspidate at the apex and opening by a slit down to the middle. Ovary 4 -celled, surmounted by the 8 -lobed disk; style short. Berry snow-white, many-seeded, rather mealy. [Greek, snow-born, in allusion to the berries.] A monotypic genus.
I. Chiogenes hispídula (L.) T. \& G. Creeping Snowberry. (I. F. f. 2798.) Branches strigose-pubescent, slender, $\mathbf{1}-3 \mathrm{dm}$. long. Leaves coriaceous, shortpetioled, acute, dark green, glabrous above, entire, with appressed stiff brownish hairs beneath and on the revolute margins, $4-10 \mathrm{~mm}$. long; flowers about 4 mm . long; berry aromatic, usually minutely bristly, crowned by the 4 calyx-teeth, becoming almost wholly inferior, about 6 mm . in diameter. In cold wet woods and bogs, Newf. to Br. Col., N. Car. and Mich. May-June.

## 7. OXYĆOCCUS Hill.

Glabrous, or slightly pubescent shrubs, with alternate nearly sessile leaves, and pendulous or cernuous, slender-peduncled red or pink flowers. Calyx-tube nearly hemispheric, adnate to the ovary, the limb 4-5-cleft, persistent. Corolla long-conic in the bud, 4 -5-divided into separate or nearly separate petals, these narrow and revolute. Stamens 8 or 10, the filaments distinct; anthers connivent into a cone, long-exserted when the flower is expanded, upwardly prolonged into hollow tubes dehiscent by a pore at the apex. Ovary 4-5-celled; style slender or filiform. Fruit a many-seeded juicy red berry. [Greek, sour berry.] Four species, natives of the northern hemisphere.
Trailing bog shrubs; leaves evergreen, entire; flowers $1-6$ from terminal buds. Leaves ovate, acute, $4-8 \mathrm{~mm}$. long; berry globose. I. O. Oxycoccus. Leaves oval or oblong, obtuse, $6-14 \mathrm{~mm}$. long; berry ovoid or oblong.
2. O. macrocarpus.

Erect mountain shrub; leaves deciduous, serrulate; flowers solitary, axillary.
3. O. erythrocarpus.
r. Oxycoccus Oxycóccus (L.) MacM. Small or European Cranberry. (I. F. f. 2799.) Stems $\mathbf{1 . 5 - 4 . 5 ~ d m}$. long. Branches ascending 'or erect. 2.5-15 cm . high; leaves thick, rounded or cordate at the base, dark green above, white beneath, $2-4 \mathrm{~mm}$. wide, the margins revolute; flowers mostly umbellate, rarely racemose, from terminal scaly buds, on erect filiform pedicels; corolla pink, about 8 mm . broad; filaments puberulent, about half the length of the anthers; berry $6-10 \mathrm{~mm}$. in diameter, acid. In cold bogs, Lab. to Alaska, N. J., Mich. and Br. Col. Also in Europe and Asia. May-July.
2. Oxycoccus macrocàrpus (Ait.) Pers. Large or American Craniberry. (I. F. f. 2800 .) Similar to the preceding, but larger, the branches often 2 dm . long. Leaves $2-6 \mathrm{~mm}$. wide, white or pale beneath, the margins revolute; flowers several, in somewhat racemose clusters, nodding on erect pedicels; corolla light pink, 8 -10 mm . broad; filaments puberulent; berry acid. $8-18 \mathrm{~mm}$. long. In bogs, Newf. to the N. W. Terr., N. Car., W. Va., Mich. and Minn. June-Aug.
3. Oxycoccus erythrocàrpus (Michx.) Pers. Southern Mountain Cranberry. (I. F. f. 28oi.) A shrub, 3-18 dm. high. Leaves thin, green both sides, paler beneath than above, reticulate-veined, ovate, ovate-lanceolate, or ovateoblong, acuminate, flat, $2.5-7.5 \mathrm{~cm}$. long, $\mathbf{1 2 - 2 5} \mathrm{mm}$. wide; peduncles pendulous, filiform, less than half as long as the leaves; corolla red, about $\mathbf{I} \mathrm{cm}$. broad; fila. ments villous; berry globose, dark red when ripe, acid, 4-6 mm. in diameter. In woods, mountains of Va. to Ga. June-July.

## Family 6. DIAPENSIÀCEAE Link.

## Diapensia Family.

Low tufted shrubs, or perennial scapose herbs, with alternate or basal simple estipulate leaves, and small, white pink or purple, perfect and regular flowers, solitary in the axils, or racemose at the summit of scapes. Calyx 5-parted, persistent; sepals imbricated in the bud. Corolla 5-lobed, 5-cleft, or 5-parted, deciduous. Stamens 5, inserted on the throat of the corolla and alternate with its lobes, or connate, sometimes with as many alternating staminodia; pollen-grains simple. Disk none. Ovary free from the calyx, superior, 3-celled; style persistent; stigma 3-lobeḍ ; ovules anatropous or amphitropous. Capsule 3-celled, laculicidally 3 -valved. Seeds minute, the testa loose or close; endosperm fleshy; embryo terete ; cotyledons short ; radicle elongated. Six genera and about 8 species, natives of the northern hemisphere.
Low tufted evergreen shrubs; corolla gamopetalous.
Tufted arctic-alpine shrub; flowers terminal, peduncled. I. Diapensia.
Trailing shrub; flowers solitary, sessile.
2. Pyxidanthera.

Tall scapose perennial'herb; flowers spicate-racemose; petals separate.
3. Galax.

## 1. DIAPÉNSIA L.

Densely tufted glabrous low evergreen shrubs, with thick rather fleshy imbricated narrow leaves, and solitary terminal erect peduncled white or pink flowers. Calyx 2-4-bracted at the base, the sepals oval, obtuse, somewhat rigid. Corolla campanulate, tardily deciduous, 5-lobed, the lobes obtuse. Stamens 5, inserted at the sinuses of the corolla; filaments short and broad; anther-cells pointed, divergent, obliquely 2 -valved; staminodia none. Style slender; ovules numerous in the cells, anatropous. Seeds oblong-cubic, the testa close, reticulated. [Greek, by fives, alluding to the stamens and corolla-lobes.] Two species, the following, the other Himalayan.
I. Diapensia Lappónica L. Diapensia. (I. F. f. 2802.) Glabrous, forming cushion-like tufts; stems $2-8 \mathrm{~cm}$. high. Leaves crowded below, thick, spatulate, sessile, often curved, entire, $6-12 \mathrm{~mm}$. long, about 2 mm . wide; peduncles $2-5 \mathrm{~cm}$. long in fruit; sepals and bracts oval; corolla usually white, $6-8 \mathrm{~mm}$. long; capsule ovoid, $4-6 \mathrm{~mm}$. high. Summits of the Adirondack Mts., and of the mountains of N. Eng.; Mt. Albert, Quebec; Lab. and arctic Am. Also in northern and alpine Europe and Asia. June-July.

## 2. PYXIDANTHÈRA Michx.

A rreeping tufted evergreen shrub, with small narrow alternate imbricated leaves, and numerous white or pinkish sessile flowers, solitary at the ends of the branches. Calyx bracted at the base, the sepals oblong, ciliate. Corolla shortcampanulate, 5 -lobed, tardily deciduous. Stamens inserted at the sinuses of the corolla; filaments broad and thick; anthers 2 -celled, the sacs globose, transversely 2 -valved, the lower valve cuspidate; staminodia none. Style columnar. Seeds globose-oblong, amphitropous, the testa black, cancellate. [Greek, box-anther.] A monotypic genus.
I. Pyxidanthera barbulata Michx. Pyxie. Flowering Moss. (I. F. f. 2803.) Glabrous, or sparingly pubescent, growing in mats or large patches. Leaves sessile, linear, lanceolate or linear-oblong, acuminate or subulate tipped,
entire, 4-8 mm. long; flowers 4-6 mm. broad; corolla-lobes cuneate-obovate, obtuse, retuse or eroded; capsule about 2 mm . high, globose, surrounded by the upper leaves. In dry sandy pine-barrens, N. J. and N. Car. March-May.

## 3. GÀLAX L.

An acaulescent perennial herb, with orbicular cordate crenate-dentate longpetioled basal leaves, and numerous small white flowers, spicate-racemose at the ends of tall slender scapes. Calyx 2-bracteolate at the base, 5 -parted, the sepals nerveless. Corolla 5 -divided, the petals oblong, entire, adnate to the bases of the monadelphous stamens. Stamen-tube Io-lobed at the summit, the lobes which are opposite the petals petaloid (staminodia), those alternate with the petals antheriferous; anthers nearly sessile, granular on the back, I-celled, transversely 2 -valved. Style very short. Seeds ovoid, the testa loose. [Greek, milk; name not characteristic of this genus.] A monotypic genus.

1. Galax aphylla L. Galax. Galaxy. Beetle-weed. (I. F. f. 2804:) Scape 3-5 dm. high, terete, with red scales at the base and many red fibrous roots. Leaves with a rather narrow sinus, persistent, shining, commonly shorter than their slender petioles, $2-8 \mathrm{~cm}$. in diameter; spike-like raceme dense, narrow, $5-13 \mathrm{~cm}$. long; flowers $3-4 \mathrm{~mm}$. broad, spreading; capsule ovoid, acute, erect, short-pedicelled, 2 mm . long, slightly exceeding the lanceolate acutish sepals. In dry woods, Va. to Ga. May-July.

## Order 2. PRIMULÀLES.

Our species herbs. Corolla usually present, gamopetalous. Calyx mostly free from the ovary. Stamens borne on the corolla, as many as its lobes, or twice as many, or more.
Style 1; fruit a capsule.
Fam. 1. Primulaceae.
Fam. 2. Plumbaginaceae.
Family I. PRIMULÀCEAE Vent.
Primrose Frmily.
Herbs, with perfect regular flowers. Calyx free from the ovary (adnate to its lower part in Samolus), usually 5-parted, persistent or rarely deciduous. Corolla gamopetalous in our species (wanting in Glaux), usually 5-cleft, deciduous. Stamens as many as the corolla-lobes and opposite them, hypogynous or rarely perigynous, inserted on the corolla; filaments distinct, or connate at the base; anthers introrse, 2 -celled, the sacs longitudinally dehiscent. Disk obsolete, or none. Ovary superior (partly inferior in Samolus), I-celled; placenta central, free; orules anatropous, or amphitropous; style i; stigma simple, capitate, entire. Capsule 1 -celled, $2-6$-valved; rarely circumscissile or indehiscent. Seeds few or several, the testa adherent to the fleshy or horny copious endosperm; embryo small, straight; cotyledons obtuse. About $2 S$ genera and 350 species of wide distribution.

> * Lobes or segments of the corolla erect or spreading, not reflexed.

Lobes of the corolla imbricated, at least in the bud.
Ovary wholly superior.
Terrestrial scapose plants; leaves not pinnatifid.
Corolla-tube longer than the calyx: style slender. I. Primula. Corolla-tube shorter than the calyx; style short. $\quad$ 2. Androsace. Aquatic leafy-stemmed plant; jeaves finely pinnatifid. 3. Hottonia. Ovary adnate to the calyx ; marst herbs.
4. Samolus.

Lobes of the corolla convolute or vaivate, at least in the bud (corolla wanting in No. 9). Capsule longitudinally dehiscent.

Corolla rotate, or rarely short-funnelform.
Stem leafy throughout; flowers yellow.
Staminodia none; corolla-lobes convolute.
5. Lysimachia.

Staminodia 5 ; each corolla-lobe curved around its stamen.
6. Steironema.

Staminodia 5, tooth-like; flowers in axillary spike-like racemes or heads.
Leaves whorled at the top of the stem; flowers white. Corolla none; flowers minute, solitary in the axils.
Capsule circumscissile; flowers axillary.
Corolla longer than the calyx; stamens borne on its base.
Corolla shorter than the calyx; stamens borne on its tube.
7. Naumburgia.
8. Trientalis.
9. Glaux.
10. Anagallis.
** Segments of the corolla reflexed; plants scapose.
II. Centunculus.
12. Dodecatheon.

## I. PRÍMULA L.

Perennial scapose herbs, with basal leaves. and dimorphous flowers, umbellate, or in bracted racemose whorls. Calyx persistent, often angled, 5 -lobed, the lobes imbricated. Corolla funnelform or salverform, the tube longer than the calyx in our species, the limb 5 -cleft. Stamens 5 . included; filaments short: anthers oblong, obtuse. Ovary globose or ovoid; ovules amplitropous; style filiform; stigma capitate. Capsule oblong, oroid or globose. 5 -valved at the summit, many-seeded. Seeds peltate, the testa punctate. [Diminutive of the Latin primus, first, from the early blossoms.] About 150 species, mostly of the northern hemisphere. Besides the following, some 10 others occur in western N. Am.

Leaves almost always white-mealy beneath; scape I-5 dm. high.
Leaves green both sides; scape $2-15 \mathrm{~cm}$. high.
Leaves spatulate or obovate, denticulate.
Leaves oval or lance-ovate, entire.

1. P. farinosa.
2. P. Mistissinica.
3. P. Egaliksensis.
I. Primula farinòsa L. Bird's-eye or Mealy Primrose. (I. F. f. 2805.) Leaves spatulate or oblong, obtuse, $2-10 \mathrm{~cm}$. long, the margins crenulate denticulate; scape 3-20-flowered; flowers umbellate; bracts acute or acuminate; calyxlobes acute; corolla pink or lilac, usually with a yellowish eye, the tube slightly longer than the calyx, the lobes cuneate, retuse or obcordate, $4-6 \mathrm{~mm}$. long; capsule narrowly oblong, erect, about I cm. long. longer than the calyx. In moist places. Me. and Quebec to Greenland, the N. W. Terr. and Alaska. Also in Europe and Asia. Summer.
4. Primula Mistassínica Michx. Mistassini or Dwarf Canadan Primrose. (I. F. f. 2806.) Similar to the preceding, but smaller. Leaves spatulate or obovate, denticulate or repand, obtuse, $1-4 \mathrm{~cm}$. long; flowers $2-8$, umbellate; bracts acute or acuminate; corolla pink, or pale purple, with or without a yellow eye, the tube longer than the calyx: corolla-lobes obcordate, $3-5 \mathrm{~mm}$. long; capsule narrowly oblong, erect. $5-8 \mathrm{~mm}$. high. On wet banks, Me. to Greenland, N. Y., Mich. and the N. W. Terr. Occurs also in Europe. Summer.
5. Primula Egaliksénsis Hornem. Greenland Primrose. (I. F. f. 2807.) Leaves oval or lance-ovate, entire, or slightly undulate, obtuse or obtusish, $\mathrm{I}-2.5 \mathrm{~cm}$. long, narrowed into petioles; scape slender, $5-15 \mathrm{~cm}$. high; umbels 2-6-flowered; bracts lanceolate, acuminate; calyx-lohes acute; corolla-lobes 2-4 mm. long, much shorter than the tube, obovate, sometimes cleft to the middle; capsule erect, about 6 mm . high, longer than the calyx. Lab. and Greenland. Summer.

## 2. ANDRÓSACE L.

Low herbs, our species scapose, with tufted small basal leaves, and terminal umbellate involucrate small white or pink flowers. Calyx persistent, 5 -lobed, the lobes erect in flower. Corolla salverform or funnelform, the tube not longer than the calyx, the limb 5 -lobed. Stamens 5 , included. inserted on the tube of the corolla; filaments short; anthers short. oblong, obtuse. Ovary turbinate or globose; ovules amphitropous; style short; stigma capitellate. Capsule 5 -valved from the apex, few many-seeded. [Greek, man's shield, from the shape of the leaf in some species.] About 50 species, natives of the northern hemisphere. Besides the following, some 6 others occur in western and northwestern N. Am.
I. Androsace occidentàlis Pursh. Androsace. (I. F. f. 2808.) Annual, minutely pubescent, or glabrate; scapes filiform, $2-8 \mathrm{~cm}$. long. Leaves oblong or spatulate, obtuse, entire, sessile, $6-16 \mathrm{~mm}$. long; bracts of the involucre similar to
the leaves but much smaller; pedicels filiform; calyx-tube obpyramidal in fruit, the lobes acute, becoming foliaceous; corolla white, shorter than the calyx; calyx longer than the capsule. In dry soil, Minn. and Ill. to Kans., the N. W. Terr., Utah and N. Mex. April-June.

## 3. HOTTÒNIA L.

Aquatic glabrous herbs, with large pinnatifid submersed crowded leaves, and small white or purplish flowers, racemose-verticillate on bracted hollow erect emersed peduncles. Calyx deeply 5 -parted, the lobes linear, imbricated, persistent. Corolla salverform, the tube short, the limb 5-parted. Stamens 5, included; filaments short. Ovary ovoid; style filiform; stigma minute, capitate; ovules numerous, anatropous. Capsule subglobose, 5 -valved. Seeds ellipsoid, numerous. [Dedicated to Peter Hotton, 1648-1709, professor at Leyden.] Two species, the following of eastern N. Am., the other of Europe and Asia.
I. Hottonia inflàta Ell. American Featherfoil. (I. F. f. 28og.) Stem submerged, spongy, sometimes 6 dm . long. Leaves sessile, or nearly so, ovate or oblong in outline, divided very nearly to the rachis into narrowly linear entire segments $\mathbf{I}-5 \mathrm{~cm}$. long, $0.5-2 \mathrm{~mm}$. wide; peduncles several in a cluster at the ends of the stem and branches, jointed, constricted at the joints; 0.7-2 dm. high; pedicels $4-25 \mathrm{~mm}$. long; flowers $4-6 \mathrm{~mm}$. long in verticils of $2-10$ at the joints; corolla white, shorter than the calyx; capsule about 3 mm . in diameter. In shallow stagnant ponds, N. H. and Mass. to central N. Y., Fla. and La. June-Aug.

## 4. SÁMOLUS L.

Perennial glabrous herbs, with alternate entire leaves, or the basal ones rosulate. Flowers small, white, in terminal racemes or panicles in our species. Calyx persistent, its tube adnate to the ovary below, its limb 5 -cleft. Corolla perigynous, subcampanulate, 5 -lobed or 5 -parted, the lobes obtuse. Stamens 5, inserted on the tube of the corolla, opposite its lobes, alternating with as many staminodia (these wanting in S. ebracteatus), filaments short; anthers cordate. Ovary partly inferior; ovules amphitropous. Capsule 5 -valved from the summit. Seeds minute. [Name Celtic.] About io species, of wide distribution. Besides the following another occurs in the southern U. S.
I. Samolus floribúndus H. B. K. Water Pimpernel. Brookweed. (I. F. f. 2810.) Erect or ascending, I.5-4.5 dm. high. Leaves $2-8 \mathrm{~cm}$. long, obovate, obtuse; flowers less than 2 mm . broad, in elongated panicled racemes; pedicels filiform, spreading, $8-25 \mathrm{~mm}$. long, bracteolate near the middle; calyx-lobes acute, shorter than the corolla; capsule $2-3 \mathrm{~mm}$. in diameter. In swamps and brooks, N. B. to Fla., Br. Col., Tex. and Cal. May-Sept.

## 5. LYSIMÀCHIA L.

Herbs, mostly perennial, with leafy stems. Leaves entire, often glandularpunctate; flowers in our species yellow, solitary in the axils, or clustered. Calyx 5-7-parted or 5-7-divided, persistent. Corolla rotate or campanulate, 5-7-parted, the tube very short. Stamens 5-7; anthers oblong or oval; staminodia none. Style filiform; stigma obtuse. Capsule 2-5-valved. [Greek, loose-strife.] About 70 species, mostly natives of the northern hemisphere. Besides the following, 2 others occur in the southern U. S.
Leaves verticillate in 3 's-7's, or some of them rarely opposite.
Corolla rotate-campanulate, pure yellow, $x-2.5 \mathrm{~cm}$. broad.
Flowers in terminal panicles; corolla-lobes glabrous. Flowers axillary; corolla-lobes glandular-ciliolate.

1. L. vulgaris.
2. L. punctata.

Corolla rotate, o.8-1.6 cm. broad, its lobes dark-streaked. 3. L. quadrifolia.
Leaves opposite. or some of them rarely alternate, sometimes verticillate in No. 5 .
Flowers in a terminal virgate raceme; stem erect.
Raceme leafy only at the base.
Raceme leafy to the middle or beyond.
4. L. terrestris.

Flowers axillary, solitary; stem creeping.
5. L. producta.
I. Lysimachia vulgàris L. Golden or Yeliow lousestrife. (I. F. f. 281I.) Densely downy-pubescent; stem 6-10 dm. high. l.awes short-petioled. ovate-lanceolate or ovate, acute or acuminate, $5-10 \mathrm{~cm}$. long; flowers $1-2 \mathrm{~cm}$.
broad; pedicels 4-12 mm. long; sepals lanceolate, acute or acuminate; corolla deeply parted; filaments monadelphous to about the middle, glandular; capsule about 3 mm . in diameter, shorter than the sepals. In fields and along roadsides, Me . to N. Y. and Penn. Nat. from Europe. June-Aug.
2. Lysimachia punctàta L. Spotted Loosestrife. (I. F. f. 2812.) Resembles the preceding, but sometimes glabrate. Leaves oval or ovate-lanceolate, short-petioled, $2-8 \mathrm{~cm}$. long, usually proportionately shorter and broader than those of L.vulgaris; flowers crowded in the upper axils, or racemose-verticillate, yellow, I. 5-2 cm . broad; pedicels $6-20 \mathrm{~mm}$. long; sepals lanceolate or oblong-lanceolate; filaments monadelphous at the base. In waste places, N. S. to N. J. Adventive from Europe. June-July.
3. Lysimachia quadrifòlia L. Crosswort. Whorled Loosestrife. (I. F. f. 28 I3.) Stem slender, 3-9 dm. high. Leaves short-petioled or sessile, lanceolate, oblong or ovate, acute or acuminate, $2-10 \mathrm{~cm}$. long, usually black-punctate; flowers axillary, $6-12 \mathrm{~mm}$. broad, borne on filiform spreading peduncles; sepals narrowly lanceolate, acute or acuminate; corolla glabrous, dark-streaked or spotted; filaments monadelphous below; capsule nearly as long as the sepals. In thickets, N. B. to Minn., Ga. and Wis. June-Aug.
4. Lysimachia terréstris (L.) B.S.P. Bulb-bearing Loosestrife. (I. F. f. 2814.) Glabrous; stem $2-6 \mathrm{dm}$. high, often bearing after flowering long bulblets in the axils. Leaves opposite or some of them rarely alternate, lanceolate or oblong-lanceolate, acute or acuminate at both ends, short-petioled, or sessile, usually black-punctate, $2-8 \mathrm{~cm}$. long; flowers $6-10 \mathrm{~mm}$. broad, in terminal bracted racemes; pedicels 1-2 cm. long; sepals ovate to lanceolate, acuite; corolla rotate, deeply parted, yellow with purple streaks or dots; filaments monadelphous below, glandular; capsule about 3 mm . in diameter, nearly as long as sepals. In swamps and moist thickets, Newf., Manitoba, Ga. and Ark. July-Sept.
5. Lysimachia prodúcta (A. Gray) Fernald. Intermediate between L. quadrifolia and L. terrestris, the leaves sometimes opposite, sometimes verticillate, pale green or glaucous and inconspicuously veined beneath; bracts of the usually loosely flowered raceme large. Me. to N. Y., Mass. and Mich. [L. polyantha Fernald.]
6. Lysimachia Nummulària L. Moneywort. Creeping Loosestrife. (I. F. f. 2815.) Glabrous; stems creeping, sometimes 6 dm . long. Leaves opposite, orbicular or broadly oval, obtuse, sometimes cordate, petioled, $\mathbf{1 - 2 . 5} \mathrm{cm}$. long, sparingly black-punctate; flowers solitary in the axils, $1.5-2.5 \mathrm{~cm}$. broad; sepals cordate-ovate to lanceolate, acute, half as long as the rotate, deeply 5 -lobed, yellow and dark-dotted corolla; filaments glandular, monadelphous at the base; capsule shorter than the sepals. In moist places, Newf. to N. J., Penn. and Ind. Nat. from Europe. June-Aug.

## 6. STEIRONEMMA Raf.

Perennial herbs, with opposite or verticillate entire leaves, and axillary slenderpeduncled yellow flowers. Calyx 5-parted, persistent, the segments valvate in the bud. Corolla rotate, deeply 5 -parted, with no proper tube, the lobes cuspidate or erose-denticulate, each involute or convolute around its stamen. Stamens 5 ; filaments distinct, or united into a ring at the base, granulose-glandular; anthers linear, becoming curved; staminodia 5, subulate. Ovary globose. Capsule 5-valved. Seeds margined or angled. [Greek, sterile threads, from the abortive stamens.] About five species, natives of N. Am.
Leaves membranous, pinnately veined.
Leaves ovate to lanceolate.
Stem erect; flowers $12-25 \mathrm{~mm}$. broad.
Petioles strongly ciliate ; capsule longer than the calyx.
r. S. ciliatum.

Petioles not ciliate, or slightly so at base; capsule not longer than the calyx.
2. S. tonsum. Stem reclined; flowers 6-8 mm. broad; leaves not ciliate; petioles naked.
3. S. radicans.

Leaves lanceolate, oblong or linear; stem erect.
Leaves firm, linear, r-nerved, the lateral veins obscure.
4. S. lanceolatum.
5. S. quadriforum.
I. Steironema ciliàtum (L.) Raf. Fringed Loosestrife. (I. F. f. 28ı6.) Stems mostly glabrous, 3-12 dm. high. Leaves acute or acuminate at the apex, obtuse, truncate or cordate at the base, $5-15 \mathrm{~cm}$. long, the margins ciliolate; peduncles $\mathrm{I}-5 \mathrm{~cm}$. long; calyx-segments lanceolate, shorter than the erose-denticulate commonly mucronate corolla-segments; flowers $\mathbf{1 . 5 - 2 . 5} \mathrm{cm}$. broad. In moist thickets, N. S. to Br. Col., Ga., Ala., Kans. and Ariz. June-Aug.
2. Steironema tónsum (Wood) Bicknell. Southern Loosestrife. (I. F. f. 2817.) Stem 3-6 dm. high, obtusely 4 -angled, minutely glandular-puberulent above. Leaves $5-8 \mathrm{~cm}$. long, acute at the apex, obtuse or subcordate at the base, ciliolate, the upper much smaller; panicle open, leafy; pedicels 2-6 times as long as the flowers; calyx-segments lanceolate, very acute; corolla $1.8-2 \mathrm{~cm}$. broad, its segments cuspidate. On dry rocks, Va. to Ky., Tenn. and Ala. June-July.
3. Steironema radicans (Hook.) A. Gray. Trailing Loosestrife. (I. F. f. 2818.) Stem soon decumbent or reclined, slender, glabrous, 3-9 dm. long. Leaves acute or acuminate, $2-10 \mathrm{~cm}$. long; peduncles 1-5 cm. long; calyx-segments ovate or lanceolate, acuminate, about equalling the erose-denticulate corollasegments; capsule about one-half as long as the calyx. In swamps, Va. and W. Va. to Ark. and La. June-Aug.
4. Steironema lanceolàtum (Walt.) A. Gray. Lance-leaved Loosestrife. (I. F. f. 2819.) Stem erect, glabrous, I.5-9 dm. high. Leaves lanceolate, linear or oblong-lanceolate, petioled or nearly sessile, acute or acuminate, $2-13 \mathrm{~cm}$. long, the margins naked or ciliate; lower leaves shorter, often oblong or nearly orbicular; petioles naked or ciliate; peduncles $\mathbf{I}-4 \mathrm{~cm}$. long; calyx segments lanceolate, acute or acuminate; flowers $\mathbf{I}-2 \mathrm{~cm}$. broad; capsule nearly as long as the calyxsegments. In moist soil, Me. to Minn., Fla., La. and Ariz. June-Aug.
5. Steironema quadrifiòrum (Sims) Hitchc. Prairie Moneywort. Linearleaved Loosestrife. (I. F. f. 2820.) Stem erect, strict, glabrous, 4-sided, 2.5-6 dm. high. Stem-leaves all but the lowest sessile or very nearly so, I-nerved, acute or acuminate at both ends, $2-10 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, usually with smaller ones fascicled in the axils; basal leaves oblong or linear-oblong, shorter, slender-petioled; peduncles filiform; calyx-segments lanceolate, acute, shorter than the cuspidate and slightly erose corolla-segments; flowers $\mathbf{I} .5-2.5 \mathrm{~cm}$. broad, often somewhat clustered in. 4 's at the ends of the branches. Along streams and lakes, W. Va. to western N. Y., Ont., Ky. and Manitoba. June-July.

## 7. NAUMBÚRGIA Moench.

An erect perennial leafy herb, with slender rootstocks, opposite sessile lanceolate entire leaves, the lower much smaller or reduced to scales, and small yellow flowers in axillary peduncled spike-like racemes or heads. Calyx 5-7-divided, the sepals linear, slightly imbricated. Corolla deeply $5-7$-parted, the tube short, the segments narrow. Stamens 5-7, exserted; filaments slender, glabrous, slightly united at the base, alternating with as many small tooth-like staminodia. Ovary globose-ovoid; ovules few or several; style slender; stigma capitate. Capsule 5-7-valved, fewseeded. Seeds somewhat angled. A monotypic genus.

1. Naumburgia thyrsiflòra (L.) Duby. Tufted Loosestrife. (I. F. f. 2821.) Stems simple, erect, $3-8 \mathrm{dm}$. high. Leaves $5-10 \mathrm{~cm}$. long, the upper lanceolate or oblong-lanceolate, acute or acuminate, the lower smaller; peduncles solitary in the axils; racemes $\mathbf{1}-2.5 \mathrm{~cm}$. long, spike-like; pedicels very short; flowers $4-\sigma \mathrm{mm}$. broad; corolla-segments yellow with black spots; anthers oblong; capsule globose, black-spotted, when mature slightly longer than the sepals. In swamps. N. S. to Alaska, N. Y., Penn., Mo. and Ore. Also in Europe and Asia. May-July.

## 8. TRIENTÀLIS L.

Glabrous low perennial herbs, with simple erect stems, and leaves mostly clustered in a verticil at the summit. Flowers few or solitary, terminal, slenderpeduncled, small, white or pink, deeply 5-9- (mostly 7-) parted. Sepals narrow. persistent, spreading. Corolla rotate, its tube almost none, its segments acute or acuminate, entire; filaments united into a narrow ring at the base; anthers linear. recurved after anthesis. Staminodia none. Ovary glohose; ovales numerous; style filiform. Capsule globose, 5 -valved. [Latin, one-third of a foot, referring to the height of the plant.] About 4 species, of the northern hemisphere.
I. Trientalis Americàna (Pers.) Pursh. Star-flower. Chickweed Wintergreen. (I. F. f. 2822.) Rootstock horizontal, sending up simple stemlike branches $0.7-2.5 \mathrm{dm}$. high, the leaves in a verticil of $5-10$ at the summit. Leaves membranous, lanceolate or oblong-lanceolate, acuminate at both ends, sessile or short-petioled, minutely crenulate, $3-10 \mathrm{~cm}$. long; pedicels filiform, erect, $2-5 \mathrm{~cm}$. long; sepals narrowly lanceolate or subulate, cuspidate; flowers $8-12 \mathrm{~mm}$. broad; capsule shorter than the sepals. In damp woods and thickets, Lab. to the N. W. Terr., Va., Ill. and Mich. May-June.

## 9. GLAÙX L.

A small succulent perennial leafy herb, with opposite entire obtuse fleshy leaves, and minute dimorphous nearly sessile axillary pink or white flowers. Calyx 5parted, the lobes petaloid. Corolla none. Stamens 5, inserted at the base of the calyx and alternate with its lobes; anthers cordate, attached by their backs to the filaments. Ovary ovoid, glandular; ovules few; style filiform; stigma capitellate. Capsule globose-ovoid, beaked, 5 -valved at the top, few-seeded. Seeds ellipsoid. [Greek, sea-green.] A monotypic genus.
i. Glaux marítima L. Sea Milkwort. Black Saltwort. (I. F. f. 2823.) Glabrous, pale or glaucous, $0.5-2 \mathrm{dm}$. high. Leaves oval, oblong or linear-oblong, rarely somewhat spatulate, sessile, $4-12 \mathrm{~mm}$. long; flowers about 3 mm . broad, usually numerous; calyx-lobes oval; capsule nearly enclosed by the calyx. In salt marshes and on sea-beaches, N. J. to Newf.; in saline soil from Minn. to the N. W. Terr., Neb. and Nev.; on the Pacific Coast. Also in Europe and Asia. June-Aug.

## ro. ANAGÁLLIS L.

Herbs, with opposite or verticillate (rarely alternate) sessile or short-petioled leaves, entire or nearly so, and small axillary peduncled flowers. Calyx 5 -parted, the lobes lanceolate or subulate, persistent. Corolla deeply 5 -parted, rotate, the segments entire or erose, convolute in the bud, longer than the calyx. Stamens 5 ; fila. ments puberulent, or pubescent, distinct, or united into a narrow ring at the base; anthers oblong, obtuse. Ovary globose; ovules numerous; stigma obtuse. Capsule globose, circumscissile, many-seeded. Seeds minute, flat on the back. [Greek, delightful.] About 15 species, mostly of the Old World.
I. Anagallis arvénsis L. Red or Scarlet Pimpernel. Poor Man's or Shepherd's Weather-glass. (I. F. f. 2824.) Annual, diffuse; branches I-3 dm . long, 4 -sided. Leaves ovate or oval, membranous, sessile or somewhat clasping, $6-20 \mathrm{~mm}$. long, black-dotted beneath; peduncles filiform, $\mathrm{I}-4 \mathrm{~cm}$. long, recurved in fruit; calyx-lobes keeled, slightly shorter than the crenate glandularciliate corolla-segments; flowers scarlet, sometimes white, usually with a darker center, 4-6 mm . broad, opening only in bright weather; capsule glabrous, about 4 mm . in diameter. In waste places, Newf. to Fla., Minn. and Mex., and on the Pacific Coast. Nat. from Europe. May-Aug.

Anagallis arvénsis coerùlea (Lam.) Ledeb. Flowers blue; corolla-segments glabrous. Reported as sparingly occurring in waste places.

## ir. CENTÚNCULUS L.

Low annual glabrous erect herbs, with alternate small entire sessile or shortpetioled leaves, or the lower opposite, and minute solitary axillary flowers. Calyx $4-5$-parted, persistent, the lobes longer than the corolla. Corolla $4-5$-cleft, marcescent, the tube subglobose, the lobes entire. Stamens 4 or 5 , inserted on the throat of the corolla; filaments short, distinct; anthers ovate or cordate, obtuse; stigma capitate. Ovules numerous, amphitropous. Capsule globose, circumscissile, many-seeded. Seeds minute, flat on the back. [Latin, diminutive of cento, a patch.] Three species, of wide distribution.
I. Centunculus mínimus L. Chaffweed. False Pimpernel. (I. F. f. 2825.) Slender, $2-15 \mathrm{~cm}$. high. Leaves spatulate, obovate or oblong, $4-8 \mathrm{~mm}$. long; flowers sessile or nearly so, shorter than the leaves, mostly 4 -parted, $2-4 \mathrm{~mm}$. broad; calyx-lobes linear or linear-lanceolate, acuminate; corolla pink; capsule shorter than the calyx. In moist soil, Ill. and Minn. to Br. Col., Fla., Tex. and Mex. Also in Europe and S. Am. April-Sept.

## 12. DODECÀTHEON L.

Glabrous scapose perennial herbs, with basal leaves. Flowers in involucrate umbels terminating scapes. Calyx deeply 5 -lobed, persistent, the lobes at first reflexed. Corolla 5 -parted, the lobes reflexed, imbricated, the tube very short, thickened at the throat. Stamens 5, on the throat of the corolla; filaments short, flat, monadelphous, connivent into a cone, exserted; anthers linear or lanceolate, connivent, attached by their bases to the filaments. Ovary superior; ovules amphitropous; style exserted; stigma simple. Capsule oblong or cylindric, erect, 5-6valved at the apex or splitting to the base. Seeds numerous, minute; the testa punctate. [Greek, twelye gods; name used by Theophrastus for some different plant.] About 15 species, of N. Am. and northeastern Asia.
I. Dodecatheon Mèadia L. Shooting Star. American Cowslip. Pride-of-Ohio. (I. F. f. 2826.) Perennial by a stout rootstock; scape erect, $2-5 \mathrm{dm}$. high. Leaves oblong or oblanceolate, obtuse or obtusish, narrowed into margined petioles, entire or toothed, $0.7-3 \mathrm{dm}$. long; flowers $2-3 \mathrm{~cm}$. long; bracts of the involucre lanceolate or linear, acute; pedicels unequal, the outer ones sometimes I dm. long; calyx-lobes acute; corolla purple, pink or white; capsule narrowly ovoid, erect, 5 -valved above. On moist cliffs and prairies, Penn. to Manitoba, Ga. and Tex. April-May.

Dodecatheon Mèadia Frénchii Vasey. Leaves ovate or elliptic, base abruptly contracted or cordate. Ill. to Ark.; southern Penn.(?)

## Family 2. PLUMBAGINÀCEAE Lindl.

Plumbago Family.
Perennial mostly acaulescent erect herbs, with basal tufted leaves, and small perfect and regular clustered flowers. Calyx inferior, gamosepalous, 5-toothed, plaited at the sinuses, the tube 5-15-ribbed. Corolla of 5 hypogynous clawed segments connate at the base, or united into a tube. Stamens 5, opposite the corolla-segments, hypogynous; anthers 2 -celled, attached by their backs to the filaments, the sacs longitudinally dehiscent. Disk none. Ovary superior, r-celled; ovule solitary, anatropous, pendulous; styles 5. Fruit a utricle or achene, enclosed by the calyx, rarely a dehiscent capsule. Seed solitary; testa membranous; endosperm mealy, or none ; embryo straight ; cotyledons entire. About Io genera and 350 species, of wide distribution, mostly in saline situations. Inflorescence cymose-paniculate ; flowers in one-sided spikes.
r. Limonium. Flowers in a dense terminal head.
2. Statice.

## x. LIMÒNIUM Adans.

Herbs, mostly with flat basal leaves, and numerous small flowers cymose-paniculate on bracted scapes, in 1-3-flowered bracteolate clusters, forming one-sided spikes. Calyx campanulate or tubular, the limb scarious, 5 -toothed, the tube usually Io-ribbed. Petals 5, clawed. Stamens adnate to the bases of the petals. Styles 5, separate in our species, stigmatic along the inner side. Fruit a utricle. [Ancient name of the wild beet.] About $\mathbf{I 2 0}$ species. Besides the following, I occurs on the South Atlantic and I on the Pacific Coast and I in the Southwest.
I. Limonium Caroliniànum (Walt.) Britton. Sea Lavender. Marsh Rosemary. Canker-root. (I. F. f. 2827.) Glabrous, fleshy, rootstock thick; fusiform or branched; scape terete, striate, paniculately branched above, 3-6 dm. high. Leaves oblanceolate, narrowed into margined petioles, entire, or slightly undulate, $0.7-2.5 \mathrm{dm}$. long, shorter than the scapes, the midvein prominent, the lateral veins very obscure; flowers erect, about 4 mm . high; calyx 5-toothed, sometimes with as many minute intermediate teeth in the sinuses; corolla pale purple; petals spatulate; styles filiform. On salt meadows, Lab. to Fla. and Tex. July-Oct.

## 2. STÁTICE L.

Tufted acaulescent fleshy herbs, with mostly naked scapes, basal persistent rosulate narrow leaves with no differentiation into blade and petiole, and short-
pedicelled or sessile flowers, in dense terminal glomerate heads, subtended by scarious bracts and bractlets, the lower bracts forming a kind of involucre to the head, the two lowest reflexed and more or less united into a sheath. Calyx ioribbed, 5 -toothed, oblique at the base or decurrent on the pedicel, scarious. Styles united at the base, pubescent below the middle. Utricle 5 -pointed at the summit, rarely dehiscent. [Greek, standing.] About 20 species. The following is the only one native in N. Am.
I. Statice Armèria L. Thrift. Sea Pink. Ladies' Cushion. (I. F. f. 2828.) Scape 1-4.5 dm. high. Leaves narrowly linear, obscurely $\mathbf{I}$-nerved, entire, $2-8 \mathrm{~cm}$. long; bracts obtuse; head of flowers $\mathrm{I}-2.5 \mathrm{~cm}$. in diameter; corolla pink, purple or white, 4-6 mm. broad; petals obtuse or cuspidate. Along the sea-coast and on mountains, Lab. to Alaska, south on the Pacific Coast to Cal. Also in Europe, Asia and apparently at the Strait of Magellan. Summer.

## Order 3. EBENÀLES.

Shrubs or trees, with alternate simple leaves, the flowers mostly regular. Calyx free from the ovary (inferior) or more or less adnate to it. Corolla gamopetalous or sometimes polypetalous. Stamens borne on the tube or base of the corolla, as many as its lobes, and opposite them, or more numerous.

Stamens as many as the coroila-lobes.
Stamens twice as many as the corolla-lobes, or more. Styles 2-8; flowers mostly monœcious or diœcious. Style 1 , simple or lobed; flowers mostly perfect. Stamens in several series. Stamens in I series.

Fam. 1. Sapotaceae.
Fam. 2. Ebenaceae.
Fam. 3. Symplocaceae.
Fam. 4. Styracaceae.

Family I. SAPOTÀCEAE Reichenb.
Sapodilla Family.
Shrubs or trees, mostly with a milky juice. Leaves entire, mostly coriaceous and estipulate. Flowers small, regular and perfect, in axillary clusters. Calyx inferior, the sepals usually $4-7$, much imbricated. Corolla gamopetalous, the tube $4-7$-lobed, the lobes imbricated in the bud, sometimes with as many or twice as many lobe-like appendages on the throat. Stamens as many as the proper lobes of the corolla and inserted on its tube ; staminodia usually present, alternate with the corolla-lobes ; anthers 2 -celled, the sacs longitudinally dehiscent. Ovary $2-5$-celled, or rarely many-celled ; ovules solitary in each cavity, anatropous or amphitropous; stigma simple. Fruit a fleshy berry, commonly i-celled and i-seeded. Seed large, the testa bony or crustaceous; embryo straight ; endosperm fleshy, or none. About 35 genera and 400 species, mostly of tropical regions.

## r. BUMELIA Sw.

Wood very hard. Leaves sometimes clustered at the nodes. Flowers small, pedicelled, white, fascicled in the axils. Calyx deeply 5 -parted, the segments unequal. Corolla 5 -lobed, with a pair of lobe-like appendages at each sinus, its tube short. Stamens 5 , inserted near the base of the corolla-tube; anthers sagittate. Staminodia 5, petaloid. Ovary 5 -celled; style filiform. Berry small, the pericarp fleshy, enclosing a single erect seed. Seed shining, the hilum at the base. [Greek, ox (large) ash.] About 30 species, natives of America. Besides the following, some ro others occur in the southern U. S.
r. Bumelia Iycioides (L.) Pers. Southern Buckthorn. (I. F. f. 2829.) Bark gray, the twigs commonly spiny. Leaves rather firm, tardily deciduous, glabrous, finely reticulate-veined, oblong, elliptic, or oblanceolate, $5-13 \mathrm{~cm}$. long; petioles $4-12 \mathrm{~mm}$. long; flowers about 3 mm . broad, numerous; pedicels about the length of the petioles, glabrous; calyx-segments obtuse, glabrous; staminodia ovate, boat-shaped, entire; berry subglobose, black, 8 -10 mm . long. In moist thickets, Va. to Ill., Mo., Fla. and Tex. June-Aug.
2. Bumelia lanuginòsa (Michx.) Pers. Woolly Buckthorn. (I. F. f. 2830.) Leaves persistent, rather coriaceous, glabrous above, densely tomentosepubescent beneath, oblanceolate, obovate or oblong, usually obtuse at the apex, narrowed or cuneate at the base, $3-8 \mathrm{~cm}$. long; flowers $3-18$ in the fascicles, about 3 mm . broad; pedicels tomentose, longer than the petioles; calyx-segments ovate, tomentose, obtusish; staminodia ovate, obscurely toothed; berry oval, black, 8-IO mm . long. In woods and thickets, Ill. to Kans., Tex., Ga. and Fla. June-July.

## Family 2. EBENÀCEAE Vent.

## Ebony Family.

Trees or shrubs with very hard wood, entire estipulate leaves, and diœcious polygamous or rarely perfect regular flowers, solitary or cymose in the axils. Calyx inferior, $3-7$-lobed, commonly accrescent and persistent. Corolla gamopetalous, deciduous, $3-7$-lobed, the lobes usually convolute in the bud. Stamens 2-3 times as many as the lobes of the corolla in the sterile flowers, and inserted on its tube, usually some imperfect ones in the pistillate flowers; anthers introrse, erect. Disk none. Ovary superior, several-celled; in the staminate flowers rudimentary or none; ovules I-3 in each cavity, suspended ; styles 2-8, distinct, or united below ; stigmas terminal, sometimes 2 -parted. Fruit a berry. Seeds oblong, the testa bony ; endosperm copious, cartilaginous ; embryo small ; cotyledons large, foliaceous. About 6 genera and 275 species, mostly tropical.

## I. DIOSPỲROS L.

Flowers lateral, cymose, racemose or solitary, the pistillate commonly solitary, the staminate usually clustered. Calyx 4-6-cleft. Corolla urceolate in our species, 4-6-lobed. Stamens $8-20$ in the sterile flowers. Styles 2-6 in the pistillate flowers; ovary globose or ovoid, its cavities twice as many as the styles. Berry large, pulpy, containing 4-12 flat hard seeds. [Greek, Zeus' wheat.] About 160 species, abundant in Asia. Besides the following, another occurs in the Southwest.

1. Diospyros Virginiàna L. Persimmon. Date-plum. (I. F. f. 2831.) A tree; bark hard, dark, furrowed. Leaves ovate or oval, deciduous, pubescent when young, acute or acuminate, dark green above, pale beneath, $5-13 \mathrm{~cm}$. long ; petioles loosely jointed with the twigs, the leaves falling away in drying; flowers mostly 4-parted; corolla greenish yellow; stamens of the sterile flowers about 16 . those of the pistillate 8 or fewer; fruit globose, about 2.5 cm . long, reddish yellow and sweet when ripe, astringent when green. In fields and woods, R. I. to Kans., Fla. and Tex. May-June. Fruit ripe Sept.-Nov.

## Family 3. SYMPLOCÀCEAE Miers.

## Sweet-leaf Family.

Trees or shrubs, with entire or dentate broad leaves, and regular mostly yellow and perfect flowers, in lateral or axillary clusters. Calyx-tube completely or partly adnate to the ovary, its limb 5 -lobed. Corolla 5 -parted, sometimes nearly to the base, the segments imbricated. Disk none. Stamens numerous in several series; filaments usually slightly united in clusters at the base of each corolla-segment; anthers innate, laterally dehiscent. Ovary 2-5-celled; ovules commonly 2 in each cavity, pendu-

Lonŝ; style and stigma one. Fruit a small mostly neantly dry drupe, usually with u oblong seed; embryo straight, endosperm fleshy. "Only the following genus, comprising about 175 species, most abundant in S . Am.

## r. SÝMPLOCOS L.

Characters of the family. [Greek, connected, referring to the stamensi]
I. Symplocos titictoria (L.) L'Her. Sweet-leaf. Horsestegak. (I. F. f. 2832.) A'shrub or small tree. Leaves oblong or slightly obövatee, acute or acuminate at both ends, crenate-serrate or repand, short-petioled, glabrous of nearly so abo and dark green when old, pale and pubesseent beneath, 7 -15 cim. Tong; flowers bright yellow, fragrant, $8-12 \mathrm{~mm}$." broad, in 'sessile scaly-bracted clusfers, appearing at the North before the leaves; corolla-segments's oblong, bbtuse, each bearing a cluster of stamèns; drupe nut-like, oblonig, 6-12 min. long, pubescent, crowned with the small calyx-lobes. Woods and thickets, Del. to Fla. and La. March-April.

## Family 4. STYRACÀCEAE A. DC.

#### Abstract

Storax Family. Flowers regular, perfect, or rarely polygamo-diocious, clustered, pubescence mostly stellate. Calyx more or less adnate to the ovary. Corolla ganopetalous or polypetalous, the lobes or petals $4-8$ it Stamens twice as many as the lobes of the corolla or petals, or more inserted on its tube or base, arranged in I series, the filaments monadelphous of 4-5adelphous. Disk none, Ovary partly superior, $2-5$-celled; ovules anattopous, style slender; stigma simple or 2-5-lobed. Fruit a berry or drupe, or often nearly dry, winged in some genera, 1-seeded; or 2-5-celled with a seed in each cavity. Endosperm copious, fleshy ${ }^{\circ}$ embryo usually straight; cotyledons flat. About 7 genera and, 7,5 species mostly tropical. Calyx superior, its tube obconic; fruit 2-4-winged. 1. Mohrodendron. Calyx nearly inferior, its tube campanulate; fruit globose or oblong. 2. Styrax.

##  <br> 1. MOHRODÉNDRON Britton.

Small treés or shrubs, more or less stellate-pubescent, with denticulate or dentảe" leaves, and large white slender-pedicelled drooping bell-shaped Howers, in hateral fascicles or short racemes, appearing with or before the leaves, Calyx-tube obconic or obpyramidal, 4-5-ribbed, adnate to the ovary, the limb short, 4 -toothed, Corolla campanulate, $4-5$-cleft or 4 - 5 -parted nearly to the lase Stanens 8-16; filaments flat, more or less monadel phous, slightly adnate to the corolla, Ovary . 2-4celled; ovules about 4 in each cavity, the lower ascending, the upper pendulous. Fruit dry, oblög, $2-4$-winged, I-4-celled, tipped with the style and the minute calyxteeth. [In honor of Chas. Mohr, botanist of the Geological Survey of Alabama.] About 3 species, natives of southeastern N. Am.
I. Mohradendrof Carolinum (L.) Britton. SthyER-BELL OR SNOW-DROP Tree. '(I. F. f.' 2833 .) A small tree. Leaves oval, ovate or ovate-oblomg denticulate, acuminate, dark green and glabrous above when old, pale green and stellatepubescent beneath, $5-15 \mathrm{~cm}$. long; pedicels filiform, $\mathrm{I}-4 \mathrm{~cm}$. long; corolla $\mathrm{I}-2 \mathrm{~cm}$. long; ovary 4 -celled; fruit oblongellipsoid, 4 -winged $2-4$ com. long. In woods and along streams, Va. to III., Fla. and Ala. March-April.

## 2. STYRAX L.

Itshabs or small trees, with rather large mostly white drooping flowers, in fascicles of leafy racemes. Calyx persistent, nearly inferior, its tube campanulate, adnate to the lower part of the ovary, its limb minutely 5 -toothed. Corolla 5 -parted or 5 -divided. Stamens twice as many as the corolla-lobes or petals (rarely fewer); filaments flat, monadelphous below or rarely separate. Ovary nearly superior, móstly 3 -celled at the base; oviles several in each cavity, ascending; stigma 3- $^{-}$ tonthed; z-tobed or capitate. Fruit néarly dry, coriaceous or crustaceous, com-
monly only 1 -seeded, 3 -valved at the summit. [Greek name of Storax.] About 70 species, natives of America, Asia and southern Europe. Besides the following, 2 others occur in the southern and western U.S.
Foliage and inflorescence glabrous; calyx glandular-scurfy.

1. S. Americana.
Lower surfaces of the leaves and inflorescence canescent or tomentose.
Leaves oblong to oval, $2.5-6 \mathrm{~cm}$. long.
2. S. pulverulenta.
Leaves obovate to oval, $5^{-15} \mathrm{~cm}$. long.
3. S. grandifolia.
I. Styrax Americàna Lam. Smooth Storax. (I. F. f. 2834.) A shrub, the foliage glabrous or nearly so. Leaves green on both sides, oblong, oval or obovate, $2-8 \mathrm{~cm}$. long; flowers few or sometimes solitary, 8-14 mm. long, about the length of their pedicels; petals oblong-lanceolate, acute, valvate or but slightly overlapping in the bud; fruit subglobose, about 6 mm . in diameter. In moist thickets and along streams, Va. to Fla., Ark. and La. March-April.
4. Styrax pulverulénta Michx. Downy Storax. (I. F. f. 2835.) Similar to the preceding, but the lower surfaces of the leaves, the calyx and pedicels are stellate-pubescent or scurfy. Leaves oval or oblong, usually denticulate, pale beneath; flowers in short terminal racemes and often in pairs in the axils, usually longer than their pedicels; petals puberulent on both sides or only on the exterior, convolute or imbricated in the bud. In moist pine-barrens, Va. to Fla. and Tex. March-April.
5. Styrax grandifòlia Ait. Large-Leaved Storax. (I. F. f. 2836.) A shrub. Leaves obovate or oval, tomentose or canescent and pale beneath, $5-15 \mathrm{~cm}$. long, or on young shoots larger; flowers io-16 mm . long, longer than their pedicels, mostly several in loose sometimes elongated racemes; petals oblong, acutish, imbricated or convolute in the bud, puberulent without and often also within; fruit obovoid, about 8 mm . long. In woods, Va. to Fla. and Ga. March-May.

## Order 4. GENTIANÀLES.

Herbs, shrubs, vines or trees. Leaves opposite, or rarely alternate. Flowers regular. Corolla gamopetalous, rarely polypetalous, nerved, wanting in Adelia and in our species of Fraxinus of the Oleaceae. Stamens mostly borne on the lower part of the corolla when this is present, as many as its lobes or fewer and alternate with them. Ovaries 2, distinct, or I with 2 cavities (rarely more), or 2 placentæ.
a. Stamens (usually 2 ), fewer than the corolla-lobes, or corolla none; our species trees or shrubs.

Fam. I. Oleaceae.
b. Stamens as many as the corolla-lobes; mostly herbs.

Stigmas distinct ; juice not milky; ovary 1 , compound.
Ovary 2 -celled; leaves stipulate, or their bases connected by a stipular line.
Fam. 2. Loganiaceae.
Ovary r-celled, leaves not stipulate.
Leaves opposite or rarely verticillate; corolla-lobes convolute or imbricated in the bud.

Fam. 3. Gentianaceae.
Leaves basal or alternate; corolla-lobes induplicate-valvate in the bud; marsh or aquatic herbs.

Fam. 4. Menyanthaceae.
Stigmas united; juice milky; ovaries 2 in our species.
Styles united; stamens distinct; pollen of simple grains. Fam. 5. Apocynaceare.
Styles distinct; stamens mostly monadelphous; pollen-grains united into waxy masses.

Fam. 6. Asclepiadaceae.

## Family I. OLEÀCEAE Lindl.

## Olive Family.

Trees or shrubs (a few genera almost herbaceous) with opposite or rarely alternate simple or pinnate estipulate leaves and regular $2-t$-parted flowers in panicles, cymes or fascicles. Calyx inferior, usually small, sometimes none. Stamens 2-4; filaments separate: anthers ovate, oblong or linear, z-celled, the sacs longitudinally dehiscent. Ovary
superior, 2-celled ; ovules few in each cavity, anatropous or amphitropous; style usually short or none. Fruit a capsule, samara, berry or drupe. Endosperm fleshy, horny or wanting; embryo straight, rather large; radicle usually short. About 21 genera and 500 species, of wide distribution in temperate and tropical regions.

## Fruit a loculicidal capsule; leaves simple; flowers complete. <br> 1. Syringa.

Fruit a samara; leaves pinnate; flowers mostly diœcious; corolla wanting.
2. Fraxinus.

Fruit a drupe or berry; leaves simple.
Flowers diœecious, mostly apetalous, from catkin-like scaly buds. Flowers complete, polypetalous, paniculate; petals linear.
3. Adelia.

Flowers complete, gamopetalous, paniculate.
4. Chionanthus.
5. Ligustrum.

## r. SYRíNGA L.

Shrubs with opposite entire (rarely pinnatifid) leaves, and gamopetalous flowers, in terminal panicles or thyrses. Calyx campanulate, mostly 4 -toothed, persistent. Corolla salverform, the tube cylindric, the limb 4-lobed, the lobes indup-licate-valvate. Stamens 2, inserted near the summit of the corolla-tube. Ovary 2-celled; ovules 2 in each cavity, pendulous; style elongated; stigma 2 -cleft. Capsule narrowly oblong, somewhat compressed, coriaceous, loculicidally 2 -valved from above. Seeds pendulous, compressed, obliquely winged. [Greek, a pipe or tube.] About 12 species, natives of Asia and eastern Europe.
I. Syringa vulgàris L. Lilac. (I. F. f. 2837.) Glabrous, 3-8 m. high. Leáves ovate, entire, deciduous, green on both sides, acuminate at the apex, truncate or subcordate at the base, $5-13 \mathrm{~cm}$. long; flowers lilac or white, very numerous, $10-15 \mathrm{~mm}$. long, in large terminal thyrses; ultimate pedicels short; capsule $1.5-2.5 \mathrm{~cm}$. long. Escaped from gardens to roadsides, Me. and N. H. to N. Y. and Penn. Native of eastern Europe. April-May.

## 2. FRÁXINUS L.

Trees, with opposite, and in our species, odd-pinnate leaves, and small diœcious or polygamous (rarely perfect) greenish fasciculate or racemose-fasciculate flowers, appearing before or with the leaves from the axils of those of the previous season. Calyx small, 4 -cleft, irregularly toothed, entire or none. Stamens 2 (rarely 3 or 4). Ovules 2 in each cavity of the ovary, pendulous; stigma 2-cleft. Fruit a flat samara, usually I-seeded. Seed oblong, pendulous. [The ancient Latin name.] About 40 species. Besides the following, some 7 others occur in the Southern and Western States.

Lateral leaflets stalked; calyx present in the fertile flowers.
Body of the samara terete or nearly so, the wing chiefly terminal.
Wing almost entirely terminal.
Foliage and twigs glabrous or nearly so. I. F. Americana.
Foliage and twigs pubescent. 2. F. Biltmoreana.
Wing manifestly extending down on the sides of the body.
Wing of samara spatulate.
Foliage, twigs and pedicels glabrous or very nearly so.
3. F. lanceolata.

Foliage, young twigs and pedicels velvety-pubescent.

Samara 3-5 cm. long.
Samara $5-7 \mathrm{~cm}$. long.
Wing of samara long linear.
Body of the samara flat, the wing extending all around it.
Twigs terete; leaflets 5-7; samara elliptic or spatulate.
Twigs 4 -sided ; leaflets $7-\mathrm{II}$; samara oblong or cuneate.
Lateral leaflets sessile; calyx none; samara winged all around.
4. F. Pennsylvanica.
5. F. profunda.
6. $F$. Darlingtòniz.
7. F. Carolinzana.
8. F. quadrangulata.
9. F. nigra.
I. Fraxinus Americàna L. White Ash. (I. F. f. 2838.) Twigs, petioles and rachis of the leaves glabrous; leaflets 5-9 (commonly 7), ovate, ovatelanceolate, oblong or rarely slightly obovate, entire or denticulate, pale or light green and often pubescent beneath, $7-15 \mathrm{~cm}$. long, acuminate or acute; flowers diœcious (rarely monœcious); samara $2-5 \mathrm{~cm}$. long, its body terete, not margined, winged only from near the summit, one-fourth to one-half the length of the wing. In rich woods, N. S. to Minn., Fla., Kans. and Tex. April-June,
2. Fraxinus Biltmoreàna Beadle. Biltmore Ash. Young twigs pubescent. Leaflets $7-9$, ovate to lanceolate, acuminate, entire or obscurely denticulate, more or less pubescent beneath, especially along the veins; rachis pubescent; samaras $3.5-5 \mathrm{~cm}$. long, the wing linear, or somewhat broadened above, 2 to 3 times as long as the narrowly elliptic, nearly terete body. Woods, Penn. to Ga.
3. Fraxinus lanceolàta Borck. Green Ash. (I. F. f. 2839.) Glabrous or nearly so. Leaflets 5-9, entire or denticulate, ovate or oblong-lanceolate, acuminate or acute, green on both sides, 5-15 cm. long; samara $2-5 \mathrm{~cm}$. long, very similar to that of the two preceding species, the usually spatulate and proportionately slightly longer wing usually decurrent on the sides of the body to below the middle. Moist soil, Vt. to the N. W. Terr., Fla. and Ariz. April-May.
4. Fraxinus Pennsylvánica Marsh. Red Ash. (I. F. f. 2840.) Twigs, petioles, rachis, petiolules and lower surfaces of the leaves velvety-pubescent; leaflets 5-9, ovate, ovate-lanceolate or oblong, acuminate or acute, usually denticulate, $7-15 \mathrm{~cm}$. long; samara $2.5-6 \mathrm{~cm}$. long, its body linear, margined above by the decurrent linear or spatulate wing, and a bout equalling it. In moist soil, N. B. to S. Dak., Fla., Ala. and Kans. April-May.
5. Fraxinus profúnda Bush. Swamp Ash. Foliage and young twigs densely pubescent. Leaflets mostly 7, lanceolate to ovate-lanceolate, entire or very nearly so, $7-15 \mathrm{~cm}$. long; samaras $5-7 \mathrm{~cm}$. long, the wing obtuse, longer than the linear body and decurrent on its sides to the middle or beyond. In swamps, Mo. to Fla. [F. Americana profunda Bush.]
6. Fraxinus Darlingtònii Britton, n. sp. Darlington's Ash. Similar to F. lanceolata and F. Pennsylvanica, the foliage and twigs either quite pubescent or glabrate; samaras $5-7.5 \mathrm{~cm}$. long, the wing about 4 mm . wide, longer than the narrowly linear body and decurrent on it for one-fourth to one-third of its length. N. Y. and Penn. Type from Westchester, Penn.
7. Fraxinus Caroliniàna Mill. Water Ash. (I. F. f. 2841.) Foliage glabrous, or slightly pubescent. Leaflets 5-7 (rarely 9), ovate, ovate-lanceolate or oblong, acuminate or acute; samara $2-5 \mathrm{~cm}$. long, elliptic or spatulate, the body linear, flat, broadly winged all around, extending more than half-way to the apex of the fruit, the wing pinnately veined. In swamps and wet soil, Va. to Fla., Ark. and Tex. Also in Cuba. March-April.
8. Fraxinus quadrangulàta Michx. Blue Ash. (I. F. f. 2842.) Foliage glabrous, or sparingly pubescent when young. Leaflets 7-II, ovate, oblong or lanceolate, acuminate, green on both sides, sharply serrate or serrulate, $7-13 \mathrm{~cm}$. long; samara linear-oblong or cuneate, $2-5 \mathrm{~cm}$. long, 6-14 mm. wide, winged all around, parallel-nerved, the body extending more than half-way to the apex. In woods, Ont., Minn. and Mich. to Ala., Iowa and Ark. March-April.
9. Fraxinus nigra Marsh. Black Ash. Hoop Ash. (I. F. f. 2843.) Foliage glabrous, except the midrib of the lower surfaces of the leaflets. Leaflets 7-II, sessile, green on both sidcs, oblong-lanceolate, long-acuminate, sharply serrate or serrulate, $7-15 \mathrm{~cm}$. long; samara oblong or linear-oblong, parallel-nerved, $2.5-4 \mathrm{~cm}$. long, the body flat, winged all around, extending to or beyond the middle. In swamps and wet woods, Newf. to Manitoba, Va. and Ark. April-May.

## 3. ADELLIA P. Br.

Shrubs with opposite leaves and small yellow or greenish diœcious or polygamous flowers, fascicled, short-racemose or paniculate from scaly buds produced at the axils of the preceding season, appearing before or with the leaves. Corolla wanting, or of 1 or 2 small deciduous petals. Stamens 2-4. Ovary ovoid, 2-celled; ovules 2 in each cavity, pendulous; style slender; stigma 2-lobed. Fruit a drupe with I or rarely 2 seeds. [Greek, inconspicuous, perhaps referring to the flowers.] About 15 species, natives of America. Besides the following, about 7 others occur in the southern U. S.
I. Adelia acuminàta Michx. Adelita. (T. F. f. $28+4$.) A shrub or small tree, the branches somewhat spiny; the foliage glabrous. Leaves orate. lanceolate or oblong, acuminate or acute at both ends, fincly denticulate, $2.5-10 \mathrm{~cm}$. long; petioles slender; staminate flowers fascicled; pistilitte flowers short paniculate: calyx obsolete; drupe narrowly oblong, about 2 cm . long. when young fusiform and often curved. River-banks, III. to Ga., Mo., Ark, and Tex. March April.

## 4. CHIONÁNTHUS L.

Shrubs or small trees, with opposite entire leaves, and complete conspicuous white flowers, in large loose panicles from the axils of the upper leaves of the preceding season. Calyx small, 4 -cleft or 4 -parted, inferior, persistent. Corolla of 4 linear petals, slightly united at the very base. Stamens 2 (rarely 3), inserted on the base of the corolla; filaments very short. Ovules 2 in each cavity of the ovary, pendulous; style short; stigma thick, emarginate or slightly 2-lobed. Fruit a usually I-seeded drupe. [Greek, snow-blossom.] About 3 species, the following of southeastern N. Am., the others Chinese.
I. Chionanthus Virgínica L. Fringe-tree. (I. F. f. 2845.) A shrub, or small tree, the young twigs, petioles and lower surfaces of the leaves pubescent, or sometimes glabrate. Leaves oval, oblong or some of them obovate, rather thick, narrowed at the base, $7-15 \mathrm{~cm}$. long; panicles drooping, sometimes 2.5 dm . long, usually with some sessile leaflike bracts, its branches and the pedicels very slender; petals 2.5 cm . long or more, 2 mm . wide or less; drupe oblong or globoseoblong, nearly black, I-I. 6 cm . long, the pulp thin. In moist thickets, Del. and southern Penn. to Fla. and Tex. May-June.

## 5. LIGÚSTRUM L.

Shrubs or small trees, with opposite entire leaves, and small white complete flowers in terminal thyrses or panicles. Calyx small, truncate or 4 -toothed, inferior. Corolla gamopetalous, funnelform, its tube mostly short, the limb 4-lobed, the lobes induplicate-valvate in the bud. Stamens 2, inserted on the tube of the corolla; filaments short. Ovary 2-celled; ovules 2 in each cavity, pendulous; stigma thickened. Fruit a $1-3$-seeded mostly globose berry. [The classical Latin name.] About 35 species, natives of the Old World.
I. Ligustrum vulgàre L. Privet. Prim. (I. F. f. 2846.) A shrub, the branches long and slender. Leaves firm, tardily deciduous, glabrous, lanceolate or oblong, short-petioled, $1.5-5 \mathrm{~cm}$. long, obscurely veined; panicles dense, short, minutely pubescent; flowers about 6 mm . broad; pedicels very short; stamens included; berries black, $4-6 \mathrm{~mm}$. in diameter. Escaped from cultivation, Me. and Ont. to Penn. and N. Car. Native of Europe and Asia. June-July.

## Family 2. LOGANIÀCEAE Dumort.

## Logania Family.

Herbs, shrubs, vines or some tropical genera trees, with opposite or verticillate simple stipulate leaves, or the leaf-bases connected by a stipular line or membrane, and regular perfect 4-5-parted flowers. Calyx inferior, the tube campanulate, sometimes short or none, the segments imbricated, at least in the bud. Corolla gamopetalous, funnelform, campanulate, or rarely rotate. Stamens inserted on the tube or throat of the corolla; anthers 2 -celled, the sacs longitudinally dehiscent; pollen-grains simple. Disk usually none. Ovary superior, 2-celled (rarely 3-5-celled); ovules anatropous or amphitropous. Fruit a 2 -valved capsule in our species. Embryo small, usually straight ; endosperm copious; radicle terete or conic. About 30 genera and 400 species, widely distributed in warm and tropical regions.

Style 4-cleft; woody vine; flowers large yellow.
Style simple, 2 -lobed or 2-divided with a common stigma; herbs.
Corolla-lobes valvate; capsule didymous or 2 -lobed; leaves broad. Style simple, jointed; spike simple. Style 2-divided below; spikes cymose.
Corolla-lobes imbricate; capsule subglobose; leaves linear.

1. Gelsemium.
2. Spigelua.
3. Cynoctonum.
4. Polypremum.

## 1. GELSEMIUM Juss.

Glabrous vines; leaves opposite, or rarely whorled, their bases connected by a stipular line: flowers in axillary and terminal nearly sessile cymes, the pedicels scaly-bracteolate. Calyx deeply 5 -parted, the segments imbricated. Corolla fun.
nelform, with 5 broad hobes imbricated in the bud. Stamens 5 pinserted on the tube of the corolla; anthers linẹar oblong, Ovary oblong 2-celled;; style slender or filiform, 4 cleft: ovules numerous on linear placentæ, Capsule elliptic, flattened contrary to the partition, septicidally dehiscent, the vaives boat-shaped, 2 -eleft at the summit; seeds flattened, winged. [From the Italian Gelsomino the Jessamine.]. Two known species, the following, the other of eastern Asia.

In Gelsemium sempérvirens ( $L_{\text {: }}$ ) Ait. f. YELLOW JESSAMINE. (I. F. f. 2847 .) Stems sometimes 6 m . long. Leaves lanceolate, oblonglanceolate or ovatelanceolate, entire, short-petioled, persistent, evergreen, $3-8 \mathrm{~cm}$. long; cymes 1-6flowered; pedicels short; bractlets several, dry, oblong or lanceolate; flowers dimorphous; corolla bright yellow, $2.5-4 \mathrm{~cm}$ lons, stigmas in one form short and anthers exserted, in the other form longer and anthers included; capsule flat, channeled on both sides, $8-14 \mathrm{~mm}$. long, cuspidate. In woods and thickets, Va. to Fla., Tex. and Guatemala.: March-Oct.

## 2. SPIGELIA L.

ni Herbs, with opposite membranous entire pinnately veined leaves, smatl stipules, or the, leaf-bases connected by a stipular line, and red, yellow or purple flowers in. scorpioid cymes or-unilateral spikes, of terminal and in the forks of the branches. Calyx deeply 5 parted. Corolla 5-lobed, the tube finely 15 -nerved. Stamens, 5 , inserted on the corollar tube; anthers, 2 lobed at the base, Ovales fumer $J$ ous on peltate placentæ; style filiform, jointed near the middle, stigma obeuse Capsule didymous, a-celled, somewhat flattened contray to the dissepiment, circumscissile, the, 2 carpels becoming 2-yalyed Seeds peltate, not wingedo [Named for Adrian von der Spigel, 1558-1625, physician ${ }_{c}$ ] About 35 species, all American. Besides the following, 4 others occur in the Squthern States
I. Spigelia Marylándica L. Indian or Carolina Pink. (I. F. f. 2848.) Perennial; stem 4 -angled, glabrous or nearly so, $3-6$ dm. Figh. Leaves sessile, ovate, or ovate-lanceolate, acute or acuminate, 5 -10 cm . long, sparingly pubescent on the veins; flowers in a terminal I-sided peduncled spike; corolla, scarlet outside, yellow within, $2-5 \mathrm{~cm}$. long, its lobes lanceolate, about 6 mm . long; calyx-segments subulate. "In woods, N. J. (according to Gray) to Wis., Fla. and Tex. May-July.

## - 3. CXNOCTONUM I GU Gmel.

Herbs, our species annual, with opposite entire leaves, and minute stipules, or the leaf-bases connected by a stipular line. Flowers small, whitish, in one-sided spikes forming cymes. Calyx 5-parted. Corolla urn-shaped, 5 -lobed. Stamens 5 , included; filaments short anthers cordate. Ovules numerous, on peltate pla-1 centæ; style short, 2 -divided below, united above by the common stigma, the divisions becoming separate, Capsule 2 -lobed at the summit, carpels divaricate, dehiscent along the inner side. Seeds numerous, small, tuberculate. [Greek, dogkilling.] About 5 species, of warm and tropical regions.
I. Cynoctonum Mitrèola (L.) Brittonv/ Minrewort (I. F. f. 2849.) Stem glabrous, erect, terete, $3-6 \mathrm{dm}$. high. Leaves lanceolate to ovate, petioled, $2.5-8 \mathrm{~cm}$, long' $6-25 \mathrm{~mm}$. wide, acute at both ends, glabrous; cymes terminal and often also, in the upper axils, slender-peduncled; flowers about 2 mm . broad, numerous, sessile or nearly; so; capsule deeply o-lobed, compressed, the lobes at length widely, diverging, acute. In wet or moist soil, Va. to Fla., Tex. and Mex. Also in the W. Indies June +Sept.

## 

A glabrous diffusely branched annual herb, with opposite lincar-subulate leaves, their bases connected by a stipular membrane, and small white flowers in terminal bracted cymes: Calyx deeply 4 -parted (rarely 5 -parted), the seyments subulate. Corolla campanulate, bearded in the throat, shorter than the calya. 4 -lobed (rarely 5 -lobed) , Stamens, 4 (rarely 5), inserted on the corolia. included; filiments short; anthers ovoid globose. Ovules numerous, on oblong placente; styte short;' stigma capitate or obscurcly z-lobed. Cppsule slightly compressed, didymonus, loculicidally 2-valved, the carpels at length septicidal. Sueds minute, smooth. [Greek, many-stemmed.] A monotypic genus,
I. Polypremum procúmbens L. Polypremum. (I. F. f. 2850.) Stems tufted, somewhat rigid, 4 -angled, $5-30 \mathrm{~cm}$. long. Leaves $\mathrm{I}-4 \mathrm{~cm}$. lorg, $\mathrm{I}-2 \mathrm{~mm}$. wide, acute, sessile, minutely rough-toothed on the margins, often with smaller ones fascicled in their axils; flowers solitary, sessile in the forks of the cymes and along their branches, leafy-bracted; corolla 2 mm . long or less; capsule crustaceous, didymous, about 2 mm . in diameter, slightly 2 -lobed, the lobes obtuse. In dry sandy soil, N. J. and Penn. to Fla., Ky., the Ind. Terr. and Mex. Also in the W. Indies. May-Sept.

## Family 3. GENTIANACEAE Dumort. Gentian Family.

Bitter mostly glabrous herbs, with opposite (rarely verticillate) estipulate entire leaves, reduced to scales in Bartonia, and regular perfect flowers in clusters, or solitary at the ends of the stem or branches. Calyx inferior, persistent, 4-12-lobed, -toothed or -divided (of 2 sepals in Obolaria), the lobes imbricated or not meeting in the bud. Corolla gamopetalous, often marcescent, 4-I2-lobed or -parted. Stamens as many as the lobes of the corolla, alternate with them, inserted on the tube or throat ; anthers 2 -celled, longitudinally dehiscent. Disk none, or inconspicuous. Ovary superior in our genera, i-celled or partly 2-celled ; ovules numerous, anatropous or amphitropous ; stigma entire, or 2 -lobed, or 2 -cleft. Capsule mostly dehiscent by 2 valves. Endosperm fleshy, copious; embryo small, terete or conic. About 65 genera and 600 species, widely distributed.
Leaves normal; corolla-lobes convolute in the bud.
Style filiform; anthers usually twisting or recurving when old.

Corolla salverform.
Corolla rotate.
Corolla campanulate-funnelform.
Style short, stout or none; anthers remaining straight. Corolla without nectariferous pits, glands or scales. Corolla funnelform, campanulate or clavate. Corolla rotate. Corolla rotate.
I or 2 nectariferous pits, glands or scales at the base of each corolla-lobe. Corolla rotate, a fringed gland at each lobe.
6. Frasera.

Corolla campanulate, spurred at the base. 7. Tetragonanthus. Leaves, at least those of the stem, reduced to scales; corolla-lobes imbricated in the bud. Calyx of 4 lanceolate sepals; leaves all reduced to scales.
8. Bartonia. Calyx of 2 foliaceous spatulate sepals; upper leaves normal. 9. Obolaria.

## 1. ERYTHRAEA Neck.

Herbs, mostly annual or biennial, with sessile or amplexicaul leaves, and pink white or yellow flowers in cymes or spikes. Calyx tubular, 5-4-lobed or -divided, the lobes or segments narrow, keeled. Corolla salverform, 5-4-lobed, the lobes spreading, contorted, convolute in the bud. Stamens 5 or 4 , inserted on the corollatube; filaments short-filiform; anthers becoming spirally twisted. Ovary 1-celled, the placentæ sometimes intruded; style filiform; stigma 2-lobed. Capsule 2-valved. Seed-coat reticulated. [Greek, red, the color of the flowers in some species.] About 25 species, natives of the Old World and western N. and S. Am. Besides the following, about 8 others occur in the western U . S.
Flowers spicate-racemose.
Flowers cymose or cymose-paniculate. Basal leaves tufted.
No tuft of basal leaves.
Flowers cymose-paniculate, numerous. 3. E. pulchella.
Flowers few, cymose; western species.
4. E. exaltata.
I. Erythraea spicàta (L.) Pers. Spiked Centaury. (I. F. f. 2851.) Glabrous, erect, $\mathbf{I}$.5-4.5 dm. high. Leaves oblong or lanceolate-oblong, sessile, obtusish, clasping, $1-4 \mathrm{~cm}$. long; flowers pink, sessile, about 16 mm . long; tube
of the corolla somewhat longer than the subulate calyx-segments, $2-3$ times as long as the linear-oblong lobes; capsule $8-10 \mathrm{~mm}$. long. Coast of Nantucket, and at Portsmouth, Va. Nat. from Europe. May-Sept.
2. Erythraea Centaùrium (L.) Pers. Lesser Centaury. Bitter-herb. Bloodwort. (I. F. f. 2852.) Glabrous, $1.5-4 \mathrm{~cm}$. high. Leaves oblong, obtuse, the lower forming a basal tuft, $2.5-6 \mathrm{~cm}$. long; stem leaves sessile or slightly clasping; flowers $12-16 \mathrm{~mm}$. long, nearly sessile, in compound bracteolate cymes; corolla-lobes obtuse, $5-6 \mathrm{~cm}$. long, about as long as the calyx-segments and onethird to one-half as long as the corolla-tube; stigmas oval. In waste places, N. S. and Quebec to Ill. Nat. from Europe. June-Sept.
3. Erythraea pulchélla (Sw.) Fries. Branching Centaury. (I. F. f. 2853.) Glabrous, much branched, o.7-2 dm. high. Leaves oval, ovate or lanceolate, the lower mostly obtuse, $6-16 \mathrm{~mm}$. long; no basal tuft of leaves; flowers pink, cymose-paniculate, all or nearly all of them pedicelled, $10-12 \mathrm{~mm}$. long; tube of the corolla $\mathrm{I}_{\frac{1}{2}-2}$ times longer than the calyx-segments, its lobes oblong, obtuse, $3-4 \mathrm{~mm}$. long; stigma oval. In fields and waste places, N. Y. to Penn. and Md.; also in the W. Indies. Nat. from Europe. June-Sept.
4. Erythraea exaltàta (Griseb.) Coville. Tall or Western Centaury. (I. F. f. 2854.) Glabrous, $1.5-4.5 \mathrm{dm}$. high, the branches few, erect. Leaves ublong or linear-oblong, sessile, mostly acute at both ends, $\mathbf{I}-2 \mathrm{~cm}$. long, the basal not tufted; flowers few, terminal and axillary, all slender-pedicelled, $12-16 \mathrm{~mm}$. long; tube of the corolla about one-third longer than the calyx-segments, the lobes oblong, obtuse, 3-4 mm. long. In sandy soil, Neb. to Wyo., Wash., Ariz. and Cal. May-Sept.

Erythraea calycòsa Buckl., a Texan species differing from this in its broader larger obtuse corolla lobes, has been found as a waif in Mo.

## 2. SABBATTIA Adans.

Annual or biennial erect glabrous herbs, with opposite or sometimes verticillate sessile or rarely petioled or clasping leaves, and terminal pink rose or white flowers. Calyx 4-12-parted or -divided, the tube campanulate, sometimes very short, the lobes or segments usually narrow. Corolla rotate, deeply 4-12-parted. Stamens 4-12, inserted on the short tube of the corolla; filaments filiform, short; anthers curved, revolute or coiled in anthesis. Ovary I-celled, the placentæ intruded; style 2 -cleft or 2-parted, its lobes filiform, stigmatic along their inner sides. Capsule 2 -valved, many-seeded. Seeds small, reticulated. [In honor of L. Sabbati, an Italian botanist.] About 14 species, natives of eastern N. Am. and Mex. Besides the following, some 5 others occur in the southern U. S.
Flowers normally 4-5-parted, sometimes 6-7-parted.
Branches opposite.
Style 2-parted to below the middle or nearly to the base; flowers white.
Leaves lanceolate or ovate, acute; flowers $16-25 \mathrm{~mm}$. broad.

1. S. lanceolata.

Leaves linear-oblong or lanceolate, obtuse; flowers $12-18 \mathrm{~mm}$. broad.
2. S. paniculata.

Style 2-cleft to about the middle; flowers normally pink.
Leaves linear-lanceolate, sessile; stem slightly 4 -angled. 3. S. angustifolia.
Leaves ovate, cordate-clasping; stem strongly 4 -angled. 4. S. angularis.
Branches alternate, the lower sometimes opposite in Nos. 5 and 6.
Calyx-segments foliaceous, longer than the corolla.
5. S. calycina.

Calyx-segments linear or lanceolate, not longer than the corolla.
Calyx-tube strongly 5 -ribbed; flowers $2.5-5 \mathrm{~cm}$. broad. 6. S. campestris.
Calyx-tube scarcely ribbed; flowers $2-4 \mathrm{~cm}$. broad.
Calyx shorter than the corolla; style 2 -parted.
Flower pink with a yellow eye (rarely white); corolla-segments obovate.
7. S. stellaris.

Flowers white, very numerous; corolla-segments spatulate or oblanceolate. 8. S. Elliottii.
Calyx-segments filiform, as long as the corolla; style 2 -cleft.
9. S. campanulata.

Flowers normally $8-12$-parted, $3.5-6 \mathrm{~cm}$. broad. 10. S. dodecandra.
I. Sabbatia lanceolàta (Walt.) T. \& G. Lance-leated Sabitha. (I. F. f. 2855.) Stem somewhat 4 -angled, 3-9 dm. high. Leaves $3-5$-nerved, $2-5 \mathrm{~cm}$. long,
the uppermost reduced to narrow bracts; flowers in bracteolate corymbed cymes in pedicels $4-14 \mathrm{~mm}$. long ; calyx-lobes filiform-linear, much shorter than the corolla; corolla-segments oblong or slightly oboyate: capsule pvoid, about 6 mm . high. In pine-barren swamps, N. J. to Fla. May Sept.
2. Sabbatia paniculata (Michx ) Pursh. Branching SabBatiat (f) Fi fu: 2856.) Stem 4 -angled, $3-7.5$ dm. high Leaves $1-4$ cm, long, the uppermost small and bract-like; fowers in corymbed cymes; central flowers of the cymes often nearly sessile, calyx-lobes linear, not more than one half the length of the corolla; corolla-segments spatulate-oblong, capsule oblong about 6 mm . high, In dry or moist soil, Va. to Fla. May-Sept.
3. Sabbatia angustifolia (Michx.) Britton NaRrow-LEAVED SABBATIA. (I. F. f. 2857.) Stem 3-6 dm. high. Leaves dinear to linear-lanceolate, sessile, $2-5 \mathrm{~cm}$ long, the uppermost small and bract-like, flowers pink with a yellowish or greenish eye, few in the cymes, or solitary, about 2.5 cm . broad, calyx-lobes linear usually more than one-half the length of the corolla; corolla-segments obovate-oblong; capsule oblong, $6-8 \mathrm{~mm}$. high. In dry or moist soil, Ind. to La., N. Car. and Fla. May-Sept.
4. Sabbatia angularis (L.) Pursh. BITTER-BLOOM. ROSE-PINK. SQUARESTEMMED SABBATLA (I. F. F. 2858) Stem 6-9 dm. high. Leaves ovate, acute cordate-clasping at the base, $1.5-3.5 \mathrm{~cm}$. long or the lower oblong, those of the branches smaller, flowers rose-pink, with a central greenish star, occasionally white, $2.5-4 \mathrm{~cm}$. broad, usually solitary at the ends of the branches; calyx-lobes linear, one-half the length of the corolla, or less; corolla-segments obovate; capsule oblong, about 6 mm . high. In rich soil, N. Y. and Penn. to Ont., Mich. Fla., the Ind. Terr. and La. July-Aug. Flowers fragrant,
5. Sabbatia calycina (Lam.) Heller. CoAst SabBatiá (I: F. f 289.) Stem 1.5-3 dm. high. Leaves oblong or some of them slightly obovate, 3 -nerved, $2-5 \mathrm{~cm}$. long, narrowed to the sessile base or the lower into petioles; flowers solitary at the ends of the branches or peduncles, 2.574 cm . broad; calyx lobes linear or spatulate, leaf-like, longer than the spatulate segments of the pink rasempurple or whitish corolla; capsule oyoid-oblong, $6-8 \mathrm{~mm}$. high. In moist soil, Va, to Fla, Also in Cuba, June-Aug,

6, Sabbatia campéstris Nutt. Prairie Sabbatia. (I. Fir f. 2860.) Stem. I. $5 \div 4 \mathrm{dm}$. high. Leaves ovate, oblong or lanceolate, mostly obtuse sessile or slightly clasping and subcordate, $1-2.5 \mathrm{~cm}$. long; flowers solitary at the ends of the branches and peduncles, $2 \pi 5 \mathrm{~cm}$. broad; calyx 5 -ribbed or almost 5 -winged, its) lobes lanceolate, wacute, $1-2.5 \mathrm{~cm}$, long, about as long as, the obovato lilac: corolla-segments; capsule oblong, $6,8 \mathrm{~mm}$. high. On prairies Mo and Kans to Tex.
7. Sabbatia stellàris Pursh. SEA OR MARSH PINK. (I. F. f. 286I.) Stem I.5-6 dm. high. Leaves lanceolateoblong, to lineax, sessile, $\mathbf{I - 2 . 5} \mathrm{cm}$. long, or the lowest smaller, somewhat obovate, the uppermost narrowly linear and bract-like; flowers $1.5+3.5 \mathrm{~cm}$. broad, solitary at the ends of the branches or slender peduncles; calyx not ribbed, ' its tobes natrowly linear, shorter that or nearly equalling the oblong or obovate corolla-segments; corolla pink to white with a yellowish starry eye bordered with red; capsule about 5 mm . high. In salt-meadows, Me. to Fla. July-Sept.
8. Sabbatia Eilióttii Steud. Ellioti's Sabbatia (F. F. f. 2862.) Stem 3-6 dm high... Lower leaves obovate or lanceolate-oblang, obtuse, $\mathbf{- 2 \mathrm { cm } \text { . long, }}$ the upper and those of the branches linear or subulate; flowers solitary at the ends of the branches, 2.5 cmt broad or less; calyx not ribbed, its lobes subulate-linear, one-half as long as the spatulate or oblanceolate segments of the corolla, or less; capsule about 5 mm , high. In pine-barrens, Va. (?), N. Car. to Fla. July-Sept.
9. Sabbatia campanulàta (L.) Torr. Slender Marsh Pink. (I. F. f. $2863^{\circ}$ ) Similar to the preceding... Stem 3-6 dm. high. Leaves linear or linearlanceolate, $2-4 \mathrm{~cm}$. long, sessile, acute or the lowest much shorter, obtuse, oblong or oblanceolate, the uppermost almost filiform'; flowers pink with a yellow eye, about" 2.5 cm . broad, mostly 5 -parted; calyx-lobes filiform-linear, equalling the oblong-obovate corolla-segments, or somewhat shorter; capsule obovold," about '5 mm . high. In salt marshes and along brackish riyers', rarely in freshe water swamps,

io. Sabbatia dodecándra (L.) B.S.P. Large Marsh Pink. (I. F. ta 2864.) Stem 3-6 dm. high, the branches alternate. Basal leaves spatulate, obtuse, $3-8 \mathrm{~cm}$. long: stem-leaves lanceolate or oblong-lanceolate, acute, the uppermost usually narrowly linear; flowers few, pink, sometimes white, solitary at the ends of the branches or peduncles; calyx-lobes narrowly linear, about one-half as long as the 9-12 spatulate-obovate corolla-segments; anthers coiled;style deeply 2-cleft, its divisions clavate; capsule globose-oval, 6 mm . high. In sandy borders of ponds and along salt marshes, Mass. to Fla. and Ala. July-Sept.

## 3. EUSTOMMA Salisb.

Glaucous annual herbs, with opposite sessile or clasping entire leaves. Flowers large blue, purple or white, long-peduncled, axillary and terminal. Calyx deeply 5-6-cleft, the lobes lanceolate, acuminate, keeled. Corolla deeply 5-6-lobed, the lobes oblong or obovate, convolute in the bud. Stamens $5-6$, inserted on the throat of the corolla; filaments filiform; anthers oblong, versatile. Ovary r-celled; stigma 2 -lamellate. Capsule 2 -valved. Seeds small, numerous, foveolate. [Greek, open-mouth, referring to the corolla.] Two species, natives of the southern U. S., Mex. and the W. Indies.

1. Eustoma Russelliànum (L.) Griseb. Russell's Eustoma. (Li. F. f. 2865.) Stem terete, 3-8 dm. high. Leaves oblong or ovate-oblong, $3-5$-nerved, the upper usually acute at the apex, cordate-clasping at the base, $3-8$. cm. long, the lower usually obtuse and narrowed to a sessile or slightly auricled base; peduncles $2-10 \mathrm{~cm}$. long; bracts lanceolate-subulate, small; flowers $5=8 \mathrm{~cm}$. broad; calyx-lobes shorter than the purple corolla; corolla-lobes obovate, about 4 times as long as the tube; anthers remaining nearly straight. On plains, Neb, to La., Tex. and Mex. May-Aug.

## 4. GENTIÀNA L.

Mostly perennial and glabrous herbs, with opposite or rarely verticillate, entire sessile or short-petioled leaves. Flowers solitary or clustered. Calyx tubular, 4-7- (usually 5-) cleft. Corolla $4-7$-lobed, often with membranous plaits ini the sinuses. Stamens as many as the lobes of the corolla and inserted its tube, included; anthers connate into a tube, or separate. Ovary r-celled; ovules very numerous; stigma cleft into 2 lamellæ. Capsule 2 -valved. Seeds numerous. [Named for King Gentius of Illyria.] About 300 species. Besides the following, some 30 others occur in the western parts of N. Am.

* Corolla without plaits or teeth in the sinuses; annuals.
Corolla-lobes fringed or serrate; flowers $2-8 \mathrm{~cm}$. long.
Corolla enclosed in the swollen wing-angled calyx.
Corolla conspicuously longer than the wingless calyx.
Corolla-lobes fringed all around their sumnits; leaves lanceolate.

2. Gurrinztán insur

Corolla-lobes fringed mainly on the margins; leaves linear.
3. G. detonsa.

Corolla-lobes with entire or rarely denticulate margins; flowers $1-2.5 \mathrm{~cm}$. long.
Corolla-lobes fimbriate-crested at the base, acute. U4. Gcrita. Corolla-lobes naked, subulate-acuminate.

Calyx-lobes unequal; flowers mostly 4-parted. in 5. G. prepinqua. Calyx-lobes equal; flowers 5 -parted.
6. Gin quinqusfolia.
** Corolla with membranous, toothed or lobed plaits in the sinuses; perennials.
Margins of leaves and calyx-lobes scabrous or ciliate; seeds winged.
Anthers separate, or merely connivent.
narrowlo funnelform.
Stems usually ciustered; calyx-lobes unequal ; corolla narrowly funnelform.
Stems mostly solitary ; calyx-lobes equal; corolla canmpatutate-ftrmnelfotm.
Anthers cohering in a ring or short tube.
Corolla-lobes distinct, longer than or equalling the plaits.
Flowers 1-4; corolla campanulate-funnelform, its libes z-3 times as long as the plaits.
Flowers several or numerous; corolla clubshaped, its lobes not much longer than the plaits. Win 10. Gaponarial (....
Corolla-lobes none or minute, the plaits very broad, int.. 11. 6i. Andretestanios

Margins of leaves and calyx-lobes smooth or nearly so.
Flowers clustered, sessile, 2-bracteolate under the calyx.
Corolla-lobes ovate, twice as long as the plaits; leaves broad, acuminate; seeds winged. 12. G. flavida.
Corolla-lobes rounded, little longer than the plaits; leaves narrow; seeds winged.
13. G. linearis.

Corolla-lobes ovate, acute, much longer than the broad plaits; leaves broad; seeds winged. 14. G. rubricaulis.

Corolla-lobes triangular-lanceolate; leaves obovate; seeds wingless.
15. G. villosa.

Flowers solitary, peduncled, not bracteolate; leaves linear. 16. G. Porphyrio.

1. Gentiana ventricòsa Griseb. Swollen Gentian. (I. F. f. 2866.) Stem terete, about 3 dm . high. Basal leaves obovate, small, those of the stem ovate-oblong, rounded or subcordate at the base, $2-5 \mathrm{~cm}$. long; flowers few, solitary at the ends of stout peduncles, 4 -parted; calyx inflated, ovoid, about 2 cm . high; corolla-lobes oblong, obtuse; ovary elliptic-oblong. Grand Rapids of Saskatchewan, between Cumberland House and Hudson Bay.
2. Gentiana crinita Froel. Fringed Gentian. (I. F. f. 2867.) Stem 3-ro dm. high, the branches erect. Basal and lower leaves obovate, obtuse, the upper lanceolate or oblong-lanceolate, $2-5 \mathrm{~cm}$. long, acute or acuminate at the apex, sessile with a rounded or subcordate base; flowers mostly 4 -parted, about 5 cm . high, solitary at the ends of the usually elongated peduncles; calyx-lobes lanceolate, acuminate; corolla bright blue, rarely white, narrowly campanulate, its lobes obovate; capsule spindle-shaped, stipitate; seeds scaly-hispid. In moist woods and meadows, Quebec to Minn., Ga. and Iowa. Sept.-Oct.
3. Gentiana detónsa Rottb. Smaller Fringed Gentian. (I. F. f. 2868.) Similar to the preceding, but smaller; stem 0.7-4.5 dm. high. Basal and lower leaves spatulate, obtuse, the upper linear or linear-lanceolate, $2.5-6 \mathrm{~cm}$. long; flowers I-6, mostly 4 -parted, about 3.5 cm . high; calyx-lobes lanceolate, acuminate; corolla narrowly campanulate, its lobes spatulate-oblong. In wet places, Newf. to Alaska, Anticosti, N. Y., Minn., S. Dak., in the Rocky Mts. to Ariz., and in the Sierra Nevada. Also in northern Europe and Asia. July-Sept.
4. Gentiana acùta Michx. Northern Gentian. (I. F. f. 2869.) Stem 1.5-5 dm. high. Basal and lower leaves spatulate or obovate, obtuse, the upper lanceolate, acuminate or acute at the apex, rounded or subcordate at the base, sessile, $\mathbf{I}-5 \mathrm{~cm}$. long; flowers racemose-spicate, $\mathbf{I - - 1 . 6 ~ c m . ~ h i g h ; ~ c a l y x - l o b e s ~ l a n c e - ~}$ olate; corolla tubular-campanulate, blue, its lobes lanceolate, acute; capsule sessile. In moist or wet places, Lab. to Alaska, Quebec, Minn., south in the Rocky Mts. to Ariz. and Mex. Also in Europe and Asia. Summer.
5. Gentiana propínqua Richards. Four-parted Gentian. (I. F. f. 2870.) Stems slender, usually branched from the base, $5-18 \mathrm{~cm}$. high. Basal leaves spatulate, obtuse, the upper distant, oblong, or lanceolate, $\mathbf{I}-4 \mathrm{~cm}$. long, rounded at the slightly clasping base; flowers $1.5-2 \mathrm{~cm}$. high; calyx 4 -cleft, 2 of the lobes oblong, the others linear-lanceolate; corolla blue or bluish, its lobes ovatelanceolate; capsule linear. Lab. to Alaska and Br. Col. Summer.
6. Gentiana quinquefòlia L. Stiff Gentian. Ague-weed. (I. F. f. 2871.) Stem ridged, $0.5-5 \mathrm{dm}$. high, quadrangular. Basal leaves spatulate, obtuse, those of the stem ovate, acute, clasping or rounded at the base, 3-7-nerved, $1-5 \mathrm{~cm}$. long; flowers in clusters of $1-7$ at the ends of the branches, or also axillary; calyx one-fourth to one-third the length of the corolla; coralla tubular-funnelform, blue, its lobes triangular, entire; capsule stipitate; seeds globose, wingless. In dry or moist soil, Me. and Ont. to Mich., Fla. and Mo. Aug.-Oct.

Gentiana quinquefòlia occidentàlis (A. Gray) A. S. Hitchcock. Usually taller; corolla more broadly funnelform; calyx-lobes foliaceous, reaching to the middle of the corolla. Ohio to Minn., Tenn. and La.
7. Gentiana affìnis Griseb. Oblong-Leaved Gentian. (I. F. f. 2872.) Stems clustered from deep roots, minutely puberulent, simple, $1.5-4.5 \mathrm{dm}$. high. Leaves linear-oblong to lanceolate oblong, firm, indistinctly nerved, $\mathrm{r}-4 \mathrm{~cm}$. long, the floral smaller; flowers 5 -parted, sessile in the axils of the upper leaves, about 2.5 cm . high, not bracted under the calyx; calyx-lobes linear or subulate, unequal; corolla blue, its lobes ovate, acute or mucronate, entire, spreading, with laciniate
appendages in the sinuses. In moist soil, Minn. to Br. Col., N. Mex. and Nev. Aug.-Oct.
8. Gentiana pubérula Michx. Downy Gentian. (I. F. f. 2873.) Stems usually solitary, $2-4.5 \mathrm{dm}$. high, puberulent, or glabrous. Leaves firm, lanceolate, or the lower oblong, indistinctly nerved, pale beneath, $2-8 \mathrm{~cm}$. long; flowers sessile or nearly so in the upper axils, rarely solitary and terminal, 2 -bracteolate under the calyx, $3-5 \mathrm{~cm}$. high; calyx-lobes linear-lanceolate, about as long as the tube; corolla campanulate-funnelform, 2-3 times as long as the calyx, its lobes ovate, entire, spreading, much longer than the cleft or laciniate appendages. On prairies, Ohio to the N. W. Terr., Ga. and Kans. Aug.-Oct.
9. Gentiana Ellióttii Chapm. Elliott's Gentian. (I. F. f. 2874.) Roots a cluster of thick fibres; stems minutely rough-puberulent, $2-5 \mathrm{dm}$. high. Leaves ovate or ovate-lanceolate, acute or acutish, thin, $2-5 \mathrm{~cm}$. long, 3 -nerved, or the lower much smaller and obtuse; flowers I-4, terminal, or rarely in the upper axils, about 5 cm . long, sessile; calyx-lobes oblong or lanceolate, foliaceous, longer than the tube; corolla blue, its lobes ovate, entire, $6-8 \mathrm{~mm}$. long, about twice as long as the fimbriate or toothed appendages; seeds oblong, broadly winged. In moist soil, Va. to Fla. Sept.-Oct.
io. Gentiana Saponària L. Soap-wort Gentian. (I. F. f. 2875.) Stem glabrous, or minutely rough-puberulent, 3-8 dm. high. Leaves lanceolate, ovatelanceolate or oblong, usually acute at both ends, $3-5$-nerved, $5-10 \mathrm{~cm}$. long, the lowest obovate and smaller; flowers $2.5-5 \mathrm{~cm}$. high, in sessile terminal and usually also axillary clusters; calyx-lobes oblong or spatulate, ciliolate; corolla blue, its lobes erect, obtuse, equalling or longer than the appendages; seeds broadly winged. In wet soil, Ont. to Minn., Conn., Fla. and La. Aug.-Oct.
ir. Gentiana Andréwsii Griseb. Closed or Blind Gentian. (I. F.f. 2876.) Similar to the preceding, stout, glabrous, 3-6 dm. high, simple. Leaves ovate to lanceolate, 3-7-nerved, acuminate, $5-10 \mathrm{~cm}$. long; flowers $2.5-3.5 \mathrm{~cm}$. high in a terminal sessile cluster and commonly 1 or 2 in the upper axils; calyxlobes lanceolate or ovate, ciliolate; corolla oblong, club-shaped, blue, or occasionally white, nearly or quite closed, its lobes obsolete, the intervening appendages very broad; seeds oblong, winged. In moist soil, Quebec to the N. W. Terr., Gia. and Mo. Aug.-Oct.
12. Gentiana flávida A. Gray. Yellowish Gentian. (I. F. f. 2877.) Stem stout, glabrous, simple, 3-9 dm. high. Leaves ovate-lanceolate or oblonglanceolate, acuminate, subcordate, clasping or rounded at the base, $5-13 \mathrm{~cm}$. long; flowers in a sessile terminal cluster and sometimes $\mathbf{I}$ or 2 in the upper axils, $3-5 \mathrm{~cm}$. high; calyx-lobes ovate, acute; corolla campanulate-funnelform, open, greenish or yellowish white, its lobes ovate, twice as long as the erose-denticulate appendages. In moist soil, Ont. to Va., Minn. and Ky. Aug.-Oct.
13. Gentiana lineàris Froel. Narrow-leaved Gentian. (I. F. f. 2878.) Glabrous; stem slender, terete, simple, 1.5-5 dm. high, leafy. Leaves linear or linear-lanceolate, acute at both ends, 3 -nerved, $3-8 \mathrm{~cm}$. long; flowers $2.5-4.5 \mathrm{~cm}$. high in a terminal cluster of $\mathbf{1 - 5}$ and sometimes also in the upper axils; calyxlobes linear or lanceolate; corolla erect, blue, oblong-funnelform, open, its lobes erect, rounded, $2-4 \mathrm{~mm}$. long, slightly longer than the entire or $\mathrm{I}-2$-toothed appendages. In bogs and on mountains, N. B. and Ont. to Md. Aug.-Sept.
14. Gentiana rubricaùlis Schwein. Red-stemmed Gentian. (I. F. f. 2879.) Glabrous; stem terete, $3^{-6 ~ d m}$. high. Leaves rather distant, lanceolate or ovatelanceolate, rounded at the base, $5-8 \mathrm{~cm}$. long, the lower narrower and obtuse; flowers $3-3.5 \mathrm{~cm}$. high in a sessile terminal cluster; calyx-lobes unequal; corolla greenish blue or bright blue, club-shaped, its lobes ovate, acute or acutish, much longer than the 1-2-toothed appendages. In wet soil, N. B. to N. V.. Ont. and Minn. Aug.-Sept.
15. Gentiana villòsa L. Striped Gentian. (I. F. f. 2S8o.) Glabrous or nearly so; stem simple, terete, 1.5-5 dm. high. Leaves obovate, ohtuse or the upper acute, faintly 5 -nerved, $2-8 \mathrm{~cm}$. long, the lower much smaller: flowers in a terminal sessile cluster and sometimes also in the upper axils, nearly 5 cm . long: calyx-lobes unequal, linear, longer than the tube; corolla greenish white, striped within, oblong-fumelform, open, its lobes erect, much longer than the oblique
entire or I-2-toothed appendages. In shaded places, N. J. and Penn. to Fla. and La. Sept.-Nov.
16. Gentiana Porphýrio J. F. Gmel. One-flowered Gentian. (I. F. f. 2881.) Glabrous; stem 1.5-4.5 dm. high. Leaves linear, firm, $2-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, or the upper and lower shorter; flowers short-peduncled, about 5 cm . high; calyx-lobes linear, longer than the tube; corolla funnelform, bright blue, sometimes brown-dotted within, its lobes ovate, spreading, $1-1.5 \mathrm{~cm}$. long, three times as long as the laciniate appendages, or more; seeds oblong, wingless. In moist pine barrens, southern N. J. to Fla. Aug.-Oct.

## 5. PLEURÓGYNE Eschol.

Slender annual glabrous herbs, with opposite leaves, and rather large flowers in terminal racemes or panicles, or solitary at the ends of the peduncles. Calyx deeply $4-5$-parted; segments narrow. Corolla rotate, $4-5$-parted; lobes ovate or lanceolate, convolute, acute, with a pair of narrow appendages at the base. Stamens 4 or 5 , inserted on the corolla-tube. Ovary I-celled; ovules numerous; style none; stigma decurrent along the sutures of the ovary. Capsule 2 -valved. Seeds small, numerous. [Greek, referring to the lateral stigmatic surfaces.] About 7 species, of the colder parts of the northern hemisphere.
Leaves linear or lanceolate; sepals linear.

1. P. rotata.

Leaves spatulate or lanceolate; sepals ovate to lanceolate.
2. P. Carinthiaca.
I. Pleurogyne rotàta (L.) Griseb. Pleurogyne. (I. F. f. 2882.) Stem erect, $\mathrm{I}-4 \mathrm{dm}$. high. Leaves $\mathrm{I}-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, the basal spatulate or oblong; sepals about the length of the lanceolate to oblong-lanceolate corolla-segments, which are 8-12 mm. long; capsule narrowly oblong. Greenland and Lab. to Alaska, south in the Rocky Mts. to Colo. Also in Europe and Asia. Summer.
2. Pleurogyne Carinthìaca (Wulf.) Griseb. Shaller Pleurogyne. (I. F. f. 2883.) Similar to the preceding, but mostly smaller and more slender, rarely over 1.5 dm . high, the stems or branches I-few-flowered; leaves spatulate, ovate, oblong, or lanceolate, $6-12 \mathrm{~mm}$. long; sepals ovate to lanceolate, shorter than the corolla-segments or at length equalling them, these $6-12 \mathrm{~mm}$. long, ovate, and acute; capules ovoid-oblong. Lab. and Quebec. The American plant was separated from the European by Dr. Gray as var. pusilla.

## 6. FRÀSERA Walt.

Perennial or biennial erect glabrous herbs, with opposite or verticillate leaves, and rather large flowers in terminal cymose panicles or thyrses. Calyx 4 -parted. Corolla rotate, 4 -parted, the lobes convolute in the bud, each bearing 1 or 2 fringed glands within. Stamens 4, inserted on the base of the corolla-tube; filaments sometimes united at the base; anthers versatile. Ovary ovoid, r-celled; style distinct; stigma 2-lobed or nearly entire. Capsule ovoid, coriaceous, compressed, 2 -valved, few-seeded. Seeds flattened, smooth, margined or narrowly winged. [In honor of John Fraser, a botanical collector.] Eight species, natives of $\mathrm{N} . \mathrm{Am}$.
i. Frasera Carolinénsis Walt. American Columbo. (I. F. f. 2884.) Stem $9-12 \mathrm{dm}$. high, stout. Leaves mostly verticillate in 4's, those of the stem lanceolate or oblong, acute or acutish, $7-15 \mathrm{~cm}$. long, the basal ones spatulate or oblanceolate, usually larger, the uppermost bract-like; inflorescence often 6 dm . long; flowers slender-pedicelled, about 2.5 cm . broad; corolla yellowish white with brown-purple dots, its lobes broadly oblong, bearing a circular long-fringed gland;
 western N. Y. and Ont. to Wis., Ga. and Ky. June-Aug.

## 7. TETRAGONÁNTHUS S. G. Gmel.

Glabrous herbs, with opposite leaves, and middle-sized flowers in often panicled cymes. Calyx deeply 4 -cleft or 4 -parted. Corolla campanulate, 4 - 5 -cleft, the lobes convolute in the bud, each with a hollow spur or projection below. Stamens 4 or 5 , inserted near the base of the corolla; anthers versatile. Ovary r-celled, the placente more or less intruded; ovules numerous; style short, or none; stigma 2-lobed. Capsule 2-valved. Seeds globose-ovoid, smooth. [Greek, allud-
ing to the "4-parted flowers.] Aborat 30 species, natives of N. Ama, S. Amo and Asia. Besides the following, another occurs in the southwestern U.S.

1. Tetragonanthus defléxus (J. E Smith) Kuntze Spurred Gentian. (I. F. f. 2885.) Annual; stem (1.5-5 dm high. Basalleaves obovate or spatulate, obtuse, narrowed into petioles; stem-leaves ovate or lanceolate, acute, sessile, 3-5nerved, $2-5 \mathrm{~cm}$. long, the uppermóst smaller, calyw-segments acute or acuminate; corolla purplish or white, about 8 mm . high, its lobes ovate, acute, the spurs deflexed or descending, one-fourth to one-half the length of the corolla; capsule 12 14 mm . long, about twice as long as the calyx. In moist woods and thickets, Lab. to Mass., N. Y., Mich. and the Ind. Terr. July-Aug.

Tetragonanthus deféxus Brentoniànus (Griseb.) Britton, Low, $0.7-2$ dm. high; spurs shorter and thicker, perhaps specifically distinct. Newf to Anticosti and Lab.

Tetragonanthus defexus heteranthus (Grisebb.) Britton. Córollas spurless, or only the earfiest spur-bearing, the dower fowers mostly smaller than the upper. Newf, to -Men [Hatenia そeterantha Griseb:]
.botuditjzib plobiw roiogqe jedrods bme smomon svi'l

## 8. OBOLARIA L.

A low glabrous perennial herb, the lower leavesireduced to opposite scales, the upper foliaceous, subtending the racemose-spicate or thyrsoid, white or purplish flowers. Calyx of 2 spatulate sepals. Cofalla oblong-campanulate, 4 -cleft, the lobes imbricated at least in the bud Stamens 4 inserted in the sinuses of the corolla. Ovary I-celled, with 4, internal placental projections; ovules numerous; style distinct; stigma 2-lamellate, - Capsule ovoid, 2-valved or irregularly bursting. Seeds minute, covering the whole interior of the capsule . EGreek, obolus, a coin, alluding to the thick reund leaves.] AA monatypic genus.

I, Obolaria Virgínica L. Pennywort. (I; F.f. 2886.) Stems $7-15 \mathrm{~cm}$. high from a perennial root of thick fibres, bearing $2-6$ pairs of thick small obtuse scales. Floral leaves broadly obovate-cuneate, abtuse, purplish, $8-12 \mathrm{~mm}$. long; flowers sessile or nearly so in the axils, in clusters of $\mathbf{T} 4$, and terminal; corolla about a cm. long, cleft to about the middle, the lobes oblong, obtuse; stamens ineluded; capsule, 5 mmo longor In rich woods and thickets; No J. to Ga., Hll and Tex. April-May.

Slender or filiform erect glabrous annual or biennial herbs, the leaves reduced to minute opposite scales, on these sometimes alternate, and small white or yellowish racemose or paniculate flowers, or these rarely solitary and terminal. Calyx deeply 4-parted, the segments acuminate. keeled. Corolla campanufite, déeply 4-cleft, the lobes imbricated in the oud. Stamens 4, inserted at the sinuses of the corolla. Qvary I-celled, the placentæ intruded, ovules numerous; style short or none stigma 2-lobed. Capsule ovoid-oblong, acute, 2 -valved. Seeds minute, covering the whole inner surface of the capsule. [In honor of Professor, Benjamin Smith Barton, $766-1815$, of Philadelphia.]
Corolla yellowish, $3-4 \mathrm{~mm}$. long, its lobes oblong......................inica.

Corolla purplish tinged, $4-5 \mathrm{~mm}$. long, its lobes broadly oblong. Corolla white, $6-8 \mathrm{~mm}$. long;' its lobes spatúlate:
2. $B$. iodandra.
3. B. everna.
(II Bartonia Virgínica (L.) B.S.P. Yellow BARTONiA. (I. F. f. 2887.) Stem almost filiform, $\mathbf{- 4}$ dm., high,-simpley or: with few-erect branches, ahove, 5 -angled, 'yellowish green. Subulate scales $2-4 \mathrm{~mm}$. long, appressed; flowers fhostly opposité, peduficléd; pedunclês ascénding or errect, $4-12$ mm: long; corolla somewhat exceeding the calyx; stamens included; stigma 2 mm. long; ovary 4 síded; capsulé about (3) mm , long;) In maist, soil, Newfor, Flan, Mich: and La. July-Sept.
2. Bartonia iodàndra Robinson. Purplish Bartonha Stem $4-25 \mathrm{~cm}$ high, simple or alternately braniched above the middle. Scales alternate,, $2-3 \mathrm{~mm}$. long; pedicels mostly a-flowered; corolla distiactly purplish, about twice as long as the calyx. its lobes obtusish, mucronate; stigma short, thiok. In sihagnum, Newf. to N. J.! [B, Mosiri of Wll. Flı, in part.]
3. Bartonia vérna (Michx.) Muhl. White Bartonia. (I. F.f. 2SSS.) Stem usually simple, $0: 5-4$ dm high, wacemosely on- conymbasety m-seraral-flowered

Scales appressed, some of them commonly alternate; flowers solitary at the ends of the elongated erect peduncles; peduncles sometimes 5 cm . long; corolla about 3 times the length of the calyx; ovary compressed; capsule about 5 mm . high. In swamps, southern Va. to Fla. and La. March-May.

## Family 4. MENYANTHÀCEAE G. Don.

## Buckbean Family.

Perennial aquatic or marsh herbs, with basal or alternate leaves, and clustered regular perfect flowers. Calyx inferior, deeply 5 -parted, persistent. Corolla 5-lobed or 5 -cleft, the lobes induplicate-valvate, at least in the bud. Stamens 5, borne on the corolla, and alternate with its lobes; anther-sacs longitudinally dehiscent; pollen-grains 3 -angled. Ovary I-celled, the 2 placentæ sometimes intruded. Fruit a capsule, or indehiscent. Five genera and about 35 species, widely distributed.
Leaves 3 -foliolate; swamp plant.
Leaves simple, entire, cordate, floating.

## 1. MENYÁNTHES L.

A glabrous marsh herb, with creeping rootstocks, long-petioled 3 -foliolate basal leaves, and white or purplish flowers, racemose or panicled on long lateral scapes. Calyx 5-parted. Corolla short-funnelform, 5 -cleft, its lobes induplicate-valvate, fimbriate or bearded within. Stamens 5, on the tube of the corolla; anthers sagittate. Disk of 5 hypogynous glands. Ovary I-celled ; style subulate; stigma 2-lamellate. Capsule oval, indehiscent or finally rupturing. Seeds few, com-pressed-globose, shining. [Greek, perhaps month-flower.] A monotypic genus.

1. Menyanthes trifoliàta L. Buckbean. Marsh or Bean Trefoil. Bog-bean. (I. F. f. 2889.) Rootstocks thick, scaly, sometimes 3 dm . long. Petioles sheathing at the base; leaflets oblong or obovate, entire, obtuse, narrowed to the sessile base, $3-8 \mathrm{~cm}$. long; raceme $10-20$-flowered; pedicels $6-25 \mathrm{~mm}$. long, bracteolate at the base; flowers $10-12 \mathrm{~mm}$. long; calyx shorter than the white or purplish corolla; capsule ovoid, obtuse, about 8 mm . long. In bogs, Greenland to Alaska, L. I., Penn., Neb. and Cal. Also in Europe and Asia. May-July.

## 2. LIMNÁNTHEMUM S. G. Gmelin.

Aquatic herbs, with slender rootstocks. Leaves petioled, ovate or orbicular, entire or repand, or the primary ones different; flowers yellow, or white, umbellate at the summit of filiform stems at the bases of the petioles, or axillary. Calyx 5parted. Corolla nearly rotate, deeply 5 -cleft, the lobes induplicate-valvate in the bud, sometimes fimbriate on the margins. Stamens 5 , inserted on the base of the corolla; anthers sagittate, versatile. Ovary 1-celled; style short or none; stigma 2-lamellate. Capsule indehiscent or irregularly bursting. [Greek, pool-blossom.] About 20 species, widely distributed.
Flowers accompanied by tufts of root-like tubers; native species.
Floating leaves $2-5 \mathrm{~cm}$. long; flowers $6-12 \mathrm{~mm}$. broad, yellow; seeds smooth.

1. L. lacunosum.

Floating leaves $5-15 \mathrm{~cm}$. long; flowers $12-20 \mathrm{~mm}$. broad, white; seeds rough.
2. L. aquaticum.

Flowers not accompanied by tufts of tubers; flowers bright yellow, 25 mm . broad, or more; introduced species.
3. L. nymphaeoides.
I. Limnanthemum lacunòsum (Vent.) Griseb. Floating Heart. (I. F. f. 2890.) Primary leaves membranous, submerged, short-petioled; stems (stolons) filiform, sometimes 3 m . long, bearing a short-petioled floating leaf, an umbel of flowers and a cluster of narrow tubers at its summit, or some of the floating leaves on petioles as long as the stems; floating leaves ovate-orbicular, purplish beneath; pedicels slender; tubers linear-conic. $\mathbf{I - 2 . 5} \mathrm{cm}$. long; capsule covered by the connivent calyx-segments. In ponds, N. S. to Fla., Ont., Minn. and La. July-Aug.
2. Limnanthemum aquáticum (Walt.) Britton. Larger Floating Heart. (I. F. f. 2891.) Similar to the preceding but stouter and larger. Floating leaves
cordate-orbicular, thick, entire or repand, spongy, and with the petioles and stolons densely covered with minute pits; primary leaves spatulate; tubers linear-oblong, thicker; seeds rough; capsule longer than the calyx. In ponds, N. J. and Del. to Fla. and Tex. May-Aug.
3. Limnanthemum nymphaeoìdes (L.) Hoffm. \& Link. Water Lily Floating Heart. (I. F. f. 2892.) Stems long, branched, the upper nodes bearing a petioled leaf and a cluster of flowers, or the upper internodes very short and their leaves apparently opposite. Petioles stout, mostly longer than the ovateorbicular firm blades, which are $5-10 \mathrm{~cm}$. broad; pedicels stout, becoming $7-15 \mathrm{~cm}$. long; corolla-segments short-fringed. Nat. in ponds, D. C. Native of Europe and Asia. May-July.

## Family 5. APOCYNÀCEAE Lindl.

## Dogbane Family.

Perennial herbs, shrubs, vines, or some tropical genera trees, mostly with an acrid milky juice, with simple estipulate leaves, and perfect regular 5-parted flowers. Calyx inferior, persistent, the lobes imbricated in the bud. Corolla gamopetalous, its lobes convolute in the bud and often twisted. Stamens as many as the lobes of the corolla, alternate with them, inserted on the tube or throat ; anthers 2-celled; pollen-grains simple. Ovary superior, or its base adherent to the calyx, of 2 distinct carpels, or 1 -celled, with 2 parietal placentæ, or 2 -celled; ovules anatropous or amphitropous; style simple, or 2-divided; stigma simple. Fruit usually of 2 follicles or drupes. Seeds often appendaged; endosperm fleshy; embryo straight; radicle terete, usually shorter than the cotyledons. About I30 genera and 1050 species, very widely distributed, mostly in tropical regions.

Leaves alternate; erect herbs.
Leaves opposite ; vines or herbs.
Flowers large, axillary, solitary.
Flowers small, cymose.
Erect or diffuse herbs; corolla campanulate to urceolate. High-climbing vines; corolla funnelform.

1. Amsonia.
2. Vinca.
3. Apocynum.
4. Trachelospermum.

## 1. AMSOONIA Walt.

Perennial herbs, with alternate membranous leaves, and rather large blue or bluish flowers, in terminal thyrsoid or corymbose cymes. Calyx 5-parted, the segments acuminate. Corolla mostly salverform, the tube cylindric, but somewhat dilated at the summit, villous within. Stamens included; anthers ovate or oblong. Disk none. Ovary of 2 carpels, connected at the top by the filiform style; ovules in 2 rows in each cavity, numerous; stigma appendaged by a reflexed membrane. Fruit of 2 erect cylindric several-seeded follicles. Seeds obliquely truncate at each end, not appendaged. [Named for Charles Amson of South Carolina.] About 12 species, natives of N. Am. and eastern Asia. Besides the following, 5 others occur in the southern and western U. S.

$$
\begin{array}{ll}
\text { Leaves ovate to ovate-lanceolate; pods divergent. } & \text { 1. A. Amsonia. } \\
\text { Leaves lanceolate to linear-lanceolate; pods ascending. } & \text { 2. A. salicifolia. }
\end{array}
$$

1. Amsonia Amsònia (L.) Britton. Broad-leated AmsoniA. (ilabrous or nearly so, 6-12 dm. high. Leaves ovate or ovate-lanceolate, entire, acuminate, narrowed at the base, sometimes pubescent beneath, $5-10 \mathrm{~cm}$. long. $2-5 \mathrm{~cm}$. wide: petioles $4-8 \mathrm{~mm}$. long; pedicels bracteolate at the base; calyx about 2 mm . long. its segments subulate; corolla $12-18 \mathrm{~mm}$. long, beaked by the convolute limb in the bud, its lobes linear and about as long as the tube; follicles $5-10 \mathrm{~cm}$. long, about 4 mm . thick, attenuate at the apex, glabrous; seeds papillose. In moist soil, Penn. to Mo., Ky., Fla. and Tex. April-July.
2. Amsonia salicifolia Pursh. Willow-leatel Amsonia. Similar to the preceding, but the leaves much narrower, lanceolate to lincar-lanceolate. $8-15 \mathrm{~cm}$.
long, $10-20 \mathrm{~mm}$. wide; pods ascending, stem often much stouter. Tenn. to Kans., Fla. and La. April-June.

## 2. VÍNCA L.

Herbs, some species slightly woody, with opposite leaves, and large solitary axillary flowers. Calyx 5 -parted, the segments acuminate. Corolla salverform, the tube pubescent within, the lobes oblique. Stamens included. Disk of 2 glands, alternate with the 2 carpels. Ovules several in each carpel; style filiform; stigma annular, its apex penicillate. Follicles 2, cylindric, several-seeded. Seeds oblongcylindric, truncate at each end. [The Latin name.] About 12 species, one native of tropical Am., occurring in Fla., the others of the Old World.
I. Vinca minor L. Periwinkle. Myrtle. (I. F. f. 2894.) Perennial, trailing, glabrous; stems $1.5-6 \mathrm{dm}$. long. Leaves oblong to ovate, entire, firm, shining, green both sides, narrowed at the base, short-petioled, $2-6 \mathrm{~cm}$. long; flowers blue, $\mathbf{I} .8-3 \mathrm{~cm}$. broad; peduncles $\mathbf{I}-4 \mathrm{~cm}$. long; calyx-segments subulatelanceolate, glabrous; corolla-tube expanded above, as long as or slightly longer than the obovate, nearly truncate lobes; anther-sacs with a broad connective. Escaped from gardens, Ont. to Conn., N. Y., N. J. and Ga. Native of Europe, Feb.-May.

## 3. APÓCYNUM L.

Perennial herbs, with opposite entire leaves, and small white or pink flowers in corymbed cymes. Calyx 5 -parted, the segments acute. Corolla campanulate, the tube bearing within 5 small triangular appendages alternate with the stamens, the limb 5 -lobed. Stamens inserted on the base of the corolla; anthers sagittate, connivent around the stigma and slightly adherent to it. Disk 5 -lobed. Ovary of 2 carpels; ovules numerous; stigma ovoid, obtuse, obscurely 2 -lobed. Follicles slender, elongated, terete. Seeds numerous, small, the apex tipped with a long coma. [Greek, dogbane.] About 15 species, of the north temperate zone.
Corolla $5-9 \mathrm{~mm}$. long, its lobes spreading or recurved.
Corolla not angled, pink, its tube narrowed in the throat. 1. A. androsaemifolium.
Corolla 5 -angled, white or faintly pink, its tube not narrowed in the throat.
Corolla campanulate, $6-7 \mathrm{~mm}$. long.
2. A. medium.

Corolla urceolate to tubular, $4^{-6} \mathrm{~mm}$. long.
Calyx-segments triangular-ovate, much shorter than the corolla-tube.
3. A. Milleri.

Calyx-segments lanceolate, about as long as the corolla-tube.
4. A. urceolifer.

Corolla $3-4.5 \mathrm{~mm}$. long, its lobes erect or nearly so.
Leaves and cymes glabrous, or somewhat pubescent.
Leaves petioled, mostly narrowed at the base.
Leaves ovate-oblong to lanceolate, 2-4 times as long as wide; flowers green to whitish. 5. A. cannabinum.
Leaves oblong-lanceolate, 4-6 times as long as wide; flowers white.
6. A. album.

Leaves sessile or very nearly so, mostly cordate-clasping or obtuse at the base.
7. A. hypericifolium.

Whole plant, including the cymes, densely soft-pubescent. 8. A. pubescens.

1. Apocynum androsaemifòlium L. Spreading Dogbane. Honeybloom. (I. F. f. 2895.) Rootstock horizontal; stem 3-15 dm. high; branches broadly spreading, mostly glabrous. Leaves ovate or oval, mucronate, glabrous above, pale and usually more or less pubescent beneath, $5-10 \mathrm{~cm}$. long; petioles 4-8 mm. long; cymes loose, usually both terminal and axillary; pedicels 4-10 mm. long, subulate-bracted at the base; flowers about 8 mm . broad; calyx-segments shorter than the terete tube of the pinkish corolla; corolla-lobes revolute, rounded; follicles $10-17 \mathrm{~cm}$. long, narrowed at the apex. In fields and thickets, Anticosti to Br. Col., Ga., Neb. and Ariz. June-July.
2. Apocynum mèdium Greene. Intermediate Dogbane. Rootstock horizontal; stem stout, 7-13 dm. high, the branches ascending, glabrous. Leaves oblong to oval, mucronulate, ascending, 6-9 cm. long, somewhat pubescent beneath; petioles $4-8 \mathrm{~mm}$. long; cymes compact, all terminal; pedicels $3-5 \mathrm{~mm}$. long; flowers erect; calyx-segments about half as long as the 5 -angled corolla-tube; corolla white,
or faintly pink, 6-7 mm. long, its segments acutish, spreading; pods 7-12 $\mathbf{~ c m}$. long. Fields and roadsides, Md. and D. C. June-Aug. [A. speciosum G. S. Miller.]
3. Apocynum Milleri Britton. Miller's Dogbane. Slender, seldom over Io dm. high, the branches widely spreading. Leaves oblong to ovate-lanceolate, $6-8 \mathrm{~cm}$. long, mucronate, pubescent beneath; petioles $3^{-6} \mathrm{~mm}$. long, pubescent; cymes small, terminal, or also in the upper axils; pedicels $2-3 \mathrm{~mm}$. long. Flowers suberect; corolla pinkish, $5-6 \mathrm{~mm}$. long, its rounded segments spreading; pods about 9 cm . long. Dry soil, N. Y. to Md. June-July. [A. medium G. S. Miller, not Greene.]
4. Apocynum urceólifer G. S. Miller. Urn-flowered Dogbane. Similar to the preceding species, and about equally tall; flowers smaller; corolla $4-5 \mathrm{~mm}$. long, white, or merely tinged with pink, its segments pointed, spreading; calyx about as long as the corolla-tube. Fields and roadsides, N. Y. to Md. and Mo. June-July.
5. Apocynum cannábinum L. Indian Hemp. Amy-root. (I. F. f. 2896.) Root deep, vertical. Stem $10-17 \mathrm{dm}$. high, the branches erect or ascending. Leaves oblong, lanceolate-oblong or ovate-oblong, mucronate, glabrous above, sometimes pubescent beneath, $5-10 \mathrm{~cm}$. long; petioles $2-15 \mathrm{~mm}$. long, or sometimes none; cymes dense; pedicels short, bracteolate at the base; calyx-segments nearly as long as the tube of the greenish white corolla; follicles $13-20 \mathrm{~cm}$. long. In fields and thickets, Anticosti to Br. Col., Fla. and Lower Cal. June-Aug.
6. Apocynum àlbum Greene. River-bank Dogbane. Glabrous; leaves smaller, oblong-lanceolate, acute at each end, or sometimes rounded at the base, seldom over 7 cm . long and 2 cm . wide, distinctly petioled. On river-shores and similar situations, Me. and Ont. to Wisc., Va. and Mo. June-July.
7. Apocynum hypericifòlium Ait. Clasping-leaved Dogbane. (I. F. f. 2897.) Glabrous, often glaucous; stem 3-6 dm. high, the branches ascending. Leaves oblong, oblong-lanceolate to oval, $2-8 \mathrm{~cm}$. long, cordate-clasping, rounded, truncate, or the upper narrowed at the base, short-petioled, or sessile, the primary venation forming broad angles with the midvein; cymes many-flowered; pedicels mostly not longer than the flowers, bracteolate; calyx-segments about the length of the corolla-tube, lanceolate, acute; follicles $5-9 \mathrm{~cm}$. long. In dry soil, or along streams, Ont. to Br. Col., Ohio, Ill. and N. Mex. June-Aug.
8. Apocynum pubéscens R. Br. Velvet Dogbane. (I. F. f. 2898.) Whole plant, including the pedicels and calyx, densely velvety-pubescent. Branches ascending; leaves oval to elliptic, strongly mucronate, obtuse or obtusish at the base, the veins impressed in the pubescence of the lower surface; petioles $2-4 \mathrm{~mm}$. long; cymes dense; calyx-segments about as long as the tube of the corolla, lanceolate, acute; corolla apparently purple, its lobes erect; follicles $6-7 \mathrm{~cm}$. long. Va. to Ill., Iowa and Mo.

## 4. TRACHELOSPÉRMUM Lemaire.

Twining woody vines (some exotic species nearly erect shrubs), with opposite entire leaves, and small flowers in compound cymes. Calyx small, deeply 5-parted, glandular within, the segments narrow. Corolla funnelform or salverform, the tube nearly cylindric, expanded above. Stamens included, or short-exserted; anthers sagittate, acuminate, connivent around the stigma. Disk of 5 glandular lobes. Ovary of 2 carpels; ovules numerous; style slender, its apex thickened below the narrow ring of the ovoid stigma. Follicles much elongated, slender. Seeds linear, not beaked, long-comose at the apex. [Greek, neck-seed, but the seed is not beaked.] About 6 species, natives of eastern Asia and N. Am.
I. Trachelospermum diffórme (Walt.) A. Gray. Trachelospermum. (I. F. f. 2899.) Stems $\mathbf{I}$ cm. in diameter or more. Leaves thin. ovate, oval or lanceolate, acuminate or acute, $3-8 \mathrm{~cm}$. long; peduncles shorter than the leaves; flowers yellow or cream-color, $8-10 \mathrm{~mm}$. long; lobes of the corolla ovate, spreading, shorter than the tube; follicles $\mathbf{1 . 2 - 2 . 3}$ dm. long, scarcely 4 mm. thick. In moist woods and along streams, Del. to Fla., Tex. and Mex., mostly near the coast. June-Aug.

# Family 6. ASCLEPIADÀCEAE Lindı.* 

## Milkweed Family.

Perennial herbs, vines or shrubs, mostly with milky juice, with estipulate leaves, and mostly umbellate perfect regular flowers. Calyx inferior, its tube very short, or none, its segments imbricated or separate in the bud. Corolla campanulate, urceolate, rotate or funnelform, 5 -lobed or 5 -cleft, the segments commonly reflexed. A 5-lobed or 5-parted crown (corona) between the corolla and the stamens and adnate to one or the other. Stamens 5, inserted on the corolla; filaments short, stout, mostly monadelphous, or distinct; anthers attached by their bases to the filaments, introrsely 2 -celled, connivent around the stigma, or more or less united with each other; anther-sacs tipped with an inflexed or erect scarious membrane, or unappendaged at the top, sometimes appendaged at the base ; pollen coherent into waxy or granular masses, one or rarely two such masses in each sac, connected with the stigma in pairs or fours, by 5 glandular corpuscles alternate with the anthers. Disk none. Ovary of 2 carpels; styles 2, short, connected at the summit by the peltate discoid stigma; ovules numerous in each carpel, mostly anatropous, pendulous. Fruit of 2 follicles. Seeds compressed, usually appendaged by a long coma; endosperm cartilaginous; embryo nearly as long as the seed; cotyledons flat. About 220 generá and 1900 species of wide distribution.
Erect or decumbent herbs.
Corona-hoods each with an incurved horn within; leaves mostly opposite.
Corona-hoods prominently crested within; leaves alternate 1. Asclepias.
Corona-hoods unappendaged or with a thickened crest-like keel; leaves opposite or alternate.
3. Acerates.

Twining vines.
Corolla-lobes erect ; corona-lobes I-2-awned. 4. Gonolobus.
Corolla rotate.
Anthers tipped with a scarious membrane; pollen-masses pendulous.
Anthers merely tipped; pollen-masses horizontal. $\quad$ 6. Vincetoxicum.

## 1. ASCLÉPIAS L.

Perennial herbs, with entire leaves, and middle-sized or small flowers in umbels. Calyx 5 -parted or 5 -divided, usually small, the segments or sepals acute, often glandular within. Corolla deeply 5 -parted, the segments mostly valvate, reflexed in anthesis. Corona-column generally present. Corona of 5 concave hoods, each bearing within a slender or subulate incurved horn. Filaments connate into a tube; anthers tipped with an inflexed membrane, winged, the wings broadened below the middle; pollen-masses solitary in each sac, pendulous on their caudicles. Stigma nearly flat, 5-angled or 5-lobed. Follicles usually thick, acuminate. Seeds comose in all but one species. [Dedicated to AEsculapius.] About 85 species, mostly natives of the New World; besides the following some 25 others occur in southern and western N. Am.

* Corolla and corona orange : leaves alternate or opposite. Stem erect or ascending; leaves nearly all alternate.

1. A. tuberosa. Stems reclining; leaves, at least the upper, opposite, oblong or oval.

> 2. A. decumbens.

> * * Corolla bright red or purple; leaves opposite.

Flowers $2-4 \mathrm{~mm}$. broad; corona-hoods $4-6 \mathrm{~mm}$. high.
Leaves lanceolate or linear; hoods oblong, obtuse
3. A. lanceolata.

Leaves ovate or ovate-lanceolate; hoods lanceolate.
4. A. rubra.

Leaves oblong, ovate or ovate-oblong; hoods oblong, acutish. 5. A. purpurascens.

[^39]Flowers 4-6 mm. broad ; corona-hoods $2-3 \mathrm{~mm}$. high.
Plant nearly or quite glabrous; leaves lanceolate or oblong-lanceolate.
6. A. incarnata.

Plant pubescent; leaves oblong.
7. A. pulchra.

*     *         * Corolla greenish, purplish, yellowish or white; leaves opposite or verticillate.

Leaves ovate, oblong, ovate-lanceolate, obovate or orbicular.
Plants glabrous throughout, or minutely pubescent above.
Leaves sessile, clasping or very short-petioled.
Peduncles of the solitary or several umbels short.
Leaves ovate-oblong ; hoods 2-auriculate at the base.
8. A. Sullivantii.

Leaves nearly orbicular; hoods truncate.
9. A. latifolia.

Peduncle of the usually solitary umbel elongated.
Leaves cordate-clasping, wavy-margined. 10. A. amplexicaulis.
Leaves sessile, flat; horn not exceeding the hood.
ir. A. Meadii.
Leaves manifestly petioled.
Corolla greenish; umbels loose; pedicels drooping. 12. A. exaltata.
Corolla white; umbels dense. 13. A. variegata.
Corolla pink; some of the leaves verticillate in 4's. 14. A. quadrifolia.
Plants, at least the lower surfaces of the leaves, canescent or tomentose.
Follicles tomentose, covered with soft spinose processes.
Corona-hoods obtuse, short.
Corona-hoods elongated, lanceolate.
15. A. Syriaca.
16. A. speciosa.

Follicles with no spinose processes, glabrous or pubescent.
Leaves wavy-margined; corolla-segments $9-11 \mathrm{~mm}$. long.
Leaves flat; corolla-segments $4^{-6} \mathrm{~mm}$. long.
17. A. arenaria.
18. A. ovalifolia.

Leaves lanceolate, oblong-lanceolate or linear.
Leaves opposite, lanceolate or oblong-lanceolate.

Leaves thick, short-petioled; inflorescence woolly.
Leaves thin, slender-petioled; inflorescence downy.
Leaves mostly verticillate in 2 's-6's, narrowly linear. Hoods entire.
Hoods dorsally hastate-sagittate.
Leaves scattered, densely crowded, filiform-linear.
19. A. brachystephana. 20. A. perennis.
21. A. verticillata.
22. A. galioides.
23. A. pumila.
i. Asclepias tuberòsa L. Butterfly-weed. Pleurisy-root. (I. F. f. 2900.) Hirsute-pubescent; stems stout above, very leafy, 3-6 dm. high, the milky sap scanty. Leaves usually all alternate, lanceolate or oblong, sessile or shortpetioled, $5-15 \mathrm{~cm}$. long; umbels cymose, many-flowered; peduncles shorter than the leaves; pedicels pubescent; corolla-segments oblong, obtuse, about 6 mm . long, greenish; hoods erect, oblong, bright orange, or rarely yellow, 2-3 times as long as the stamens, slightly longer than the filiform horns; fruiting pedicels decurved; follicles nearly erect, finely pubescent, $10-12 \mathrm{~cm}$. long. In dry fields, Me. and Ont. to Minn., Fla., Tex. and Ariz. June-Sept.
2. Asclepias decúmbens L. Decumbent Butterfly-weed. (I. F. f. 2901.) Hirsute-pubescent; stems 6-9 dm. long, the ends ascending or erect. Leaves sessile or short-petioled, oblong or elliptic, obtuse at the apex, narrowed and often inequilateral at the base, $5-8 \mathrm{~cm}$. long, the upper opposite, the lower commonly alternate, the uppermost very small; umbels racemose along the branches; peduncles stout; pedicels slender, somewhat pubescent; corolla-segments oblong, acutish, about 6 mm . long; the hoods erect, oblong, orange, slightly longer than the subulate horn; follicles more slender than in the preceding. In dry fields, Conn. to Ill., Ohio, N. Car. and Fla. June-Aug.
3. Asclepias lanceolàta Walt. Few-flowered Milkwefi). (I. F. f. 2002.) Nearly glabrous; stem usually simple, naked above, 6-12 dm. high. Leaves opposite, distant, elongated, acuminate, narrowed at the basc. short-petioled, 10-25 cm . long, roughish on the margins, the primary nerves widely spreading; umbels few-flowered, solitary or 2-4 at the summit; peduncles about cypalling the slender puberulent pedicels; corolla-segments oblong, $0-1 \mathrm{Imm}$. long, deep red; hoods olnowate or oblong, 2 -toothed near the base, nearly twice the length of the anthers and longer than the subulate incurved horn; anther-wings notched at the base; fruiting pedicels decurved; follicles erect, minutcly puberulent, fusiform, about i dm. long. In swamps, N. J. to Fla. and Tex., mostly near the coast. June-Aug.
4. Asclepias rùbra L. Red Milkweed. (I. F. f. 2903.) Nearly glabrous; stem usually simple, 3-12 dm. high. Leaves opposite, rather distant, short-petioled, rounded or subcordate at the base, gradually acuminate, rather firm, I-2 dm. long, the primary nerves wide-spreading; umbels I-4, many-flowered; peduncles shorter than or equalling the upper leaves; pedicels slender, downy; corolla purplish red, or the hoods orange-red, $6-9 \mathrm{~mm}$. long; horns of the hoods very slender, nearly straight; fruiting pedicels deflexed, the follicles erect, spindle-shaped, glabrous, about I dm. long. Moist soil, N. J. and Penn. to Fla., La. and Tex. June-July.
5. Asclepias purpuráscens L. Purple Milkweed. (I. F. f. 2904.) Stem stout, puberulent or glabrous, usually simple, 6-12 dm. high, leafy to the top. Leaves petioled, mucronulate, nearly glabrous above, finely tomentose beneath, 820 cm . long, the primary nerves wide-spreading; umbels many-flowered; peduncles stout; pedicels slender, puberulent; corolla deep purple, its segments oblong, about 6 mm . long; hoods nearly twice as long as the anthers, pale red or purple, the horns broad at the insertion, short-subulate and incurved at the apex; fruiting pedicels deflexed, the downy follicles nearly erect $10-13 \mathrm{~cm}$. long. In dry fields and thickets, Mass. to Va., Ont., Minn. and Kans. June-Aug. [A. amoena L. ?]
6. Asclepias incarnàta L. Swamp Milkweed. (I. F. f. 2905.) Stem slender, 6-12 dm. high, leafy to the top. Leaves acuminate, $8-15 \mathrm{~cm}$. long, the primary nerves not wide-spreading; umbels usually numerous, many-flowered; pedicels pubescent; corolla red or rose-purple, rarely white, its lobes oblong, about 4 mm . long; horns incurved, longer than the hoods, obtuse, pink or purplish; anther-wings entire, or obscurely notched at the base; fruiting pedicels erect or incurved; follicles erect, $5-9 \mathrm{~cm}$. long, sparingly puberulent. In swamps, N. B. to the N. W. Terr., Tenn., La. and Kans. July-Sept.
7. Asclepias púlchra Ehrh. Hairy Milkweed. (I. F. f. 2906.) Similar to the preceding; stem stout, tomentose-pubescent, 6-10 dm. high, leafy to the top. Leaves acute, acuminate or some of them obtusish, pubescent, at least on the veins beneath, $7-13 \mathrm{~cm}$. long; petioles usually short; flowers similar to those of $A$. incarnata, but the corolla commonly lighter red or pink, rarely white; peduncles and pedicels tomentose; fruiting pedicels erect or incurved; follicles erect, finely and densely pubescent, $5-8 \mathrm{~cm}$. long. In moist fields and swamps, Me. to Minn. and Ga. July-Sept.
8. Asclepias Sullivántii Engelm. Sullivant's Milkweed. (I. F. f. 2907.) Stem stout, 6-12 dm. high, leafy to the top. Leaves thick, oblong or ovateoblong, usually obtuse and mucronulate at the apex, subcordate, rounded or slightly clasping at the base, $10-15 \mathrm{~cm}$. long, the primary nerves very widespreading; umbels terminal and sometimes also in the upper axils, many-flowered; peduncles shorter than the leaves; corolla-segments oval-oblong, II-I3 mm. long, purplish; hoods oval, obtuse or truncate, longer than the anthers and the subulate incurved horn; follicles erect, glabrous, $8-10 \mathrm{~cm}$. long, usually with blunt processes near the apex. In moist soil, Ohio to Minn., Neb., Mo. and Kans. July-Sept.
9. Asclepias latifolia (Torr.) Raf. Broad-leaved Milkweed. (I. F. f. 2908.) Stem stout, usually simple, 3-7 dm. high, very leafy. Leaves very thick, oval to orbicular, commonly broadly emarginate and mucronulate at the apex and cordate or subcordate at the base, $10-15 \mathrm{~cm}$. long and nearly as wide, primary nerves very wide-spreading; umbels 2-4, many-flowered, short-peduncled in the upper axils or rarely terminal; pedicels slender, canescent; corolla-segments ovate, acute, $9-13 \mathrm{~mm}$. long, greenish; hoods about equalling the anthers, the horn projecting from a short crest over the edge of the stigma; follicles erect on deflexed pedicels, ovoid, acutish, $5-8 \mathrm{~cm}$. long, about 2.5 mm . thick. On dry plains, Neb. to Colo., Tex. and Ariz. July-Sept.
ro. Asclepias amplexicaùlis J. E. Smith. Blunt-leaved Milkweed. (I. F. f. 2909.) Nearly glabrous, pale green, somewhat glaucous; stem erect or ascending, 6-9 dm. high. Leaves oblong or ovate-oblong, obtuse and mucronulate, $8-13 \mathrm{~cm}$. long; primary nerves wide-spreading; umbel many-flowered, rarely with a second shorter-peduncled one at its base; pedicels slender, downy, about 2.5 cm . long; corolla-segments oblong, greenish purple, about 9 mm . long; hoods pink, nearly truncate and toothed at the summit, shorter than the subulate incurved horn; follicles erect on the stout decurved fruiting pedicels, downy,

10-15 cm. long. In dry fields, mostly in sandy soil, Me. to Fla., Minn., Kans. and Tex. May-Aug. [A. obtusifolia Michx.]
II. Asclepias Mèadii Torr. Mead's Milkweed. (I. F. f. 2910.) Nearly glabrous throughout, pale green or glaucous; stem simple, or rarely branched above, 3-6 dm. high. Leaves flat, mostly distant, ovate, ovate-lanceolate, lanceolate er the lower oblong, the margins scabrous; umbel several-flowered, borne on a peduncle $8-15 \mathrm{~cm}$. long; corolla-segments greenish yellow, ovate, acute, $6-9 \mathrm{~mm}$. long; hoods ovate, purplish, nearly twice as long as the anthers, rounded and truncate at the summit, longer than the subulate inflexed horn, with a small tooth at each side on the inner infolded margin; follicles erect on decurved pedicels, puberulent, narrow, Io- $\mathbf{1 2} \mathrm{cm}$. long. Dry soil, Ill. to Iowa and Wisc. June-Aug.
12. Asclepias exaltàta (L.) Muhl. Poke or Tall Milkweed. (I. F. f. 2911.) Nearly glabrous throughout, with two opposite lines of pubescence on the usually simple stem, I-2 m. high. Leaves thin or membranous, oval, ovate or oblong, acuminate at both ends, $10-23 \mathrm{~cm}$. long, $3-10 \mathrm{~cm}$. wide, the lower sometimes obovate, obtuse, shorter; peduncles $2.5-8 \mathrm{~cm}$. long; umbels usually several; pedicels slender, drooping or spreading, $2.5-5 \mathrm{~cm}$. long, puberulent; corolla-segments ovate or oblong, obtusish, 6-9 mm. long; hoods white or pink, slightly shorter than the anthers, much shorter than the subulate horn, at the summit truncate and entire or erose, with I or 2 slender teeth on each of the inner margins; follicles erect on the deflexed pedicels, downy, long-acuminate, $10-15 \mathrm{~cm}$. long. In thickets and woods, Me. to Minn., Ga. and Mo. June-Aug.
13. Asclepias variegàta L. White Milkweed. (I. F. f. 2912.) Stem glabrous below, pubescent above when young, simple, 3-9 dm. high. Leaves thick, oval, ovate, oblong or the lower somewhat obovate, obtuse and cuspidate or acutish, dark green above, pale beneath, 6-15 cm. long, the middle ones sometimes verticillate in 4 's; petioles $6-25 \mathrm{~mm}$. long; umbels $1-4$, terminal, or rarely 1 or 2 in the upper axils, densely many-flowered; pedicels erect or ascending, usually densely puberulent; corolla-segments ovate or oval, about 6 mm . long, white, or purple near the base; column purplish; hoods globose-obovoid, obtuse, spreading, longer than the anthers, about equalling the semi-lunate horizontally pointed horn; follicles downy, erect on the deflexed fruiting pedicels, $10-13 \mathrm{~cm}$. long. In dry woods and thickets, Conn. to Ill., Fla., Ark. and La. June-July.
14. Asclepias quadrifòlia Jacq. Four-leaved Milkweed. (I. F. f. 2913.) Stem slender, simple, 3-6 dm. high, usually leafless below. Leaves thin, sparingly pubescent on the veins beneath, ovate to lanceolate, $5-15 \mathrm{~cm}$. long, acute or acuminate, or the lowest pair much smaller, obovate and obtuse; umbels I-4, terminal, or rarely in the upper axils; peduncles slender; corolla-lobes lanceolateoblong, 4-6 mm. long; hoods white, obtuse at the apex, broadly 2 -toothed above the base, twice as long as the anthers and the incurved horn; follicles erect on the erect fruiting pedicels, $8-\mathbf{I} 3 \mathrm{~cm}$. long, glabrous. Woods and thickets, Mer and Ont. to Minn., N. Car. and Ark. May-July.
15. Asclepias Syrìaca L. Common Milkweed. Silkweed. (I. F. f. 2914.) Stem stout, usually simple, $9-15 \mathrm{dm}$. high, finely pubescent at least above. Leaves oblong, oval or ovate, densely pubescent beneath, soon glabrous above, io23 cm . long, the primary nerves wide-spreading; petioles stout, $6-17 \mathrm{~mm}$. long; umbels several or numerous; peduncles pubescent or tomentose, $3-9 \mathrm{~cm}$. long; pedicels $2.5-5 \mathrm{~cm}$. long; corolla green-purple, its segments oblong-lanceolate, 6-9 mm . long; hoods ovate-lanceolate with a tooth on each side, longer than the anthers and the incurved horn; follicles $6-13 \mathrm{~cm}$. long, erect on recurved pedicels. In fields and waste places, N. B. to the N. W. Terr., N. Car. and Kans. Leaves rarely lanceolate. June-Aug.
16. Asclepias speciòsa Torr. Showy Milkweed. (I. F. f. 2915.) Whitetomentose or canescent all over, or glabrate below, pale; stem simple, stout, 3-7 dm. high. Leaves thick, broadly ovate or oval, petioled, $8-20 \mathrm{~cm}$. long; peduncles $2.5-7 \mathrm{~cm}$. long; umbels several or rarely solitary, many-flowered; pedicels stout; corolla purple-green, its segments oblong or ovate-oblong, $9-13 \mathrm{~mm}$. long, tomentose on the outer face; column very short or none; hoods lanceolate, II-15 mm . long, obtusish, expanded and with 2 blunt teeth below, the apex ligulate, 5-7 times as long as the anthers; horn short, inflexed; follicles erect or spreading on
the recurved fruiting pedicels, 7 -10 cm. long. In moist soil, Minn. to Br. Col. Kans., Utah and Cal. May-July.
17. Asclepias arenària Torr. Sand Milkweed. (I. F. f. 2916.) Densely tomentose-canescent all over; stems simple, ascending or erect, stout, 3-6 dm. high. Leaves obovate or oval, thick, obtuse or retuse and cuspidate at the apex, truncate, subcordate, obtuse, or rarely some of them narrowed at the base, 5-10 cm . long, the angle of the primary nervation broad; umbels densely many-flowered, short-peduncled or sessile; corolla greenish white, its segments oval-oblong; hoods oblong, truncate at each end, oblique at the apex, longer than the anthers, with a broad tooth on each side within; horn semi-lunate with an abruptly incurved subulate apex; follicles puberulent, $5-10 \mathrm{~cm}$. Iong, erect on the decurved fruiting pedicels. On sand-bars and hills, Neb. and Colo. to Mex. and N. Mex. June-Sept.
18. Asclepias ovalifòlia Dec. Oval-leaved Milkwort. (I. F. f. 2917.) Finely tomentose all over; stem simple, usually slender, erect, 3-6 dm. high. Leaves oval, ovate, oblong or ovate-lanceolate, $5-8 \mathrm{~cm}$. long, short-petioled, the upper surfaces becoming glabrate; umbels solitary or few, many-flowered; peduncles short; corolla greenish-white or purplish, its segments ovate-oblong, obtuse; hoods oval-oblong, nearly twice as long as the anthers, bearing a large acute tooth on each of the inner margins; horn subulate, incurved over the stigma; follicles ascending on the reflexed fruiting pedicels, pubescent. In woods and on prairies, Ill. to S. Dak., Manitoba and the N. W. Terr. June-July.
19. Asclepias brachystéphana Engelm. Short-crowned Milkweed. (I. F. f. 2918.) Puberulent when young, soon glabrate; stems clustered, often branched, spreading or ascending, $15-25 \mathrm{~cm}$. long. Leaves lanceolate or linearlanceolate, long-acuminate, $5-8 \mathrm{~cm}$. long, or the lowest shorter; umbels several, terminal and axillary, few-flowered; peduncles short; pedicels equalling or longer than the peduncles; corolla greenish purple, its segments about 4 mm . long; hoods ovate, obtuse, shorter than the anthers, the short erect-incurved horn slightly exserted; follicles erect on the spreading or decurved fruiting pedicels, downy or hoary, acuminate, 5-9 cm. long. In dry soil, Kans. (according to B. B. Smyth), Wyo. to Tex., Ariz. and Mex. June-Aug.
20. Asclepias perénnis Walt. Thin-leaved Milkweed. (I. F. f. 2919.) Puberulent above, glabrous below ; stem slender, erect, sometimes slightly woody at the base, 3-9 dm. high. Leaves lanceolate, oblong or ovate-lanceolate, acuminate or acute at both ends, $5-15 \mathrm{~cm}$. long, glabrous or nearly so ; umbels solitary, or several and corymbose; peduncles $2.5-5 \mathrm{~cm}$. long; pedicels slender; flowers very small, white ; corolla-segments oblong, $2-4 \mathrm{~mm}$. long ; hoods oval, erect, entire, about as long as the anthers, shorter than the subulate-filiform incurved horn; follicles glabrous, erect on the erect fruiting pedicels; seeds $11-13 \mathrm{~mm}$. long, very thin, destitute of coma. On river-shores and in wet places, N. Car. to Ill., Mo., Fla. and Tex. May-Aug.
21. Asclepias verticillàta L. Whorled Milkweed. (I. F. f. 2920.) Roots fascicled; stem slender, pubescent in lines at least above, very leafy, $3-8 \mathrm{dm}$. high. Leaves narrowly linear, sessile, verticillate in 3 's- 7 's or some of them alternate, glabrous or nearly so, their margins narrowly revolute ; umbels usually numerous, small; peduncles slender; pedicels filiform; corolla greenish white, its segments oblong, $3-4 \mathrm{~mm}$. long; hoods white, oblong, entire, about equalling the anthers, much shorter than the subulate incurved horn; follicles erect on the erect.fruiting pedicels, narrowly spindle-shaped, glabrous, 5-7 cm. long. Dry fields and hills, Me. and Ont. to the N. W. Terr., Fla., Mex. and N. Mex. July-Sept.
22. Asclepias galioides H. B. K. Bedstraw Milkweed. (I. F. f. 2920a.) Glabrous, except the minutely pubescent stems and pedicels. Stems erect, $3-5 \mathrm{dm}$. high from a horizontal rootstock ; leaves erect or spreading, in whorls of 2-6, narrowly linear, $5-8 \mathrm{~cm}$. long, the margins revolute; peduncles longer than the pedicels and shorter than the leaves; umbels $19-26 \mathrm{~mm}$. in diameter; flowers greenish-white; corolla-segments 4 mm . long; hoods as high as the anthers, broadly rounded at the summit, dorsally hastate-sagittate, the ventral margins slightly involute, entire; horn arising from the base of the hood, long-exserted over the anthers; anther-wings minutely notched at the base; follicles erect on erect fruiting pedicels, attenuated, 5-7 cm. long, glabrous or nearly so. Kans. to Colo., Ariz. and Mex. May-July.
23. Asclepias pùmila (A. Gray) Vail. Low Milkweed. (I. F. f. 2921.) Stems $4^{-25} \mathrm{~cm}$. high, tufted from a woody root. Leaves numerous, crowded, sometimes obscurely whorled, filiform-linear, $2.5-5 \mathrm{~cm}$. long, smooth or minutely roughened, the margins revolute; umbels 2-several, short-peduncled, few-flowered; pedicels filiform, puberulent, $6-9 \mathrm{~mm}$. long; corolla greenish white, its segments oblong, 3-4 mm. long; hoods white, erect, oblong, entire, equalling the anthers, shorter than the slender incurved horn; follicles erect on erect fruiting pedicels, narrowly spindle-shaped, $3-5 \mathrm{~cm}$. long, finely puberulent. Dry plains, S. Dak. to Ark., Colo. and N. Mex. July-Aug.

## 2. ASCLEPIODÒRA A. Gray.

Perennial herbs, similar to Asclepias, with entire leaves, and rather large flowers in terminal umbels. Sepals lanceolate. Corolla rotate, its segments spreading. Hoods oblong, inserted over the whole of the short corona-column, curved upward, obtuse, crested within, at least in the upper part, slightly longer than the anthers; at the sinuses between the hoods a small lobe or appendage, alternate with the anther-wings, simulating an inner crown. Anthers tipped with a scarious membrane, their wings horny, narrowed below, sometimes angled above the middle. Pollen-masses pendulous, pyriform, longer than their caudicles. Follicles ovoid or oblong, acuminate, with or without soft spinose processes, erect or ascending on the decurved or twice bent fruiting pedicels. [Greek, gift of Esculapius.] Five or six species, natives of the southern U. S. and Mex.
Glabrous or nearly so; leaves oblong to ovate-lanceolate; umbels usually more than one, corymbose.
Stem rough-puberulent ; leaves lanceolate; or linear, acuminate; umbels solitary.
I. Asclepiodora víridis (Walt.) A. Gr. Oblong-leaved Milkweed. (I. F. f. 2922.) Stem erect, rather stout, simple, 3-6 dm. high. Leaves rather thin, short-petioled, 6-1 3 mm . long; pedicels slender; corolla globose-ovoid in the bud, greenish, its segments, when expanded, oblong, obtuse or acute, $9-13 \mathrm{~mm}$. long, 2-3 times as long as the purplish or violet entire-margined hoods; antherwings narrow, scarcely angled above; fruiting pedicels twice bent; follicles ascending, puberulent, $5-8 \mathrm{~cm}$. long, sometimes with soft spinose projections. In dry soil, Ill. to Kans., Tex., S. Car. and Fla. May-July.
2. Asclepiodora decúmbens (Nutt.) A. Gray. Decumbent Milkweed. (I. F. f. 2923.) Stems decumbent or ascending, rather stout, 2-5 dm. long. Leaves firm, glabrous above, puberulent, at least on the veins beneath, narrowed at the base, $8-18 \mathrm{~cm}$. long; umbel many-flowered; pedicels rather stout; corolla depressedglobose in the bud, greenish, its segments, when expanded, ovate or broadly oval, somewhat longer than the hoods : hoods purple, obtusely 3 -lobed on the ventral margins, about 6 mm . long, their tips incurved ; anther-wings broad, angled above; follicles nearly erect on the recurved fruiting pedicels, $8-10 \mathrm{~cm}$. long, puberulent, at least when young, with or without soft projections. In dry soil, Kans. to Tex., Mex., Utah and N. Mex. April-June.

## 3. ACERÀTES Ell.

Perennial herbs, similar to Asclepias, with thick leaves, and green or purplish fowers in short-peduncled or sessile umbels. Calyx 5-parted or 5-divided, the segments acute, glandular within. Corolla deeply 5 -cleft, the segments valvate, reflexed in anthesis. Corona-column very short. Corona of 5 involute-concave or somewhat pitcher-shaped hoods, neither horned nor crested within or in one species having a small interior crest and usually a few small processes at the base of the anther-wings, forming an obscure inner crown. Pollen-masses solitary in cach sac, oblong, pendulous. Stigma 5-lobed. [Greek, without horn, referring to the crown.] About 7 species, natives of N. Am.
Umbels sessile, or very nearly so, mostly axillary.
Leaves oval to linear; hoods entire at the apex. 1. A. viriditlora.
Leaves narrowly linear; hoods 3 -toothed. 2. A. angustijolia.
Umbels, at least the lower, distinctly peduncled.
Plants glabrous, or nearly so; umbels usually several; leaves narrow.

Hoods obtuse, entire; column 1 mm . long; stem roughish, puberulent. 3. A. Floridana.

Hoods emarginate; column very short; stem glabrous. 4. A. auriculata. Plant hirsute; umbel solitary, terminal; leaves ovate to oblong.
5. A. lanuginosa.
I. Acerates viridifiòra (Raf.) Eaton. Green Milkweed. (I. F. f. 2924.) Puberulent or tomentulose, at least when young; stems simple, reclined or ascending, rather stiff, 3-9 dm. high. Leaves slightly rough, alternate or opposite, thick, $2.5-8 \mathrm{~cm}$. long, $1.5-5 \mathrm{~cm}$. wide, short-petioled, the margins usually undulate; umbels several, or rarely solitary, densely many-flowered; pedicels very slender, tomentose; flowers green; corolla-segments narrowly oblong, $4-6 \mathrm{~mm}$. long; column very short or none; hoods lanceolate-oblong, obtuse, minutely 2 -auricled at the base; mass of anthers longer than thick; anther-wings tapering below, semirhomboid above; follicles puberulent, $5-10 \mathrm{~cm}$. long. In dry, sandy or rocky soil, Mass. to Ont., the N. W. Terr., Fla. and Tex. June-Sept.

Acerates viridiflòra Ívesii Britton. Leaves lanceolate or oblong-lanceolate, 5-12 cm . long, $6-25 \mathrm{~mm}$. wide. Range of the type, often with it.

Acerates viridiflòra lineàris A. Gray. Leaves elongated-linear; stem low; umbels often solitary. Minn. and Manitoba to the N. W. Terr., La. and N. Mex.
2. Acerates angustifòlia (Nutt.) Dec. Narrow-leaved Milkweed. (I. F. f. 2925.) Stems mostly several together, erect. 3-6 dm. high, puberulent above, glabrate below. Leaves opposite, or some of the lower alternate, sessile, $5-13 \mathrm{~cm}$. long, glabrous, the revolute margins and the thick midvein rough beneath; umbels 10-15-flowered, usually numerous; pedicels puberulent! corolla-segments oblong, greenish; hoods white, not exceeding the anthers, the acute middle tooth merely a prolongation of the thickened crest-like midvein, shorter than the obtuse lateral ones; anther-wings notched at about the middle; follicles slender, erect, about 8 cm . long or more. On dry plains, Mo. to Neb., Colo. and Tex.
3. Acerates Floridàna (Lam.) Hitchc. Florida Milkweed. (I. F. f. 2926.) Stem slender, simple or little branched, 3-9 dm. high. Leaves linear or rarely linear-lanceolate, acute or acuminate, short-petioled, $5-20 \mathrm{~cm}$. long, $3-13 \mathrm{~cm}$. wide, commonly rough-ciliolate on the margins and midrib; umbels usually many-flowered; peduncles $6-20 \mathrm{~mm}$. long; pedicels slender, hirsute; corolla greenish-white, its segments narrowly oblong, about 4 mm . long; column distinct; hoods oblong, shorter than the anthers; anther-wings narrowed to the base; follicles densely puberulent, $10-13 \mathrm{~cm}$. long. In moist soil, Ohio to southerrı Ont., Minn., N. Car., Fla. and Tex. June-Sept.
4. Acerates auriculàta Engelm. Auricled Milkweed. (I. F. f. 2927.) Stem often glaucous, sinuous above, usually stout, 3-9 dm. high. Leaves narrowly linear, glabrous, short-petioled, $8-20 \mathrm{~cm}$. long, I-5 mm. wide, becoming leathery, the rough margins not revolute; umbels commonly several, densely manyflowered; peduncles 4-25 mm. long, pubescent; pedicels slender, pubescent; flowers greenish white, tinged with dull purple: corolla-segments oblong, 4-5 mm. long; column distinct; hoods yellow, often with a purplish keel, truncate at the apex, not exceeding the anthers, the involute margins spreading at the base into broad auricles; follicles $5-8 \mathrm{~cm}$. long, curved. In dry soil, Neb. and Colo. to Tex. and N. Mex. June-Sept.
5. Acerates lanuginòsa (Nutt.) Dec. Woolly Milkweed. (I. F. f. 2928.) Stems erect, slender, simple, 1.5-4 dm. high. Leaves obtuse at the apex, narrowed or rounded at the base, short-petioled, $3-10 \mathrm{~cm}$. long; umbel densely manyflowered; peduncle stout, densely hirsute, I. $2-4 \mathrm{~cm}$. long; pedicels slender, puberulent or hirsute; corolla greenish, its segments oblong, about 5 mm . long; column none: hoods purplish, oblong, obtuse, entire, with a flat fold or auricle on the infolded lower ventral margins, shorter than the anthers; anther-wings broadest below the middle. On prairies, Ill. to Minn. and Wyo. June-Aug.
4. GONÓLOBUS Michx.
(Ampelanus Raf.)
Perennial herbaceous vines, with petioled opposite cordate thin leaves, and small whitish flowers in axillary cymes. Calyx 5-parted, minutely glandular
within, the segments lanceolate. Corolla campanulate, deeply 5 -cleft, the lobes slightly contorted, nearly erect. Crown nearly sessile, of 5 membranous truncate lobes, each appendaged by a simple or 2 -cleft awn. Stamens inserted at the base of the corolla, the filaments connate into a short tube; anthers terminated by an inflexed membrane; pollen-masses solitary in each sac, ellipsoid, pendulous. Stigma conic, slightly 2-lobed. Follicles thick, angled, acuminate. [Greek, angle-pod.] Two species, natives of America.
I. Gonolobus laevis Michx. Sand Vine. (I. F. f. 2929.) Stem sparingly puberulent, at least above, high-climbing, slender. Leaves ovate, gradually acuminate, palmately veined, glabrous or very nearly so, entire, $8-18 \mathrm{~cm}$. long; cymes usually numerous, rather densely flowered; peduncles stout, $6 \mathrm{~mm} .-5 \mathrm{~cm}$. long; flowers $4-6 \mathrm{~mm}$. long; corolla-segments lanceolate, acute, about twice as long as those of the calyx and slightly exceeding the 2-cleft awns of the corona-lobes; follicles erect on the ascending fruiting pedicels, $10-15 \mathrm{~cm}$. long, glabrous when mature. Along river-banks and in thickets, Penn. to Ill., Kans., Fla. and Tex. June-Aug. [Ampelanus albidus (Nutt.) Britton.]

## 5. CYNÁNCHUM L.

Perennial vines (some species erect herbs), with opposite or rarely verticillate or alternate leaves, and small yellowish green or purplish flowers in axillary cymes. Calyx 5-parted, minutely glandular within. Corolla rotate, deeply 5 -cleft, the segments spreading, somewhat twisted. Crown cup-like, entire, 5 -lobed or 5 -parted, the lobes not appendaged. Stamens attached to the base of the corolla, their filaments connate into a tube; anthers appendaged by an inflexed membrane. Pollenmasses solitary in each sac, pendulous. Stigma flat or conic. Follicles acuminate, glabrous. [Greek, dog-strangling, alluding to its poisonous qualities.] About ioo species, natives of warm and temperate regions. Besides the following, 2 native species occur in the southeastern U. S.
I. Cynanchum nigrum (L.) Pers. Black Swallow-wort. (I. F. f. 2930.) Twining, or at first erect, stem slightly puberulent, slender, $6-15 \mathrm{dm}$. high. Leaves ovate or ovate-lanceolate, entire, thin, acuminate at the apex, rounded at the base, pinnately veined, petioled, $5-\mathbf{I} 3 \mathrm{~cm}$. long, glabrous, or puberulent beneath; petioles $4-25 \mathrm{~mm}$. long; flowers purple, 5 mm . broad; crown fleshy, 5 -lobed; follicles on nearly straight fruiting pedicels, about 4 mm . long, glabrous. Waste places, escaped from gardens, Mass. to Penn. and Ohio. Introduced from Europe. June-Sept.

## 6. VINCETÓXICUM Walt.

Perennial vines, with opposite usually cordate leaves, and rather large flowers in axillary umbel-like cymes or fascicles. Calyx 5 -parted or deeply 5 -cleft, mostly 5 -glandular within. Corolla rotate, very deeply 5 -parted, the tube very short, the segments convolute in the bud. Corona (crown) annular or cup-shaped, adnate to the corolla. Stamens inserted on the base of the corolla, the filaments connate into a tube; anthers not appendaged, merely tipped, borne along or just under the margin of the flat-topped stigma, the sacs more or less transversely dehiscent. Pollenmasses solitary in each sac, horizontal or nearly so. Follicles thick. acuminate, smooth, angled or tuberculate. [Greek, subduing poison.] About 75 species, natives of America. Besides the following, some 10 others occur in the southern U.S.
Crown annular, ro-crenate; folicles angled, not warty.
Corolla about twice as long as the calyx. I. V. suberosum.
Corolla 3-4 times as long as the calyx.
2. V. gonocarpos.

Crown cup-shaped, about as high as the anthers; follicles warty.
Flowers purple to dull yellow.
Corolla-segments oblong, 6-9 mm. long.
Corolla-segments linear or linear-oblong,
Corolla-segments linear or linear-oblong, $11-15 \mathrm{~mm}$. long.
Crown merely crenulate.
4. V. obliquum. Crown toothed or lobed.

Crown 5 -lobed, with a subulate a-cleft tooth in each sinus.
5. V. Carolinen :

Crown ro-toothed, the alternate teeth thinner and longer.
Flowers white.
6. I. Shortio.
7. V. Baldzinianam.
I. Vincetoxicum suberòsum (L.) Britton. Coast Vincetoxicum. (I. F. f. 2931). Stem slender, twining. Leaves thin, $5^{-13} \mathrm{~cm}$. long, ovate or ovateoval, acute or abruptly acuminate, the basal sinus shallow, open; petioles $1-5 \mathrm{~cm}$. long; cymes commonly few-flowered; peduncles $6-25 \mathrm{~mm}$. long; pedicels $\mathbf{1 3 - 2 5}$ mm . long, fleshy, nearly glabrous; corolla brown-purple, broadly conic in the bud, its segments lanceolate or ovate-lanceolate, acute, pubescent or granulose within, 6-9 mm. long, about twice as long as the calyx; follicles glabrous, 3-5-angled, when young fleshy, when mature dry and spongy, $10-15 \mathrm{~cm}$. long, 2.5 cm . in diameter or more. In thickets, Va. to Fla. May-July.
2. Vincetoxicum gonocàrpos Walt. Large-leaved Angle-pod. (I. F.f. 2932.) Stems slender, climbing high. Leaves broadly ovate, thin, I-2 dm. long, $5-15 \mathrm{~cm}$. wide, acuminate, the basal sinus narrow or the rounded auricles overlapping; petioles $3-10 \mathrm{~cm}$. long; cymes few-flowered; peduncles $3-8 \mathrm{~cm}$. long; pedicels rather stout, glabrous or nearly so; corolla conic in the bud, its segments lanceolate, 3-4 times as long as the calyx; follicles glabrous, similar to those of the preceding species but usually shorter. Along rivers and in moist thickets, Va. to S. Car., Ind., Mo. and Tex. May-July.
3. Vincetoxicum hirsùtum (Michx.) Britton. Hairy Vincetoxicum. (I. F. f. 2933.) Stem downy, slender. Leaves ovate, acuminate, downy, $5-10 \mathrm{~cm}$. long, $3-7 \mathrm{~cm}$. wide, the basal sinus narrow, or the lobes sometimes overlapping; petioles slender, pubescent; peduncles usually about equalling the petioles, sometimes longer; umbels few-several-flowered ; corolla brown-purple to greenish yellow, ovoid in the bud, its segments oblong, very obtuse, 6-9 mm. long, minutely puberulent without, about 4 times as long as the densely pubescent calyx; crown fleshy, the margin io-crenate; follicles lanceolate, $8-13 \mathrm{~cm}$. long, muricate, puberulent; seeds entire. In thickets, Md. to Fla. and Tenn. July-Aug.
4. Vincetoxicum obliquum (Jacq.) Britton. Large-flowered Vincetoxicum. (I. F. f. 2934.) Stem puberulent, or hirsute, slender. Leaves pubescent, broadly ovate, acuminate at the apex, $5-20 \mathrm{~cm}$. long, $4^{-15} \mathrm{~cm}$. wide; basal sinus open or closed; petioles rather stout, pubescent, $2.5-10 \mathrm{~cm}$. long; umbels slen-der-peduncled, few-flowered; pedicels very slender, $2.5-5 \mathrm{~cm}$. long; corolla narrowly conic in the bud, red-purple within, greenish and minutely pubescent without, its segments elongated-linear, obtuse; crown fleshy, its margin io-crenulate, the intermediate crenulations sometimes 2 -dentate; follicles ovoid-lanceolate, 5-8 cm . long, muricate. In thickets, Penn. to Ohio, Va. and Ky. July-Aug.
5. Vincetoxicum Carolinénse (Jacq.) Britton. Carolina Vincetoxicum. (I. F. f. 2935.) Stem hirsute. Leaves broadly ovate, acute or shortacuminate, $8-18 \mathrm{~cm}$. long, $5-14 \mathrm{~cm}$. wide, pubescent, at least beneath; basal sinus narrow or closed; petioles hirsute; peduncles $5-10 \mathrm{~cm}$. long; pedicels very slender, 2.5 cm . long or more; corolla brown-purple, oblong-conic in the bud, puberulent without, its segments linear-oblong or linear-lanceolate, obtusish, 5-6 times longer than the hirsute calyx; crown scarcely fleshy, 5 -lobed, with a subulate longer 2 -cleft erect tooth in each sinus; follicles muricate. In thickets, Va. to Mo., S. Car. and La. May-July.
6. Vincetoxicum Shórtii (A. Gray) Britton. Short's Vincetoxicum. (I. F. f. 2936.) Stem pubescent, or hirsute with spreading hairs. Leaves downy, broadly ovate, acute or short-acuminate at the apex, when old with a narrow or closed basal sinus, IO-I2 cm . long, $4-14 \mathrm{~cm}$. wide; petioles stout, pubescent: peduncles usually longer than the petioles; cymes several-flowered; pedicels 2.5 cm . long or more; corolla oblong-conic in the bud, dark crimson-purple, its lobes linear, II-15 mm. long; calyx hirsute; crown cup-shaped, fleshy. as high as the anthers, its margin about ro-toothed, the alternate teeth thinner and longer, emarginate or 2 -parted, the others broader, thicker, with an obscure internal crest or ridge below the summit; follicles warty. In thickets, Penn. to Ky. and Ga. Flowers with the odor of the Strawberry-shrub. June-Aug.
7. Vincetoxicum Baldwiniànum (Sweet) Britton. Baldwin's VincetoxiCum. (I. F. f. 2937.) Stem pubescent or hirsute. Leaves downy, broadly ovate, acute, or short-acuminate at the apex, $8-15 \mathrm{~cm}$. long, or more; petioles hirsute, $2.5-5 \mathrm{~cm}$. long; peduncles usually longer than the pedicels; cymes several-manyflowered; corolla white, or cream-color, the lobes thin, oblong, or becoming spatulate, 9-II mm. long; crown thin, the 5 broader lobes quadrate, emarginate, or
obscurely toothed; in their sinuses a pair of very slender linear-subulate teeth of more than double their length, much surpassing the stigma. Mo. and Ark. to Ga. May-June.

## Order 5. POLEMONIALES.

Mostly herbs; rarely shrubs or trees. Corolla almost always gamopetalous, regular or irregular. Stamens adnate to the corolla-tube usually to the middle or beyond, as many as the corolla-lobes, or fewer and alternate with them. Ovary i, superior, compound (in Boraginaceae and Labiatæ deeply 4 -lobed around the style).
a. Corolla regular (irregular in Echium of the Boraginaceae).

Ovary not 4 -lobed, the carpels not separating as distinct nutlets at maturity.
Ovary 2-celled, rarely 3-4-celled; style I, entire, 2 -cleft, or 2 -parted; mostly twining vines.
Leaves normal. Fam. r. Convolvulaceae. White or yellowish parasitic vines, the leaves reduced to minute scales.

Fam. 2. Cuscutaceae.
Ovary 3-celled; stigmas 3, linear; herbs, not twining. Fam. 3. Polemoniaceae. Ovary 1-celled ( 2 -celled in Nama); style 1, 2-lobed, or 2-parted; herbs not twining.

Fam. 4. Hydrophyllaceae.
Ovary deeply 4 -lobed around the style, or not lobed (Heliotropium) ; carpels separating as nutlets. Fam. 5. Boraginaceae.
b. Corolla irregular, more or less 2 -lipped (regular in Solanaceae, in Mentha and Lycopus of the Labiatae, and nearly or quite so in Verbena and Callicarpa of the Verbenaceae).
I. Carpels $\mathbf{1 - 2}$-seeded.

Ovary not lobed, 2-4-celled, the style apical; carpels separating into i-seeded nutlets. Fam. 6. Verbenaceae.
Ovary 4 -lobed around the style, the lobes ripening into 1 -seeded nutlets.
Fam. 7. Labiatae.
2. Carpels several-many-seeded (2-seeded in some Acanthaceae).
$\ddagger$ Fruit a berry, or more commonly a capsule which is 1 -2-celled, 2 -valved, circumscissile, or irregularly burstíng, not elastically dehiscent.
Placentæ axile.
Ovary 2-celled, or rarely 3-5-celled.
Flowers regular; fertile stamens 5 (4 in Petunia); fruit a berry or capsule.
Fam. 8. Solanaceae.
Flowers more or less irregular; fertile stamens 2 or 4 ( 5 in Verbascum); fruit a capsule.

Fam. 9. Scrophulariaceae.
Ovary 1-celled; marsh or aquatic herbs with flowers on scapes.
Fam. Io. Lentibulariaceae.
Placentæ parietal.
Herbs, parasitic on the roots of other plants, the leaves reduced to scales, not green; ovary 1 -celled.

Fam. II. Orobanchaceae.
Trees, vines, shrubs, or herbs, the foliage normal.
Trees, shrubs, or woody vines; capsule 2 -celled; seeds winged in our genera.
Fam, 12. Bignoniaceae.
Opposite-leaved herbs; capsule r-celled in our genus; seeds wingless.
Fam. 13. Martyniaceae.
$\ddagger \ddagger$ Capsule completely 2 -celled, elastically loculicidally dehiscent; opposite-leaved herbs; placentæ axile. Fam. I4. Acanthaceae
3. Ovary and fruit $\mathbf{I}$-celled with r erect orthotropous ovule and seed; herb with spicate flowers and reflexed fruits. Fam. 15. Phrymaceae.

## Family r. CONVOLVULACEAE Vent.

Morning-glory Family.
Herbs or vines, some tropical species shrubs or trees, with alternate estipulate leaves, and regular perfect axillary cymose or solitary flowers. Calyx inferior, 5-parted or 5-divided, usually persistent, the segments or sepals imbricated. Corolla gamopetalous, the limb 5-angled, 5-lobed or
entire. Stamens 5, inserted low down on the tube of the corolla and alternate with its lobes, all anther-bearing, the filaments filiform, or dilated at the base; anthers 2 -celled, the sacs longitudinally dehiscent. Disk annular or none. Ovary superior, sessile, 2-3-celled, with 2 ovules in each cavity, or falsely 4 -6-celled with a single ovule in each cavity, entire or 2-4-divided; styles 1-3, terminal, or arising from between the ovary-divisions; ovules anatropous. Fruit a $2-4$-valved capsule or of 2-4 distinct carpels, in our species. Seeds erect, the testa villous, pubescent or glabrous; embryo plaited or crumpled; cotyledons foliaceous; endosperm fleshy or cartilaginous, usually scanty. About 40 genera and 900 species, of wide distribution.
Ovary 2 -divided, the carpels 2-ovuled; creeping herbs. Ovary entire, 2-4-celled; style simple, cleft or divided.

Style 2-cleft or 2-divided.
Style 2-cleft or 2 -parted.
Style 2-divided to the ovary, each division 2 -cleft.
Style entire up to the stigma.
Stigma or stigmas capitate or globose.
Corolla salverform ; stamens and style exserted.
Corolla funnelform or campanulate; stamens and style included.
Stigmas 2, filiform to oblong.
5. Ipomoea.

## I. DICHÓNDRA Forst.

Prostrate or creeping slender herbs, with nearly orbicular cordate or reniform petioled entire leaves, and small solitary axillary peduncled flowers. Sepals nearly equal. Corolla open-campanulate, deeply 5 -lobed. Stamens shorter than the corolla; filaments filiform. Ovary villous, deeply 2 -parted, each lobe 2 celled; styles 2, simple, arising from the bases of the ovary-lobes; stigmas capitate. Fruit of 2 pubescent 2 -valved or indehiscent 1-2-seeded capsules. [Greek, two-grained, referring to the capsules.] About 5 species, natives of warm and tropical regions.
I. Dichondra Carolinénsis Michx. Carolina Dichondra. (I. F. f. 2938, as D. evolvulacea.) Somewhat pubescent, or glabrous; stems almost filiform, rooting at the nodes, $1.5-6 \mathrm{dm}$. long. Leaves orbicular to reniform, deeply cordate, $6-30 \mathrm{~mm}$. in diameter, palmately veined; petiole often much longer than the blade; flowers $2-4 \mathrm{~mm}$. broad; peduncles filiform; sepals obtuse, spatulate or obovate, villous; corolla yellow to white, shorter than the sepals, its lobes ovate to oblong; capsule 3 mm . high or less. In moist or wet places, Va. to Tex. and Mex., near the coast. Widely distributed in Central and S. Am.

## 2. BREWERIA R. Br.

Herbs, mostly perennial and procumbent, with entire short-petioled or sessile leaves, and 1 - 5 -flowered axillary peduncles. Corolla campanulate or funnelformcampanulate: limb plaited, 5 -angled or slightly 5 -lobed. Stamens included. Ovary 2-celled; style 2 -cleft or 2-parted; stigmas capitate. Capsule, 2-celled, 24 -valved. Seeds I-4. [Named for Samuel Brewer, a correspondent of Dillen.] About 30 species, widely distributed in warm-temperate and tropical regions.
Corolla white; filaments pubescent; plant pubescent.
I. B. humistrata.

Corolla purple; filaments glabrous; plant silky-tomentose.
2. B. aquatica.

Sepals obtuse; leaves narrowly linear.
3. B. Pickeringii.
I. Breweria humistràta (Walt.) A. Gray. Southern Breweria. (I. F.f. 2939.) Pubescent or puberulent; stems slender. 3-6 dm. long, simple, or with a few long branches. Leaves elliptic. oblong-elliptic, or ovate-oblong, obtuse and mucronulate or some of them emarginate. $1-2.5 \mathrm{~cm}$. wide, $2-5 \mathrm{~cm}$. long; peduncles slender, longer than the leaves. I-7-flowered. minutely bracted at the summit; sepals oblong, $4-6 \mathrm{~mm}$. long; corolla white, $12-16 \mathrm{~mm}$. long; filaments pubescent; capsule ovoid, acute, glabrous, about as long as the calyx. In dry pine barrens, Va. to Fla. and La. May-Aug.
2. Breweria aquática (Walt.) A. Gray. Water Breweria. (I. F. f. 2940.) Finely and densely silky-tomentose, the branches long and slender. Leaves oblong, elliptic, or oblong-lanceolate, obtuse at both ends, mucronate or emarginate, sometimes subcordate, $1-4 \mathrm{~cm}$. long, $4-16 \mathrm{~mm}$. wide; peduncles $\mathrm{I}-3$-flowered, longer than the leaves, minutely bracted at the summit; sepals tomentose, oblong; about 4 mm . long; corolla $\mathbf{I} \mathbf{- I . 5} \mathbf{~ c m}$. long: style 2-parted nearly to the base. In wet soil, Mo. to Tex., N. Car. and Fla. May-Aug.
3. Breweria Pickeríngii (M. A. Curtis) A. Gray. Pickering's Breweria. (I. F. f. 2941.) Stem pubescent or puberulent, very slender, 3-6 dm. long. Leaves puberulent or glabrous, narrowly linear, narrowed at the base, $2.5-6 \mathrm{~cm}$. long, $1-4 \mathrm{~mm}$. wide; peduncles about as long as the leaves, with I or 2 linear bracts at the summit; sepals pubescent or hirsute, ovate to oval, about 4 mm . long; corolla white, about 2.5 cm . long; style 2 -cleft; capsule ovoid, acute, pubescent. In dry pine barrens, N. J. to N. Car.; Ill. to La. and Tex. June-Aug.

## 3. EVÓLVULUS L.

Mostly silky-pubescent or pilose herbs, with small leaves, and axillary smal flowers. Sepals nearly equal. Corolla funnelform, campanulate or rotate, the limb plaited, 5 -angled or 5 -lobed. Filaments filiform; anthers ovate or oblong. Ovary entire, 2 -celled; style 2 -divided to the base, or near it, each division deeply 2-cleft; stigmas linear-filiform. Capsule 2-4-valved, I-4-seeded. Seeds glabrous. [Latin, unrolling.] About 85 species, of warm and tropical regions. Besides the following, some 7 others occur in the southern U.S.
I. Evolvulus pilòsus Nutt. Evolvulus. (I. F. f. 2942.) Perennial, silkypubescent or villous; stems $0.7-2.4 \mathrm{dm}$. high, very leafy. Leaves sessile, oblong, lanceolate or spatulate, $6-18 \mathrm{~mm}$. long; flowers solitary in the axils; peduncles 2 bracted at the base, recurved in fruit, $2-4 \mathrm{~mm}$. long; sepals acute or acuminate; corolla funnelform-campanulate, purple or blue, $6 \mathbf{- 1 2} \mathrm{~mm}$. broad; capsule $3-4 \mathrm{~mm}$. in diameter. On dry plains, Mo. to Kans., Mex. and Ariz. May-July.

## 4. QUÁMOCLIT Moench.

Twining herbaceous vines, with petioled leaves, and peduncled axillary flowers. Sepals 5, herbaceous, equal, acuminate, mucronate or appendaged. Corolla salverform (scarlet in the following species), the tube longer than the spreading 5 -lobed limb. Stamens and style exserted; stigma capitate; ovary 2 -celled or falsely 4 -celled, 4 -ovuled. Fruit usually 4 -celled and 4 -seeded. [Greek, dwarf kidneybean.] About Io species, of warm and tropical regions; the following in N. Am.

Leaves pinnately parted into very narrow segments.
Leaves cordate, acuminate, entire or angulate-lobed.

1. Q. Quamoclit.
2. Q. coccinea.
I. Quamoclit Quámoclit (L.) Britton. Cypress Vine. Indian Pink. (I. F. f. 2943.) Annual, glabrous, Leaves ovate in outline, 5-18 cm. long, pinnately parted into segments less than 2 mm . wide; peduncles slender, 1 - 6 -flowered: pedicels thickening in fruit; sepals obtuse, usually mucronulate, $4-6 \mathrm{~mm}$. long; corolla $2 \cdot 5-4 \mathrm{~cm}$. long, the tube expanded above, the limb nearly flat, the lobes ovate, acutish; ovary 4 -celled; capsule ovoid, $\cdot 4$-valved, about 1 cm . high, twice as long as the sepals. In waste and cultivated ground, Va. to Fla., Kans, and Tex. Sparingly escaped from gardens farther north. Nat. from tropical Am. July-Oct.
3. Quamoclit coccinea (L.) Moench. Small Red Morning-glory. (I. F. f. 2944.) Annual. Leaves ovate to orbicular, long-acuminate, $5-19 \mathrm{~cm}$. long. entire or angulate-lobed, slender-petioledp; peduncles few-several-flowered; sepals obtuse, about 4 mm . long, subulate-appendaged; corolla $2-4 \mathrm{~cm}$. long, the limb obscurely 5 -lobed; ovary 4 -celled; capsule globose, 4 -valved, $6-8 \mathrm{~mm}$. in diameter. Along river-banks and in waste places, Penn. to Fla., Ohio, Kans., Tex. and Ariz. Nat. from tropical America, or native in the Southwest. A hybrid with the preceding is sometimes cultivated. July-Oct.

## 5. IPOMOEA L.

Twining trailing or rarely erect herbs, with large showy axillary flowers. Corolla funnelform or campanulate, the limb entire. 5 -ingled or 5 -lubed, the tube
plaited. Stamens included. Ovary entire, 2-4-celled, 4-6 ovuled; style filiform, included; stigmas I or 2, capitate or globose. Capsule usually septifragally 2-4valved, $2-4$-seeded. [Greek, worm-like.] About 350 species, of wide distribution. Besides the following, some 25 others occur in southern and western N. Am.
Ovary 2 -celled (rarely 4 -ceiled); stigma entire or 2 -lobed.
Leaves cordate; stems trailing or twining.

$$
\begin{array}{cl}
\text { Perennial from an enormous root; corolla } 5-8 \mathrm{~cm} \text {. long. } & \text { I. I. pandurata. } \\
\text { Annual; roots fibrous; corolla 8-20 mm. long, white. } & \text { 2. I. lacunosa. } \\
\text { Annual; corolla 2.5-4 cm. long, pink or purple. } & \text { 3. I. Carolina. } \\
\text { Leaves linear; stems ascending or erect; perennial. } & \text { 4. I. leptophylla. } \\
\text { Ovary 3-celled; ; stigmas 3; leaves cordate ; annuals. } & \text { 5. } \\
\text { Leaves entire; corolla 5-7 cm. long. } & \text { purpurea. } \\
\text { Leaves deeply 3-lobed, corolla } 2.5-4 \mathrm{~cm} \text {. long. } & \text { 6. I. hederacea. }
\end{array}
$$

I. Ipomoea panduràta (L.) Meyer. Wild Potato Vine. (I. F. f. 2945.) Glabrous or puberulent; stems $0.5-4 \mathrm{~m}$. long. Leaves acuminate, $5-15 \mathrm{~cm}$. long, slender-petioled, entire, sometimes contracted in the middle, or some of the later ones rarely dentate or 3 -lobed; peduncles 1 - 5 -flowered, much elongated in fruit; sepals oblong, $12-16 \mathrm{~mm}$. long, glabrous; corolla funnelform, white, or with pinkish purple stripes in the throat, the limb 5 -lobed; capsule ovoid, 2 -valved, $2-4$-seeded, the seeds woolly on the margins and pubescent on the sides. In dry soil, Ont. to Conn., Fla., Mich., Kans. and Tex. May-Sept.
2. Ipomoea lacunòsa L. Small-flowered White Morning-Glory. (I. F. f. 2946.) Pubescent or hirsute, rarely glabrous; stem $0.5-3.5 \mathrm{~m}$. long. Leaves slender-petioled, acute or acuminate, entire, angled or 3-lobed, $5-10 \mathrm{~cm}$. long, the lobes acute; peduncles 1-3-flowered, shorter than the leaves; sepals oblong or lanceolate, acute or acuminate, pubescent or ciliate, about I cm. long; corolla funnelform, white, or the limb purple; stigma capitate; capsule globose, 2 -valved. In moist soil, Penn. to S. Car., Ill., Kans. and Tex. July-Sept.
3. Ipomoea Carolina (L.) Pursh. Small-flowered Pink Morningglory. (I. F. f. 2947.) Similar in habit to the preceding species, but the leaves usually more lobed; peduncles often longer than the leaves, 1 - 3 -flowered; sepals lanceolate or oblong-lanceolate, acuminate, pubescent or ciliate; capsule glabrous or pubescent. Kans. to Tex., east to S. Car. and Fla.
4. Ipomoea leptophylla Torr. Bush Morning-glory. (I. F. f. 2948.) Perennial from an enormous root, glabrous; stems rather stout, 6-12 dm. long, much branched. Leaves narrowly linear, entire, acute, $5-8 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide; petioles very short; peduncles stout, nearly erect, usually shorter than the leaves, I-4-flowered; sepals broadly ovate, obtuse, $6-8 \mathrm{~mm}$. long, or the outer shorter; corolla funnelform, purple or pink, about 8 cm . long, the limb scarcely lobed; capsule ovoid, acute, $1.5-2.5 \mathrm{~cm}$. long, 2 -celled; seeds pubescent. In dry soil, S. Dak. to Wyo., Tex. and N. Mex. May-July.
5. Ipomoea purpùrea (L.) Roth. Morning-Glory. (I. F. f. 2949.) Stem retrorsely hairy, $\mathrm{I}-3.5 \mathrm{~m}$. long. Leaves acute or acuminate, $5-10 \mathrm{~cm}$. wide, slen-der-petioled; peduncles I- 5 -flowered; sepals lanceolate or oblong, acute, pubescent, or hirsute near the base, $12-16 \mathrm{~mm}$. long; corolla funnelform, blue, purple, pink, variegated or white; ovary 3 -celled (rarely 2 -celled); stigmas 3 (rarely 2 ); capsule depressed-globose, about $\mathbf{I ~ c m}$. in diameter, shorter thian the sepals. In waste places, commonly escaped from gardens, N. S. to Fla., Ont., Neb. and Tex. Adventive or nat. from trop. Am. July-Oct.
6. Ipomoea hederàcea Jacq. Iyy-leaved Morning-Glory. (I. F. f. 2950.) Stem 6-15 dm. long, slender, retrorsely hairy. Leaves ovate-orbicular in outline, long-petioled, deeply 3 -lobed, $5-\mathrm{I} 3 \mathrm{~cm}$. long, the lobes ovate, acuminate; peduncles 1 - 3 -flowered, much shorter than the petioles; flowers opening in early morning, soon closing; sepals lanceolate with long linear often recurved tips. densely hirsute below, sparingly so above, $\mathbf{1 . 5 - 2 . 5} \mathrm{cm}$. long; corolla funnelform, the tube usually nearly white, the limb light blue or purple; capsule depressedglobose, 3 -valved, about as long as the lanceolate portion of the sepals. In fields and waste places, L. I. to Fla., Penn., S. Dak., Neb. and Mex. Nat. or adventive from trop. Am. July-Oct.

## 6. CONVÓLVULUS L.

Herbs (the following species perennials with slender roots or rootstocks) with trailing, twining or erect stems. Leaves mostly cordate or sagittate and petioled. Flowers axillary, large. Sepals nearly equal or the outer larger, the calyx bractless or with a pair of bracts at its base. Corolla funnelform or campanulate, the limb plaited, 5 -angled, 5 -lobed, or entire. Stamens inserted on the tube of the corolla, included. Ovary 1-2-celled, 4 -ovuled; style filiform; stigmas 2, filiform, oblong, or ovoid. Capsule globose, 1-4-celled, 2-4-valved. Seeds glabrous. [Latin, to roll together, or entwine.] About 175 species, of wide distribution. Besides the following, some 25 others occur in the southern and western U. S.

Calyx with 2 large bracts at the base, which enclose it. (Genus Volvulus Medic.) Stems trailing or climbing.

Leaves hastate, the auricles often dentate. I. C. sepium.
Leaves sagittate, the auricles rounded, entire.
Stem erect or ascending ; flowers white; bracts not cordate. Calyx not bracted; peduncle bracted at the summit. Glabrous or nearly so; leaves entire, auriculate.
2. C. repens.
3. C. spithamaeus.

Canescent; leaves with 2-4 basal lobes.
4. C. arvensis.
5. C. incanus.

1. Convolvulus sèpium L. Hedge or Great Bindweed. Rutland Beauty. (I. F. f. 295 1.) Stems 1-3.5 m. long. Leaves slender-petioled, triangular in outline, hastate, $5-13 \mathrm{~cm}$. long, acute or acuminate, the basal lobes divergent, usually acute, angulate-dentate or entire; peduncles I-flowered, longer than the leaves; flowers pink with white stripes or white throughout, about 5 cm . long; bracts at the base of the flower large, ovate, cordate; stigmas oblong. In fields and thickets, usually in moist soil, N. S. to N. Car., Mont., Utah and Kans. Also in Europe and Asia. June-Aug. The pink-flowered American plant (C. sepium Americanus Sims ; C. Americanus Greene) is, perhaps, specifically distinct from the European.

Convolvulus Japónicus Thunb., a species with narrow hastate leaves and smaller pink flowers, cultivated in a double-flowered form, has in this form escaped from cultivation from N. H. to D. C. and Mo.
2. Convolvulus rèpens L. Trailing Bindweed. (I. F. f. 2952.) Pubescent or tomentose; stems $3-9 \mathrm{dm}$. long. Leaves ovate or oblong, $2-5 \mathrm{~cm}$. long, sagittate or cordate at the base, entire, the basal lobes rounded, scarcely or not at all divergent; peduncles 1 -flowered, equalling or longer than the leaves; flowers white (sometimes pink ?) about 5 cm . long; calyx enclosed by 2 ovate slightly cordate bracts; stigmas oblong. In fields, Va. to Fla., Dak. and Tex. May-Aug.
3. Convolvulus spithamaèus L. Upright Bindweed. (I. F. f. 2953.) Pubescent or glabrate; stem erect or ascending, or the summit sometimes feebly twining, 1.5-3 dm. high. Leaves oval, short-petioled or the uppermost sessile, usually obtuse at both ends, $2-6 \mathrm{~cm}$. long; peduncles r-flowered, longer than the leaves; flowers white, nearly 5 cm . long; calyx enclosed by 2 large oval acutish bracts which are narrowed at both ends; stigmas oblong, thick. In dry sandy or rocky fields or on banks, N. S. to the N. W. Terr., Fla, and Ky. May-Aug.
4. Convolvulus arvénsis L. Small Bindweed. (I. F. f. 2954.) Glabrous, or nearly so; stems slender, 3-8 dm. long. Leaves slender-petioled, ovate or oblong, entire, sagittate or somewhat hastate, $2-5 \mathrm{~cm}$. long, the basal lobes spreading, acute; peduncles I-4 flowered, shorter than the leaves, I-3 bracted at the summit; sepals oblong, obtuse, 3 mm . long; corolla pink or nearly white, $\mathbf{1 . 5 - 2 . 5} \mathrm{cm}$. broad; stigmas linear. In fields and waste places, N. S. to Ont., N. J., Neb. and Kans. Nat. from Europe. May-Sept.
5. Convolvulus incanus Vahl. Hoary Bindweed. (I. F. f. 2055.) Finely and densely canescent, 3-9 dm. long. Leaves short-petioled, lanceolate, ovate to linear in outline, $2-5 \mathrm{~cm}$. long, usually with 2-4 divergent lohes at the base, or the lower pair of lobes reflexed, obtuse and mucromulate; peduncles $\mathbf{I}$-2-flowered, as long as or longer than the leaves: sepals oblong, about 6 mm . long; corolla white to rose-color; stigmas narrowly linear; capsule globose. In dry soil, Neb., Kans. and Ark, to Ariz., Mex. and Tex. April-Aug.

## Family 2. CUSCUTACEAE Dumort. <br> Dodder Family.

White, red or yellow slender parasites, dextrorsely twining, the leaves reduced to minute alternate scales. Calyx inferior, 5-lobed or 5 -parted (rarely 4 -lobed or 4 -parted), or of 5 distinct sepals. Corolla 5 -lobed (rarely 4 -lobed), the tube bearing as many fimbriate or crenulate scales as there are lobes and alternate with them, or these sometimes obsolete. Stamens as many as the corolla-lobes, inserted in the throat or sinuses above the scales; anthers short, ovate or oval, obtuse, 2 -celled, the sacs longitudinally dehiscent. Ovary, 2 -celled; ovules 2 in each cavity; styles 2, terminal, separate, or rarely united below; stigmas linear or capitate. Capsule globose or ovoid, circumscissile, irregularly bursting or indehiscent, I-4 seeded. Seeds glabrous; embryo linear, terete, curved or spiral, its apex bearing $1-4$ minute alternate scales, endosperm fleshy; cotyledons none.

## 1. CÚSCUTA L.

Characters of the family. The filiform twining stems are parasitic on herbs and shrubs by numerous minute suckers. The seeds germinate in the soil and the plantlet attaches itself to its host, its root and lower portion soon perishing. The subsequent nutrition of the parasite is apparently wholly through its suckers. Indications of a small amount of green coloring matter, possibly chlorophyll, have been observed in some species. [Name from the Arabic.] About 100 species, of wide distribution. Besides the following, some $\mathbf{I}_{5}$ others occur in the southern and western parts of N. Am.

* Corolla-scales crenulate ; stigmas slender ; capsule circumscissile. Scales crenulate above, not incurved.

1. C. Epilinum. Scales crenulate all around, strongly incurved.
2. C. Epithymum.

*     * Corolla-scales fringed ; stigmas capitate ; capsule indehiscent.

Sepals united below into a gamosepalous calyx.
Flowers very nearly sessile ; corolla persistent at the base of the capsule.
Corolla-scales ovate, fringed all around; calyx-lobes obtuse. 3. C. arvensis. Corolla-scales abortive, or of a few processes; calyx-lobes acutish.
4. C. Polygonorum.

Flowers distinctly pedicelled; corolla enclosing or capping the capsule, or at length deciduous.
Tips of the corolla-lobes incurved or inflexed. Scales ovate, fringed all around; capsule enclosed by the corolla.
5. C. indecora.

Scales abortive, or of a few slender processes; corolla capping the capsule.
6. C. Coryli.

Corolla-lobes spreading or recurved.
Scales small, irregularly fringed; capsule depressed-globose.
7. C. Cephalanthi.

Scales long, fringed mainly above; capsule pointed. Corolla 3 mm . long; capsule globose, short-pointed or pointless.
8. C. Gronovii. Flowers 4-6 mm. long; capsule oval, long-pointed.
9. C. rostrata.

Sepals separate, subtended by similar bracts.
Flowers cymose, pedicelled; scales short; bracts entire.
10. C. cuspidata.

Flowers closely sessile in dense clusters; bracts serrulate.
Bracts few, broad, appressed; styles as long as the ovary. ir. C. compacta.
Bracts numerous, narrow, their tips recurved; styles longer than the ovary.
12. C. paradoxa.
I. Cuscuta Epílinum Weihe. Flax Dodder. (I. F. f. 2956.) Stems yellow or red; flowers sessile in dense clusters, yellowish white, about 3 mm . long. Calyx hemispheric, 5 -lobed, the lobes ovate, acute; corolla short, becoming urceolate, 5 -lobed, the lobes ovate, acutish, spreading, its scales short, erect, less
than one-half the length of the tube, 2 -cleft or emarginate, the crenulations not extending to the base; stigmas linear-filiform; capsule circumscissile, the withering corolla borne on its summit. On flax, N. S. to N. J. and Penn. Introduced from Europe. July-Aug.
2. Cuscuta Epíthymum Murr. Thyme Dodder. Clover Dodder. (I. F. f. 2957.) Stems filiform, red; flowers sessile in small dense clusters, pinkish, about 2 mm . long. Calyx 4-5-lobed, more than one-half the length of the cylindric corolla-tube, the lobes acute; corolla 4-5-lobed, the lobes erect, about one-half as long as the tube, acute, its scales strongly incurved, crenulate nearly or quite to the base; stigmas filiform; capsule circumscissile, capped by the withering corolla. Usually on clover, Me. and Ont. to Conn., N. Y., Pa. and S. Dak. Introduced from Europe. July-Sept.
3. Cuscuta arvénsis Beyrich. Field Dodder. (I. F. f. 2958.) Plant pale yellow; stems filiform, the flowers nearly sessile in small clusters. Calyx broad, 5 -lobed, the lobes obtuse; corolla nearly campanulate, 5 -lobed, the lobes acute or acuminate, as long as the tube, their tips reflexed, its scales large, ovate, densely fringed all around with short irregular processes; stamens not exserted: style shorter than the ovary; stigmas capitate; capsule depressed glohose, indehiscent. On various herbs and low shrubs, Mass. to the N. W. Terr., Fla., Tex., Mex. and Cal. Also in S. Am. July-Aug.
4. Cuscuta Polygonòrum Engelm. Smart-weed Dodder. (I. F. f. 2959.) Plant orange-yellow; stems rather coarse; flowers sessile or nearly so in dense clusters. Calyx short, 4-5-lobed, the lobes ovate-oblong, acute or acutish; lobes of the corolla 4 or 5 , triangular-ovate, acute, the scales usually obsolete, wanting, or consisting of only 2 or 3 slender processes on each side of the attached lower portion of the filament; styles shorter than the ovary; stigmas capitate; capsule globose. On Polygonums and other herbs, Minn. and Wis. to Neb. and Ark. Also in Penn. and Del. Range probably more extensive. July-Sept.
5. Cuscuta indecòra Choisy. Pretty Dodder. (I. F. f. 2960.) Stems rather stout; flowers white, 3 mm . long, pedicelled in loose cymes. Calyx 5 -lobed, lobes ovate to lanceolate, acute; corolla campanulate, 5 -lobed, the lobes triangular, minutely crenulate, spreading, nearly as long as the tube; scales ovate, erect, irregularly fringed with short processes all around; stigmas capitate; capsule oblong, acute. On various herbs and low shrubs, Ill. to Neb., Fla., Tex., and Mex. Also in the W. Indies and S. Am. June-Aug.
6. Cuscuta Córyli. Engelm. Hazel Dodder. (I. F. f. 296I.) Stems coarse; flowers about 2 mm . long, pedicelled in cymes. Calyx $4-5$-lobed, the lobes triangular or triangular-lanceolate, acutish; corolla campanulate, 4-5lobed, the lobes minutely crenulate, nearly erect, triangular, acute, about as long as the tube; scales small, oval, obtuse, often with only a few processes on each side; styles shorter than the ovary; stigmas capitate; capsule oblong, pointed. On hazels and other shrubs or herbs, Conn. to Va., S. Dak. and Ark. July-Aug.
7. Cuscuta Cephalánthi Engelm. Button-bush Dodder. (I. F. f. 2962.) Plant yellow; stems rather coarse; flowers about 2 mm . long, short-pedicelled, clustered; calyx 5 -lobed, the lobes ovate, obtuse; corolla cylindric-campanulate, its lobes ovate, obtuse, spreading, one-half the length of the tube or less; scales about as long as the lobes, fringed mainly toward the apex with irregular processes; styles slender, about as long as the ovary; stigmas capitate; capsule depressed-globose, 3 mm . in diameter. On shrubs and tall herbs, Penn. to Minn., the N. W. Terr., Tex. and Ariz. July-Aug.
8. Cuscuta Gronòvii Willd. Gronovius' Donder. Love-vine. (I. F. f. 2963.) Stems yellow to orange, slender, flowers usually short-pedicelled, numerous in dense cymes. Calyx not bracted, its lobes ovate, obtuse. shorter than the corolla-tube ; corella campanulate, the lobes ovate, obtuse, spreading, nearly as long as the tube, the scales narrow, thickly fringed about the summit and sparingly along the sides with long slender processes; styles slender; stigmas capitate; capsule 3 mm . in diameter, enveloped in or capped by the withering deciduous corolla. On herbs and low shrubs, N. S. to Manitoba, Fla, and Tex. July-Aug.
9. Cuscuta rostràta Shuttlw. Beaked Donder. (I. F. f. 2064.) Stems coarse, yellowish white; flowers larger than in any of our other species, loosely
cymose. Calyx 5-lobed, the lobes ovate-triangular, shorter than the corolla-tube; corolla campanulate, white, its lobes broadly ovate, obtuse, about as long as the calyx-lobes; scales narrow, heavily fringed at the summit and sparingly along the sides with slender processes; styles slender; stigmas capitate. On herbs and shrubs, Md. to S. Car. and Ga. July-Sept.
10. Cuscuta cuspidàta Engelm. Cuspidate Dodder. (I. F. f. 2965.) Plant yellowish; stems slender; flowers about 3 mm . long in loose panicled cymes. Calyx shorter than the corolla-tube, with $2-4$ similar bracts at its base; sepals cuspidate, mucronate or acuminate; corolla nearly salverform, its lobes triangularlanceolate or oblong, acute or cuspidate, spreading; scales narrow, usually less than one-half as long as the tube, fringed with short irregular processes; styles very slender; stigmas capitate; capsule bearing the withered corolla on its summit. On coarse herbs, Neb. to Mo. and Tex. July-Sept.
ir. Cuscuta compácta Juss. Compact Dodder. (I. F. f. 2966.) Plant yellowish white; stems rather stout; flowers about 4 mm . long in dense clusters. Calyx of 5 (rarely 4) oval crenulate obtuse sepals, subtended by 3-5 rhombicorbicular appressed serrulate bracts; corolla salverform, the tube cylindric, its 5 (rarely 4) lobes oblong or ovate, obtuse, spreading, much shorter than the tube, the scales narrow, fringed with numerous long processes; styles slender; capsule oblong, enveloped in or capped by the withering corolla. On shrubs, Ont. to N. Y., Ala., Kans. and Tex. July-Sept.
12. Cuscuta paradóxa Raf. Glomerate Dodder. (I. F. f. 2967.) Plant yellowish white; stems slender; flowers sessile, 3 mm . long, exceedingly numerous in dense confluent clusters covering portions of the stem of the host-plant. Calyx of 5 concave oblong obtuse serrulate sepals, subtended by 8-1 5 narrower serrulate imbricated bracts with recurved tips; corolla-tube oblong-cylindric, its lobes obtuse, persistent; scales copiously fringed at the summit and sparingly along the sides with long processes; styles 2-4 times as long as the ovary; capsule capped by the withering corolla. On tall herbs, mainly Compositae, Ohio to S. Dak., Neb. and Tex. July-Sept. [C. aphylla Raf.?]

## Family 3. POLEMONIACEAE DC.

## Phlox Family.

Herbs. Flowers perfect, clustered, regular, or nearly so. Calyx inferior, tubular or campanulate, 5 -cleft, the lobes or teeth slightly imbricated. Corolla gamopetalous, the limb 5 -parted, the lobes contorted. Stamens 5, inserted on the tube of the corolla and alternate with its lobes; anthers versatile, 2 -celled, the sacs longitudinally dehiscent. Ovary superior, mostly 3 -celled; ovules $2-\infty$ in each cavity, amphitropous; style filiform; stigmas 3, linear. Capsule mostly loculicidally 3 -valved. Seeds sometimes winged, sometimes enveloped in mucilage and emitting spiral tubes when wetted; endosperm present; embryo straight; cotyledons flat; radicle inferior. About 10 genera and 200 species, most abundant in western Am.
Calyx distended and at length ruptured by the ripening capsule.

Corolla salverform ; leaves opposite, entire.
Corolla funnelform, tubular, salverform or campanulate; leaves alternate or opposite.
Calyx not distended nor ruptured by the capsule; leaves alternate.
Calyx-teeth herbaceous, not spinulose-tipped.
Stamens declined; leaves pinnate.
Stamens straight and leaves entire in our species.
Calyx-teeth spinulose-tipped; leaves pinnatifid.
3. Polemonium.
4. Collomia. 5. Naverretia.

## 1. PHLÓX L.

Perennial or rarely annual, herbs, with opposite entire leaves, or some of the upper ones alternate, and large flowers, in terminal cymes or cymose panicles. Calyx tubular or tubular-campanulate, 5 -ribbed, 5 -cleft, the lobes acute or acuminate, mostly scarious-margined, Corolla salverform, the tube narrow, the limb

5-iobed; lobes obovate, orbicular or obcordate, spreading. Stamens straight, short, unequally inserted on the corolla-tube. Ovary 3-celled; style usually slender; ovules I-4 in each cavity. Capsule ovoid, 3 -valved at length distending and rupturing the calyx-tube. Seeds ovoid, not emitting spiral threads when wetted. [Greek, flame.] About 30 species, natives of N. Am. and Asia. Besides the following, some 24 others occur in southern and western N. Am.
Leaves flat. ovate, oblong, lanceolate or linear.
Cymes panicled; flowers short-pedicelled or sessile.
Calyx-teeth subulate.
Stem glabrous or puberulent; leaves lanceolate to oblong.
I. P. paniculata.

Stem villous, very glandular above; leaves ovate to ovate-lanceolate.
2. P. amplifolia.

Calyx-teeth lanceolate, acute; leaves lanceolate to ovate, acuminate.
3. P. maculata.

Cymes corymbose, simple, or flowers scattered.
Flowering stems erect or ascending, simple.
Plants glabrous or nearly so.
Leaves ovate or oblong; calyx-teeth acute. 4. P. ovata.
Leaves lanceolate or linear; calyx-teeth subulate-lanceolate.
5. P. glaberrima.

Plants pubescent, hirsute or villous.
Stems erect or ascending; no prostrate sterile shoots.
Leaves linear or lanceolate, acuminate, spreading.
6. P. piīosa.

Leaves linear-oblong, acute or obtuse, nearly erect.
7. P. amoena.

Stems ascending or reclining; sterile shoots prostrate.
Lower leaves and those of the sterile shoots oblong or ovate.
8. P. divaricata.

Lower leaves and those of the sterile shoots obovate.
9. P. reptans.

Stems diffusely branched, usually creeping; leaves narrow.
Corolla-lobes cleft to or about the middle. 1o. P. bifida.
Corolla-lobes cleft only at the apex. Ir. P. Stellaria. Corolla-lobes rounded; western.
12. P. Kelseyz.

Leaves subulate, fascicled or crowded; plants low.
Stems creeping or ascending ; flowers cymose ; eastern.
Corolla-lobes shallowly emarginate; plant not glandular. I3. P. subulata.
Corolla-lobes deeply emarginate; upper part of plant glandular.
14. P. Brittoniiz.

Densely tufted: flowers mostly solitary; western.
Leaves densely white-woolly, 2 mm . long; plant moss-like. ${ }^{15}$. P. bryoides.
Leaves less woolly or merely ciliate, $4-12 \mathrm{~mm}$. long.
Corolla-tube shorter than or equalling the calyx. 16. P. Hoodii. Corolla-tube longer than the calyx.
17. P. Douglasiz.
I. Phlox paniculàta L. Garden Phlox. (I. F. f. 2968.) Stem glabrous or puberulent, $6-18 \mathrm{dm}$. high. Leaves sessile or short-petioled, oblong to oblonglanceolate, acute or acuminate, $5-15 \mathrm{~cm}$. long; flowers in compact paniculate cymules, the inflorescence often 3 dm . long; calyx-teeth more than one-half as long as the tube; corolla pink, purple or white, its lobes broadly obovate, rounded, shorter than its tube; capsule oval, obtuse. In woods and thickets, Penn. to Fla., Ill., Kans. and La. Freely escaped from gardens in the north and east. July-Sept.
2. Phlox amplifolia Britton, n. sp. Large-leaved Phlox. Stem villous or glandular-villous, at least above, 6-12 dm. tall. Leaves large and broad, $7-15 \mathrm{~cm}$. long, $3-6 \mathrm{~cm}$. wide, roughish above, the upper sessile, the lower or some of them narrowed, usually abruptly, into winged petioles, sometimes one-third the length of the blade; flowers similar to those of the preceding; calyx glandularvillous; corolla-tube glabrous. Tenn. to Mo. Aug.-Sept. Type from Kinox Co., Tenn.
3. Phlox maculàta L. Wild Sweet-ivilliam. (I. F. f. 2060.) Stem glabrous or puberulent, usually flecked with purple. 3-0 dm. high. Leaves lanceolate or the upper ovate-lanceolate, glabrous, rather firm, long-acuminate, sessile, rounded or subcordate at the base, $5-12 \mathrm{~cm}$. long; flowers short-pedicelled, the compact cymules formmg an elongated narrow panicle; calyx-tweth acute, or acu-
minate, about one-fourth the length of the tube; corolla-lobes rounded, shorter than the tube. In moist woods and along streams, N. J. to Fla., Minn. and Tenn. Occasionally escaped from gardens further north. June-Aug.
4. Phiox ovàta L. Mountain Phlox. (I. F. f. 2970.) Stems simple, ascending from a decumbent base, 3-6 dm. high. Leaves rather firm, the upper ovate or ovate-lanceolate, sessile by a rounded or subcordate base, acute, $2-5 \mathrm{~cm}$. long, the lower and basal ones longer, oblong or ovate-oblong, acute, narrowed into slender petioles; flowers short-pedicelled; calyx-teeth one-third to one-half the length of the tube; corolla pink or red, its lobes obovate, rounded, entire. In woods, Penn. to N. Car. and Ala. May-Aug.
5. Phlox glabérrima L. Smooth Phlox. (I. F. f. 2971.) Stem simple 3-6 dm. high. Leaves lanceolate or linear, mostly I-nerved, acuminate, narrowed at the base, $3-10 \mathrm{~cm}$. long, sessile, or the lowest linear or oblong, obtusish, and short-petioled; flowers short-pedicelled, the cymules corymbed; calyx-teeth onethird to one-half the length of the tube; corolla commonly pink, its lobes obovate, longer than the tube. In open woods and on prairies, Va. to Wis., Fla. and Ky. May-July.
6. Phlox pilòsa L. Downy Phlox. (I. F. f. 2972.) Soft-downy or hairy, often glandular; stem slender, 3-6 dm. high. Leaves linear or lanceolate, spreading, long-acuminate, $2-8 \mathrm{~cm}$. long, sessile; cymules corymbed; flowers shortpedicelled; calyx glandular, viscid, its teeth setaceous-subulate, longer than the tube; corolla-lobes obovate, entire, the tube usually pubescent; capsule shorter than the calyx. In dry soil, Ont. to Manitoba, N. J., Fla., Kans.; Ark. and Tex. April-June.
7. Phlox amoèna Sims. Hairy Phlox. (I. F. f. 2973.) Usually quite hairy; stems $\mathbf{I} .5-5 \mathrm{dm}$. high. Leaves linear-oblong, sessile, nearly erect, $\mathbf{I - 4} \mathrm{cm}$. long, the lowest much shorter; flowers nearly sessile in a dense cyme, which is subtended by the uppermost pair of leaves; calyx hirsute, its teeth subulate; corolla pink or white, its lobes obovate, shorter than the glabrous tube. In dry soil, Va. to Tenn., Fla. and Ga. April-June.
8. Phlox divaricàta L. Wiid Blue Phlox. (I. F. f. 2974.) Finely viscidpubescent; stems ascending or diffuse, with creeping or ascending leafy shoots. Leaves of the sterile shoots obtuse, $2-5 \mathrm{~cm}$. long, those of the flowering stems lanceolate, ovate-lanceolate, or oblong, mostly acute; flowers in open corymbed cymules, faintly fragrant; calyx-teeth subulate, longer than the tube; corolla bluish, its lobes not much longer than the tube; capsule oblong-globose. In moist woods, Ont. to Minn., Penn., Fla., Kans., La. and Ark. April-June.
9. Phlox réptans Michx. Crawling Phlox. (I. F. f. 2975.) Stems slender, diffuse, producing sterile creeping leafy shoots. Leaves of the sterile shoots, obtuse, $2-8 \mathrm{~cm}$. long, narrowed into petioles; flowering stems $\mathrm{I}-2 \mathrm{dm}$. high, their leaves oblong or lanceolate; flowers slender-pedicelled; calyx-teeth linear subulate; corolla pink, purple, or violet, its lobes rounded, about one-half the length of the tube. In woods, Penn. to Ga. and Ky. April-June.
10. Phlox bífida Beck. Cleft Phlox. (I. F. f. 2976.) Puberulent or pubescent; stems much branched, often 3 dm . long, the branches $\mathrm{I}-2 \mathrm{dm}$. high. Leaves of sterile shoots linear, sessile, $2-5 \mathrm{~cm}$. long, acute, those of flowering branches much shorter; flowers slender-pedicelled; calyx-teeth lanceolate-subulate; corolla pale purple, its lobes shorter than the tube, cuneate, $2-3$-cleft to about the middle into obtuse diverging segments. In dry places, Ind. to Tenn. and Mich. April-Juhe.
II. Phlox Stellària A. Gray. Chickweed Phlox. (I. F. f. 2977.) Glabrous or puberulent; stems, much branched, the branches $0.7-2 \mathrm{dm}$. high. Leaves linear, or linear-lanceolate, sessile, acute, $2-5 \mathrm{~cm}$. long; flowers slender-pedicelled; calyx-teeth subulate-lanceolate, shorter than the tube; corolla pale blue or nearly white, its lobes cuneate, 2 -lobed, nearly as long as the tube. On cliffs, Ill. and Ky. April-May.
12. Phlox Kélseyi Britton. Kelsey's Phlox. (I. F. f. 2978.) Manystemmed from a woody root, the stems sometimes 2 dm . long, glabrous, or slightly pubescent above. Leaves oblong, or linear-oblong, sessile, glabrous, or nearly so, $6-25 \mathrm{~mm}$. long, $2-4 \mathrm{~mm}$. wide, or the upper longer and narrower, rigid, the apex spinose-mucronate, the revolute margins ciliate; flowers sessile, or short-peduncled;
calyx-teeth subulate, as long as the tube, or longer; corolla-tube somewhat exceeding the calyx, the limb about 16 mm . broad, blue or lilac. N. Dak. to Neb. and Mont. May-June.
13. Phlox subulàta L. Ground or Moss Pink. (I. F. f. 2979.) Pubescent or becoming glabrate, forming mats, much branched, the branches $5-15 \mathrm{~cm}$. long. Leaves acute or acuminate, $8-20 \mathrm{~mm}$. long, $\mathbf{I}-3 \mathrm{~mm}$. wide, spreading, ciliate, commonly fascicled at the nodes; flowers slender-pedicelled; calyx 8-9 mm. long, its teeth subulate from a broader base, about as long as the tube; corolla pink, purple or white, its lobes shorter than the tube. In dry sandy or rocky soil, N. Y. to Fla., Mich. and Ky. Escaped from cultivation in N. Eng. April-June.
14. Phlox Brittònii Small. Britton's Phlox. Similar to the preceding. Leaves shorter and narrower; upper part of the plant glandular-pilose; calyx 5-7 mm . long; corolla white, the tube longer than the calyx, the lobes cuneate-obovate with 2 pale magenta spots near the base. Mountain slopes, Va. and W. Va. to N. Car. April-May.
15. Phlox bryoìdes Nutt. Moss Phlox. (I. F. f. 2980.) Depressed, mosslike, densely branched from a deep woody root, forming compact tufts $5-8 \mathrm{~cm}$. high. Leaves about 2 mm . long, closely imbricated in four ranks, copiously whitewoolly, triangular-lanceolate, pale, acute, the margins infolded; flowers solitary and sessile at the ends of the branches, about 5 mm . long; tube of the corolla longer than the calyx, its lobes broadly cuneate, entire. On dry hills, western Neb. and Wyo. May-July.
16. Phlox Hoòdii Richards. Hood's Phlox. (I. F. f. 2981.) Densely tufted and branched from a woody root, $5-10 \mathrm{~cm}$. high. Leaves imbricated, erect, rigid, subulate, mucronate, somewhat woolly or ciliate, becoming glabrate, 4-12 mm . long; flowers sessile at the ends of the branches, about $\mathbf{I ~ c m}$. long; calyx-teeth lanceolate, acuminate, rigid, longer than the tube; corolla-lobes obovate, entire. In dry sandy or rocky soil, Manitoba to the N. W. Terr., western Neb. and Wyo. May-July.
17. Phlox Douglásii Hook. Douglas' Phlox. (I. F. f. 2982.) Similar to the preceding species; leaves less imbricated, sometimes spreading, rigid, usually fascicled at the nodes, $8-14 \mathrm{~mm}$. long. Flowers sessile or short-pedicelled at the ends of the branches $\mathbf{1}-1.6 \mathrm{~cm}$. long; calyx-teeth narrowly lanceolate, acuminate, about equalling the tube; tube of the purple or white corolla longer than the calyx, its lobes obovate, entire. Dry soil, Neb. and Mont. to Utah, Cal. and Br. Col. May-July.

Phlox Douglásii andícola (Nutt.) Britton. Leaves longer, $16-25 \mathrm{~mm}$. long, less fascicled at the nodes. Range of the type. Perhaps specifically distinct.

## 2. GILIA R. \& P.

Calyx 5 -toothed or 5 -cleft, the sinuses usually scarious. Corolla funnelform, tubular, campanulate or rarely salverform, 5 -lobed. Stamens equally or unequally inserted on the corolla. Ovary 3-celled. Capsule ovoid or oblong, 3-celled, at length distending and rupturing the calyx. Seed-coat commonly mucilaginous when wetted, in some species emitting spiral thread-like tubes. [Named for Philip Gil, a Spanish botanist.] About 75 species, natives of America. Besides the following, some 48 others occur in southern and western N. Am.

## Leaves entire.

Flowers paniculate.
Flowers narrowly thyrsoid-spicate.
Leaves pinnately divided, pinnatifid or palmatifid.
Leaves palmatifid into 5-7 rigid subulate segments.
Leaves palmatifid into 5-7 rigid subulate segments.
Leaves pinnatifid or pinnately divided, the segments linear, not rigid.
Flowers thyrsoid-paniculate or corymbose-paniculate.
Corolla $2-5 \mathrm{~cm}$. long; plants $3-12 \mathrm{dm}$. tall.

Flowers paniculate, white.
Flowers narrowly thyrsoid, red. Corolla 6-10 mm. long, violet or blue.
Flowers narrowly thyrsoid-spicate, purplish.
Flowers in dense or capitate cymes, or heads,
Flower-clusters leafy-bracted.
x. G. gracilis.
6. G. spicata.
2. G. caespitosa.
3. G. Iongifora.
4. G. aggregata.
5. G. pinnalitida.
6. G. spicata.

# Perennial ; corolla-tube not longer than the calyx. 7. G. congesta. Annual; corolla-tube 2-3 times as long as the calyx. 8. G. pumila. Clusters bractless; corolla campanulate. Flowers axillary and terminal, scattered. <br> 9. G. tricolor. <br> 10. G. acerosa. 

I. Gilia grácilis Hook. Entire-leaved Gilia. (I. F. f. 2983.) Annual, pubescent, at length much branched, $5-15 \mathrm{~cm}$. high, the branches ascending. Lower and basal leaves oblong to spatulate, obtuse, commonly opposite and nearly sessile, the upper linear or lanceolate, sessile, $\mathbf{I - 2 . 5} \mathrm{cm}$. long, opposite or alternate; cymes 1-5-flowered; calyx-lobes linear-subulate; corolla $8-12 \mathrm{~mm}$. long, the tube yellowish, narrow, the lobes purple or violet, short; ovules 2 or 3 in each cavity; capsule oblong, obtuse; seeds mucilaginous when wet. In dry or moist soil, western Neb., Colo. and N. Mex. to Br. Col. and Cal. April-Aug.
2. Gilia caespitòsa (Nutt.) A. Nelson. Tufted Gilia. Sharp-leaved Gilia. Shrubby, densely tufted, rigid, usually much branched, $0.5-1.5 \mathrm{dm}$. high. Leaves alternate, sessile, $5-7 \mathrm{~mm}$. long, palmately divided into $3-5$ subulate rigid awl-shaped segments, often with smaller ones fascicled in their axils, sometimes densely imbricated; flowers solitary, or 2-3 together, sessile at the ends of the branches, $10-15 \mathrm{~mm}$. long; calyx-lobes 4 , subulate, as long as the tube, or shorter; corolla white to yellowish, salverform, the tube longer than the calyx, the limb 4 -lobed; stamens 4 ; seeds not mucilayinous when wetted. In dry soil, Neb. and Wyo. May-July. [Gilia pringens caespitòsa (Nutt.) A. Gray.]
3. Gilia longiflòra (Torr.) Don. White-flowered Gilia. (I. F. f. 2985.) Annual, glabrous, paniculately branched, 3-6 dm. high. Leaves all alternate, sessile, $2-6 \mathrm{~cm}$. long, pinnately divided or the uppermost entire; flowers white, paniculate, about 5 cm . long; calyx-teeth triangular-lanceolate, acuminate; corolla salverform, its tube narrow, 4 or 5 times as long as the orbicular or ovate, spreading lobes; stamens unequally inserted; ovules 8-12 in each cell; capsule narrowly oblong; seed-coat mucilaginous and emitting spiral threads when wetted. In dry soil, Neb. and Colo. to Tex. and Ariz. May-Sept.

Gilia rúbra (L.) Heller (G. coronopifolia Pers.), a related species with less spreading corolla-lobes, is commonly cultivated, and rarely escapes from gardens.
4. Gilia aggregàta (Pursh) Spreng. Scarlet Gilia. (I. F.f. 2986.) Biennial, pubescent or puberulent; stem 6-12 dm. high. Leaves alternate, the basal often tufted, mostly petioled, $2-8 \mathrm{~cm}$. long, pinnately parted into narrowly linear segments; inflorescence often 3 dm . long; flowers sessile or nearly so in small peduncled clusters, scarlet or red; corolla tubular-funnelform, the tube $2-4 \mathrm{~cm}$. long, the limb cleft into ovate or lanceolate acute or acuminate spreading or recurved lobes; ovules numerous; seeds mucilaginous and emitting spiral threads when wetted. In dry soil, Neb. and Wyo. to Tex., Mex., Br. Col. and Cal. June-Aug.
5. Gilia pinnatífida Nutt. Small-flowered Gilia. (I. F. f. 2987.) Biennial or perennial from a deep root, much branched, viscid-glandular, I.5-6 dm. high. Leaves thick, pinnatifid, the basal tufted, $2-8 \mathrm{~cm}$. long, the segments linear-oblong, those of the stem alternate, the uppermost minute and entire; flowers numerous, paniculate; calyx 5-lobed, the lobes lanceolate to ovate; corolla salverform, 6 -10 mm . long, the limb violet or blue, its white tube longer than the calyx and its obovate lobes; stamens exserted; seeds not mucilaginous when wetted. In sandy soil, Neb. and Wyo. to N. Mex. June-Aug.
6. Gilia spicàta Nutt. Spicate Gilia. (I. F. f. 2988.) Perennial, woollytomentose; stems stout, simple, 1.5-5 dm. high. Leaves alternate, narrowly linear, entire, or pinnately parted into $3-5$ linear segments, $2-5 \mathrm{~cm}$. long; flowers in an elongated narrow thyrsus, sessile in small clusters, purplish, $8-\mathbf{1 2} \mathrm{mm}$. long; tube of the corolla considerably longer than the ovate-oblong lobes; calyx-lobes acuminate; anthers equally inserted in the throat of the corolla. In dry soil, western Neb. and Kans. to Wyo. and Utah. May-Aug.
7. Gilia congésta Hook. Round-headed Gilia. (I. F. f. 2989.) Perennial, woolly-tomentose, at least when young, $0.7-4.5 \mathrm{dm}$. high. Leaves mostly petioled, $\mathbf{I}-5 \mathrm{~cm}$. long, pinnately divided into 3-9 sharp-pointed segments, or the uppermost entire; flowers white, densely capitate-clustered, 4-6 mm. long; calyxlobes awn-like; corolla-tube about the length of the calyx; filaments equally
inserted in or below the sinuses of the corolla; ovules $\mathbf{x}-4$ in each cavity. In dry soil, Neb. and Colo. to Cal., Mont. and Ore. May-Aug.
8. Gilia pùmila Nutt. Low Gilia. (I. F. f. 2990.) Annual, woolly at least when young, $0.7-2 \mathrm{dm}$. high. Leaves thick, $\mathbf{I}-2.5 \mathrm{~mm}$. long, pinnately divided into mucronulate sometimes lobed segments, or the uppermost entire; flowers in dense cymes; corolla $6-8 \mathrm{~mm}$. long, its tube about 3 times the length of the lobes; calyx-lobes awn-like; stamens inserted in or below the sinuses of the corolla; ovules 5 or 6 in each cavity. In dry soil, Neb. to Tex., Nev. and N. Mex. April-June.
9. Gilia trìcolor Benth. Tricolored Gilia. (I. F. f. 2991.) Annual, viscid-puberulent, at least above; stems 1.5-5 dm. high. Leaves slender-petioled, or the upper sessile, 2-3-pinnately divided into acute segments; flowers shortpedicelled, $10-14 \mathrm{~mm}$. long, in simple cymes; calyx-lobes triangular-lanceolate, acute or acuminate; corolla campanulate-funnelform, 2--3 times as long as the calyx, its tube yellowish, short, the throat brown-purple, the oval to orbicular lobes lilac or violet; ovules several in the cavities; seeds mucilaginous and emitting spiral threads when wetted. Escaped from gardens to roadsides at Lincoln, Neb. (according to Webber). Native of Cal. April-May.
10. Gilia acerósa (A. Gray) Britton. Needle-leaved Gilia. Perennial, glandular-puberulent, $8-15 \mathrm{~cm}$. high, bushy-branched. Leaves pinnately parted into 3-7 acicular segments; pedicels slender, 2 cm . long or less; corolla nearly rotate, 2 cm . in diameter, or less; filaments filiform; anthers oblong. Dry soil, Kans. to Tex., Mex. and N. Mex. [G. rigidula acerosa A. Gray.]

## 3. POLEMONIUM L.

Perennial or rarely annual herbs, with alternate pinnate leaves, and mostly large cymose-paniculate or thyrsoid flowers. Calyx herbaceous, campanulate, 5cleft, accrescent in fruit, the segments entire, erect, or connivent over the capsule. Corolla tubular-campanulate or tubular-funnelform, rarely rotate, the limb 5-lobed. Stamens about equally inserted near the base of the corolla, declined. Ovary ovoid; ovules few or several in each cavity. Capsule ovoid, obtuse, 3-valved. Seeds mucilaginous and emitting spiral threads when wetted. About 15 species, natives of the north temperate zone. Besides the following, some 10 others occur in western N. Am.
Anthers exserted; flowers $16-20 \mathrm{~mm}$. broad; stem erect.

1. P. Van Bruntiae.
Anthers included; flowers $10-12 \mathrm{~mm}$. broad; stem reclining.
2. P. reptans.
I. Polemonium Van Brúntiae Britton. American Jacob’s Ladder. (I. F. f. 2992.) Rootstock stout, horizontal. Stems somewhat glandular-pubescent above, $3-7.5 \mathrm{dm}$. high, leafy to the top; leaflets of the lower leaves 15-19, ovate or lanceolate, acute, $\mathbf{1}-4 \mathrm{~cm}$. long, the uppermost leaves $3-5$-foliolate or simple; cymose clusters rather loosely 3-5-flowered; flowers bluish purple; corolla-lobes rounded; calyx much enlarged in fruit, the lobes acute; ovules 3 or 4 in each cavity. In swamps and along streams, Vt. and northern N. Y. to Md. May-July.
3. Polemonium réptans L. Greek Valerian. (I. F. f. 2093.) Glabrous or very nearly so, usually not more than 3 dm . high; stems weak, at length reclining or diffuse, the rootstock short. Leaflets oblong, ovate-oblong, or lanceolateoblong, the uppermost leaves $3-5$-foliolate or simple; flowers blue; calyx 5 -lobed; ovules 3 or 4 in each cavity. Woods, N. Y. to Minn., Ga. and Kans. April-May.

## 4. COLLÒmiA Nutt.

Annual or rarely perennial herbs, with alternate leaves, and capitate or cymose flowers. Calyx obpyramidal or cup-shaped, 5 -cleft, scarious in the sinuses, accrescent in fruit, not distended nor ruptured by the ripening capsule, its lobes entire. erect, the sinuses often at length enlarged into a revolute lobe. Corolla tubularfunnelform or salverform, the limb 5 -lobed, the lobes obtuse. Stamens unequally inserted on the tube of the corolla, the filaments unequal. Seeds of most species mucilaginous and emitting spiral threads when wetted. [Cireck, gluten, referring to the glutinous seeds when wetted.] About ro species, natives of western Am. Besides the following, some 6 others occur in the western U. S. and Br. Col,
r. Collomia lineàris Nutt. Narrow-leaved Collomia. (I. F. f. 2994.) Annual, viscid-puberulent; stem $0.7-4.5 \mathrm{dm}$. high. Leaves linear-oblong, lanceolate or linear-lanceolate, entire, acuminate, sessile, or the lower shortpetioled, $2-6 \mathrm{~cm}$. long; flowers $10-15 \mathrm{~mm}$. long, in capitate leafy-bracted clusters; calyx-lobes triangular-lanceolate, acute; corolla light purple or nearly white, the tube slender, longer than the calyx, the lobes 2-4 mm. long; capsule about as long as the calyx. In dry soil, Manitoba to Minn., Neb., Br. Col., Ariz. and Cal. Also in N. Y. and N. B. May-Aug.

## 5. NAVARRÈTIA R. \& P.

Annual herbs, with alternate spinose-pinnatifid leaves, or the lowest entire, and small flowers in dense terminal bracted clusters. Calyx prismatic or obpyramidal, the tube 5 -angled, 5 -cleft, not accrescent, not distended by the ripening capsule, the sinuses scarious, the lobes spiny-tipped, often toothed. Corolla tubular-funnelform or salverform, 5 -lobed. Stamens equally inserted in or below the throat of the corolla. Ovary 2-3-celled. Capsule 1-3-celled. Seeds mostly mucilaginous and emitting spiral threads when wetted. [In honor of Navarrete, a Spanish physician.] About 24 species, natives of western Am. Besides the following, some 22 others occur in the western U. S.
i. Navarretia mínima Nutt. Small Navarretia. (I. F. f. 2995.) Depressed, tufted, somewhat pubescent; stem $2-8 \mathrm{~cm}$. high. Leaves sessile, $\mathrm{I}-2.5 \mathrm{~cm}$. long, I-2-pinnatifid into almost filiform acicular segments; flowers about 4 mm . long, white (?); calyx-lobes awl-shaped, mostly toothed, about as long as the tube; the sinuses more or less white-pubescent; calyx-tube about equalling the indehiscent I-6-seeded capsule. In dry soil, Neb. and S. Dak. to Wash. and Ariz. Summer.

## Family 4. HYDROPHYLLACEAE Lindl. <br> Water-leaf Family.

Herbs, mostly hirsute, pubescent or scabrous, with alternate or basal, rarely opposite leaves, and perfect regular 5 -parted flowers, in scorpioid cymes, spikes or racemes, or rarely solitary. Calyx inferior, deepiy cleft or divided. Corolla gamopetalous. Stamens 5, inserted on the corolla, and alternate with its lobes; filaments filiform ; anthers mostly versatile, 2-celled, the sacs longitudinally dehiscent. Disk annular, or none. Ovary superior, 2 -celled, or 1-celled with 2 placentæ; styles 2, separate, or partly united; stigmas.small, terminal; ovules anatropous or amphitropous. Capsule i-2-celled, mostly loculicidally 2 -valved. Seeds usually pitted, rugose or reticulated ; endosperm fleshy or cartilaginous; embryo small; cotyledons half-terete or plano-convex. About 17 genera and 160 species, mostly natives of western N. Am.

| Styles united below; ovary i-celled; leaves mostly lobed or dentate. |  |
| :--- | :--- |
| Corolla-lobes convolute in the bud; placentæ dilated. | 1. Hydrophyllum. |
| Stamens exserted. | 2. Nemophila. |
| Stamens not exserted. | Sinuses of the calyx appendaged. |
| Calyx much enlarged in fruit, its sinuses not appendaged. | Macrocalyx. |
| Corolla-lobes imbricated in the bud; placentæ narrow. | 3. Mhacelia. |
| Styles distinct to the base; ovary 2-celled; leaves nntire. | 4. Nama. |

## r. HYDROPHÝLLUM L.

Perennial or biennial herbs, with large lobed pinnatifid or pinnately divided leaves, and white, blue or purple flowers, in more or less scorpioid cymes. Calyx deeply 5 -parted, the segments lanceolate or subulate. Corolla tubular-campanulate or campanulate, 5 -lobed, the lobes convolute in the bud, each with a linear appendage within, which extends to the base of the corolla and is incurved into a groove. Stamens 5, exserted; filaments pilose below or at the base; anthers versatile. Ovary I-celled, hispid-pubescent; placentæ fleshy, dilated, free from the ovary-wall except at the top and bottom, each enclosing 2 ovules; styles united nearly to the
summit. Capsule 2-valved. Seeds 1-4, globose-obovoid. [Greek, water-leaf, refer. ring to the supposed cavity for water in each leaf.] About 6 species, of N. Am.
Leaves, at least the lower, pinnatified or pinnately divided.
Calyx not appendaged in the sinuses or scarcely so.
Plant sparingly pubescent; leaf-segments acute.
Plant villous-hirsute; leaf-segments blunt.
Calyx with a reflexed appendage in each sinus.
Leaves palmately $5-9$-lobed.

\author{

1. H. Virginicum. <br> 2. H. macrophyllum. <br> 3. H. appendiculatum. <br> 4. H. Canadense.
}
I. Hydrophyllum Virgínicum L. Virginia Water-leaf. (I. F. f. 2996.) Perennial by scaly rootstocks; stems slender, glabrous or nearly so, rather weak, 3-9 dm. long. Lower and basal leaves $1.5-2.5 \mathrm{dm}$. long, pinnately divided into 5-7 acute or acutish sharply toothed or incised segments $2-5 \mathrm{~cm}$. long, glabrous or with few scattered hairs; upper leaves, short-petioled, smaller, with fewer segments; cymes slender-peduncled; flowers white to violet purple, short-pedicelled; pedicels strigose- pubescent; calyx-segments hispid; corolla about 8 mm . long. In woods, Quebec to Alaska, south to S. Car., Kans. and Wash. May-Aug.
2. Hydrophyllum macrophýllum Nutt. Large-leaved Water-Leaf. (I. F. f. 2997.) Perennial, villous-hirsute; stem 6-9 dm. high. Lower leaves 2-3 dm . long, deeply pinnatifid or pinnately divided into $7-13$ obtuse dentate segments $2-8 \mathrm{~cm}$. long; upper leaves smaller, shorter-petioled and with fewer segments; cymes long-peduncled, very dense; flowers nearly white; calyx cleft to below the middle, its lobes lanceolate, erect, white-hispid; corolla $10-12 \mathrm{~mm}$. long; anthers oblong; capsule densely white-hispid, enclosed by the calyx. In rich woods, Ohio to Ala., Ill. and Tenn. April-June.
3. Hydrophyllum appendiculàtum Michx. Appendaged Water-leaf. (I. F. f. 2998.) Biennial, rough-hairy: stems weak, 3-6 dm. long, somewhat viscid above. Lower and basal leaves pinnatifid or pinnately divided into 5-7 irregularly dentate or incised segments; upper leaves ovate to orbicular, variously lobed, the lobes acute and dentate; cymes loose, branched, the pedicels $8-20 \mathrm{~mm}$. long; calyx parted to near the base, enlarging in fruit, the segments triangular-lanceolate, acuminate; corolla violet or purple, $12-14 \mathrm{~mm}$. long. In woods, Ont. to N. Car., Minn. and Kans. May-June.
4. Hydrophyllum Canadénse L. Broad-leaved Water-leaf. (I. F. f. 2999.) Perennial; stems glabrous or nearly so, 3-8 dm. high. Leaves nearly orbicular, cordate, sparingly pubescent, at least above, 5-9 lobed, the lower often 3 dm . broad; upper leaves smaller; lobes ovate, acuminate, dentate; cymes dense or becoming loose; pedicels short, nearly glabrous; calyx cleft nearly to the base, its segments linear-lanceolate, acute, nearly or quite glabrous, sometimes with a minute tooth in each sinus; corolla campanulate-rotate, white to purplish. In woods, Mass. to N. Car., Ill. and Ky. June-Aug.

## 2. NEMÓPHILA Nutt.

Annual diftuse pubescent fragile herbs, with mostly pinnatifid or lobed leaves. Flowers white, blue, or variegated, solitary, peduncled. Calyx with an appendage in each sinus. Corolla campanulate or rotate-campanulate, usually with io small appendages within at the base, the lobes convolute in the bud. Stamens included. Ovary 1-celled with placentæ similar to those of Hydrophyllum; styles partly united. Capsule 2 -valved. Seeds I-4 in our species. [Greek, grove-loving.] About io species, natives of N. Am.
i. Nemophila micrócalyx (Nutt.) F. \& M. Small-flowered Nemophila. (I. F. f. 3000.) Stems slender, 5-40 cm. long. Leaves membranous, petioled. $2-6 \mathrm{~cm}$. long, pinnatifid or pinnately divided into $3-5$ obovate cuncate or oblique obtuse $2-3$-dentate or -lobed segments, the upper alternate, the lowest opposite; peduncles $8-25 \mathrm{~mm}$. long, opposite the leaves; flowers white or blue. $3^{-+}+\mathrm{mm}$. long: appendages of the calyx minute; calyx scarcely enlarged in fruit; ovules 2 on each placenta; corolla appendages obsolete or none; anthers oval; capsule about 3 mm . in diameter, I-2-seeded. In woods, Va. to Fla., Ark. and Tex. April-June.
3. MACRÓCALYX Trew.

Annual hirsute or pubescent slender herbs, with pinnately divided or 1-3-pinnatifid leaves, and small white or bluish flowers. Calyx 5 -lobed or 5 -parted,
spreading, much enlarged in fruit, destitute of appendages. Corolla campanulate or nearly cylindric, shorter than or slightly exceeding the calyx, usually with 5 minute appendages on the tube within, its lobes convolute in the bud. Stamens included. Ovary I-celled; styles united below; ovules 2-4 on each of the placentæ. [Greek, large calyx.] About 3 species, natives of N. Am.
i. Macrocalyx Nyctèlea (L.) Kuntze. Nyctelea. (I. F. f. 3001.) Sparingly hirsute-pubescent; stem forked, I-3 dm. high. Leaves pinnately divided, petioled, $4-10 \mathrm{~cm}$. long, ovate-oblong in outline, the upper alternate, the lower opposite, the segments oblong or lanceolate; peduncles I-flowered, opposite the leaves; calyx in flower about 4 mm . long, about equalling the corolla, enlarging, widely spreading and becoming $15-30 \mathrm{~mm}$. broad in fruit, its lobes lanceolate or ovatelanceolate, acuminate; fruit at length pendulous; capsule globose. In moist soil, N. J. to Minn., the N. W. Terr., Va., Neb. and Kans. April-July.

## 4. PHACELLIA Juss.

Mostly hirsute hispid or scabrous herbs, with alternate leaves, the lowest rarely opposite, and blue, purple, violet or white flowers in terminal scorpioid cymes or racemes. Calyx 5 -lobed, somewhat enlarging in fruit; sinuses not appendaged. Corolla-tube sometimes appendaged within, opposite the lobes, the lobes imbricated in the bud. Stamens attached near the base of the corolla; anthers mostly ovate. Ovary I-celled, the 2 placentæ narrow, affixed to the walls; styles united below. Capsule I-celled, or falsely nearly 2 -celled, 2 -valved. Seeds usually reticulated. [Greek, a cluster, referring to the clustered flowers.] About 80 species, natives of the New World. Besides the following, some 50 others occur in western N. Am.

[^40]1. P. leucophylla.
2. P. integrifolia.
3. P. bipinnatifida. 4. P. Frankliniz.
4. P. dubia.
5. P. hirsuta.
6. P. Covillei.
7. P. Purshizi.
8. P. fimbriata.

## I. Phacelia leucophýlla Torr. Silky Phacelia. (I. F. f. 3002.) Peren-

 nial by a stout rootstock, pale. densely silky-pubescent. Stem 3-5 dm. high; leaves lanceolate to oblong, $5-10 \mathrm{~cm}$. long, the lower long-petioled; spike-like branches of the scorpioid cymes dense, $2-8 \mathrm{~cm}$. long: flowers sessile, numerous, about 8 mm . high; calyx-lobes hispid, oblong-lanceolate or linear, somewhat shorter than the white or bluish, 5-lobed corolla; corolla-appendages in pairs between the filaments; filaments exserted, glabrous or sparingly hairy; ovules 2 on each placenta. In dry soil, S. Dak. to Idaho and Neb. May-Aug.2. Phacelia integrifòlia Torr. Crenate-leaved Phacelia. (I. F. f. 3003.) Annual or biennial; stem very leafy, 1.5-5 dm. high. Leaves finely strigose-pubescent, ovate-oblong or oblong-lanceolate, irregularly crenate-dentate, obtuse at the apex, rounded or cordate at the base, $2-6 \mathrm{~cm}$, long, petioled or the uppermost sessile; spike-like branches of the scorpioid cymes dense, $5-10 \mathrm{~cm}$. long when expanded; flowers sessile, about 8 mm . long; calyx-segments acute; corolla tubular-campanulate, white or blue, its tube longer than the calyx; filaments glabrous, exserted; ovules 2 on each placenta. In saline soil, Kans. and Colo. to Mex., Utah and Ariz. April-Sept.
3. Phacelia bipinnatíída Michx. Loose flowered Phacelia. (I. F. f. 3004.) Biennial, hirsute-pubescent ; stem glandular-viscid above, 3-6 dm. high. Leaves slender-petioled, $5^{-13} \mathrm{~cm}$. long, pinnately divided or deeply pinnatifid
into 3-7, dentate or incised segments, or these again pinnatifid; flowers blue or violet, $12-16 \mathrm{~mm}$. broad, in loose racemes, the inflorescence only slightly scorpioid; pedicels $8-20 \mathrm{~mm}$. long, recurved in fruit; calyx-segments linear; appendages of the rotate-campanulate corolla in pairs between the stamens; filaments pilose, exserted. Moist thickets and along streams, Ohio to Mo., south to Ala. April-June.
4. Phacelia Franklínii (R. Br.) A. Gray. Franklin's Phacelia. (I. F. f. 3005.) Annual, villous pubescent; stem $1.5-4.5 \mathrm{dm}$. high. Leaves $3-8 \mathrm{~cm}$, long, pinnately parted into 7-15 linear or linear-oblong acute segments; flowers blue or nearly white, in scorpioid racemes; calyx-segments linear-lanceolate, acute, longer than the tube of the rotate-campanulate corolla; appendages of the corolla free at the apex; filaments glabrous, or nearly so; styles united nearly to the summit. Ont. and Minn. to Br. Col., Wyo. and Idaho. Summer.
5. Phacelia dùbia (L.) Small. Small-flowered Phacelia. (I. F. f. 3006.) Annual, puberulent or glabrate, I-3 dm. high. Lower and basal leaves petioled, $2-5 \mathrm{~cm}$. long, pinnatifid or pinnately divided into $3-5$ obtuse segments or rarely merely dentate, or even entire; flowers light blue or white, racemose; racemes 5-15-flowered; corolla rotate-campanulate; anthers slightly exserted; capsule 6-12-seeded; fruiting pedicels ascending. In moist soil, Penn. to Ga., Kans. and Tex. April-June.
6. Phacelia hirsùta Nutt. Hairy Phacelia. (I. F. f. 3007.) Similar to the preceding but usually stouter, hirsute-pubescent. Leaves pinnatifid into 5-9 usually entire segments, or the upper 3 - 5 -lobed, or entire, sessile; racemes rather dense; flowers blue; calyx-segments hirsute; corolla rotate-campanulate; ovules 3 or 4 on each placenta; stamens scarcely exserted; capsule $4-8$-seeded. In dry soil, Va. to Ga., Kans. and Tex. April-June.
7. Phacelia Covíllei S. Wats. Coville's Phacelia. (I. F. f. 3008.) Similar to the two preceding species, pubescent; branches weak, $1.5-3 \mathrm{dm}$. long. Leaf-segments $3-7$, obtuse; racemes $\mathbf{I}-5$-flowered; pedicels filiform, $\mathrm{I}-3.5 \mathrm{~cm}$. long; calyx-segments linear; corolla tubular-campanulate, about 6 mm . long and broad; anthers not exserted; capsule 3-4 mm. in diameter; fruiting pedicels recurved. Along the Potomac River above Washington, and in Ill. April-May.
8. Phacelia Púrshii Buckl. Pursh's Phacelia. (I. F. f. 3009.) Annual, pubescent; stem $\mathbf{I} .5-4.5 \mathrm{dm}$. high. Lower and basal leaves pinnately parted or pinnatifid into $9 \mathbf{- 1 5}$ oblong or lanceolate segments; upper leaves sessile, with fewer segments; racemes strongly I-sided, 10-20-flowered; pedicels 6-25 mm. long; calyxsegments lanceolate or linear-lanceolate; corolla $10-12 \mathrm{~mm}$. broad, blue or white; filaments slightly exceeding the corolla; ovules 2 on each placenta. In moist woods or thickets, Penn. to Minn., N. Car., Ala. and Mo. April-June.
9. Phacelia fimbriàta Michx. Fringed or Mountain Phacelia. (I. F. f. 3010.) Annual, sparingly pubescent; stems 1.5-5 dm. long. Basal and lower leaves slender-petioled, pinnately divided into 5-9 obtuse segments; upper leaves sessile, their segments acute; clusters loose, 3 - 12 -flowered; pedicels $8-30 \mathrm{~mm}$. long; flowers 8 -10 mm . broad, white; calyx-segments linear to spatulate, obtuse; corolla rotate-campanulate; filaments pilose, about equalling the corolla; ovules 2 on each placenta. In woods, mountains of Va. to Ala. May-June.

## 5. NÀMA L.

Perennial herbs, with alternate entire leaves, sometimes with spines in their axils, and blue clustered flowers. Calyx-segments distinct to the base. Corolla rotate-campanulate, 5 -cleft, the lobes imbricated in the bud. Stamens inserted on the base of the corolla; anthers sagittate. Ovary 2 -celled (rarely 3-celled); ovules numerous on fleshy adherent placentæ; styles 2, rarely 3 , distinct to the base: stigma capitellate. Capsule globose or ovoid, septicidally or irregularly dehiscent. [Greek, a stream, referring to the habitat.] About 15 species, natives of warm and tropical regions. Besides the following, another occurs in the southern U. S.

Leaves lanceolate; flowers mostly in axillary clusters.
Glabrous, or very nearly so, throughout ; sepals ovate to ovate-lanceolate.

Villous, at least above, and on the calyx; sepals lanceolate.
Leaves ovate ; flowers mostly in terminal clusters; sepals villous.

1. N. affinis.
2. N. पuadrizalzis, 3. 小. ©rata.
I. Nama affinis (A. Gray) Kuntze. Smooth Nama. (I. F. f. 3оII.) Glabrous or nearly so; stems 3-8 dm. high. Leaves oblong-lanceolate, petioled, acute or acuminate at both ends, $5-13 \mathrm{~cm}$. long; flowers $12-14 \mathrm{~mm}$. broad, shortpedicelled, in rather dense peduncled leafy-bracted axillary clusters; sepals about equalling the corolla; capsule 4 mm . in diameter, shorter than the sepals. In wet places, southern Ill. to Mo., La. and Tex. June-Aug.
3. Nama quadriválvis (Walt.) Kuntze. Hairy Nama. (I. F. f. 30I2.) Similar to the preceding, but pubescent, at least above, with spreading hairs; stem ascending, $3^{-6} \mathrm{dm}$. high. Leaves lanceolate, acute or acuminate, glabrous, or sparingly pubescent, petioled, $5-13 \mathrm{~cm}$. long; sepals about as long as the corolla; capsule $4-6 \mathrm{~mm}$, in diameter, about the length of the sepals. In wet soil, Va. to Fla. and La. June-Aug.
4. Nama ovàta (Nutt.) Britton. Ovate-leaved Nama. (I. F. f. 3013.) Stem 3-9 dm. high, puberulent, or hirsute, at least above. Leaves ovate, rarely ovatelanceolate, puberulent, or glabrous, $2-7 \mathrm{~cm}$. long, acute; flowers terminal, often 2.5 cm . broad, or more; sepals lanceolate, acuminate, very villous, shorter than the corolla, longer than the capsule. In wet soil, Ga. to Mo., La. and Tex. May-Sept.

## Family 5. BORAGINÀCEAE Lindl.

## Borage Family.

Herbs, shrubs, or some tropical species trees. Leaves alternate, rarely opposite or verticillate, estipulate, mostly entire and hispid, pubescent, scabrous or setose. Flowers perfect, usually regular, mostly blue, in onesided scorpioid spikes, racemes, cymes, or sometimes scattered. Calyx inferior, mostly 5-lobed, 5 -cleft, or 5 -parted, usually persistent. Corolla gamopetalous, mostly regular and 5-lobed, rarely irregular. Stamens as many as the corolla-lobes and alternate with them, inserted on the tube or throat ; anthers 2 -celled, the sacs longitudinally dehiscent. Disk commonly inconspicuous. Ovary superior, of 2 2-ovuled carpels, entire, or the carpels commonly deeply 2 -lobed, making it appear as of 4 r-ovuled carpels; style simple, entire or 2 -cleft in our genera; ovules anatropous or amphitropous. Fruit mostly of 4 I -seeded nutlets, or of 22 -seeded carpels. Endosperm fleshy, copious, or none ; cotyledons mostly flat or plano-convex; radicle short. About 85 genera and 1500 species, of wide distribution.

* Ovary entire or $2-4$-grooved; style terminal. 1. Heliotropium.
*     * Ovary 4-divided or deeply 4 -lobed, the style arising from the center.

Flowers regular.
Nutlets armed with barbed prickles.
Nutlets spreading or divergent, covered by the prickles. 2. Cynoglossum.
Nutlets erect or incurved, the prickles on their backs or margins.
3. Lappula.

Nutlets unarmed.
Nutlets attached laterally to the receptacle, sometimes just above their bases.
Fruiting calyx not greatly enlarged nor membranous.
Corolla small, usually white; receptacle conic or elongated.
Annuals; calyx nearly closed in fruit; inflorescence naked or bracteolate.

Lowest leaves mostly opposite; calyx persistent.
4. Allocarya.

Leaves all alternate ; calyx at length deciduous.
5. Cryptanthe.

Perennials or biennials; calyx-segments more or less spreading in fruit; inflorescence leafy.
6. Oreocarya.

Corolla tubular-funnelform, mostly blue; receptacle flat or convex.
Maritime; nutlets fleshy, smooth and shining. 7. Pneumaria.
Not maritime; nutlets wrinkled and dry when mature.
8. Mertensia.

Fruiting calyx much enlarged, membranous, veiny.
9. Asperugo.

Nutlets attached to the receptacle by their very bases.
Scar of attachment small, flat.
Corolla salverform or funnelform, its lobes rounded, spreading.
Racemes not bracted; corolla-tube short. 10. Myosotis.
Racemes bracted; corolla-tube cylindric, usually slender.
Corolla tubular, its lobes erect, acute.
II. Lithospermum.

Scar of attachment large, concave.
Corolla tubular, 5 -toothed.
Corolla rotate; anthers erect in a cone.
Flowers irregular.
Stamens included; throat of the corolla closed by scales.
Stamens exserted; throat of the corolla dilated, open.
12. Onosmodium.
13. Symphytum.
14. Borago.

## I. HELIOTRÒPIUM L.

Herbs or shrubs, with alternate mostly entire leaves, and small blue or white flowers, in scorpioid spikes, or scattered. Calyx-lobes or -segments lanceolate or linear. Corolla salverform or funnelform, naked in the throat, its tube cylindric, its lobes imbricated, plicate or induplicate in the bud. Stamens included; filaments short, or none. Stigma conic or annular. Fruit 2-4-lobed, separating into 4 I-seeded nutlets, or into 22 -seeded carpels. [Greek, sun-turning, i. e., turning to or with the sun.] About 115 species, widely distributed. Besides the following, some 9 others occur in southern and western N. Am.

Fruit 4-lobed, each lobe becoming a r-seeded nutlet.
Flowers in scorpioid spikes.
Plant rough-puberulent; leaves oval. Glabrous, fleshy; leaves linear or spatulate. Flowers solitary, terminating short branches.
Fruit 2 -lobed, or of 2 carpels.
Style elongated; flowers large, scattered, white.
Style very short; flowers blue, in scorpioid spikes.

1. H. Europaeum.
2. H. Curassavicum.
3. H. tenellum.
4. H. convolvulaceum.
5. H. Indicum.
6. Heliotropium Europaèum L. European Heliotrope. (I. F. f. 3014.) Annual, much branched, rough puberulent, $\mathbf{1} .5-5 \mathrm{dm}$. high. Leaves oval, $2-5 \mathrm{~cm}$. long, obtuse, narrowed at the base, slender-petioled; flowers white, $2-4 \mathrm{~mm}$. broad, in dense $I$-sided, bractless spikes; terminal spikes in pairs, the lateral ones commonly solitary; calyx-segments shorter than the corolla-tube ; anthers distinct, obtuse; stigma-tip long-conic; fruit depressed-globose, pubescent. In waste places, N. Y. and Penn. to Fla. Adventive or nat. from Europe. June-Oct.
7. Heliotropium Curassávicum L. Sea-side Heliotrope. (I. F. f. 3015.) Annual (or southward perennial ?), fleshy, more or less glaucous, diffuse, the branches 1.5-4.5 dm. long. Leaves oblanceolate, linear, or spatulate, entire, inconspicuously veined, $2-5 \mathrm{~cm}$. long, 3-6 mm . wide, obtuse, narrowed into petioles, or the upper sessile; scorpioid spikes dense, bractless, mostly in pairs; flowers about 4 mm . broad; calyx-segments acute; corolla white with a yellow eye or changing to blue; stigma umbrella-shaped; anthers acuminate; fruit globose. On sandy seashores, Va. to Tex. and Mex. In dry saline soil from Manitoba and the N. W. Terr. to Neb. and Tex. On the Pacific Coast from Ore. to Mex. Widely distributed in saline and maritime soil in S. Am. and the Old World. In ballast about the northern seaports. May-Sept.
8. Heliotropium tenéllum (Nutt.) Torr. Slender Heliotrope. (I. F. f. 3016.) Annual, strigose-canescent; stem commonly leafless below. 1.5-4.5 dm. high. Leaves linear, entire, $\mathbf{I}-4 \mathrm{~cm}$. long, narrowed at both ends, sessile, or the lower petioled; flowers white, about 5 mm . long, bracted by 1 or 2 leaves; calyxsegments unequal; corolla-tube canescent, its lobes entire; anthers obtuse; stigma subulate-tipped; fruit depressed, strigose-pubescent. In dry soil, Ky. to Kans., Ala., Tex. and N. Mex. April-Aug.
9. Heliotropium convolvulàceum (Nutt.) A. Gray. Bindween Ifeliotrope. (I. F. f. 3017.) Annual, strigose-canescent, 1.5-4 dm. high. Leaves oblong. ovate, or lanceolate, entire, short-petioled, narrowed at the base. $1-+\mathrm{cm}$. long: flowers numerous, fragrant, short-peduncled, mostly solitary and opposite the leaves; calyx-segments acuminate, equal; corolla white, strigose, $\mathbf{1 . 5 - 2} \mathbf{~ c m}$. long, about $\mathbf{1 2}$
mm . broad, its tube narrowed at the throat, longer than the angulate-lobed limb; anthers inserted on the tube of the corolla, slightly cohering by their tips; style filiform; stigma with a tuft of bristly hairs; fruit 2 -lobed, pubescent. In dry sandy soil, Neb. to Tex., Utah and Mex. July-Sept.
10. Heliotropium Índicum L. Indian Heliotrope. (I. F. f. 30I8.) Annual, hirsute or hispid; stem 3-9 dm. high. Leaves ovate or oval, obtuse, rounded or subcordate at the base, $5-15 \mathrm{~cm}$. long, repand or undulate, margined-petioled; flowers blue, $4^{-6} \mathrm{~mm}$. broad, sessile in terminal dense bractless usually solitary scorpioid spikes; calyx-segments acute, shorter than the strigose corolla-tube; style very short, deciduous; fruit deeply 2-lobed, glabrous. In waste places, N. Car. to Ill., Fla. and Tex. Nat. from India. Also in ballast about the northern seaports. May-Nov.

## 2. CYNOGLÓSSUM L.

Hirsute or hispid (rarely glabrous) mostly tall herbs. with alternate entire leaves, the basal long-petioled, and purple blue or white flowers in panicled, more or less scorpioid racemes. Calyx 5 -cleft or 5 -parted, enlarged in fruit. Corolla funnelform or salverform, the tube short, the throat closed by 5 scales opposite the imbricated rounded lobes. Stamens included; filaments short. Ovary deeply 4 -lobed. Nutlets oblique, attached laterally to the convex or conic receptacle, covered with short barbed prickles. [Greek, dog's tongue.] About 75 species of wide distribution. Besides the following, some 3 others occur in western N. Am.

Stem leafy to the top: flowers reddish, purple or white; nutlets flat. I. C. officinale. Stem leafless above; flowers blue; nutlets convex.
2. C. Virginicum.
r. Cynoglossum officinale L. Hound's-tongue. Gipsy Flower. (I. F. f. 3019.) Biennial; stem stout, 4-9 dm. high. Basal and lower leaves oblong or oblong-lanceolate, sometimes obtuse, I.5-3 dm. long; upper leaves lanceolate, a cute or acuminate, sessile; racemes much elongated in fruit; pedicels $6-12 \mathrm{~mm}$. long; calyx-segments ovate-lanceolate, acute; corolla about 8 mm . broad; fruit pyramidal, about $\mathbf{I ~ c m}$. broad, each of the 4 nutlets forming a side of the pyramid, flat on their upper faces, margined, splitting away at maturity, but hanging attached to portions of the subulate style. In fields and waste places, Quebec and Ont. to Minn., Manitoba, N. Car. and Kans. May-Sept.
2. CynoglossumVirgínicum L. Wild Comfrey. (I. F. f. 3020.) Perennial, hirsute; stem usually simple, leafless above, stout, 4-8 dm. high, Basal and lower leaves oval or oblong, 1-3 dm. long, obtuse, narrowed into petioles; upper leaves oblong, or ovate-lanceolate, sessile and clasping by a cordate base, acute; racemes 2-6, bractless, long-peduncled; flowers about I cm. broad; calyx-segments oblong-lanceolate, obtuse; fruit depressed, 8 mm . broad, the nutlets convex on the upper face, not margined, separating and falling away at maturity. In woods, N. B. to western Ont., Fla., La. and Kans. April-May.

## 3. LÁPpULA Moench.

Rough-pubescent or canescent herbs, with alternate narrow entire leaves, and small blue or white flowers, in terminal racemes. Calyx deeply 5 -cleft or 5 -parted, the segments narrow. Corolla salverform or funnelform, the tube very short, the throat closed by 5 scales, the lobes obtuse, spreading, imbricated in the bud. Stamens included; filaments very short. Ovary 4-lobed; style short. Nutlets 4, laterally attached to the receptacle, at length separating, the margins or backs armed with stout barbed prickles, the sides usually papillose or tuberculate. [Diminutive of the Latin lappa, a bur.] About 40 species, mostly of the north temperate zone. Besides the following, several others occur in western N. A.:
Racemes bracted; fruiting pedicels not deflexed.

Prickles in two rows on the margins of the nutlets, distinct.
Prickles in one row on the margins, more or less confluent.
Racemes bracted only at the base; fruiting pedicels deflexed.
Stem leaves ovate-oblong, the basal cordate; fruit globose.
Leaves oblong, oblong-lanceolate or linear; fruit pyramidal. Flowers $6-10 \mathrm{~mm}$. broad; fruit about 6 mm . broad. Flowers $2-4 \mathrm{~mm}$, broad; fruit about 4 mm , broad,

1. L. Lappula.
2. L. Texana.
3. L. Virginiana.
4. L. foribunda.
5. L. Americana.
6. Lappula Láppula (L.) Karst. European Stickseed. Burseed. (I. F. f. 3021.) Annual, pale, leafy, hispid or appressed-pubescent, 3-6 dm. high, the branches erect. Leaves linear, linear-oblong or the lowest spatulate, sessile or the lower narrowed into petioles, obtuse or obtusish, $\mathbf{I}-4 \mathrm{~cm}$. long; racemes more or less I-sided; pedicels short, stout; calyx-segments lanceolate; corolla blue, about 2 mm . broad; fruit globose-oval, 3 mm . in diameter, the nutlets papillose on the back, the margins with 2 rows of slender prickles. In waste places, N. S. to Br. Col., N. J. and Kans. Nat. from Europe. May-Sept.
7. Lappula Texàna (Scheele) Britton. Hairy Stickseed. (I. F. f. 3022.) Annual, similar to the preceding. Leaves-linear or linear-oblong, mostly obtuse, the lower narrowed into petioles; pedicels short, not deflexed in fruit; flowers about 2 mm . broad; nutlets papillose-tuberculate on the back, the margins armed with a row of flat, usually confluent bristles, or these united into a cup. In dry soil, Manitoba and the N. W. Terr. to Br. Col., Neb., Tex. and Ariz. AprilAug.
8. Lappula Virginiàna (L.) Greene. Virginia Stickseed. (I. F. f. 3023.) Biennial, pubescent; stem $6-12 \mathrm{dm}$. high, the branches spreading. Basal leaves (seldom present at flowering time) ovate to orbicular, cordate, long-petioled; stem leaves ovate-oblong or oval, acute or acuminate, petioled, o.7-2 dm. long, the uppermost smaller, sessile; racemes slender, divergent; pedicels short, deflexed in fruit; corolla nearly white, about 2 mm . broad; fruit nearly 4 mm . in diameter; nutlets covered on the margins and usually also on the back by the slender flattened barbed prickles, the backs commonly also more or less papillose. In dry woods and thickets, N. B. to Ont. and Minn., Ala., La. and Kans. June-Sept.
9. Lappula floribúnda (Lehm.) Greene. Large-flowered Stickseed. (I. F. f. 3024.) Biennial or perennial, rough-pubescent; stem stout, 6-15 dm. high. Leaves oblong to linear-lanceolate, $5-10 \mathrm{~cm}$. long, 4-20 mm. wide, sessile, or the lower narrowed into petioles; racemes erect or nearly so, densely flowered, many of them in pairs; pedicels $4-8 \mathrm{~mm}$. long, deflexed in fruit; flowers blue, $6-10 \mathrm{~mm}$. broad; fruit pyramidal, about 6 mm . broad; nutlets keeled, papillose-tuberculate on the back, the margins armed wlth a row of flat prickles. Western Ont. and Minn. to Br. Col., N. Mex. and Cal. June-Aug.
10. Lappula Americàna (A. Gray) Rydberg. Nodding Stickseed. (I. F. f. 3025.) Annual, rough-puberulent; stem 3-9 dm. high. Leaves oblong or oblonglanceolate, mostly narrowed at both ends, $5-10 \mathrm{~cm}$. long; racemes slender; pedicels slender, $4^{-8} \mathrm{~mm}$. long, deflexed in fruit; corolla white or bluish, about 2 mm . broad; fruit pyramidal; nutlets keeled, papillose-tuberculate on the back, rarely with a few prickles on the keel, the margins armed with a row of flat prickles. In thickets, Manitoba and N. Dak. to Br. Col. May-Aug.

## 4. ALLOCÀRYA Greene.

Mostly annual low herbs, with linear entire leaves, the lowest often opposite, and small flowers in terminal spikes or racemes. Pedicels thickened at the summit, persistent. Calyx 5 -divided, persistent, the segments narrow. Corolla salverform, white, yellow in the throat. Stamens included. Ovary 4-divided; style short. Nutlets crustaceous, attached at their base or below the middle to the receptacle. [Greek, different nuts.] About 25 species, of western N. Am.
I. Allocarya scopulòrum Greene. Mountain Allocaria. (I. F. f. 3026.) Pubescent, with scattered stiff appressed hairs, the slender spreading branches $2-20 \mathrm{~cm}$. long. Leaves $\mathbf{I}-3.5 \mathrm{~cm}$. long, $2-3 \mathrm{~mm}$. wide, sessile or shortpetioled; flowers about 2 mm . broad, distant, borne in most of the axils, shertpedicelled; floral bracts similar to the leaves; calyx-segments linear-lanceolate; nutlets reticulate on the back, lightly grooved on the ventral side. Western Neb. to Mont., Wyo. and Colo. June-Sept.

## 5. CRYPTÅNTHE Lehm.

Low annual setose or hispid herbs, with narrow alternate entire leaves, and small mostly white flowers, in scorpioid spikes. Caly: 5 -parted or 5 -cleft, at length deciduous, the lobes or segments erect, mostly commivent in fruit. Corolla small, funnelform, usually with 5 scales closing the throat, the lobes imbricated in
the bud. Stamens included. Ovary 4 -divided; style short; stigma capitellate. Nutlets erect, rounded on the back, not keeled, attached laterally to the conic or elongated receptacle, the scar of attachment mostly longer than broad. [Greek, hidden-flowered.] About 50 species, natives of Am., mostly of the western U. S.

Nutlets, at least some of them, with short processes.
All four nutlets smooth and shining.
I. C. crassisepala.
2. C. Fendleri.
I. Cryptanthe crassisépala (T. \& G.) Greene. Thick-sepaled Cryptanthe. (I. F. f. 3027.) Densely hispid, $7-15 \mathrm{~cm}$. high. Leaves linear, or linear-spatulate, I-4 cm. long; sessile, or the lower narrowed into petioles; spikes densely flowered; flowers about 4 mm . broad, sessile, bracteolate; fruiting calyx 6 mm . long, closing over the fruit, its segments linear, obtusish, their midribs much thickened; fruit of 3 finely muricate nutlets, and I larger smooth and shining nutlet about 2 mm . long. In dry soil, N. W. Terr. to Neb., Kans., Tex. and N. Mex. June-Aug.
2. Cryptanthe Féndleri (A. Gray) Greene. Fendler's Cryptanthe. (I. F. f. 3028.) Erect, hispid; stem I.5-4 dm. high. Leaves linear, or the lowest linear-spatulate, $2-6 \mathrm{~cm}$. long; spikes slender, bracteolate only at the base; flowers sessile, $2-4 \mathrm{~cm}$. broad; fruiting calyx nearly closed, its segments linear, leaf-like, herbaceous; nutlets 4, all alike, brown, less than 2 mm . long. In dry soil, N. W. Terr. to Wash., Neb. and Ariz. June-Aug.

## 6. OREOCARYA Greene.

Hispid or strigose-pubescent herbs, mostly with thick woody roots, alternate or basal narrow leaves, and small white racemose-paniculate or densely thyrsoid flowers. Calyx deeply 5-parted or 5 -divided, the segments lanceolate, more or less spreading or recurved in fruit. Corolla funnelform or salverform, mostly crested in the throat, 5 -lobed. Stamens included. Ovary 4-divided; style mostly short. Nuthets 4, laterally attached to the receptacle, not keeled, their margins acute or winged. [Greek, mountain nut.] About 9 species, natives of western N. Am. and Mex.

Inflorescence racemose-paniculate; nutlets smooth.

1. O. suffruticosa.

Inflorescence thyrsoid or thyrsoid-glomerate; nutlets rough.
Corolla-tube not longer than the calyx, little longer than the lobes.
Densely rough-hairy, $1.5-4.5 \mathrm{dm}$. high. 2. O. glomerata.
Silvery appressed-pubescent, o.7-1.5 dm. high. 3. O. sericea.
Corolla-tube longer than the calyx, 2 or 3 times as long as the lobes.
4. O. fulvocanescens.
I. Oreocarya suffruticòsa (Torr.) Greene. Shrubby Oreocarya. (I. F. f. 3029.) Perennial, rather stout, strigose-pubescent or somewhat hirsute, 1 - 3 dm . high. Upper leaves linear, $1-2.5 \mathrm{~cm}$. long, the lower oblanceolate, somewhat longer; pedicels about 2 mm . long; calyx canescent and somewhat hispid; bractlets longer than the fruiting calyx; corolla $3-6 \mathrm{~mm}$. broad; nutlets nearly 2 mm . long, shining, closely fitting together, triangular, acute-margined. In dry soil, western Neb. and Wyo. to Tex. and Ariz. May-Aug.
2. Oreocarya glomeràta (Pursh) Greene. Clustered Oreocarya. (I. F. f. 3030.) Perennial or biennial; stem I.5-4.5 dm. high. Leaves spatulate or the upper linear, obtuse, $2-6 \mathrm{~cm}$. long, the basal commonly tufted; inflorescence of thyrsoid clusters, the short dense lateral spike-like clusters mostly longer than the subtending bracts; calyx densely bristly; corolla $6-10 \mathrm{~mm}$. broad; fruit pyramidal, the nutlets triangular-ovate, acute, acutely margined, papillose on the back. In dry soil, Manitoba to the N. W. Terr., Neb., N. Mex. and Utah. May-Sept.
3. Oreocarya serícea (A. Gray) Greene. Low Oreocarya. (I. F. f. 303I.) Perennial, low, tufted; stems $7-15 \mathrm{~cm}$. high. Leaves linear-spatulate, $1-2.5 \mathrm{~cm}$. long, imbricated on the short sterile shoots and at the bases of the flowering stems: inflorescence usually short; calyx densely hispid; corolla $4-6 \mathrm{~mm}$. broad; style short; nutlets acutely margined, acute, papillose on the back. In dry soil, N. W. Terr. to Neb. and Utah. May-Sept.
4. Oreocarya fulvocanéscens (A. Gray) Greene. Tawny Oreocarya. (I. F. f. 3032.) Perennial, similar to the preceding, but densely strigose or hirsute.

Leaves spatulate, or oblanceolate, obtuse, the lower and basal ones $2-4 \mathrm{~cm}$. long; calyx densely setose with yellowish hairs; corolla about 4 mm . broad; styie filiform; nutlets acutely margined, tuberculate on the back. In dry soil, western Neb. (according to Webber); Wyo. to Nev. and N. Mex. May-Aug.

## 7. PNEUMARIA Hill.

A perennial fleshy glabrous glaucous herb, with alternate entire leaves, and small blue pinkish or white flowers in loose terminal leafy-bracted racemes. Calyxlobes triangular-ovate or lanceolate, somewhat enlarging in fruit. Corolla tubularcampanulate, crested in the throat, 5 -lobed, the lobes imbricated in the bud, slightly spreading. Ovary 4 -divided; style slender. Nutlets erect, fleshy, attached just above their bases to the somewhat elevated receptacle, smooth, shining, acutish-margined, becoming utricle-like when mature. A monotypic genus.
I. Pneumaria marítima (L.) Hill. Sea Lungwort. Sea Bugloss. Oyster Plant. (I. F. f. 3033.) Pale green, the branches spreading or ascending, $0.7-4 \mathrm{dm}$. long. Leaves thick, ovate, obovate, or oblong, $2-10 \mathrm{~cm}$. long, the lower and basal ones contracted into margined petioles; flowers blue or nearly white, about 6 mm . long, pedicelled; pedicels slender, $1-3.5 \mathrm{~cm}$. long; calyx shorter than the corolla-tube; nutlets about as long as the calyx-lobes when mature. On seabeaches, L. I. (?); Mass. to Newf. and Greenland; Ore. to Alaska. Also on the coasts of Europe and Asia. May-Sept.

## 8. MERTÉNSIA Roth.

Perennial herbs, with alternate leaves, and rather large clustered blue purple or white flowers. Calyx-lobes lanceolate or linear, little enlarged in fruit. Corolla tubular-funnelform or trumpet-shaped, its lobes obtuse, imbricated, little spreading. Stamens inserted on the tube of the corolla, included, or scarcely exserted; anthers obtuse. Ovary 4-divided; style filiform. Nutlets erect, coriaceous, wrinkled when mature, attached above their bases to the convex or nearly flat receptacle. [In honor of Prof. C. F. Mertens, a German botanist.] About 16 species, of the northern hemisphere. Besides the following some 9 others occur in western N. Am.

Corolla trumpet-shaped, not crested in the throat, the limb barely 5 -lobed.

1. M. Virginica.

Corolla funnelform-campanulate, crested in the throat, the limb manifestly 5 -lobed.

Stem-leaves ovate or ovate-lanceolate, acuminate.
Stem-leaves oblong or lanceolate, obtuse or acute.
2. M. paniculata.
3. M. lanceolata.
I. Mertensia Virgínica (L.) DC. Virginia Cowslip. (I. F. f. 3034.) Glabrous; stem 3-6 dm. high. Leaves oblong, oval, or obovate, obtuse, $5^{-13} \mathrm{~cm}$. long, the lower narrowed into margined petioles; racemes short, corymb-like; flowers blue-purple, showy, about 2.5 cm . long; calyx-lobes oblong-lanceolate, obtusish; corolla-tube cylindric, a little expanded above, longer than the 5 -lobed plaited limb, pubescent at the base within; disk with two opposite linear lobes; filaments filiform, much longer than the anthers. In low meadows and along streams, Ont. to N. J., S. Car., Minn., Neb. and Kans. March-May.
2. Mertensia paniculàta (Ait.) G. Don. Tall Lungwort. (I. F. f. 3035.) Roughish-pubescent, dark green; stem 4-9 dm. high. Leaves thin. pinnately veined, those of the stem $5-13 \mathrm{~cm}$. long, the lower narrowed into slender petioles; basal leaves ovate, rounded or cordate at the base; pedicels filiform, $8-20 \mathrm{~mm}$. long; flowers purple-blue, $\mathbf{1 2 - 1 4} \mathbf{m m}$. long; calyx-lobes lanceolate, acute; corolla-tube about twice as long as the calyx and exceeding the 5 -lobed limb; filaments flattened, slightly longer than the anthers; style filiform, usually somewhat exserted. In woods or thickets, Hudson Bay to Alaska, Mich., Neb., Colo. and Ltah. JulyAug.
3. Mertensia lanceolàta (Pursh) DC. I.ance-Learen Lungifort. (I. F. f. 3036.) Stem slender, r.5-4.5 dm. high. Leaves papillose, indistinctly veined. light green, the upper lanceolate, acute, sessile or slightly clasping at the banc, the lower oblong or oblanceolate, obtuse, $7-10 \mathrm{~cm}$. long, narrowed into maryined petioles; flowers blue, $\mathbf{1 0 - 1 2} \mathbf{~ m m}$. long; pedicels $6-1+\mathrm{mm}$. long; calyx-lohes lanceolate, the tube longer than the calyx and longer than the 5 -lobed limb. hairy at the
base within; filaments a little longer than the anthers; style filiform, scarcely exserted. In thickets, western Neb. to Manitoba, Wyo. and N. Mex. June-Aug.

## 9. ASPERŨGO L.

An annual rough-hispid procumbent herb, with alternate entire leaves, or the uppermost sometimes opposite, and small blue or nearly white flowers, short-pedicelled and $\mathrm{I}-3$ together in the upper axils. Calyx campanulate, unequally 5 -cleft, enlarged and folded together in fruit, the lobes incised-dentate. Corolla tubularcampanulate, 5 -lobed, the lobes imbricated. Stamens 5 , included, inserted on the corolla-tube; filaments short. Style short; stigma capitate. Nutlets 4, ovoid, erect, granular-tuberculate, keeled, laterally attached above the middle to the elongated-conic receptacle. [Latin, rough, referring to the leaves.] A monotypic genus of Europe and Asia.
I. Asperugo procúmbens L. German Madwort. Catchweed. (I. F. f. 3037.) Stems slender, $1.5-4.5 \mathrm{dm}$. long. Leaves oblong, lanceolate, or the lower spatulate, $\mathrm{I}-4 \mathrm{~cm}$. long, the lower narrowed into margined petioles; flowers shortpedicelled, about 2 mm . broad, the pedicels recurved in fruit; fruiting calyx dry and membranous, strongly veined, $8-\mathrm{I} 2 \mathrm{~mm}$. broad. In waste places and ballast, N. Y. to D. C. and Minn. Adventive from Europe. May-Aug.

## ro. MYOSÒTIS L.

Low pubescent herbs, with alternate entire leaves, and small blue pink or white flowers in elongated more or less 1 -sided racemes. Calyx 5 -cleft, the lobes narrow. Corolla salverform, the limb 5 -lobed, the lobes convolute in the bud, rounded, the throat crested. Stamens 5, included, inserted on the corolla-tube; filaments filiform; anthers obtuse. Style filiform. Nutlets erect, attached by their bases to the receptacle, the scar of attachment small, flat. [Greek, mouseear.] About 35 species of wide distribution. Besides the following, I or 2 others occur in southern and western N. Am.

Hairs of the calyx all straight; perennial swamp or brook plants.
Calyx-lobes shorter than the tube; corolla 6-8 mm . broad.
Calyx-lobes as long as the tube; corolla $4^{-6} \mathrm{~mm}$. broad.

1. M. palustris. 2rs 2. M. laxa.
Fruiting pedicels longer than the calyx.
Fruiting pedicels not longer than the calyx. Calyx-lobes equal.

Calyx closed after flowering; corolla yellow, changing to violet or blue.
Calyx open after flowering, corolla blue 4. M. versicolor. Calyx-lobes unequal ; corolla white.

Calyx not nodding in fruit, mostly less than 5 mm . long; seeds I .5 mm . long.
6. M. Virginica.

Calyx nodding or spreading in fruit, 5-7 mm. long; seeds 2 mm . long.
7. M. macrosperma.

1. Myosotis palústris (L.) Lam. Forget-me-not. Mouse-ear Scorpiongrass. (I. F. f. 3038.) Appressed-pubescent, with slender rootstocks or stolons; stems decumbent, $\mathbf{I} .5-5 \mathrm{dm}$. long. Leavcs oblong, oblanceolate or oblong-lanceolate, obtuse, narrowed at the base, $2-8 \mathrm{~cm}$. long; racemes loosely many-flowered; pedicels longer than the calyx; calyx-lobes equal, triangular-ovate, acute, spreading in fruit: corolla blue with a yellow eye; nutlets angled and keeled on the inner side. In brooks and marshes, N. S. to N. Y. and Tenn. Escaped from cultivation. Native of Europe and Asia. May-July.
2. Myosotis láxa Lehm. Smaller Forget-me-not. (I. F. f. 3039.) Similar to the preceding. Leaves oblong, oblong-lanceolate or spatulate, obtuse; racemes very loosely many-flowered; pedicels spreading, much longer than the fruiting calyx; calyx-lobes equal, ovate-lanceolate, acutish, spreading in fruit. quite as long as the tube; corolla blue with a yellow eye, its limb concave, about 4 mm . broad; nutlets convex on both the inner and outer sides. In wet muddy places, Newf. to Ont., Va. and Tenn. Also in Europe. May-July.
3. Myosotis arvénsis (L.) Lam. Field Scorpion-grass. or Mouse-ear. (I. F. f. 3040.) Hirsute-pubescent; stem 1.5-4.5 dm. long. Basal and lower
leaves oblanceolate, obtuse; stem leaves mostly oblong or oblong-lanceolate, narrowed to the sessile base, $1-4 \mathrm{~cm}$. long; calyx-lobes equal, erect, or connivent in fruit, triangular-lanceolate, acute, about as long as the tube; coroila blue or white, the limb concave, $2-3 \mathrm{~mm}$. broad; nutlets convex on the outer side, somewhat keeled on the inner. In fields, N. B. to Ont. and Minn., south to W. Va. Perhaps not indigenous. Also in Europe. June-Aug.
4. Myosotis versícolor (Pers.) Reichenb. Yellow and Blue Scorpiongrass. (I. F. f. 304I.) Annual, hirsute-pubescent, often branched above; stems I-3 dm. high. Leaves oblong, obtuse or obtusish, sessile, or the lower spatulate and narrowed into margined petioles; pedicels erect; calyx-lobes linear-lanceolate, erect or connivent in fruit, longer than or equalling the tube; corolla pale yellow changing to violet or blue, its limb about 2 mm . broad; nutlets convex on the outer, slightly keeled on the inner side. In fields and along roadsides, southern N. Y. to Del. Nat. from Europe. May-July.
5. Myosotis collina Hoffm. Early Myosote. Similar to the two preceding species, usually much branched from the base, rarely over 1.5 dm . high. Leaves oblong, or the lower spatulate, mostly obtuse; pedicels rarely over 2 mm . long, the segments not closed over the fruit. Fields, Me. to Ont., Mass. and N. Y. Adventive from Europe. May-June.
6. Myosotis Virgínica (L.) B.S.P. Spring Scorpion-Grass. (I. F. f. 3042.) Hirsute-pubescent or hispid, o.7-3 dm. high, the branches erect. Leaves oblong or linear-oblong, sessile, $0.6-2.5 \mathrm{~cm}$. long, obtuse, or the lower spatulate and narrowed into short petioles; racemes strict, dense; pedicels ascending or erect, or slightly spreading at the apex, shorter than the fruiting calyx; calyx somewhat 2-lipped, unequally 5 -cleft, the lobes lanceolate, acute, longer than the tube, connivent in fruit, very hispid; corolla limb 3 mm . broad or less; nutlets convex on the back, slightly keeled and margined on the inner side. On dry hills and banks, Me. to Ont., Minn., Ga. and Tex. April-June.
7. Myosotis macrospèrma Engelm. Southern Scorpion-Grass. Similar to M. Virginica, but usually larger, the slender branches ascending or spreading; racemes with comparatively few and distant fruiting calyces; pedicels ascending or recurved, about equalling the fruiting calyx. D. C. to Fla., Ky., Ark. and Tex. April-May.

## II. LITHOSPÉRMUM L.

Pubescent hirsute or hispid herbs, with alternate entire leaves, the flowers in leafy-bracted spikes or racemes. Calyx 5 -parted or 5 -cleft, the segments or lobes narrow. Corolla funnelform or salverform, 5 -lobed, naked, pubescent or crested in the throat, the tube sometimes pubescent at the base within. Stamens 5, included, inserted on the throat of the corolla; filaments short. Stigma capitate, or 2 -lobed. Nutlets 4, or fewer, erect. white, smooth and shining, or brown and wrinkled, attached by their bases to the nearly flat receptacle, the scar of attachment not concave. [Greek, stone-seed, from the hard nutlets.] About 40 species, of the northern hemisphere, a few in S. Am. and Africa. Besides the following, some 7 others occur in the southern U. S.

Corolla white or yellowish, its tube shorter than or equalling the calyx ; flowers distant.

Nutlets brown, wrinkled and pitted; annual or biennial.
Nutlets white, smooth and shining; perennials.
Leaves lanceolate, acute; nutlets ovoid. 2. L. officinale. Leaves ovate, acuminate; nutlets globose-ovoid. 3. L. latifolium.
Corolla dull yellow, its tube longer than the calyx; leaves lanceolate; flowers dense.
4. L. pilosum.

Corolla bright yellow, its tube much longer than the calyx; flowers dense.
Corolla-lobes entire; flowers all complete.
Hispid-pubescent; corolla-tube bearded at the base within. 5. L. Gmelini.
Hirsute, somewhat canescent; corolla-tube not bearded at the base within.
6. L. canescens.

Corolla-lobes erose-denticulate; later flowers cleistogamous.
7. L. lincarifolium.

1. Lithospermum arvénse L. Bastard Aikinet. Corn Gromiweli.. (I. F. f. 3043.) Appressed-pubescent. 1.55 dm. high. Leaves bright green, lanceolate, linear or linear-oblong, sessile or the lowest short-petioled, mostly ap-
pressed, narrowed at the base, indistinctly veined, $1-4 \mathrm{~cm}$. long, the uppermost smaller; flowers sessile or nearly so, white, about 6 mm . long; calyx-segments linearlanceolate, longer than or equalling the corolla-tube; corolla funnelform, puberulent in the throat; nutlets glabrous, about 2 mm . high, convex on the back, keeled on the inner side, one-third to one-half the length of the calyx-segments. In waste places and fields, Quebec to Ont., Mich., Ga. and Kans. Nat. from Europe. May-Aug.
2. Lithospermum officinàle L. Gromwell. (I. F. f. 3044.) Finely puberulent; stem 6-12 dm. high, leafy. Leaves few-veined, sessile, $3-10 \mathrm{~cm}$. long, the upper surface rough; flowers yellowish white, about 4 mm . long, sessile; calyx-segments linear-lanceolate, about equalling the corolla-tube; corolla funnelform, crested in the throat; style about as long as the stamens; nutlets about 3 mm . high, ovoid, obtuse, seldom all ripening. In fields and waste places, Ont. to N. Y., west to Minn. Nat. from Europe. May-Aug.
3. Lithospermum latifolium Michx. American Gromwell. (I. F. f. 3045.) Rough-puberulent; stem 6-9 dm. high, the branches long and slender. Leaves pinnately veined, $5-13 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide, or the uppermost smaller; flowers yellowish white or pale yellow, 4-6 mm. long, few; calyx-segments linearlanceolate, about as long as the corolla; corolla funnelform, crested in the throat; style shorter than the stamens; nutlets globose-ovoid, about 4 mm . long. In dry thickets and fields, Ont. and western N. Y. to Minn., Va., Kans. and Ark. May.
4. Lithospermum pilòsum Nutt. Woolly Gromwell. (I. F. f. 3046.) Perennial from thick roots, hirsute; stems usually clustered, very leafy, $2-4 \cdot 5 \mathrm{dm}$. high. Leaves $5-10 \mathrm{~cm}$. long, 4-10 mm. wide, gradually acuminate, sessile, indistinctly veined; flowers crowded in a terminal leafy thyrsus; calyx-segments densely hirsute, shorter than the cylindric corolla-tube; corolla salverform, the throat puberulent below each lobe; style longer than the filaments; nutlets ovoid, acute, white, shining, about 4 mm . long. Western Neb. (according to Williams); Mont. to the N. W. Terr., Br. Col. and Cal. May-July.
5. Lithospermum Gmélini (Michx.) A. S. Hitchcock. Hairy Puccoon. (I. ․ F. f. 3047.) Perennial, hispid-pubescent, or scabrous; stems rather stout, 3-6 dm. high, very leafy. Leaves lanceolate, sessile, $5-8 \mathrm{~cm}$. long, the lowest commonly reduced to appressed scales, the uppermost oblong; flowers $12-18 \mathrm{~mm}$. long, in short terminal leafy racemes, dimorphous; calyx-segments linear-lanceolate; corolla salverform; corolla-lobes rounded, the throat crested, the tube bearded at the base within by 10 hirsute teeth; nutlets white, shining, about 4 mm . high, ovoid, much shorter than the calyx-segments. In dry woods, N. Y. to Fla., Minn., Mont., Colo. and N. Mex. April-June.
6. Lithospermum canéscens (Michx.) Lehm. Hoary Puccoon. (I. F.f. 3048.) Perennial, hirsute, canescent at least when young; stems 1.5-4.5 dm. high. Leaves oblong, linear-oblong, or linear, sessile, $1-4 \mathrm{~cm}$. long, the lowest often reduced to appressed scales; flowers about 12 mm . long, sessile, numerous in short leafy racemes, dimorphous; calyx-segments linear-lanceolate; corolla salverform, crested in the throat, its lobes rounded, entire, its tube glandular within; nutlets white, smooth, shining, acutish. much shorter than the calyx-segments. In dry soil, Ort. to N. J., Ala., the N. W. Terr., Kans. and Ariz. April-June.
7. Lithospermum linearifolium Goldie. Narrow-leaved Puccoon. (I. F. f. 3049.) Perennial by a deep root, strigose-pubescent and scabrous; stem 1.5-6 dm. high. Leaves linear, sessile, acute or acutish, $1-5 \mathrm{~cm}$. long; flowers of two kinds, in terminal leafy racemes; corolla of the earlier ones salverform, about 2.5 cm . long, bright yellow, the tube $3-5$ times as long as the linear-lanceolate calyx-segments, the lobes erose-denticulate, the throat crested; later flowers (sometimes all of them) much smaller, pale yellow, cleistogamous, abundantly fertile, their pedicels recurved in fruit; nutlets white, smooth, shining, ovoid, $3-4 \mathrm{~mm}$. high, pitted, keeled on the inner side. In dry soil, Manitoba to Ill., Kans., Tex., Br. Col., Utah and Ariz. April-July. [L. angustifolium Michx., not Forsk.]

## 12. ONOSMODIUM Michx.

Perennial stout hispid or hirsute herbs, with alternate entire strongly veined leaves, and rather small yellowish or greenish white proterogynous flowers, in
terminal leafy-bracted scorpioid spikes or racemes. Calyx deeply 5-parted. Corolla tubular or tubular-funnelform, 5 -lobed, the lobes erect, the sinuses slightly inflexed, the tube with a glandular Io-lobed band within at the base. Stamens 5, inserted on the corolla, included; filaments short. Ovary 4-parted; style filiform, exserted. Nutlets 4, or commonly only I or 2 perfecting, ovoid, sometimes sparingly pitted, shining, smooth, white, attached by the base to the nearly flat receptacle, the scar of attachment small, flat. [Greek, like onosma, or ass-smell.] About 6 species, of N. Am. and Mex. Besides the following, 2 others occur in the southwestern U. S.
Leaves acute; stem hirsute.
Plant green; hairs long and shaggy; nutlets ovoid, 3 mm . long. 1. O. Carolinianum. Plant pale; hairs shorter and soft; nutlets ovoid-globose, 4 mm . long.
2. O. molle.

Leaves obtuse; stem appressed-hispid.
3. O. Virginianum.
I. Onosmodium Caroliniànum (Lam.) DC. Shaggy False Gromwell.
(I. F. f. 3050.) Spreading-hirsute with bristly hairs; stem 3-9 dm. high. Leaves lanceolate, ovate-lanceolate or oblong, sessile, $5-9$-ribbed, $5-12 \mathrm{~cm}$. long; flowers numerous and crowded; pedicels 2-4 mm. long in fruit; calyx-segments linear, acute; corolla pubescent outside, about $\mathbf{I} \mathrm{cm}$. long, its lobes triangular-lanceolate, acute, about one-half as long as the tube; nutlets obtuse. In dry fields or thickets, or on banks, Ont. and western N. Y. to Minn., Kans., south to Ga. and Tex. May-July.
2. Onosmodium mólle Michx. Soft-hairy False Gromwell. (I. F. f. 3051.) Similar to the preceding, but usually lower, 3-6 dm. high, canescent, at least when young, the pubescence soft and shorter, that of the leaves appressed. Leaves smaller, ovate-lanceolate; corolla-lobes usually less than one-half the length of the tube; nutlets larger. On plains, Manitoba and the N. W. Terr. to Ill., Kans., Tex. and Utah. May-July.
3. Onosmodium Virginiànum (L.) DC. Virginia False Gromwell. (I. F. f. 3052.) Appressed-hispid with stiff hairs; stem 3-8 dm. high. Leaves oblong, oval, or oblong-lanceolate, sessile, $2-8 \mathrm{~cm}$. long, or the lower oblanceolate, acutish and narrowed into petioles; calyx-segments linear-lanceolate, acuminate; corolla cylindric or nearly so, about 8 mm . long, the lobes lanceolate, acuminate, nearly as long as the tube, strigose without; nutlets ovoid, obtuse or obtusish, $2-3 \mathrm{~mm}$. long. In thickets or on hillsides, N. Eng. to Fla., Kans. and Tex. May-July.

## 13. SÝMPHYTUM L.

Erect rough hairy perennial herbs, with mucilaginous roots, alternate entire leaves, the uppermost tending to be opposite, the lower long-petioled. Flowers yellow, blue, or purple, in terminal scorpioid racemes. Calyx deeply 5 -cleft. Corolla tubular to campanulate, slightly dilated above, 5 -lobed, the lobes short, the throat with 5 crests below the lobes. Stamens 5, included, inserted on the corollatube. Style filiform. Nutlets 4, obliquely ovoid, wrinkled, inserted by their bases on the flat receptacle, the scar of the attachment broad, concave, dentate. [Greek, grow-together, from its supposed healing virtues.] About 15 species, of the Old World.

Pilose-pubescent.
Stem bristly-papillose.

1. S. officinale.
2. S. asperimum.
3. Symphytum officinàle L. Comfrey. Healing-herb. (I. F. f. 3053.) Roots thick, deep; stem 6-9 dm. high. Leaves lanceolate, ovate-lanceolate, or the lower ovate, pinnately veined, $0.7-2.5 \mathrm{dm}$. long, acute or acuminate; pedicels 4-8 mm. long: calyx-segments ovate or ovate-lanceolate, acute or acuminate, much shorter than the corolla; corolla yellowish or purplish, $1-2 \mathrm{~mm}$. long; nutlets brown. shining, 4 mm . high. In waste places, Newf. to Minn., south to Md. Nat. or adventive from Europe. June-Aug.
4. Symphytum aspérimum Sims. Rough Comfrey. Similar to the preceding, but the stem and branches very rough-bristly. Leaves ovate to ovatelanceolate, rough; calyx-segments subulate. In waste places, N. 1. and Mass. Summer. Adventive from Europe.

## 14. BORÀGO L.

Hirsute or hispid annual or biennial herbs, with alternate entire leaves, and showy blue flowers, in terminal loose leafy racemes. Calyx deeply 5 -cleft or 5 -parted. Corolla rotate, the tube short, the throat closed by scales, the limb 5 -lobed, the lobes imbricated, acute. Stamens 5, on the corolla-tube; filaments dilated below, narrowed above into a slender appendage; anthers linear, erect, and connivent into a cone. Nutlets 4, ovoid, erect, attached by their bases to the flat receptacle, the scar of attachment large, concave. [Middle Latin, burra, rough hair, alluding to the foliage.] Three species, natives of the Mediterranean region.
4. Borago officinàlis L. Borage. (I. F. f. 3054.) Stem 3-8 dm. high. Leaves oblong to obovate, $5-13 \mathrm{~cm}$. long, narrowed into margined petioles, or the upper smaller, ovate-lanceolate, sessile or partly clasping; flowers $1.5-2 \mathrm{~cm}$. broad; pedicels $3-5 \mathrm{~cm}$. long, spreading or recurving; calyx-segments lanceolate, nearly erect in fruit; corolla-lobes ovate-lanceolate, the cone of anthers darker, about 6 mm . long; nutlets 4 mm . high. In waste places, escaped from gardens, N. S. to Ont. and Penn. Native of Europe. June-Sept.

## 15. LYCÓPSIS L.

Annual bristly-hispid herbs, with alternate leaves, and small blue or bluish flowers, in leafy-bracted terminal spike-like scorpioid racemes. Calyx 5-parted. Corolla slightly irregular, salverform, the tube curved, the limb somewhat unequally 5 -lobed, the lobes obtuse, imbricated, the throat closed by hispid scales. Stamens 5, included, on the tube of the corolla; filaments short; anthers obtuse at each end. Nutlets 4, wrinkled, erect, attached by their bases to the flat receptacle, the scar of attachment concave. [Greek, wolf-face.] About 4 species, natives of the Old World.
I. Lycopsis arvénsis L. Small Bugloss. (I. F. f. 3055.) Stem 3-6 dm. high, the branches becoming procumbent. Leaves lanceolate, narrowly oblong or the lower oblanceolate, obtuse, $2-5 \mathrm{~cm}$. long, undulate or dentate, sessile, or the lower narrowed into petioles, the upper much smaller and acute or acutish; flowers 4-6 mm. broad; calyx-segments lanceolate, acute, nearly as long as the curved corolla-tube. In fields and waste places, N. S. to Ont., Penn. and Va. Nat. or adventive from Europe. June-Sept.

## 16. ÉCHIUM L.

Mostly bristly-hirsute herbs, with alternate leaves, and rather large blue violet or rarely white flowers, in leafy-bracted scorpioid spikes. Calyx 5-parted, the segments narrow. Corolla tubular-funnelform, the limb unequally 5 -lobed, the lobes rounded, spreading. Stamens 5, inserted low down on the tube of the corolla, unequal, at least the longer ones exserted; filaments dilated at the base; anthers ovate or oblong. Style filiform, 2 -cleft at the summit. Nutlets 4 , erect, ovoid, rugose, attached by their bases to the flat receptacle. [Greek, a viper.] About 30 species, natives of the Old World.
I. Echium vulgàre L. Viper's Bugloss. Blueweed. (I. F. f. 3056.) Bristly-hairy, biennial; stem 3-8 dm. high. Leaves oblong, linear-oblong, or linear-lanceolate, entire, $5-15 \mathrm{~cm}$. long, sessile, or the lower and basal ones narrowed into petioles; flowers bright blue, varying to violet-purple, $\mathbf{1 . 5 - 2 . 5} \mathbf{~ c m}$. long, numerous in short I-sided spikes, forming a narrow thyrsus. In fields and waste places, N. B. to Va., Ont. and Neb. Nat. from Europe. June-July.

## Family 6. VERBENACEAE J. St.Hil.

## Vervain Family.

Herbs, shrubs or some tropical genera trees, with opposite verticillate or rarely alternate leaves, and perfect irregular, or sometimes regular flowers, in spikes, racemes, cymes or panicles. Calyx inferior, mostly persistent, usually $4-5$-lobed or $4-5$-cleft. Corolla regular, or 2 -lipped, the tube usually cylindric and the limb 4-5-cleft. Stamens 4 , didynamous, rarely only 2 , or as many as the corolla-lobes, inserted on the corolla and alternate with its lobes; anthers 2 -celled, the sacs
longitudinally dehiscent. Ovary superior, 2-4-celled (rarely 8-io-celled), composed of 2 carpels, each carpel with 2 anatropous or amphitropous ovules, thus in 4 -celled ovaries i ovule in each cavity; style terminal; stigmas I or 2. Fruit dry, separating at maturity into $2-4$ nutlets, or a drupe containing the $2-4$ nutlets. Endosperm little or none, or rarely fleshy; embryo straight. About 70 genera and 1200 species, of wide geographic distribution.
Flowers in heads or spikes; ovary $2-4$-celled; fruit of 2 or 4 erect nutlets; ours herbs.

Corolla-limb 5 -lobed, regular or nearly so; nutlets 4 . Corolla-limb 4-lobed, 2 -lipped; nutlets 2 .
Flowers in axillary cymes; shrubs; fruit drupaceous.

1. Verbena.
2. Lippia.
3. Callicarpa.

## 1. VERBÈNA L.

Herbs (some exotic species shrubby), mostly with opposite leaves, and bracted flowers, in terminal spikes. Calyx usually tubular, 5 -angled, unequally 5 -toothed. Corolla salverform or funnelform, the limb spreading. Connective of the anthers unappendaged, or sometimes provided with a gland. Ovary 4-celled; ovule I in each cavity; style usually short, 2 -lobed at the summit, one of the lobes stigmatic. Fruit mostly enclosed by the calyx, at length separating into 4, I-seeded linear or linear-oblong crustaceous nutlets. [Latin name of a sacred herb.] About Ioo species, natives of Am., or a single one indigenous in the Mediterranean region. Besides the following, some 13 others occur in the southern and western parts of N. Am.
Flowers 4-10 mm. long, in narrow spikes; anthers unappendaged.
Spikes filiform or slender; bracts shorter than the flowers.
Spikes filiform; fruit scattered; corolla usually white.
Leaves incised or pinnatifid; diffuse annual; fruit short.

1. $V$. officinalis.

Leaves serrate (rarely incised); erect perennial; fruit oblong.
2. V. urticifolia. Spikes slender; fruits densely imbricated; corolla blue.

Plants glabrous or sparingly rough-pubescent; corolla 4-6 mm. long. Leaves lanceolate, acuminate, petioled.
Leaves linear to spatulate-lanceolate, mostly obtuse and sessile. Leaves linear to spatulate-lanceolate, mostly obtuse and sessile. 4. V. angustifolia.

Plants densely soft-pubescent; corolla 8 -1o mm. long. Spikes thick, dense; bracts longer than the flowers. 5. V. . stricta. Flowers $1^{-25} \mathrm{~mm}$. long, in short dense elongating spikes; connective of the longer stamens appendaged.
Corolla-limb ${ }_{12-20} \mathrm{~mm}$. broad; bracts mostly shorter than the calyx.
7. V. Canadensis.

Corolla-limb 8-10 mm. broad; bracts equalling or exceeding the calyx.
8. V. bipinnatifida.

1. Verbena officinàlis L. European Vervain. Herb-of-the-Cross. BERBINE. (I. F. f. 3057.) Stem 4 -sided, glabrous or nearly so, diffusely branched, 3-9 dm. high. Leaves minutely pubescent, the lower deeply incised or I-2 pinnatifid, ovate, oblong, or obovate, $2-8 \mathrm{~cm}$. long, narrowed into margined petioles, the teeth acute; upper leaves linear or lanceolate, acute, entire, sessile; spikes filiform, at length $10-13 \mathrm{~cm}$. long; fruits less than 2 mm . high, scattered; bracts ovate, acuminate; corolla purplish or white, the limb $2-4 \mathrm{~mm}$. broad. In waste and culivated ground, Me. to Fla. and Tex. Also on the Pacific Coast. Nat. from the Old World. June-Sept.
2. Verbena urticifòlia L. Wiite or Nettle-lfayei) Vervain. (I. F. f. 3058.) Usually pubescent; stem strict, 4 -sided, $9-15$ dm. high, the branches upright. Leaves ovate, oblong, or oblong-lanceolate, all petioled, or the uppermost sessile, serrate-dentate, thin, acute or acuminate, $3-13 \mathrm{~cm}$. long; spikes tiliform, at length $\mathrm{I}-\mathrm{I} .5 \mathrm{dm}$. long; fruits oblong, about 2 mm . high; bracts ovate, acuminate; corolla white or pale purple, its limb about 2 mm . broad. In fields and waste places, N. B. to S. Dak., Kans., Fla. and Tex. Hybridizes with V. bracteosa, $V$. hastata and $V$. stricta. June-Sept.

Verbena urticifòlia ripària (Raf.) Britton. Leaves incised, sometimes 3-cleft near the base; flowers blue. River-banks, N. J. to N. Car.
3. Verbena hastàta L. Blue Vervain. Wild Hyssop. (I. F. f. 3059.) Perennial, roughish-puberulent; stem strict, 4-sided, 9-22 dm. high. Leaves oblonglanceolate or lanceolate, petioled, acute or acuminate, serrate or incised-dentate with acute teeth, $0.7-\mathrm{I} .5 \mathrm{~cm}$. long, the lower sometimes hastately 3 -lobed at the base; spikes panicled, slender, usually peduncled, $5-15 \mathrm{~cm}$. long; fruits $2-3 \mathrm{~mm}$. high; bracts ovate, acuminate; corolla blue, its limb about 3 mm . broad. In moist fields, meadows and in waste places, N. S. to Br. Col., Fla., Neb. and N. Mex. Hybridizes with $V$. stricta and $V$. bracteosa. June-Sept.

Verbena hastàta pinnatífida (Lam.) Britton. Leaves deeply incised or pinnatifid. Occasional in the range of the type.
4. Verbena angustifòlia Michx. Narrow-leaved Vervain. (I. F. f. 3060.) Perennial, roughish-puberulent or pubescent; stem slender, 4 -sided above, 3-6 dm. high. Leaves linear, spatulate or lanceolate, cuneate at the base, serrate or serrulate, veiny, $3-8 \mathrm{~cm}$. long, 4-10 mm . wide; spikes mostly solitary, slender, dense, $5-13 \mathrm{~cm}$. long; fruits 3 mm . high; bracts lanceolate, acuminate, equalling or shorter than the calyx; corolla purple or blue, about 6 mm . long. In dry fields, Mass. to Fla. to Minn., Kans. and Ark. Hybridizes with V. stricta and V. bracteosa. June-Aug.
5. Verbena strícta Vent. Hoary or Mullen-leaved Vervain. (I. F. f. 3061.) Perennial, soft-pubescent; stem obtusely 4 -angled, strict, very leafy, $3-8 \mathrm{dm}$. high. Leaves ovate, oval, or oblong, short-petioled, prominently veined, incised-serrate or laciniate, $2-10 \mathrm{~cm}$. long; spikes mostly sessile, dense, becoming I. 5-3 dm. long in fruit; fruits $4-5 \mathrm{~mm}$. high; bracts lanceolate-subulate, nearly as long as the calyx; corolla purplish blue. In dry soil, Ohio to Minn., S. Dak., Wyo., Tenn., Tex. and N. Mex. Nat. as a weed further east. Hybridizes with V. bracteosa. June-Sept.
6. Verbena bracteòsa Michx. Large-bracted Vervain. (I. F. f. 3062.) Perennial, hirsute-pubescent; stem 4 -sided, the branches decumbent or ascending, slender, 1.5-4 dm. long. Leaves ovate, oval, or obovate in outline, pinnately incised or pinnatifid, $2-8 \mathrm{~cm}$. long, the lobes mostly dentate; spikes sessile, stout, becoming $\mathbf{1}-1.5 \mathrm{dm}$. long in fruit; bracts conspicuous, linear-lanceolate, rather rigid, the lower ones often incised; corolla purplish blue, about 4 mm . long. On prairies and in waste places, Minn. and Ill. to Ala. and Fla., Br. Col., Ariz. and Cal. Hybridizes with $V$. Canadensis. May-Aug.
7. Verbena Canadénsis (L.) Britton. Large-flowered Verbena. (I. F. f. 3063.). Perennial; stem slender, $2-4 \mathrm{dm}$. high, the branches ascending. Leaves ovate in outline, petioled, $2-8 \mathrm{~cm}$. long, truncate or broadly cuneate at the base, irregularly pinnately incised, often 3 -cleft, the lobes dentate; spikes peduncled, solitary at the ends of the branches, becoming $5-10 \mathrm{~cm}$. long in fruit; bracts linearsubulate; calyx-teeth filiform-subulate; corolla $2-2.5 \mathrm{~cm}$. long, blue, purple, white or in cultivation variegated; fruit 5-6 mm. high. In dry soil, Ill. to Tenn., Fla., Kans., Mex. and N. Mex. This and the next the source of many garden and other hybrids. May-Aug.
8. Verbena bipinnatífida Nutt. Small-flowered Verbena. (I. F. f. 3064.) Perennial, producing suckers, hirsute or hispid; stems erect, 1.5-4.5 dm. high. Leaves petioled or the uppermost sessile, broadly ovate in outline, deeply r-2-pinnatifid into linear or linear-oblong lobes and segments; spikes solitary at the ends of the branches, thick, dense, becoming 5-10 cm . long in fruit; calyxteeth filiform-subulate; corolla $\mathbf{1 2 - 1 8} \mathrm{mm}$. long, purple or lilac; fruit $3-4 \mathrm{~mm}$. high. On dry plains and prairies, S. Dak. to Tex., Chihuahua, Colo. and Ariz. May-Sept.

## 2. LÍPPIA L.

Perennial herbs, or shrubs, with opposite, or rarely alternate leaves, and small bracted flowers, in spikes or heads. Calyx small, ovoid, campanulate or compressed and 2 -winged, 2-4-toothed or 2-4-cleft. Corolla-tube cylindric, the limb oblique, somewhat 2 -lipped, 4 -cleft. Stamens 4, didynamous; anthers ovate, not appendaged, the sacs nearly parallel. Ovary 2 -celled; ovules 1 in each cavity;
style short; stigma oblique or recurved. Fruit dry, with a membranous exocarp, at length separating into 4 nutlets. [Named in honor of Auguste Lippi, 16781703, a French naturalist.] About 100 species, most abundant in tropical Am. Besides the following, about 6 others occur in the southern U. S.

Leaves spatulate, $2-8$-toothed above; peduncles little exceeding the leaves.

\author{

1. L. cuneifolia.
}

Leaves sharply serrate; peduncles much longer than the leaves.
Leaves oblong or lanceolate, mostly acute.
2. L. lanceolata.

Leaves spatulate or obovate, mostly obtuse.
3. L. nodiflora.

1. Lippia cuneifòlia (Torr.) Steud. Wedge-leaved Fog-Fruit. (I. F. f. 3065.) Pale, minutely puberulent, or glabrous, diffusely branched from the woody base; branches rigid, procumbent, somewhat zigzag. Leaves sessile, obscurely veined, rigid, $2-4 \mathrm{~cm}$. long, with $2-8$ sharp teeth above the middle or rarely entire, acutish; head becoming cylindric and $12-16 \mathrm{~mm}$. long; bracts cuneate, abruptly acuminate; calyx-lobes 2 -toothed or emarginate; corolla-tube longer than the calyx; fruit oblong. On plains, S. Dak., Neb. and Colo. to Tex., Mex. and Ariz. May-Aug.
2. Lippia lanceolàta Michx. Fog-fruit. (I. F. f. 3066.) Green, glabrous, or sparingly pubescent with forked hairs; stems slender, procumbent or ascending, sometimes rooting at the nodes, 3-6 dm. long. Leaves thin, oblong, ovate, or oblong-lanceolate, pinnately veined, short-petioled, acute or subacute, sharply serrate to below the middle, $2-8 \mathrm{~cm}$. long, $0.6-3 \mathrm{~cm}$. wide; heads becoming cylindric and about 12 mm . long in fruit; bracts acute; corolla pale blue, scarcely longer than the calyx; fruit globose. In moist soil, N. J. to Ill., Kans., Fla., Tex. and Mex. Also in Cal. June-Aug.
3. Lippia nodiflora (L.) Michx. Spatulate-leaved Fog-fruir. (I. F. f. 3067.) Minutely and rather densely puberulent, creeping, or the branches ascending, 3-9 dm. long. Leaves thickish, spatulate, oblanceolate, or obovate, $1-6 \mathrm{~cm}$. long, o. $6-2.5 \mathrm{~cm}$. wide, mostly obtuse, narrowed into a cuneate entire base, sharply serrate above the middle; heads at length cylindric and $\mathbf{I}-2.5 \mathrm{~cm}$. long; corolla purple to white. In wet or moist soil, S. Car. to Mo., Fla. and Tex. Also in Cal., Cent. Am. and the W. Indies. May-Sept.

## 3. CALLICARPA L.

Shrubs or trees, with opposite leaves, and small blue purple or white flowers in axillary cymes. Calyx short, campanulate, 4 -toothed (rarely 5 -toothed), or truncate. Corolla-tube short, expanded above, the limb 4 -cleft (rarely 5 -cleft), the lobes equal. Stamens 4, equal, exserted; anther-sacs parallel. Ovary incompletely 2 -celled; ovules 2 in each cavity, laterally attached, amphitropous; style slender; stigma capitate, or 2-lobed. Fruit a berry-like drupe, much longer than the calyx, containing I-4 nutlets. [Greek, handsome fruit.] About 35 species, the following of southeastern N. Am., the others Asiatic, African and of tropical Am.

1. Callicarpa Americàna L. French Mulberry. (I. F. f. 3068.) A shrub, $6-15 \mathrm{dm}$. high, the twigs, petioles and young leaves stellate-scurfy, the mature leaves glabrous or nearly so, and glandular-dotted. Twigs terete; leaves thin, ovate, slender-petioled, acute or acuminate, crenate-dentate, 7-15 cm. long; cymes many-flowered, short-peduncled; pedicels very short; calyx-teeth much shorter than the tube; corolla pale blue, about 3 mm . long; fruit violet-blue, globose, 3 mm . in diameter. In moist thickets, Va. to Fla., Ala., Ark. and Tex. June-July.

Family 7. LABIATAE B. Juss.
Mint Family.
Aromatic punctate herbs, or shrubs (a few tropical species trees), mostly with 4 -sided stems and simple opposite leaves ; stipules none. Flowers irregular, perfect, clustered, the inflorescence typically cymose, usually bracteolate. Calyx inferior, persistent, 5 -toothed or 5 -lobed (rarely 4 -toothed), mostly nerved. Cornlla with a short or long tube,
the limb 4-5-lobed, mostly 2-lipped, regular in a few genera; upper lip 2-lobed, or sometimes entire ; lower lip mostly 3-lobed. Stamens borne on the corolla-tube, typically 4 and didynamous, sometimes 2 , rarely equal; filaments separate, alternate with the corolla-lobes; anthers 2-celled, introrse, or confluently i-celled, or sometimes of a single sac. Disk usually present, fleshy. Ovary 4-lobed, or 4-parted, superior, each lobe or division with I mostly anatropous ovule; style arising from the centre of the lobed or parted ovary, 2 -lobed at the summit. Fruit of 4 i-seeded nutlets. Seed erect (transverse in Scutellaria); endosperm scanty, or none ; embryo mostly straight ; radicle short, inferior. About 160 genera and 3000 species, of wide distribution. The family is also known as Lamiaceae.

## A. Ovary 4 -lobed, the style not basal; nutlets laterally attached.

Corolla-limb very irregular, apparently r -lipped, or the other lip very short; stamens exserted.
Upper lip of corolla short, truncate. I. Ajuga.
Upper lip of corolla 2 -lobed, or all the lobes united into the lower lip.
2. Teucrium.

Corolla-limb nearly equally 5 -lobed.
Corolla-lobes spreading; stamens short-exserted. 3. Isanthus.
Corolla-lobes declined; stamens long-exserted.
4. Trichostema.

## B. 0vary 4-parted, the style basal; nutlets basally attached.

* Calyx with a protuberance on the upper side.

5. Scutellaria. ** Calyx not gibbous on the upper side.
Stamens and style very short, included in the corolla-tube.
6. Marrubium.

Stamens longer, not included in the corolla tube.
$\dagger$ Corolla strongly 2 -lipped; lips unlike, the upper concave.
(a) Anther-bearing stamens 4 .

Posterior (upper) pair of stamens longer than the anterior.
Anther-sacs parallel or nearly so.
Tall erect herbs; posterior stamens declined, anterior ascending.
7. Agastache.

Trailing herb; stamens all ascending under upper lip of corolla.
8. Meehania.

Anther-sacs divergent.
Calyx tubular, nearly equally 5 -toothed, not 2 -lipped; plant erect.
9. Nepeta.

Calyx distinctly 2-lipped, or unequally 5 -toothed.
Trailing herb; calyx unequally 5 -toothed.
Erect herbs; calyx 2 -lipped.
Posterior pair of stamens shorter than the anterior.
Calyx distinctly 2 -lipped, closed in fruit.
Calyx 3 -Io-toothed, not distinctly 2 -lipped, open in fruit.
Calyx membranous, inflated in fruit, faintly nerved.
Calyx nearly equally 5 -toothed, or 5 -lobed. 13. Physostegia.
Calyx 4-lobed.
10. Glecoma.
iv. Dracocephalum.
12. Prunella.
14. Synandra.
14. Syna
15. Phlomis.
(6.

Style-branches very unequal.
16. Galeopsis.
16. Gale
Anther-sacs transversely 2 -valved.
Anther-sacs not transversely 2-valved, parallel or divergent.

Nutlets 3 -sided, truncate.
Calyx-teeth not spiny-tipped. 18. Lamium.
Calyx-teeth spiny-tipped.
17. Leonurus.

Nutlets ovoid, rounded above.
Calyx with a spreading 5 -toothed limb. Ig. Ballota.
Calyx-limb not spreading.
Corolla-tube not longer than the calyx; anther-sacs divergent. 20. Stachys.
Corolla-tube exserted; lower petioles very long; anthersacs parallel. 21. Betonica.
(b) Anther-bearing stamens 2.

Connective of the anther very long, bearing a perfect sac at one end, and a rudimentary one, or none, at the other.
22. Salvia.

Connective very short, the anther-sacs confluent.
Calyx tubular, 15 -nerved, equally 5 -toothed.
Calyx ovoid-tubular, r3-nerved, 2 -lipped.
23. Monarda.
24. Blephilia.
$\dagger \dagger$ Corolla 2 -lipped, or regular; upper lip, when present, flat, or only slightly concave.
(a) Flowers in axillary whorls or clusters, or these forming terminal spikes.

Corolla 2-lipped.
Stamens curved, often converging, or ascending under the upper lip of the corolla.
Anther-bearing stamens 2.
25. Hedeoma.

Anther-bearing stamens 4 .
Corolla-tube upwardly curved, exserted. 26. Melissa.
Corolla-tube straight.
Calyx ro-nerved, campanulate, about equally 5 -toothed.
27. Satureia.

Calyx mostly 13 -nerved, tubular, 2 -lipped.
Stamens straight, often diverging.
Calyx 15-nerved.
28. Clinopodium.

Calyx so-f 3 -nerved.
Anther-bearing stamens 4 .
Anther-sacs divergent.
Calyx equally 5 -toothed; erect herbs. 30. Origanum. Calyx 2-lipped, creeping herbs.
Anther-sacs parallel.
Anther-bearing stamens 2.
Corolla regular, $4-5$-lobed.
Anther-bearing stamens 2; plants not aromatic. 34. Lycopus. Anther-bearing stamens 4 ; aromatic fragrant herbs. 35. Mentha.
(b) Flowers in terminal panicled racemes or spikes; corolla 2-lipped.

Anther-bearing stamens 2; lower lip of corolla long, fimbriate; native.
36. Collinsonia.

Anther-bearing stamens 4 ; lower lip of corolla not fimbriate; introduced.
Flowers racemose. 37. Perilla.
Flowers densely spiked.
38. Elsholtzia.

## I. ÁJUGA L.

Herbs, mostly with dentate leaves, and rather large verticillate-clustered flowers in terminal spikes, or in the upper axils. Calyx 10-many-nerved, 5 -toothed or 5 -lobed, the teeth or lobes nearly equal. Corolla-limb 2-lipped, the upper lip short, the lower spreading, with 2 small lateral lobes and a much larger emarginate or 2 -cleft middle one. Stamens 4, didynamous, the anterior pair the longer; anthersacs divergent, only slightly confluent at the base. Nutlets obovoid, rugose-reticulate. [Greek, without a yoke; from the seeming absence of the upper lip of the corolla.] About 40 species, natives of the Old World.

1. Ajuga réptans L. Bugle. (I. F. f. 3069.) Perennial, producing slender stolons; stem erect, I.5-4 dm. tall. Basal leaves tufted, obovate, rounded at the apex, crenate or undulate, $2-8 \mathrm{~cm}$. long, tapering into margined petioles; leaves of the stem oblong or oblanceolate, smaller, sessile or nearly'so, those of the stolons mostly petioled; upper flower-clusters, often forming a short spike, the lower commonly distant and axillary; corolla blue or nearly white, about 12 mm . long. In fields, Quebec and Me. to southern N. Y. Nat. from Europe. May-June.

## 2. TEÙCRIUM L.

Herbs or shrubs, with rather small pink white or purplish flowers, in terminal bracted spikes or heads, or verticillate in the upper axils. Calyx tubular-campanulate, Io-nerved, 5 -toothed. Corolla-tube short, the limb irregularly 5 -lobed, the 2 short upper lobes oblong, the lateral lobe declined, more or less united with the upper ones, the lower lobe broader, also declined. Stamens 4 didynamous, the anterior pair the longer; anther-sacs divergent, confluent at the base. Nutlets obovoid, rugose-reticulated. [Named from the Trojan king, Tencer.] Orer 100 species, of wide distribution. Besides the following, 3 others occur in the southern U. S.

[^41]1. Teucrium Canadénse L. American Germander or Wood Sage. (I. F. f. 3070.) Perennial, pubescent or canescent; stem stiff, 3-6 dm. tall. Leaves lanceolate to ovate-lanceolate, acuminate, irregularly dentate, mostly narrowed at the base, short-petioled, $3-13 \mathrm{~cm}$. long; spike becoming $1.5-3 \mathrm{dm}$. long in fruit, its lower bracts sometimes foliaceous; upper bracts commonly not longer than the calyx; flowers $\mathbf{I}-2 \mathrm{~cm}$. long, short-pedicelled; calyx about 6 mm . long in fruit, its three upper teeth obtuse or subacute. In moist thickets or along marshes, N. E. to Manitoba, Fla., Kans., Tex. and Mex. June-Sept.
2. Teucrium occidentale A. Gray. Hairy Germander. (I. F. f. 3071.) Perennial, villous or pubescent; stem 3-9 dm. high. Leaves lanceolate or ovatelanceolate, thin, acute or acuminate, sharply dentate, mostly rounded at the base, usually slender-petioled, $2-9 \mathrm{~cm}$. long; spikes becoming $0.7-2 \mathrm{dm}$. long in fruit; bracts lanceolate-subulate or the lower sometimes larger; calyx and axis of the spike villous-pubescent, the 3 upper calyx-teeth acute or acutish; corolla 8-12 mm. long. In moist soil, Ont. to Penn., Br. Col., Kans., N. Mex. and Cal. July-Sept.
3. Teucrium laciniàtum Torr. Cut-leaved Germander. Diffusely branched from a woody perennial root, 1.5-3 dm. high. Leaves pinnately 3-7parted into linear segments; upper leaves about equalling the flowers; corolla I-2 cm. long, blue or lilac. Plains, Kans. and Colo. to Tex. and Ariz.

## 3. ISÁNTHUS Michx.

An annual erect finely viscid-pubescent much-branched herb, with narrow entire or few-toothed leaves, and small blue flowers in loose axillary cymes. Calyx broadly campanulate, Io-neryed, nearly equally 5 -toothed, the teeth lanceolate. Corolla-tube not longer than the calyx, enlarged into the throat, the limb nearly equally 5 -cleft into obovate somewhat spreading lobes. Stamens 4, didynamous, incurved-ascending, not longer than the corolla, the anterior pair slightly the longer; anther-sacs divergent at maturity. Ovary deeply 4-lobed; style minutely 2 -cleft at the summit. Nutlets rugose-reticulated. [Greek, equal-flower, the corolla-lobes being nearly equal.] A monotypic genus.
i. Isanthus brachiàtus (L.) B.S.P. False Pennyroyal. (I. F. f. 3072.) Stem slender, much branched, I.5-5 dm. tall, the branches spreading. Leaves oblong or elliptic-lanceolate, acute at each end, entire, or with a few sharp teeth, 3 -nerved, short-petioled, $2-5 \mathrm{~cm}$. long, 4-12 mm .wide; axillary cymes $\mathbf{1}$-3-flowered; pedicels very slender, some of them as long as the fruiting calyx; calyx-lobes acute or acuminate, longer than or equalling the tube; corolla 4-6 mm. long, the fruiting calyx 6 mm . long. In sandy soil, especially along streams, Quebec and Ontario to Minn., Kans., Ga. and Tex. July-Sept.

## 4. TRİCHOSTEMMA L.

Annual or perennial erect branching herbs, some western species shrubby, with lanceolate oblong or linear entire or slighly repand leaves. Flowers small, or middle-sized, pink, blue, purple, or white, paniculate, or in axillary loose or dense cymes. Calyx campanulate, very unequally 5 -lobed in our species, the lobes ovate or lanceolate. Corolla-tube slender, exserted or included, the limb somewhat oblique and deeply 5 -cleft into oblong more or less declined segments. Stamens 4, didynamous, ascending, curved, the anterior pair the longer, the filaments filiform, spirally coiled in the bud, long-exserted; anther-sacs divaricate, more or less confluent at the base. Ovary deeply 4-lobed; style 2 -cleft at the summit. Nutlets obovoid, reticulated. [Greek, hair-stamen, referring to the slender filaments.] About 8 species, natives of North America.

Leaves oblong or lanceolate; plant minutely viscid-pubescent. Leaves linear; plant puberulent or glabrous.

1. T. dichotomum.
2. T. lineare.
I. Trichostema dichótomum L. Blue Curls. Bastard Pennyroyal. (I. F. f. 3073.) Annual, minutely viscid-pubescent; stem slender, I.5-5 dm. high. Leaves oblong or oblong-lanceolate, membranous, narrowed into short petioles, $2-8 \mathrm{~cm}$. long; the upper gradually smaller; flowers paniculate, $\mathbf{1 2 - 1 8} \mathrm{mm}$. long, borne I-3 together on 2-bracteolate peduncles; calyx oblique, very unequally 5 -lobed, the 3 upper lobes much longer and more united than the 2 lower ones; corolla blue, pink or rarely nearly white, the limb longer than the tube; stamens
blue or violet. In dry fields, Me. to Fla., Penn., Ky. and Tex. The lateral flowers become inverted by torsion of the pedicels. July-Oct.
3. Trichostema lineàre Nutt. Narrow-leaved Blue Curls. (I. F. f. 3074.) Puberulent or glabrous, not viscid or scarcely so. Leaves linear, sessile or short-petioled, $\mathbf{I}-5 \mathrm{~cm}$. long, sometimes with smaller ones or short leafy branches in their axils; flowers similar to those of the preceding, sometimes larger. In sandy fields and dry pine barrens, R. I. to Ga. and La. July-Aug.

## 5. SCUTELLÀRIA L.

Bitter herbs, some species shrubby. Flowers blue to violet, in bracted mostly secund spike-like racemes, or solitary or $2-3$ together in the axils. Calyx campanulate, gibbous, 2 -lipped, the lips entire, the upper one with a crest or protuberance upon its back and often deciduous in fruit. Corolla recurved-ascending, dilated above into the throat, glabrous within, the limb 2-lipped; upper lip arched, entire or emarginate; lower lip spreading or deflexed, its lateral lobes small and somewhat connected with the upper, its middle lobe broad, the margins mostly recurved. .Stamens 4, didynamous, all anther-bearing, ascending under the upper lip, the upper pair somewhat the shorter, their anthers 2-celled, ciliate; anthers of the lower pair of stamens I-celled, also ciliate. Nutlets papillose or tuberculate. [Latin, a dish, from the appendage to the fruiting calyx.] About roo species of wide distribution. Besides the following, some II others occur in southern and western N. Am.

* Nutlets wingless, very slightly elevated on the short gynobase.

Flowers 6-10 mm. long, in axillary and sometimes terminal racemes.
Flowers $12-30 \mathrm{~mm}$. long, in terminal often panicled racemes.
Plant glabrous or very nearly so; leaves broad.

1. S. lateriflora.

Plants pubescent, puberulent or pilose.
Leaves, all except the floral, crenate or dentate, broad.
Canescent, not glandular ; corolla canescent.
3. S. incana.

Densely glandular-pubescent; corolla puberulent.
4. S. cordifoha.

Pubescent below, glandular above; corolla nearly glabrous.
5. S. pilosa.

Leaves all except the lowest entire, narrow. 6. S. integrifolia. Flowers solitary in the axils or sometimes also in terminal bracted racemes.

Annual, villous, branched from the base.
7. S. Drummondii.

Perennial from a thick woody root.
8. S. resinosa.

Fibrous-rooted; perennial by rootstocks or stolons.
Flowers $4-8 \mathrm{~mm}$. long.
Plant glabrous, or slightly pubescent. 9. S. parvula.
Plant densely pubescent all over. 1o. S. campestris.
Flowers $16-26 \mathrm{~mm}$. long.
Minutely and densely glandular-pubescent, resiniferous.

| Densely cinereous-pubescent, pale. | 11. S. Brittonii. |
| :--- | :--- |
| Glabrous or merely slightly puberulent. | 12. S. Bushiii. |
| Leaves ovate, slender-petioled, cordate, obtuse. | 13. S. saxatilis. |
| Leaves lanceolate or ovate-lanceolate, nearly sessile, acute. |  |

14. S. galericulata. * * Nutlets membranous-winged, elevated on the slender gynobase; flowers axillary.
15. S. nervosa.
m. Scutellaria lateriflòra L. Mad-dog Skullcap. (I. F. f. 3075.) Perennial by slender stolons, glabrous, or puberulent above; stem slender, leafy, 2-6 dm. high. Leaves ovate, ovate-oblong or ovate-lanceolate, thin, slenderpetioled, acute or acuminate, coarsely dentate-serrate, obtuse, rounded or subcordate at the base, $2-8 \mathrm{~cm}$. long, the upper gradually smaller, the uppermost sometimes entire; racemes narrow, secund; corolla bluc, varying to nearly white, its lips about equal. one-fifth as long as the tube. In wet places, Newf. to (Ont., Br. Col., Fla., N. Mex. and Wash. July-Sept.
16. Scutellaria serràta Andr. Showy Skullcar. (I. F. f. 3076.) Perennial; stem slender, 3-6 dm. high. Leaves ovate or elliptic. slender-petioled, acute, crenate or dentate, $5-10 \mathrm{~cm}$. long, the uppermost reduced to small bracts; racemes almost always simple and terminal, the flowers opposite; corolla 2.5 cm .
long, blue, minutely puberulent, its tube narrow, gradually expanded above into the throat, its upper lip shorter than the lower. In woods, N. Y. and Penn. to N. Car., Ill. and Ky. Nāay-June.
17. Scutellaria incàna Muhl. Downy Skullcap. (I. F. f. 3077.) Perennial, finely and densely whitish downy, or the upper surfaces of the leaves glabrous; stem 6-12 dm. high. Leaves ovate, oval, or oblong, rather firm, slenderpetioled, acute, crenate-dentate, 7-II cm. long; racemes terminal, usually numerous and panicled; corolla $18-20 \mathrm{~mm}$. long; upper lip of the corolla slightly longer than the lower. In moist woods and thickets, Ont. to Ill., Kans., N. Car. and Ala. June-Aug.
18. Scutellaria cordifolia Muhl. Heart-leaved Skullcap. (I. F. f. 3078.) Perennial, densely glandular-pubescent; stem 3-9 dm. high, often simple. Leaves slender-petioled, broadly ovate, crenate-dentate all around, $5-10 \mathrm{~cm}$. long, all but the uppermost cordate at the base; racemes terminal, narrow; bracts ovate, mostly entire, commonly longer than the pedicels; corolla puberulent, $2-2.5 \mathrm{~cm}$. long, blue with the lower side lighter or white, its tube narrow, its throat moderately dilated. In woods and thickets, Penn. to Fla., west to Wis., Kans. and Tex. June-Aug. S. venosa Kearney (S. versicolor minor Chapm.) appears to differ from this only in size.
19. Scutellaria pilòsa Michx. Hairy Skullcap. (I. F. f. 3079.) Perennial; stem slender, $3^{-8} \mathrm{dm}$. high. Leaves ovate, oval, or oblong, petioled, obtuse, or the upper subacute, crenate. $2-8 \mathrm{~cm}$. long; racemes terminal, sometimes also in the upper axils; bracts oblong or spatulate, entire, longer than the pedicels; corolla blue, $12-16 \mathrm{~mm}$. long, its lower lip and lateral lobes somewhat shorter than the arched upper one. In dry sandy woods and thickets, N. Y. and Penn. to Mich., Mo., Fla. and Tex. May-July.

Scutellaria pilòsa hirsùta (Short) A. Gray. Stouter, sometimes 9 dm . high, hirsute; leaves larger, coarsely crenate. Va. and Ky.
6. Scutellaria integrifolia L. Larger or Hyssop Skullcap. (I. F. f. 3080.) Perennial, hoary with a minute down; stem $1.5-6 \mathrm{dm}$. high. Leaves thin, linear to oblong, petioled, or the upper sessile, obtuse, entire, $2-5 \mathrm{~cm}$. long, or the lower ovate, lanceolate or nearly orbicular, obtuse and sometimes subcordate at the base, often crenate-dentate or incised; racemes terminal; bracts linear-oblong, subacute, longer than the pedicels; corolla blue or whitish underneath, $2-3 \mathrm{~cm}$. long, its large lips nearly equal. In fields, woods and thickets, Conn. and R. I. to W. Va., Fla., La. and Tex. May-Aug.
7. Scutellaria Drummóndii Benth. Drummond's Skullcap. (I. F. f. 3081.) Villous-puberulent or pubescent, the branches $0.7-2 \mathrm{dm}$. long. Leaves ovate, oblong, or obovate, entire, or the lower sparingly crenulate, $8-25 \mathrm{~mm}$. long, the upper sessile, the lower petioled, the uppermost gradually smaller; flowers solitary in the axils, short-peduncled; corolla blue, or the tube nearly white, $8-10 \mathrm{~mm}$. long, pubescent, the lower lip violet, spotted, longer than the upper. Kans. (according to Smyth), Tex. and Mex. April-June.
8. Scutellaria resinòsa Torr. Resinous Skullcap (I. F. f. 3082.) Minutely canescent or puberulent and usually resiniferous; stems rigid, tufted, ascending, 1.5-2.5 dm. high. Leaves ovate, oval, or oblong, sessile, or the lower short-petioled, entire, obtuse, $6-12 \mathrm{~mm}$. long; flowers solitary in the axils; corolla violet or nearly white, very pubescent, 12-18 mm. long, its tube narrow and lips nearly equal. On dry plains, Neb. to Tex. and Ariz. May-Aug.
9. Scutellaria pàrvula Michx. Small Skullcap. (I. F. f. 3083.) Glabrous, or sparingly puberulent, sometimes slightly glandular; stems o.7-3 dm. tall. Leaves ovate, oval or lanceolate, or the lower nearly orbicular, entire and sessile, or the lower sparingly dentate and petioled, 6-25 mm. long; flowers solitary in the axils; corolla $4-8 \mathrm{~mm}$. long, violet, pubescent. In moist sandy soil, Quebec to Ont., S. Dak., N. J., Fla., Neb. and Tex. April-July.
10. Scutellaria campestris Britton. Prairie Skullcap. (I. F. f. 3084.) Pubescent; stems diffuse, or ascending, I-3 dm. long. Leaves ovate, or the lower almost orbicular, entire, or dentate, $\mathbf{I}-2 \mathrm{~cm}$. long, obtuse at the apex, rounded or or truncate at the base, the lower short-petioled, the upper sessile; flowers solitary
in the axils; corolla 6-10 cm. long, violet or purple, pubescent. In dry sandy or gravelly soil, N. Car. to Ill., Iowa, Kans. and the Ind. Terr. April-July.
II. Scutellaria Brittònii Porter. Britton's Skullcap. (I. F. f. 3085.) Viscidly glandular, pubescent or puberulent, branched from the base; stems $\mathbf{1 - 2}$ dm . high, leafy. Leaves oblong or oval, sessile and entire or the lowest shortpetioled and slightly crenulate, obtuse, rather prominently veined on the lower surface, $\mathbf{I}-\mathbf{2 . 5} \mathrm{cm}$. long, the upper scarcely smaller; flowers solitary in the axils; pedicels mostly shorter than the calyx; corolla pubescent, blue, $2-3 \mathrm{~cm}$. long. Neb. (according to Coulter); Colo. and Wyo. June-July.
12. Scutellaria Búshii Britton, n. sp. Bush's Skullcap. Erect, rather stiff, 1.5-2.5 dm. high, finely ashy-pubescent. Leaves oblanceolate, obtuse, firm, entire, sessile, $2-3.5 \mathrm{~cm}$. long, $3-5 \mathrm{~mm}$. wide, the veins prominent; flowers axillary, shortpeduncled, 2.5 cm . long; corolla pubescent. Rocky grounds, Shannon Co., Mo. (B. F. Bush, No. 54, June 3, 1890).
13. Scutellaria saxátilis Riddell. Rock Skullcap. (I. F. f. 3086.) Perennial by filiform stolons, glabrate or sparingly puberulent; stem weak, ascending or reclining, $\mathbf{I} .5-3 \mathrm{dm}$. long. Leaves ovate, slender-petioled, thin, coarsely crenate, obtuse, cordate, $2-5 \mathrm{~cm}$. long, or the lower nearly orbicular, and the upper lanceolate, subacute and entire; flowers solitary in the upper axils, or clustered in a terminal loose raceme; bracts longer than the pedicels; corolla light blue, very nearly glabrous, $\mathrm{I}^{5-5 \mathrm{~cm} \text {. long. On moist banks and in thickets, Del. to Va., }}$ Ohio and Tenn. May-July.
14. Scutellaria galericulàta L. Hooded Willow-herb. Marsh SkullCAP. (I. F. f. 3087.) Perennial by filiform stolons, puberulent or pubescent; stem 3-9 dm. high. Leaves oblong-lanceolate to ovate-oblong, thin, short-petioled, or the upper sessile, acute, dentate or the upper entire, subcordate or rounded at the base, $2-6 \mathrm{~cm}$. long, the uppermost usually much smaller; flowers solitary in the axils; peduncles shorter than the calyx; corolla blue, puberulent, nearly or quite 2.5 cm . long, with a slender tube and slightly enlarged throat. In swamps and along streams, Newf. to Alaska, N. Car., Ohio, Neb., Ariz. and Wash. Also in Europe and Asia. June-Sept.
15. Scutellaria nervòsa Pursh. Veined Skullcap. (I. F. f. 3088). Perennial by filiform stolons; stem glabrous or sparingly pubescent, $2-6 \mathrm{~cm}$. high. Leaves thin, the lower slender-petioled, nearly orbicular, crenate, often subcordate, the middle ones larger, ovate, $2-5 \mathrm{~cm}$. long, sessile or nearly so, coarsely dentate or crenate, the upper lanceolate or ovate-lanceolate, acute, commonly entire; flowers solitary in the axils; corolla blue, $8-10 \mathrm{~mm}$. long, puberulent, the lower lip longer than the concave upper one. In moist woods and thickets, N. Y. and N. J. to Ill., N. Car., Tenn. and Mo. May-Aug.

## 6. MARRÙBIUM L.

Perennial herbs, with petioled dentate rugose leaves, and small white or purplish flowers in dense axillary clusters. Calyx tubular, 5-10-nerved, regularly 5-10toothed, the teeth nearly equal, or the alternate ones shorter, spreading or recurved in fruit. Corolla-limb 2 -lipped, the upper lip erect, the lower spreading, 3 -cleft, its broader middle lobe commonly emarginate. Stamens 4, didynamous, included, the posterior pair the shorter; anthers 2 -celled, the sacs divergent. Style 2-cleft at the summit, the lobes short. Nutlets ovoid, smooth. [Name Middle Latin, its meaning uncertain.] About 40 species, of the Old World.
I. Marrubium vulgare L. White Hoarhound. (I. F. f. 3oSg.) Stem stout, woolly, 3-9 dm. high. Leaves oval, broadly ovate or nearly orbicular, rugose-veined, obtuse, crenate-dentate, $2-5 \mathrm{~cm}$. long, rough, whitish above; petioles $\mathbf{1}-\mathbf{2 . 5} \mathrm{cm}$. long, usually exceeding the flowers; clusters many-flowered; flowers whitish; calyx-teeth usually 10 , subulate, glabrous above, woolly below. In waste places, Me. and Ont. to Minn., Br. Col., N. Car., Tex. and Mex. Nat. from Europe.

## 7. AGÁSTACHE Clayt.

Tall perennial herbs, with serrate, petioled leaves, and vellowish purplish or blue flowers, verticillate-clustered in thick bracted terminal spikes. Calyx narrowly campanulate, somewhat oblique, slightly z-lipped. 5 -toothed. Corolla
strongly 2 -lipped, the tube as long as the calyx; upper lip erect, 2-lobed; lower lip spreading, 3 -lobed, its middle lobe broader than the lateral ones and crenulate. Stamens 4, all anther-bearing, didynamous, the upper pair the longer; anthers 2-celled, their sacs nearly parallel. Nutlets ovoid, smooth. [Greek, many-spikes.] About 4 species, natives of N. Am. Besides the following, I or 2 others occur in the Western States.
Glabrous or very nearly so, stout; corolla greenish yellow. I. A. nepetoides.
Pubescent, stout; corolla purplish; leaves green both sides. 2. A. scrophulariaefolia.
Glabrous or slightly pubescent, slender; corolla blue; leaves pale beneath.
3. A. anethiodora.
I. Agastache nepetoìdes (L.) Kuntze. Catnep Giant-hyssop. (I. F. f. 3090.) Stem 6-I5 dm. high. Leaves ovate or ovate-oblong, acuminate or acute, mostly thin, coarsely dentate, $5-15 \mathrm{~cm}$. long; spikes $0.7-4.5 \mathrm{dm}$. long, usually very dense; petioles of the lowest leaves often 5 cm . long; bracts ovate, acute or acuminate; calyx-teeth oblong or ovate-oblong, obtuse or subacute, sometimes purplish; corolla greenish-yellow, about 8 mm . long, scarcely exceeding the calyx. In woods and thickets, Vt. and Ont. to S. Dak., Kans., Ga. and Ark. July-Sept.
2. Agastache scrophulariaefolia (Willd.) Kuntze. Figwort. GiantHyssop. (I. F. f. 309I.) Similar to the preceding, but commonly taller, the stem, petioles and lower surfaces of the leaves more or less pubescent. Bracts broadly ovate, abruptly acumínate; calyx-teeth lanceolate or ovate-lanceolate, very acute or sometimes acuminate, whitish or purplish; corolla purplish, $10-12 \mathrm{~mm}$. long, considerably exceeding the calyx. In woods and thickets, Mass. to Wis., Kans., N. Car. and Ky. Plant strong-scented. July-Oct.

Agastache scrophulariaefolius móllis (Fernald) Britton. Stem and lower leaf surfaces densely tomentose. Vt. and Conn. to Iowa. (Lophanthus scrophulariaefolius mollis Fernald.)
3. Agastache anethiodòra (Nutt.) Britton. Fragrant Giant-hyssop. (I. F. f. 3092.) Stem rather slender, 6-12 dm. high. Leaves ovate or triangularovate, firm, mostly short-petioled, acute or acuminate at the apex, truncate, obtuse or sometimes subcordate at the base, sharply serrate, 5-9 cm. long, anise-scented; spikes seldom 1.5 dm . long; bracts broadly ovate, abruptly acuminate; calyx-teeth ovate to lanceolate, acute, purple; corolla blue, 8 -10 mm. long, somewhat exceeding the calyx. On prairies and plains, Minn. to the N. W. Terr., Ill., Neb. and Colo. July-Sept.

## 8. MEEHÁNIA Britton.

A low pubescent spreading or decumbent herb, with long-petioled cordate leaves, trailing leafy stolons, and large blue flowers in terminal secund bracted spikes. Calyx campanulate, 15 -nerved, slightly 2 -lipped, its teeth lanceolate, acute, the 3 upper longer than the 2 lower. Corolla much exserted, puberulent without, pubescent within, the tube narrow at the base, gradually widely ampliate into the throat, the limb 2-lipped; upper lip 2-lobed, arched, the lobes ovate, obtuse; lower lip about equalling the upper, spreading, 3 -lobed, the middle lobe emarginate, broader than the lateral ones. Stamens 4 , included. the upper pair longer than the lower; anthers 2 -celled, the sacs nearly parallel. Nutlets oblong, smooth. [Named for Thomas Meehan, of Philadelphia, botanist and horticulturist.] A monotypic genus.
I. Meehania cordàta L (Nutt.) Britton. Meehania. (I. F. f. 3093.) Flowering stems $0.7-2 \mathrm{dm}$. high; stolons sometimes 6 dm . long. Leaves broadly ovate or ovate-orbicular, thin, obtuse or subacute, crenate all around, sparingly pubescent with scattered hairs on both surfaces, or nearly glabrous beneath, green on both sides, $2-5 \mathrm{~cm}$. long, the basal sinus broad; spikes $2-10 \mathrm{~cm}$. long; bracts ovate or oblong, acute, membranous, the lower sometimes crenulate and surpassing the calyx; bractlets small, lanceolate; calyx about 1 cm . long, puberulent, its longer teeth about one-half the length of the tube; corolla $2.5-3 \mathrm{~cm}$. long, showy. In rich moist woods and thickets, Penn. to Tenn. and N. Car. May-July.

## 9. NÉPETA L.

Herbs, with dentate or incised leaves, and mostly white or blue flowers in verticillate clusters, usually crowded in terminal spikes. Calyx tubular, somewhat
oblique, 15 -nerved, 5 -toothed, scarcely 2 -lipped, but the upper teeth usually longer than the lower. Corolla-tube enlarged above, the limb strongly 2-lipped; upper lip erect, entire, emarginate or 2-lobed; lower lip spreading, 3-lobed. Anthers 2 -celled, the sacs divaricate. Nutlets ovoid, compressed, smooth. [Ancient Latin name of catnep.] About 150 species, natives of Europe and Asia.
I. Nepeta Catària L. Catmint. Catnep. Nep. (I. F. f. 3094.) Perennial, densely tomentulose-canescent, pale green; stem 6-9 dm. high. Leaves ovate to oblong, petioled, acute, coarsely crenate-dentate, mostly cordate at the base, $2-8 \mathrm{~cm}$. long; flower-clusters spiked, the spikes $2-13 \mathrm{~cm}$. long; bracts small; bractlets subulate; calyx densely puberulent, the upper teeth about one-half the length of the tube; corolla nearly white, or pale purple, dark-dotted, puberulent without, $10-12 \mathrm{~mm}$. long, the broad middle lobe of its lower lip crenulate. In waste places, N. B. and Quebec to S. Dak., Va. and Kans. Nat. from Europe. July-Nov.

## 10. GLECÒMA L.

Low creeping herbs, with long-petioled nearly orbicular or reniform crenate leaves, and blue or violet flowers in small axillary verticillate clusters. Calyx oblong-tubular, 15 -nerved, oblique, not 2 -lipped, unequally 5 -toothed. Corollatube exserted, enlarged above, the limb 2-lipped; upper lip erect, 2 -lobed or emarginate; the lower lip spreading, 3-lobed, the middle lobe broad, emarginate. Anther-sacs divergent. Nutlets ovoid, smooth. [Greek name for thyme, or pennyroyal.] About 6 species of Europe and Asia.
I. Glecoma hederàcea L. Ground Ivy. Gill-over-the-ground. (I. F. f. 3095.) Perennial, pubescent, the creeping stems sometimes 4.5 dm . long. Lower petioles commonly longer than the leaves; leaves $\mathrm{I}-4 \mathrm{~cm}$. in diameter; clusters few-flowered, the flowers $\mathbf{I} 4^{-2} \mathrm{~cm}$. long, short-pedicelled; bractlets subulate, shorter than the calyx; calyx puberulent, its teeth acute or lanceolate-acuminate; corolla-tube 2-3 times as long as the calyx; upper pair of stamens much longer than the lower. In waste places, woods and thickets, Newf. to Minn., Ga. and Kans. March-May.

## II. DRACOCÉPHALUM L.

Herbs, with blue or purple flowers in axillary and terminal bracted clusters. Calyx tubular, 15 -nerved, 5 -toothed, or 2 -lipped with the 3 upper teeth more or less united. Corolla expanded above, its limb 2 -lipped; upper lip erect, emarginate; lower lip spreading, 3 -lobed, the middle lobe sometimes 2 -cleft. Anthers 2 -celled, the sacs divaricate. Nutlets ovoid, smooth. [Greek, dragon-head.] About 35 species, of the northern hemisphere.

Corolla scarcely exceeding the calyx ; clusters mostly terminal, dense.

$$
\begin{array}{ll}
\text { Corolla 2-3 times as long as the calyx; clusters mostly axillary. } & \text { 1. D. parviflorum } \\
\text { 2. D. Moldavica. }
\end{array}
$$

1. Dracocephalum parviflòrum Nutt. American Dragon-head. (I. F. f. 3096.) Annual or biennial; stem 1.5-5 dm. high. Leaves lanceolate, ovate, or oblong, slender-petioled, serrate, or the lower incised, thin, $2-8 \mathrm{~cm}$. long; clusters, many-flowered, in dense terminal spikes, and sometimes also in the upper axils; bracts ovate to oblong, pectinate with awn-pointed teeth; upper tonth of the calyx ovate-oblong, longer than the narrower lower and lateral ones, all acuminate; corolla light blue, scarcely longer than the calyx. In dry gravelly or rocky soil, N. Y. and Ont. to Minn., Alaska, and in the Rocky Mts. to Ariz. and N. Mex. MayAug.
2. Dracocephalum Moldávica L. Moldavian Dragon-head. (I. F. f. 3097.) Annual, puberulent; stem 3-8 dm. high. Leaves oblong or linear-oblong. dentate or somewhat incised, obtuse, $2-5 \mathrm{~cm}$. long, clusters loose, few-flowered. mostly axillary; bracts narrowly oblong, usually shorter than the calyx, deeply pectinate with aristate teeth; pedicels $4-8 \mathrm{~mm}$. long; calyx slightly curved, the 2 lower teeth somewhat shorter than the 3 broader equal upper ones; corolla $2-3$ times as long as the calyx. In a cañon near Spring View, Neb. Also in northern Mex. Introduced from Europe. June-Aug.

## 12. PRUNÉLLA L.

Perennial herbs, with petioled leaves, and rather small clustered purple or white flowers, in dense bracted spikes or heads. Calyx oblung, reticulate-veined, about ro-nerved, deeply 2 -lipped, closed in fruit; upper lip nearly truncate, or with 3 short teeth; lower lip 2-cleft. Corolla-tube inflated, slightly narrowed at the mouth, its limb strongly 2 -lipped; upper lip entire, arched; lower lip spreading, 3-lobed. Filaments of the longer stamens 2 -toothed at the summit, one of the teeth bearing the anther, the other sterile; anthers 2 -celled, the sacs divergent or divaricate. Nutlets ovoid, smooth. [Origin of name doubtful; often spelled Brunella, the pre-Linnaean form.] About 5 species, of wide geographic distribution.

Leaves entire or crenate.
Leaves pinnatifid or deeply inctised.

1. P. vulgaris.
2. P. laciniata.
3. Prunella vulgàris L. Self-heal. Heal-all. (I. F. f. 3098.) Stem slender, $0.5-6 \mathrm{dm}$. high. Leaves ovate, oblong or oblong-lanceolate, rather thin, $2-10 \mathrm{~cm}$. long, the lowest commonly shorter and sometimes subcordate; spikes terminal, sessile or short-peduncled, becoming $5-10 \mathrm{~cm}$. long in fruit; bracts broadly ovate-orbicular, cuspidate, ciliate; corolla violet, purple or sometimes white, $8-12 \mathrm{~mm}$. long, about twice as long as the calyx. In fields, woods and waste places throughout nearly the whole of N. Am. Nat. from Europe. MayOct.
4. Prunella laciniàta L. Cut-leaved Self-heal. (I. F. f. 3099.) Similar to the preceding, but the stem leaves pinnatifid, lobed, or incised, the basal ones often entire or merely crenulate. Vicinity of Washington, D. C. Adventive or fugitive from Europe. Summer.

## 13. PHYSOSTÈGIA Benth.

Erect perennial glabrous or puberulent herbs, with large or middle-sized bracted purple violet pink or white flowers in terminal spike-like racemes. Calyx membranous, swollen and remaining open in fruit, faintly reticulate-veined and ıo-nerved, equally 5 -toothed. Corolla much longer than the calyx, its tube gradually much enlarged upward, its limb strongly 2 -lipped; upper lip concave, rounded, entire; lower lip spreading, 3-lobed, the middle lobe commonly emarginate. Filaments pubescent; anthers all alike, 2 -celled, the sacs nearly parallel, the margins of their valves commonly spinulose or denticulate. Nutlets ovoid-triquetrous, smooth. [Greek, bellows-covering, from the inflated fruiting calyx.] About 8 species, natives of N. Am.
Flowers 2.5 cm . long, or more; leaves firm. Spike dense, many-flowered; leaf-serrations very acute. I. P. Virginiana. Spike loose, few-flowered; leaf-serrations blunt.
Flowers $\mathrm{r}-\mathrm{I} .5 \mathrm{~cm}$. long; leaves thin.
Spike loose, $10-20 \mathrm{~cm}$. long; leaves few and distant. 3. $P$. intermedia.
Spike dense; ${ }^{2-10} \mathrm{~cm}$. long; stem leafy.
4. P. parviflora.
r. Physostegia Virginiàna (L.) Benth. False Dragon-head. Obedient Plant. Lion's Heart. (I. F. f. 310o.) Stem 3-12 dm. tall. Leaves lanceolate, oblong-lanceolate, or linear-lanceolate, acuminate, serrate or serrulate, the upper sessile $5-13 \mathrm{~cm}$. long, the lowest petioled; bracts lanceolate, shorter than the calyx; spikes dense, becoming I-2 dm. long in fruit; flowering calyx campanulate or somewhat turbinate, its teeth ovate, acute; fruiting calyx oblong, $8-10 \mathrm{~mm}$. long, the teeth much shorter than the tube; corolla pale purple or rose, often variegated with white, temporarily remaining in whatever position it is placed. In moist soil, Quebec to the N. W. Terr., Fla., La. and Tex. July-Sept.
2. Physostegia denticu!àta (Ait.) Britton. Few-flowered Lion's Heart. (I. F. f. 31or.) Stem slender, simple, or little branched, 3-6 dm. high. Leaves oblong, linear-oblong, or oblanceolate, crenulate, or entire, $2-8 \mathrm{~cm}$. long, the lower slender-petioled; bracts lanceolate, little longer than the fruiting pedicels; flowering calyx oval-campanulate, its teeth acute, about one-third as long as the tube; fruiting calyx oblong, $6-8 \mathrm{~mm}$. long; corolla rose-pink. In moist soil, Va. to Fla, and Tex, June-Aug.
3. Physostegia intermèdia (Nutt.) A. Gray. Slender Lion's Heart. (I. F. f. 3 IO2.) Stem slender, usually simple, 3-9 dm. high. Leaves remote, narrowly lanceolate or linear, acute or acuminate, repand-denticulate, sessile, or the lowest petioled, $5-8 \mathrm{~cm}$. long; spikes slender; lower bracts often nearly as long as the campanulate calyx; calyx-teeth acute, shorter than the tube; fruiting calyx broadly oval, $4-5 \mathrm{~mm}$. long; corolla much dilated above. On prairies, western Ky. (according to Gray); La., Ark. and Tex. May-July.
4. Physostegia parviflòra Nutt. Purple or Western Lion's Heart. (I. F. f. 3IO3.) Stem usually simple, 3-9 dm. high. Leaves lanceolate, oblonglanceolate, or ovate-lanceolate, acute, acuminate or the lower obtuse, sharply serrate or dentate, sessile or the lowest petioled, $7-10 \mathrm{~cm}$. long; spikes long; bracts ovate or ovate-lanceolate, acute, shorter than the calyx; fruiting calyx globose-oblong, 4-6 mm. long; corolla purple. In moist soil, Minn. to Neb., Br. Col. and Ore. June-Aug.

## 14. SYNÁNDRA Nutt.

An annual or biennial, somewhat hirsute herb, with long-petioled ovate cordate crenate leaves, and large white flowers in a terminal leafy-bracted spike. Calyx campanulate-oblong, membranous, deeply 4 -cleft, inflated in fruit, faintly veined, the lobes narrowly lanceolate, the two upper shorter than the lower. Corolla much longer than the calyx, its tube narrow below, much expanded above, 2 -lipped; upper lip concave, entire; lower lip spreading, 3 -lobed. Filaments villous; anthers glabrous, 2 -celled, the sacs divaricate, the contiguous ones of the upper pair of stamens sterile and connate. Nutlets ovoid, smooth, sharply angled. [Greek, stamens-together.] A monotypic genus.
I. Synandra hispídula (Michx.) Britton. Synandra. (I. F. f. 3104.) Stem weak, $3^{-8} \mathrm{dm}$. long, striate. Leaves thin, palmately veined, the blade $5-10 \mathrm{~cm}$. long, and commonly shorter than the petiole; floral leaves sessile, ovate or ovatelanceolate, acute or acuminate; flowers solitary in their axils; uppermost leaves very small; calyx hirsute, its lobes about as long as the tube; corolla $2.5-4 \mathrm{~cm}$. long, the lower lip with purple lines. Along streams and in wet woods, Ohio and Ill. to Va. and Tern. May-June.

## 15. PHLÒMIS L.

Tall perennial herbs, or shrubs. Calyx tubular or tubular-campanulate, 5-10nerved, the limb mostly equally 5 -toothed. Corolla-tube usually with a woolly ring within, the limb strongly 2 -lipped; upper lip erect, concave, arched or sometimes keeled, entire or emarginate; lower lip spreading, 3 -cleft. Anterior pair of stamens the longer and their filaments with hooked appendages at the base; anthersacs divergent. Nutlets ovoid, glabrous, or pubescent above. [Greek, mullen, in allusion to the thick woolly leaves of some species.] About 50 species, of the Old World.

1. Phlomis tuberòsa L. Jerusalem Sage. (I. F. f. 3IO5.) Herbaceous from a thick root; stem purplish, glabrous or loosely pubescent above, 9-18 dm. tall. Lower leaves triangular-ovate, long-petioled, acuminate or acute, coarsely dentate, deeply cordate, strongly veined, $1-2.5 \mathrm{dm}$. long; upper leaves lanceolate, short-petioled or sessile, truncate or sometimes narrowed at the base; clusters densely many-flowered; bractlets subulate; calyx $10-\mathbf{1 2} \mathbf{~ m m}$. long. its teeth setaceous with a broader base, spreading; corolla $2-2.5 \mathrm{~cm}$. long, pale purple or white, twice as long as the calyx, densely pubescent, and the margins of its upper lip fringed with long hairs. In waste places, south shore of Lake Ontario. Nat. from Europe. June-Sept.

## 16. GALEÓPSIS L.

Erect annual herbs, with yellow red purple or mottled verticillate-clustered flowers in the upper axils, or forming terminal spikes. Calyx campanulate or tubular-campanulate, 5-10-nerved, 5 -toothed, the teeth nearly equal. spinulose. Corolla-tube narrow, the throat expanded, the limb strongly $z$-lipped; upper lip erect, concave, entire; lower lip spreading, 3 -cleft, the mididle lobe oboordate or emarginate. Anthers 2 -celled, the sacs transversely 2 -valied, the inner valve
ciliate, the outer smooth, larger. Nutlets ovoid, slightly flattened, smooth. [Greek, weasel-like.] About 6 species, of Europe and Asia.
Plant puberulent; leaves linear to lanceolate.

1. G. Ladanum.

Plant hispid; leaves ovate.
2. G. Tetrahit.
I. Galeopsis Ládanum L. Red Hemp-nettle. Ironwort. (I. F. f. 3106.) Puberulent; stem 1.5-5 dm. high. Leaves linear, oblong, or lanceolate, mostly short-petioled, acute at both ends, dentate, or nearly entire, $2-5 \mathrm{~cm}$. long; flowerclusters mainly axillary; corolla $\mathbf{1 2 - 1 6 ~ m m}$. long, red or purple to white and variegated. In waste places, N. B. to Mich. and N. J. Adventive or nat. from Europe. July-Oct.
2. Galeopsis Tetràhit L. Hemp-nettle. Hemp Dead Nettle. (I. F. f. 3107.) A coarse rough-hairy herb, the stem $3-9 \mathrm{dm}$. high, swollen under the joints. Leaves ovate, membranous, slender-petioled, acuminate, coarsely dentate, $5-13 \mathrm{~cm}$. long ; flower-clusters axillary, or in a short leafy-bracted spike; corolla ${ }^{16}-25 \mathrm{~mm}$. long, pink or pale purple variegated with white. In waste places, Newf. to Alaska, N. Car. and Mich. Nat. from Europe. June-Sept.

## 17. LEONU封 L.

Tall herbs, with palmately cleft, parted or dentate leaves, and small white or pink flowers verticillate in dense axillary clusters. Calyx tubular-campanulate, 5 -nerved, nearly regular and equally 5 -toothed, the teeth rigid, subulate or aristate. Corolla-limb 2-lipped; upper lip erect, entire; lower lip spreading or deflexed, 3 -lobed, the middle lobe broad, obcordate or emarginate. Anthers 2 -celled, the sacs mostly parallel. Nutlets 3 -sided, smooth. [Greek, lion's-tail.] About Io species, of Europe and Asia.

Lower leaves palmately $2-5$-cleft, the upper 3 -cleft.
Leaves deeply 3 -parted, the segments cleft and incised. Leaves coarsely dentate or incised-dentate.

1. L. Cardiaca.
2. L. Sibiricus.
3. L. Marrubiastrum.
4. Leonurus Cardiaca L. Motherwort. (I. F. f. 3108.) Perennial, puberulent; stem 6-15 dm. tall, the branches straight and ascending. Leaves slender-petioled, the lower nearly orbicular, $5-10 \mathrm{~cm}$. broad, the lobes acuminate, incised or dentate; upper leaves oblong-lanceolate or rhombic, 3 -cleft, or the uppermost merely 3 -toothed; flower-clusters exceeded by the petioles; corolla pink, purple or white, $6-10 \mathrm{~mm}$. long, its tube with an oblique ring of hairs within, its upper lip slightly concave, densely white-woolly without, the lower lip mottled; anther-sacs parallel. In waste places, N. S. to N. Car., S. Dak. and Kans. Nat. from Europe. June-Sept.
5. Leonurus Sibíricus L. Siberian Motherwort or Lion’s-tail. (I. F. f. 3rog.) Biennial, puberulent or glabrate; stem 6-18 dm. high. Leaves longpetioled, 3-parted into ovate or lanceolate, acute or acuminate, cleft and incised segments, the lobes lanceolate or linear, acute; the uppermost linear or lanceolate; clusters dense, usually all axillary ; calyx campanulate, 6 mm . long, glabrous or minutely puberulent; corolla purple or red, densely puberulent without, $8-12 \mathrm{~mm}$. long, its tube naked within; anther-sacs divergent. In waste and cultivated soil, Penn. and Del. Nat. from eastern Asia. May-Sept.
6. Leonurus Marrubiàstrum L. Hoarhound Motherwort or Lion'stail. (I. F. f. 3IIO.) Biennial, puberulent or pubescent; stem 6-15 dm. high. Leaves petioled, ovate or ovate oblong, $2-8 \mathrm{dm}$. long, the upper narrower; flowerclusters axillary; calyx finely puberulent or glabrate; corolla nearly white, glabrate, about 8 mm . long, its tube scarcely exceeding the calyx, naked within. In waste places, N. J. (according to S. Watson); Penn. and Del. Nat. from Europe. JuneSept.

## 18. LÀMIUM L.

Mostly diffuse herbs, with crenate dentate or incised, usually cordate leaves, and rather small flowers, verticillate in axillary and terminal clusters. Calyx tubularcampanulate, about 5 -nerved, 5 -toothed, the teeth equal or the upper ones longer. Corolla-limb 2-lipped; upper lip concave, erect. usually entire; lower lip spread, ing, 3-cleft, the middle lobe emarginate, contracted at the base. Arthers 2-celled,
the sacs divaricate, often hirsute on the back. [Greek, throat, from the ringent corolla.] About 40 species, of the Old World.

Upper leaves sessile or clasping.

1. L. amplexicaule.

Leaves all petioled.

> Flowers red or purple.
> Corolla $12-18 \mathrm{~mm}$. long; leaves not blotched. Corolla $20-25 \mathrm{~mm}$. long; leaves commonly blotched.
> Flowers white.
> 2. L. purpureum.
> 3. L. maculatum.
> 4. L. album.
I. Lamium amplexicaùle L. Henbit. (I. F. f. 3III.) Biennial or annual, sparingly pubescent; stems weak, slender, ascending or decumbent, I.5-5 dm. long. Leaves orbicular or nearly so, coarsely crenate, $\mathbf{1}-4 \mathrm{~cm}$. wide, rounded at the apex, the lower slender-petioled; flowers in axillary and terminal clusters; calyx pubescent, its teeth erect, nearly as long as the tube; corolla purplish or red, $12-16 \mathrm{~mm}$. long, its tube very slender, the lateral lobes of its lower lip very small. In waste and cultivated ground, N. B. to Ont., Br. Col., Fla. and Ark. Nat. from Europe. Feb.-Oct.
2. Lamium purpùreum L. Red Dead Nettle. (I. F. f. 3112.) Annual, slightly pubescent, stems decumbent, $1.5-4.5 \mathrm{dm}$. long. Leaves crenate or crenulate, the lower orbicular or broadly ovate, rounded at the apex, cordate at the base, the upper ovate, $\mathbf{I}-4 \mathrm{~cm}$. long; flowers in axillary and terminal clusters; calyx-teeth narrowly lanceolate, acuminate; corolla purple-red, rarely exceeding $\mathbf{1 2} \mathrm{mm}$. long, the lateral lobes of its lower lip reduced to $\mathbf{1}$ or $\mathbf{2}$ short teeth. In waste and cultivated soil, R. I. to Penn. and D. C. Also in ballast about the northern seaports. Nat. or adventive from Europe. April-Oct.
3. Lamium maculàtum L. Spotted Dead Nettle. (I. F. f. 3113.) Perennial, somewhat pubescent; stems $2-5 \mathrm{dm}$. long. Leaves crenate or incised-crenate, usually blotched, broadly ovate or triangular-ovate, truncate or cordate at the base, $2-5 \mathrm{~cm}$. long, or some of the lower ones much smaller and nearly orbicular; clusters mainly axillary; corolla purple-red, its tube contracted near the base, with a transverse ring of hairs within, the lateral lobes of its lower lip very small. Along roadsides, escaped from gardens, Me. to Va. Native of Europe and Asia. May-Oct.
4. Lamium álbum L. White Dead Nettle. (I. F. f. 3II4.) Perennial, pubescent; stems 3-5 dm. long. Leaves ovate, crenate, dentate or incised, acute or acuminate, cordate or truncate at the base, $2-8 \mathrm{~cm}$. long, or the lower shorter and obtuse; clusters mostly axillary; corolla about 2.5 cm . long, its tube short, stout, contracted near the base, with an oblique ring of hairs within, the lateral lobes of its lower lip each with a slender tooth. In waste places, Ont. to Va. Nat. or adventive from Europe. April-Oct.

## 19. BALLÒTA L.

Perennial pubescent or tomentose herbs, some species shrubby, with dentate or crenate leaves, and small bracted flowers in axillary clusters. Calyx tubular-funnelform, 10 -nerved, 5-10-toothed, the teeth dilated at the base, or connate into a spreading limb. Corolla-tube provided with a ring of hairs within, the limb strongly 2 -lipped; upper lip erect, concave, emarginate. Anther-sacs divergent at maturity. Nutlets ovoid, smooth. [The Greek name.] About 30 species, of the Old World.
r. Ballota nigra L. Black or Fetid Hoarhound. (I. F. f. 3ri5.) Herbaceous, puberulent or pubescent, ill-scented; stem 4-9 dm. high, its hairs mostly reflexed. Leaves slender-petioled, ovate, or the lower nearly orbicular, coarsely dentate, thin, $2-5 \mathrm{~cm}$. long, clusters several-flowered, dense; bractlets subulate; calyx about 8 mm . long, its teeth lanceolate, bristle-pointed, spreading in fruit; corolla $12-18 \mathrm{~mm}$. long, reddish-purple to whitish, its upper lip pubescent on both sides; nutlets shining. In waste places, Mass. to Penn. Nat. from Europe. June-Sept.

## 20. STÀCHYS L.

Herbs, with purple yellow red or white flowers, loosely verticillate-clustered in terminal spikes, or also in the upper axils. Caly $\mathbf{x}$ mostly campanulate, 5-10-
nerved, 5 -toothed, the teeth nearly equal in our species. Corolla purple in our species, its tube narrow, the limb strongly 2 -lipped; upper lip erect, concave, entire or emarginate; lower lip spreading, 3 -cleft, the middle lobe broader than the lateral ones, sometimes 2 -lobed. Anthers contiguous in pairs, 2 -celled, the sacs mostly divergent. Nutlets ovoid or oblong. [Geeek, a spike, from the spicate inflorescence.] About 150 species, of wide distribution. Besides the following, some 12 others occur in the southern and western U. S.

Leaves narrowed at the base, linear to lanceolate or oblong.
Stem glabrous; leaves entire, or nearly so.
Leaves linear, $2-5 \mathrm{~mm}$. wide. I. S. hyssopifolia.
Leaves oblong to linear-oblong, $4-10 \mathrm{~mm}$. wide. ${ }^{\text {2. S. Atlantica. }}$
Stem retrorsely hirsute ; leaves serrate.
Leaves slightly pubescent; calyx-teeth lanceolate.
Whole plant densely clothed with stiff appressed hairs.
3. S. ambigua.
4. S. arenicola.

Leaves cordate or truncate at the base, lanceolate to ovate.
Stem glabrous or nearly so.
Calyx-teeth lanceolate-subulate, nearly as long as the tube. 5. S. teruifolia.
Calyx-teeth triangular, about one-fourth as long as the tube. Stem hirsute.

Leaves all very short-petioled, lanceolate to oblong. 7. S. palustris.
Leaves, at least the lower, slender-petioled.
Leaves lanceolate or ovate, acute or acuminate.
Plant dark green ; leaves firm ; petioles $6-36 \mathrm{~mm}$. long.
8. S. aspera.

Plant light green ; leaves membranous ; petioles $\mathrm{I}-5 \mathrm{~cm}$. long.

Leaves ovate, obtuse; diffuse annual.
Whole plant densely white-villous; introduced species.
9. S. cordata.
10. S. arvensis.
11. S. Germanica.
I. Stachys hyssopifòlia Michx. Hyssop Hedge Nettle. (I. F. f. 3 II6.) Perennial, glabrous or nearly so, sometimes slightly hirsute at the nodes; stem slender, erect. 3-5 dm. high. Leaves linear, acute at both ends, short-petioled or sessile, entire, or sparingly denticulate with low teeth, $2-5 \mathrm{~cm}$. long, the uppermost reduced to short bracts; clusters forming an interrupted spike; fruiting calyx glabrous or slightly hirsute, 6 mm . long, its teeth lanceolate-subulate, nearly as long as the tube; corolla about 1.5 cm . long, light purple, glabrous. In fields and thickets, Mass. to Fla., Mich. and Va. July-Sept.
2. Stachys Atlántica Britton, n. sp. Coast Hedge Nettle. Perennial, glabrous, or with a few hairs at the nodes, weak, 2-4 dm. high. Leaves thin, mostly oblong and obtuse or obtusish, spreading, $2-5 \mathrm{~cm}$. long, usually over 5 mm . wide, remotely denticulate, the upper sometimes rounded at the base; corolla 1 cm . long; fruiting calyx 5 mm . long, its teeth triangular-ovate, acuminate. In marshy ground, L. I., to eastern Penn. Type from Southampton, L. I. Aug.-Sept.

Stachys ánnua L. An annual European species with lanceolate to oblong leaves, at least the lower crenate-dentate, a slender puberulent stem, and villous calyx, has been found at one locality in Kansas, and in ballast about the seaports.
3. Stachys ambígua (A. Gray) Britton. Dense-flowered Hedge Nettie. (I. F. f. 3II7.) Perennial; stem retrorsely hispid, at least below, 3-6 dm. high. Leaves oblong. oblong-lanceolate, or linear. pubescent or glabrate, acuminate or acute, 4-20 mm. wide, $2-8 \mathrm{~cm}$. long, serrulate; clusters in a terminal rather dense spike, and usually also in the upper axils; calyx more or less hirsute, 5 mm . long, its lanceolate-subulate teeth more than one-half as long as the tube. In moist soil, Penn. to Ga., Ill. and Ky. July-Aug.
4. Stachys arenícola Britton, n. sp. Sand Hedge Nettle. Perennial, very densely pubescent, $5-8 \mathrm{dm}$. high. Leaves lanceolate, narrowed at the base, sessile, finely crenate-dentate, acuminate, $6-10 \mathrm{~cm}$. long, the upper much smaller: upper bracts little longer than the flowers; calyx-teeth subulate-acicular, about as long as the tube; corolla about 1 cm . long. In sandy soil, southern N. Y. to Ill. and Mich. Type from New Dorp, Staten Island, N. Y.
5. Stachys tenuifòlia Willd. Smooth Hedge Nettle. (I. F. f. 3118.) Perennial; stem smooth, or slightly scabrous on the angles, slender. $3-8 \mathrm{dm}$. high. Leaves lanceolate, oblong, or ovate-lanceolate, slender-petioled, thin, acuminate at
the apex, obtuse or subcordate at the base, sharply dentate or denticulate, dark green, $5^{-13} \mathrm{~cm}$. long; clusters in terminal spikes, or also in the upper axils; calyx glabrous, or sparingly hirsute, 4 mm . long, its teeth one-half as long as the tube or more; corolla $12-16 \mathrm{~mm}$. long, pale red and purple. In moist fields and thickets, N. Y. to Ill., Kans., N. Car. and La. June-Aug.
6. Stachys làtidens Small, n. sp. Broad-toothed Hedge Nettle. Similar to $S$. tenuifolia, glabrous, or very nearly so throughout. Leaves thin, all shortpetioled, crenate-dentate, the lower ovate to oval, obtusish, the upper lanceolate to oblong-lanceolate, acuminate, $5-10 \mathrm{~cm}$. long; spike interrupted; fruiting calyx broadly campanulate, about 5 mm . long, its triangular sharp-pointed teeth 1 mm . long, I. 5 mm . wide. White Top Mt., Va. (J. K. Small, 1892).
7. Stachys palústris L. Hedge Nettle. Marsh or Clown's Woundwort. (I. F. f. 3II9.) Perennial, hirsute or pubescent; stem strict, retrorsehispid on the angles, 3-12 dm. high. Leaves lanceolate, oblong, or oblong-lanceolate, sessile, or very short-petioled, acuminate or acute, $5-13 \mathrm{~cm}$. long; crenulate or dentate; clusters forming an interrupted spike, sometimes also in the upper axils; calyx pubescent, its teeth subulate; corolla purplish to pale red, purple spotted, $12-16 \mathrm{~mm}$. long, its upper lip pubescent. In moist soil, Newf. to the N. W. Terr., Ore., N. Y., Ill., Mich. and N. Mex. Also in Europe and Asia. June-Sept.
8. Stachys áspera Michx. Rough Hedge Nettle or Woundwort. (I. F. f. 3120.) Perennial, rough hairy ; stem 6-12 dm. high, commonly retrorsehispid on the angles. Leaves oblong, oblong-lanceolate, or ovate-oblong, crenatedentate, acute or acuminate, $5-15 \mathrm{~cm}$. long, the lower slender-petioled; spike mostly interrupted; clusters sometimes also in the upper axils; calyx about 6 mm . long, its teeth triangular-lanceolate, acuminate; corolla red-purple, about 12 mm . long, its upper lip pubescent. In moist soil, Ont. to N. E., Fla., Minn. and La. June-Sept.
9. Stachys cordàta Riddell. Light-green Hedge Nettle. (I. F. f. 3121.) Perennial, hirsute, pale green; stem slender, weak, 6-9 dm. long. Leaves membranous, flaccid, ovate, oblong or ovate-lanceolate, acuminate, acute or the lowest obtuse, nearly all of them cordate at thẻ base, dentate or crenate all around, long-petioled, $7-15 \mathrm{~cm}$. long, $2-8 \mathrm{~cm}$. wide, the lowest petioles nearly as long as the blades; calyx-teeth subulate-lanceolate; corolla purplish, pubescent or puberulent, about 1 cm . long. In woods and thickets, Ohio to N. Car. and Tenn. JulyAug.
10. Stachys arvénsis L. Corn or Field Woundwort. (I. F. f. 3122.) Annual, hirsute; stem slender, diffusely branched, o.5-6 dm. long. Leaves ovate or ovate-oblong, thin, long-petioled, obtuse, crenate, cordate or the upper rounded at the base, about 2.5 cm . long; lower petioles commonly as long as the blades; clusters 4 - 6 -flowered, in the upper axils and in short terminal spikes; calyx about 6 mm . long, its teeth lanceolate, acuminate; corolla purplish, $6-10 \mathrm{~mm}$. long. In waste places, Me., Mass., and in ballast about the eastern seaports. Nat. from Europe. July-Oct.
ir. Stachys Germánica L. Downy Woundwort. Mouse-ear. (I. F. f. 3122a.) Annual; stem 3-9 dm. high. Leaves oval, ovate or lanceolate, cre-nate-dentate, villous, the lower rounded or subcordate at the base, long-petioled, mostly obtuse, the upper narrowed at both ends; clusters of flowers dense, borne in most of the axils; bracts lanceolate, half as long as the calyx; calyx-tecth ovate, acuminate, awned; corolla purple, its tube about as long as the calyx. Ruadsides near Guelph, Ont. Adventive from Europe. July-Sept.

## 2x. BETÓNICA L.

Annual or perennial herbs, similar to Stachys. Lower leaves very long-petioled. Verticils many-flowered, in terminal spikes. Calyx nearly equally 5 -toothed, 5-10-nerved. Corolla purple, the tube exceeding the calyx, the limibstrongly-2-lipped; upper lip concave; lower 3 -cleft, spreading. Stamens and pistil as in Stachys, but the anther-sacs parallel in some species. Nutlets ovoid, rounded above. [The classical Latin name of Wood Betony.] Ten species, or more, natives of Europe and Asia.
I. Betonica officinàlis L. Betony. Woon Betonv. (I. F. f. 3I23.) Perennial, deep green; stem erect, 3-9 dm. tall. Leaves oblong or ovate, wbtuse,
crenate, firm, cordate or truncate at the base, the basal and lower ones very longpetioled, the blades $7-15 \mathrm{~cm}$. long, the upper short-petioled or nearly sessile; spike short, dense; bracts ovate, mucronate, about as long as the calyx; calyx-teeth acicular; corolla-tube exserted. In a thicket at Newton, Mass. Fugitive from Europe. July-Sept.

## 22. SÁLVIA L.

Herbs, or some species shrubs, with clustered flowers, the clusters mostly spiked, racemed, or panicled. Calyx mostly naked in the throat, 2-lipped; upper lip entire or 3-toothed; lower lip 2-cleft or 2-toothed. Corolla strongly 2 -lipped; upper lip entire, emarginate or 2-lobed; lower lip spreading, 3-cleft or 3-lobed. Antherbearing stamens 2 (the posterior pair wanting or rudimentary); connective of the anthers transverse, linear or filiform, bearing a perfect anther-sac on its upper end, its lower end dilated, capitate or sometimes bearing a small or rudimentary one. Nutlets smooth, usually developing mucilage and spiral tubes when wetted. [Latin, salvus, safe, from its healing virtues.] About 500 species, of wide distribution. Besides the following, some 25 others occur in southern and western N. Am.
Leaves mostly basal, only $\mathrm{r}-3$ small pairs on the stem.

Leaves lyrate-pinnatifid or repand: upper corolla-lip short.
Leaves crenulate; upper lip arched, longer than the lower.
Stem leafy, bearing several pairs of leaves.
Leaves narrowly oblong, or lanceolate.
Corolla $2-3 \mathrm{~cm}$. long, its tube exserted.
Corolla $8-12 \mathrm{~mm}$. long, its tube not exserted.
Leaves ovate, or broadly oval.
Upper corolla-lip short, not exceeding the lower.
Leaves merely crenate or crenulate; fruiting calyx spreading.
5. S. urticifolia.

Leaves pinnatifid, sinuate or incised; fruiting calyx deflexed.
6. S. verbenaca.

Upper lip of corolla arched, longer than the lower.
7. S. Sclarea.
I. Salvia lyràta L. Lyre-leaved Sage. (I. F. f. 3124.) Perennial or biennial, hirsute or pubescent; stem 3-9 dm. high, bearing several whorls of large violet flowers. Basal leaves tufted, long-petioled, obovate or broadly oblong, thin, $0.7-2 \mathrm{dm}$. long; calyx campanulate, the teeth of its upper lip subulate, those of the lower longer, aristulate; corolla about 2.5 cm . long, the upper lip much smaller than the lower; anther-sacs borne on both the upper and lower ends of the connective. In dry, mostly sandy woods and thickets, N. J. to Fla., Ill., Ark. and Tex. Corolla rarely undeveloped. May-July.
2. Salvia praténsis L. Meadow Sage. (I. F. f. 3125.) Perennial, pubescent or puberulent. Basal leaves long-petioled, ovate, oblong, or ovate-lanceolate, crenulate, obtuse at the apex, rounded or cordate at the base, thick, rugose, $5-18 \mathrm{~cm}$. long; spike elongated, interrupted; calyx campanulate, glandular-pubescent, the teeth of the upper lip minute, those of the lower long, subulate; corolla purple, minutely glandular; lower end of the connective with a small or imperfect anther-sac. Atlantic Co., N. J. Fugitive or adventive from Europe. May-July.
3. Salvia Pítcheri Torr. Pitcher’s Sage. (I. F. f. 3126.) Perennial, downy; stem $6-15 \mathrm{dm}$. high; branches nearly erect. Leaves linear or linearoblong, sessile, or narrowed at the base into short petioles, firm, $5-13 \mathrm{~cm}$. long, the uppermost reduced to small bracts; clusters in long spikes; calyx oblong-campanulate, densely and finely woolly, about 6 mm . long, its upper lip entire, obtuse, the lower with 2 ovate acute teeth; corolla blue, finely pubescent, its lower lip broad, sinuately 3 -lobed, longer than the concave upper one; lower ends of the connectives destitute of anther-sacs. On dry plains, Mo., Kans. and Colo. to Tex. Introduced into Ill. July-Sept.
4. Salvia lanceolàta Willd. Layce-Leaved Sage. (I. F. f. 3127.) Annual, puberulent or glabrous; stem $1.5-4.5 \mathrm{dm}$. high. Leaves petioled, mostly obtuse, $2-5 \mathrm{~cm}$. long, the upper reduced to lanceolate-subulate bracts; flowers in terminal spike-like racemes; pedicels shorter than the campanulate calyx; calyx 4-6 mm. long, its upper lip ovate, entire, the lower 2 -cleft, the teeth ovate, mucronate; corolla blue, its lower lip narrow, twice as long as the upper; lower ends of
the connectives dilated. On plains, Neb. and Colo. to Tex., Ariz. and Mex. May-Sept.
5. Salvia urticifolia L. Nettle-leaved Sage. (I. F. f. 3128.) Perennial; stem glandular above, 3-6 dm. high. Leaves $5-10 \mathrm{~cm}$. long, irregularly crenate-dentate, usually acute, abruptly contracted into margined petioles; clusters in terminal interrupted spikes; bracts early deciduous; calyx oblong-campanulate, about 6 mm . long, the upper lip minutely 3 -toothed, the lower 2 -cleft, its teeth triangular-lanceolate, acuminate; corolla puberulent, $12-16 \mathrm{~mm}$. long, blue and white, the lower lip broad, 3 -lobed, twice as long as the upper; lower ends of the connectives dilated. In woods and thickets, Md. to Ky., Ga. and La. AprilJune.
6. Salvia verbenàca L. Wild Sage. Wild Clary. (I. F. f. 3129.) Perennial; stem glandular-pubescent, 3-6 dm. high. Leaves coarsely and irregularly incised-dentate or pinnatifid, the lower $0.7-2 \mathrm{dm}$. long, obtuse, cordate, nearly glabrous, the upper acute, much smaller; floral bracts broadly ovate, short; clusters in terminal interrupted spikes; pedicels shorer than the calyx; calyx $6-8 \mathrm{~mm}$. long, its upper lip recurved-spreading, witht 3 minute connivent teeth, the lower one with 2 lanceolate mucronate teeth; corolla blue, about 8 mm . long, its upper lip scarcely longer than the lower: lower ends of the connectives dilated. In waste places, Ohio to S. Car. and Ga. Nat. from Europe. June-Aug.
7. Salvia Sclàrea L. Clary. Clear-eye. See-bright. (I. F. f. 3I30.) Biennial or annual, glandular-pubescent; stem 6-II dm. high. Leaves broadly ovate, rugose, cordate, irregularly dentate-crenate or denticulate, the lower longpetioled, I.5-2 dm. long, the upper small, short-petioled or sessile; clusters in terminal spikes; bracts broad, ovate, acuminate, pink or white; calyx campanulate; deflexed-spreading in fruit, $8-10 \mathrm{~mm}$. long, its lips about equal, the teeth subulate, acicular; corolla blue and white, about 2.5 cm . long; upper lip laterally compressedlower portions of the connectives dilated. In fields, Penn. to S. Car., escaped from gardens. Nat. from Europe. June-Aug.

## 23. MONÀRDA L.

Erect aromatic herbs, with dentate or serrate leaves, and white red purple yellowish or mottled flowers, in dense capitate clusters, terminal and sometimes also axillary. Calyx tubular, narrow, 15 -nerved, nearly or quite equally 5toothed, mostly villous in the throat. Corolla usually puberulent or glandular, the limb 2-lipped; upper lip erect or arched; lower lip spreading, 3-lobed, the middle lobe larger or longer than the others. Anther-bearing stamens 2, ascending, usually exserted, the posterior pair (staminodia) rudimentary or wanting; anthers versatile, 2 -celled, the sacs divaricate, more or less confluent at the base. Nutlets ovoid, smooth. [In honor of Nicolas Monardes, a Spanish physician and botanist.] About ro species, of N. Am. and Mex.
Flower-clusters solitary, terminal (rarely also in the uppermost axils). Leaves manifestly petioled, the petioles commonly slender.

Corolla scarlet, $3-5 \mathrm{~cm}$. long; bracts red.

1. M. didyma.

Corolla white, pink, or purple, $2-3 \mathrm{~cm}$. long.
Leaves membranous; corolla slightly pubescent, $2-2.5 \mathrm{~cm}$. long.
2. M. Clinopodia.

Leaves thin or firm; corolla pubescent, $2.5-3 \mathrm{~cm}$. long. Pubescence spreading; leaves thin.

Corolla cream-color, pink, or purplish. 3. M. fistulosa.
Corolla and bracts deep purple or purple-red. 4. M. media, Pubescence short, canescent ; leaves firm, pale.
5. M. scabra.

Leaves sessile, or very short-petioled.
6. M. Bradburiana.

Flower-clusters both axillary and terminal.
Calyx-teeth triangular-lanceolate ; corolla yellowish, mottled. 7. M. punctata.
Calyx-teeth subulate-aristate ; corolla white or purple, not mottled.
8. M. citriodora.

1. Monarda dídyma L. Oswego Tea. Americin Bee Balim. (I. F. f. 313I.) Peremial; stem 6-9 dm. high. Leaves thin, ovate or ovate-lanceolate. petioled, dark green, usually with some villous pubescence bencath, acuminate. sharply serrate, $7-15 \mathrm{~cm}$. long; bracts commonly red; calyx incurved, slightly
hirsute in the throat, its teeth subulate, nearly erect, about as long as the diameter of the tube; corolla sparingly puberulent. In moist soil, especially along streams, N. B. (?) to Ont., Mich. and Ga. July-Sept.
2. Monarda Clinopòdia L. Basal Balm. (I. F. f. 3132.) Perennial; stem glabrous or slightly villous, 3-9 dm. high. Leaves lanceolate, ovate or ovatelanceolate, bright green, mostly slender-petioled, villous on the veins beneath and puberulent above, acuminate, sharply serrate, $5-10 \mathrm{~cm}$. long; bracts pale or white; calyx curved, nearly glabrous without, somewhat hirsute in the throat, its teeth subulate, slightly spreading, about as long as the diameter of the tube; corolla yellowish pink, slightly pubescent. In woods and thickets, Ont. to Ga. and Ky. June-Aug.
3. Monarda fistulòsa L. Wild Bergamot. (I. F. f. 3133.) Perennial, villous-pubescent or glabrate ; stem 6-9 dm. high. Leaves thin but not membranous, usually slender-petioled, lanceolate, ovate or ovate-lanceolate, acuminate, serrate, $3-10 \mathrm{~cm}$. long; bracts whitish or purplish; calyx puberulent or glabrous, densely villous in the throat, its subulate teeth rarely longer than the diameter of the tube ; corolla yellowish-pink or purplish. On dry hills and in thickets, Me. and Ont. to Minn., Kans., Fla. and La. June-Sept.
4. Monarda mèdia Willd. Purple Bergamot. (I. F. f. 3134.) Perennial, sparingly hairy or glabrate; stem stout, 6-I I dm. high. Leaves dark green, ovate, ovate-lanceolate, or the uppermost lanceolate, slender-petioled, acuminate, sharply toothed, usually rounded at the base, $7-13 \mathrm{~cm}$. long; bracts deep purple, very conspicuous; calyx curved, glabrous, or nearly so, slightly villous in the throat, its teeth slightly spreading. In moist thickets, Me. to Ont., Penn. and Va. June-Aug.
5. Monarda scàbra Beck. Pale Wild Bergamot. (I. F. f. 3I35.). Perennial; stem slender, puberulent at least above, $3-8 \mathrm{dm}$. high. Leaves usually shortpetioled, acuminate or acute, serrate, canescent or puberulent, rarely nearly glabrous, $2-10 \mathrm{~cm}$. long, $\mathbf{1}-2.5 \mathrm{~cm}$. wide; bracts green or slightly pink; calyx puberulent, often hairy at the summit, densely villous in the throat, its short subulate teeth nearly erect; corolla yellowish or pink, pubescent, sometimes glandular. On prairies and plains, N. W. Terr. and Br. Col. to Mont., Neb., Mo. and Tex. June-Aug.
6. Monarda Bradburiàna Beck. Bradbury's Monarda. (I. F. f. 3136.) Perennial, sparingly villous or glabrate; stem slender, 3-6 dm. high. Leaves bright green, ovate or ovate-lanceolate, sessile, or nearly so, or partly clasping by the cordate or subcordate base, acuminate, serrate, 5-9 cm. long; bracts green or purplish; calyx glabrous outside, hirsute within, narrowed at the throat, its teeth long, bristle-pointed, divergent, longer than the diameter of the tube; corolia pink or nearly white, about 2.5 cm . long, its upper lip pubescent or puberulent, the lower commonly purple-spotted. On dry hills or in thickets, Ill. tn Ala., Mo. and Kans. May-July.
7. Monarda punctàta L. Horse-mint. (I. F. f. 3137.) Perennial, usually rather densely downy; stem usually branched, 6-9 dm. high. Leaves lanceolate, linear-lanceolate or narrowly oblong, serrate, or nearly entire, usually acute at both ends, petioled, $2-8 \mathrm{~cm}$. long, often with smaller ones fascicled in their axils; bracts white or purplish, acute; calyx puberulent, villous in the throat, its teeth short, not longer than the diameter of the tube; corolla purple-spotted, about 2.5 cm . long, the stamens equalling or slightly surpassing its pubescent upper lip. In dry fields, southern N. Y. to Fla., Wis., Kans. and Tex. July-Oct.
8. Monarda citriodòra Cerv. Lemon Monarda. (I. F. f. 3138 .) Annual, puberulent; stem 3-6 dm. high. Leaves lanceolate or oblong-lanceolate, mostly sharply serrate or serrulate, acute, narrowed at the base, $2-8 \mathrm{~cm}$. long: bracts white or purple, awned, the awns becoming recurved; calyx-tube nearly glabrous, the throat densely villous, the teeth bristle-pointed, barbed, divergent or spreading, nearly half as long as the tube; corolla not spotted, nearly or quite glabrous, $2-2.5 \mathrm{~cm}$. long; stamens not exserted. On dry plains, Neb. and Colo. to Mo., Tex. and Ariz. Nat. in Tenn. June-Sept.

Monarda clinopodioides A. Gray, a related Texan species, with a slender stem, green or greenish bracts, and hirsute calyx with erect broader teeth, is reported from Kansas.

## 24. BLEPHÍLIA Raf.

Perennial hirsute or pubescent erect herbs, with axillary and terminal dense glomerules of purplish or bluish flowers, or the glomerules in terminal interrupted spikes Calyx tubular, $\mathbf{1} 3$-nerved, not villous in the throat, 2 -lipped, the upper lip 3 -toothed, the lower 2 -toothed, the teeth all aristate or those of the lower lip subulate. Corolla glabrous within, the limb 2-lipped; upper lip erect, entire; lower lip 3-lobed, the middle lobe narrower than the lateral ones. Anther-bearing (anterior) stamens 2, ascending; posterior stamens reduced to filiform staminodia, or none; anthers 2 -celled, the sacs divaricate, somewhat confluent at the base. Nutlets ovoid, smooth. [Greek, eyelash, from the fringed calyx-teeth.] Two or three species, natives of eastern N. Am.

| Pubescence short; upper leaves lanceolate or oblong, slightly serrate. | 1. B. ciliata. |
| :--- | :--- | :--- |
| Pubescence villous; leaves ovate or ovate-lanceolate, sharply serrate. | 2. $B$. hirsuta. |

I. Blephilia ciliàta (L.) Raf. Downy Blephilia. (I. F. f. 3139.) Stem puberulent, or with some short-villous pubescence above, commonly simple, 3-6 dm. high. Lower leaves and those of sterile shoots ovate or oval, crenatedenticulate, $2-5 \mathrm{~cm}$. long, the upper short-petioled or sessile, longer and narrower; clusters in a terminal spike and in the uppermost axils; outer bracts ovate to lanceolate, acuminate, usually purplish, ciliate; calyx hirsute, the teeth of the upper lip about one-third longer than those of the lower; corolla purple, villous-pubescent, IO-I2 mm. long. In dry woods and thickets, Mass. to Mich., Wis., Ga. and Mo. June-Aug.
2. Blephilia hirsùta (Pursh) Torr. Hairy Blephilia. (I. F. f. 3140.) Stem villous-pubescent, usually branched, 3-9 dm. high. Leaves membranous, ovate or ovate-lanceolate, acuminate, $5-10 \mathrm{~cm}$. long, or the lower shorter and broader; clusters axillary, or in a short terminal spike; outer bracts lanceolate or linear-lanceolate, long-acuminate, hirsute; calyx-tube nearly glabrous, its teeth very villous, those of the upper lip much exceeding the lower; corolla pubescent, pale purple, darker-spotted, $8-10 \mathrm{~mm}$. long. In woods and thickets, Vt. to Wis., Kans., Ga. and Tex. June-Sept.

Blephilia hirsùta glabràta Fernald. Stem glabrous, or villous only above; head solitary, or with one or two additional lower ones. Vt.

## 25. HEDEOMA Pers.

Aromatic and pungent herbs, with small leaves, and small blue or purple flowers in axillary clusters, these crowded into terminal spikes or racemes. Calyx tubular, 13-nerved, villous in the throat, the mouth mostly contracted in fruit, 2-lipped, or nearly equally 5 -toothed, the upper lip 3 -toothed, the lower 2 -cleft. Corolla-limb 2 -lipped, the upper lip erect, entire, emarginate or 2 -lobed, the lower spreading, 3-cleft. Perfect stamens 2, ascending under the upper lip, their anthers 2-celled, the sacs divergent or divaricate. Sterile stamens (staminodia) 2, minute, or none, very rarely anther-bearing. Nutlets ovoid, smooth. [Greek, sweet smell.] About 15 species, natives of Am. Besides the following, some 8 others occur in the Southern States.

$$
\begin{array}{ll}
\text { Teeth of the upper lip of the calyx triangular; leaves serrate. } \\
\text { Teeth of both lips of the calyx subulate; leaves entire. } & \text { 1. H. pulegioides. } \\
\text { Calyx-teeth all nearly equal; annual. }
\end{array}
$$

Teeth of the lower lip nearly twice as long as the upper; perennial.
3. H. Drummondit.

1. Hedeoma pulegioìdes (L.) Pers. American Pennyroyal. (I. F. f. 3141.) Annual; stem slender, much branched, finely soft-pubescent, 1.5-4.5 dm. high. Leaves ovate to ovate-oblong, petioled, sparingly serrate, mostly obtuse. glabrous, or sparingly pubescent, thin, $1-4 \mathrm{~cm}$. long, the upper smaller; clusters few-flowered, rather loose; pedicels shorter than or equalling the calyx; calyx pubescent, gibbous, oblong-ovoid in fruit, its 3 upper teeth acute, not exceeding the 2 subulate hispid lower ones; corolla purple, about 6 mm . long; rudimentary stamens manifest, rarely anther-bearing. In dry fields, N. S. to Ont. and Minn., Fla. and Kans. July-Sept.
2. Hedeoma híspida Pursh. Rough Penntroyal. (I. F. f. 3 Ifz.) Ammal; stem $0.7-2 \mathrm{dm}$. high, pubescent. Leaves linear, firm, sessile, or the lower short-
petioled, hispid-ciliate but otherwise mostly glabrous, $\mathbf{I}-2.5 \mathrm{~cm}$. long, the lower much shorter and smaller; clusters numerous, crowded; pedicels pubescent, shorter than the calyx; bracts subulate, hispid; calyx oblong, gibbous, hispid, its teeth subulate, upwardly curved in fruit, about one-half as long as the tube, the 2 lower ones somewhat narrower and more hispid than the upper; corolla about 6 mm . long, bluish-purple; sterile stamens rudimentary or none. On dry plains, Ill. to the N. W. Terr., La., Ark. and Colo. May-Aug.
3. Hedeoma Drummóndii Benth. Drummond's Pennyroyal. (I. F. f. 3143.) Perennial from a woody base, with an ashy down nearly all over; stems 1.5-4.5 dm. high. Leaves oblong or linear, short-petioled or sessile, obtuse, $1-2 \mathrm{~cm}$. long, the lowest shorter; clusters loosely few-flowered; pedicels puberulent, about one-half as long as the calyx; calyx cylindric-oblong, hirsute, slightly gibbous, its teeth subulate, upwardly curved and connivent in fruit; corolla purple, $8-12 \mathrm{~mm}$. long; sterile stamens rudimentary or none. In dry soil, Neb. and Colo. to Tex., Ariz. and Mex. April-Aug.

## 26. MELÍSSA L.

Leafy herbs, with broad dentate leaves, and rather small white or yellowish axillary clustered flowers. Caly x oblong-campanulate, deflexed in fruit, 13 -nerved, nearly naked in the throat, 2-lipped; upper lip flat, 3 -toothed, the lower 2-parted. Corolla exserted, its tube curved-ascending, naked within, the limb 2 -lipped; upper lip erect, emarginate; lower lip 3 -cleft, spreading. Anthers 2 -celled, their sacs divaricate. Nutlets ovoid, smooth. [Greek, bee.] About 4 species, of Europe and western Asia.
I. Melissa officinàlis L. Garden or Lemon Balm. Bee-balm. (I. F. f. 3144.) Perennial, pubescent; stem 3-8 dm. high. Leaves ovate, petioled, mostly obtuse at both ends, sometimes cordate, $2.5-6 \mathrm{~cm}$. long; pedicel shorter than the calyx; calyx about 6 mm . long, the teeth of its lower lip slightly exceeding those of the upper; corolla white, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. long. In waste places, thickets and woods, Me. to Ga. and W. Va. Nat. from Europe. Plant lemon-scented. June-Aug.

## 27. SATUREIA L.

Herbs or shrubs, with small entire leaves, sometimes with smaller ones fascicled in their axils, and bracted purple flowers in dense terminal or axillary clusters. Calyx campanulate, mostly 1o-nerved, 5 -toothed, naked or rarely villous in the throat. Corolla-limb 2-lipped, the upper lip erect, flat, entire or emarginate, the lower spreading, 3-cleft. Anthers 2-celled, the sacs parallel or divaricate. Nutlets oblong or oval. [The classical Latin name.] About 18 species, the following introduced as a garden herb from Europe, one of doubtful affinity in Florida, the others of the Mediterranean region.
I. Satureia horténsis L. Savory. Summer Savory. (I. F. f. 3145.) Annual, puberulent; stems much branched, I.5-4.5 dm. high. Leaves linear or linear-oblong, short-petioled, acute, $\mathbf{1}-4 \mathrm{~cm}$. long; clusters $6-10 \mathrm{~mm}$. in diameter, terminal and in many of the upper axils; calyx about equalling the corolla-tube, somewhat pubescent, its teeth subulate, about as long as the tube, ciliate; corolla little longer than the calyx: stamens scarcely exserted. In waste places, N. B. and Ont. to Penn., west to Nev. Nat. or adventive from Europe. July-Sept.

## 28. CLINOPÒDIUM L.

Herbs, or low shrubs, with entire or sparingly dentate leaves, and rather large flowers variously clustered. Calyx mostly gibbous at the base, about $\mathbf{1} 3$-nerved, 2-lipped, the upper lip 3 -toothed, the lower 2 -cleft. Corolla usually expanded at the throat, the tube straight, the limb 2 -lipped; upper lip erect, entire or emarginate; lower lip spreading, 3 -cleft. Stamens somewhat connivent in pairs, the longer mostly exserted; anthers 2-celled, the sacs divergent or divaricate. Nutlets ovoid, smooth. [Greek, bed-foot, the flowers likened to a bed-caster.] About 50 species, of the north temperate zone. Besides the following, 3 others occur in the southeastern U. S. and in Cal.

## * Flower-clusters dense, axillary and terminal, setaceous-bracted.

r. C. vulgare.

*     * Flower-clusters loose, axillary, or forming terminal thyrses; bracts small.

Plants pubescent; introduced species.
Clusters peduncled; calyx not gibbous; upper leaves very small; perennials.
Leaves $0.6-2.5 \mathrm{~cm}$. long; corolla somewhat exceeding the calyx.
C. Nepeta.

Leaves $2-5 \mathrm{~cm}$. long; corolla at least twice as long as the calyx.
3. C. Calamintha.

Clusters sessile; calyx very gibbous; plant leafy; annual. 4. C. Acinos. Plants glabrous; native species.

Leaves linear or the lower spatulate, entire; corolla 8 mm . long. 5. C. glabrum.
Leaves oblong or oblong-lanceolate, serrate; corolla $\mathbf{1 2 - 1 4} \mathrm{mm}$. long.
6. C. glabellum.

1. Clinopodium vulgàre L. Field or Wild Basil. Basil-weed. (I. F. f. 3146.) Perennial by short stolons, hirsute; stem 3-6 dm. high. Leaves ovate or ovate-lanceolate, petioled, entire, undulate or crenate-dentate, thin, $2-6 \mathrm{~cm}$. long; flowers in capitate clusters $2-3 \mathrm{~cm}$. in diameter; bracts hirsute-ciliate, usually as long as the calyx-tube; calyx pubescent, the setaceous teeth of its lower lip rather longer than the broader ones of the upper; corolla purple, pink, or white, little exceeding the calyx. In woods and thickets, N. S. to N. Car., Minn. and Manitoba, south in the Rocky Mts. to Colo. Also in Europe and Asia. June-Oct.
2. Clinopodium Népeta (L.) Kuntze. Field Balm. Lesser Calamint. (I. F. f. 3147.) Villous or pubescent. Leaves broadly ovate, petioled, crenulate with few low teeth, the lower $1-2.5 \mathrm{~cm}$. long; flowers few in the numerous loose cymes, forming an almost naked elongated thyrsus; bracts very small, linear; calyx villous in the throat, about 3 mm . long, the teeth of its lower lip twice as long as those of the upper; corolla light purple or almost white, about 8 mm . long. In fields and waste places, Md. to S. Car., Ala., Ky. and Ark. Nat. from Europe. June-Sept.
3. Clinopodium Calamíntha (L.) Kuntze. Calamint. Calamint Balm. (I. F. f. 3148.) Perennial by creeping rootstocks, $3-8 \mathrm{dm}$. high. Leaves broadly ovate, petioled, obtuse at both ends or subacute at the apex, dentate or crenatedentate, $2-5 \mathrm{~cm}$. long and nearly as wide; inflorescence as in the preceding species, but commonly more leafy; calyx villous in the throat, $4-6 \mathrm{~mm}$. long; corolla purplish, $\mathbf{1 2 - 1 4} \mathrm{mm}$. long. "Inclined to escape from cultivation in a few places" (according to Gray). Native of Europe and Asia. June-Aug.
4. Clinopodium Ácınos (L.) Kuntze. Basil Thyme. Basil Balm. (I. F. f. 3149.) Stems branched from the base, very slender, 1.5-2 dm. high. Leaves oblong or ovate-oblong, petioled, acutish at both ends or the lower obtuse, crenulate or entire, $8-16 \mathrm{~mm}$. long; flowers about 6 together in the axils; bracts shorter than the pedicels; calyx rough-hairy, longer than its pedicel, contracted at the throat, its subulate teeth somewhat unequal; corolla purplish, $11 / 2-2$ times as long as the calyx. In waste places, Ont. to Mass., N. Y. and N. J. Adventive from Europe. May-Aug.
5. Clinopodium glàbrum (Nutt.) Kuntze. Low Calamint. (I. F. f. 3150. ) Perennial, stoloniferous, erect or ascending, $\mathbf{r}-3 \mathrm{dm}$. high. Leaves of the flowering branches linear, entire, short-petioled or sessile, mostly obtuse, obscurely veinct, $8-18 \mathrm{~mm}$. long, the margins slightly revolute; lower leaves and those of the stolons shorter and broader, distinctly petioled; flowers I-4 in the axils; pedicels filiform, mostly longer than the calyx; calyx not gibbous, its throat pubescent in a ring within, its lower teeth somewhat longer than the upper; corolla purple. On rocks and banks, N. Y. and Ont. to Ill., Minn., Mo. and Tex. May-Aug.
6. Clinopodium glabéllum (Michx.) Kuntze. Slender Calamint or Bed's-FOOT. (I. F. f. 3 r5I.) Perennial, stoloniferous; stems spreading or decumbent, at length freely branched, $2-6 \mathrm{dm}$. long. Leaves membranous, oblong, shortpetioled, obtuse or the uppermost subacute, narrowed to a cuncate base, serrate with low testh, $2-5 \mathrm{~cm}$. long, $4-16 \mathrm{~mm}$. wide, the lowest and those of the stolens sometimes shorter; axils $2-5$-flowered; pedicels commonly twice as long as the calyx; calyx not gibbous, its throat pubescent in a ring within, its teeth nearly equal; corolla purplish. On river banks, Ky. and Tenn. Rare and local. MayJuly,

## 29. HYSSÒPUS L.

A perennial erect herb, the stem somewhat woody at the base, with narrow, entire leaves, and small bracted purple or blue flowers, in dense clusters in the upper axils, and forming elongated terminal spikes. Calyx tubular, 15 -nerved, about equally 5 -toothed. Corolla-limb 2 -lipped, the upper lip erect, emarginate, the lower spreading, 3 -cleft. Anthers 2 -celled, the sacs divaricate. Nutlets ovoid, somewhat 3 -sided, nearly smooth. [Greek, an aromatic herb.] A monotypic genus.

1. Hyssopus officinàlis L. Hyssop. (I. F. f. 3152.) Stems usually several together, strict, puberulent, 3-9 dm. high. Leaves linear to oblong, sessile or nearly so, firm, acute at both ends or the lower obtuse, puberulent or glabrate, faintly veined, $3-5 \mathrm{~cm}$. long, sometimes with smaller ones or short leafy branches in their axils; spike dense; outer bracts as long as the calyx; calyx-teeth lanceolate, acute; corolla $8-10 \mathrm{~mm}$. long. Along roadsides and in waste places, Ont. to Me. and N. Car., and on the Pacific Coast. Nat. from Europe. June-Sept.

## 30. ORÍGANUM L.

Perennial herbs, some species shrubby, with crenate-dentate or entire leaves, and small bracted pink or purple flowers, in dense terminal glomerules. Calyx villous in the throat, about 13 -nerved, 5 -toothed or 2 -lipped. Corolla-limb 2 -lipped, the upper lip erect, emarginate or 2 -lobed, the lower longer, spreading, 3 -cleft. Stamens didynamous, ascending; anthers 2 -celled, the sacs divergent. Nutlets ovoid or oblong, smooth. [Greek, mountain-joy.] About 30 species, of the Old World.
I. Origanum vulgàre L. Wild Marjoram. Organy. (I. F. f. 3153.) Perennial from nearly horizontal rootstocks, villous or hirsute; stem 3-8 dm. high. Leaves ovate, petioled, rounded or subcordate, crenate or entire, $2.5-4 \mathrm{~cm}$. long, often with smaller ones in their axils; flower-clusters often 5 cm . broad; bracts purplish, ovate or oval, about equalling the 5 -toothed calyx; corolla pink, purple or nearly white, the upper lobe broad; all four stamens, or the two longer, exserted. In fields and waste places, Ont. to N. J. and Penn. Nat. from Europe. July-Sept.

## 31. KOÈLLIA Moench.

Perennial, mostly fragrant erect herbs, with small white or purple-dotted flowers, in terminal or sometimes also axillary capitate glomerules or cymose clusters. Calyx 10-I3-nerved, 5 -toothed, not villous in the throat, the 2 upper teeth sometimes united below. Corolla 2-lipped, the upper lip emarginate or entire, the lower 3 -cleft. Stamens 4, didynamous, nearly equal, or the lower pair a little longer: anther-sacs parallel. Nutlets smooth, pubescent, or roughened. [Named for J. L. C. Koelle, a German botanist of the eighteenth century.] About 14 species, of N. Am. Besides the following, I occurs in California and I or 2 in the Southern States.

* Leaves prevailingly linear, linear-lanceolate or oblong-lanceolate. Calyx-teeth ovate-triangular, acute, one-fourth as long as the tube.

2. K. Virginiana。

Calyx-teeth subulate, lance-subulate or bristle-tipped.
Leaves linear or lanceolate; calyx-teeth subulate or lanceolate.
Leaves linear or narrowly linear-lanceolate, entire. 1. K. flexuosa.
Leaves lanceolate, entire, or usually serrate.
Bracts appressed, erect ; clusters dense.
Hirsute or pilose; leaves mainly entire. 3. $K$. pilosa.
Puberulent or glabrate; leaves mostly denticulate.
4. $K$. verticillata. Bracts spreading; clusters loose. 5. $K$. clinopodioides.
Leaves oblong to linear-oblong, obtuse or subacute; calyx-teeth awn-like.
6. K. हyssopifolia.

*     * Leaves prevailingly ovate, ovate-oblong or ovate-lanceolate.

Calyx-teeth bristle-tipped or subulate.
Bracts appressed; clusters dense; calyx-teeth bristle-pointed.
7. K. aristata,

Bracts spreading; clusters loose; calyx-teeth subulate. Calyx-teeth about one-half as long as the tube. Calyx-teeth as long as the tube. Calyx-teeth triangular, triangular-lanceolate or lanceolate. Bracts spreading; clusters loose; calyx-teeth short.
Bracts appressed; clusters dense.
Bracts canescent; leaves firm, acute. Bracts ciliate or villous; leaves membranous, acuminate
12. K. montana.
I. Koellia flexuòsa (Walt.) MacM. Narrow-leaved Mountain-mint. (I. F. f. 3154.) Stem stiff, nearly glabrous, $4-8 \mathrm{dm}$. high. Leaves entire, glabrous or the uppermost puberulent, sessile, or the lower very short-petioled, $2-5 \mathrm{~cm}$. long, $\mathbf{I}-3 \mathrm{~mm}$. wide, often with short leafy branches in their axils; glomerules cymose, $6-10 \mathrm{~mm}$. broad, canescent; bracts appressed, acuminate, or subulatetipped. not longer than the clusters; calyx cylindraceous, canescent, its teeth subulate and rigid, equal or nearly so, 3-4 times longer than broad, about one-third as long as the tube. In fields and thickets, Me. and N. H. to Fla., Ont., Kans., Minn. and Tex. Little fragrant. July-Sept.
2. Koellia Virginiàna (L.) MacM. Virginia Mountain-mint. (I. F. f. 3155.) Stem strict, glabrous or pubescent, 3-9 dm. high. Leaves lanceolate or linear-lanceolate, fragrant, short-petioled or sessile, firm, entire, acuminate, glabrous, or puberulent beneath, or the uppermost canescent, $2-5 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide, often with short leafy branches in their axils; glomerules dense, $8-12 \mathrm{~mm}$. in diameter, cymose, canescent; bracts appressed, rigid, acute, acuminate or sub-ulate-tipped, not exceeding the clusters; calyx canescent, its teeth equal or nearly so, acute, little longer than wide; corolla pubescent, purple-spotted. In dry fields and thickets, Quebec and Ont. to Minn., Ga., Ala. and Kans. July-Sept.
3. Koellia pilòsa (Nutt.) Britton. Hairy Mountain-mint. (I. F. f. 3156.) Pubescent, 3-8 dm. high. Leaves lanceolate, short-petioled or sessile, entire or sparingly denticulate, $2-5 \mathrm{~cm}$. long, 6-12 mm . wide, firm, acuminate, commonly with short leafy shoots in their axils; glomerules cymose, villous or hirsute-canescent, about 8 mm . in diameter; bracts lanceolate, acuminate, equalling or exceeding the clusters; calyx narrow, canescent, its teeth equal, about 3 times as long as wide and one-fourth to one-third the length of the tube; corolla pubescent. On prairies and in dry woods, Ohio to Ga., Kans. and Ark. July-Sept.
4. Koellia verticillàta (Michx.) Kuntze. Torrey's Mountain-mint. (I. F. f. $3^{15} 5$.) Stem slender, $3^{\circ}-8 \mathrm{dm}$. high. Leaves linear-lanceolate to ovate-lanceolate, short-petioled or sessile, serrulate or entire, acute or acuminate, $2-8 \mathrm{~cm}$. long, $6-20 \mathrm{~mm}$. wide, the uppermost sometimes canescent; clusters dense, canescent, 10-12 mm . broad, cymose and commonly also in the upper axils; bracts appressed, lanceolate, acuminate, equalling or longer than the clusters; calyx canescent, its teeth subulate or lance-subulate, 2-3 times as long as wide, one-fourth to one-third as long as the tube; corolla pubescent. In dry fields and thickets, Vt. to R. I., N. Y., Va., Pa. and Mo. The narrower-leaved forms are Koellia Torreyi (Benth.) Kuntze, and are possibly distinct. July-Sept.
5. Koellia clinopodioìdes (T. \& G.) Kuntze. Basil Mountain-Mint. (I. F. f. 3158.) Pubescent or puberulent; stem 3-8 dm. high. Leaves rather thin, short-petioled, sharply serrate, or the upper entire, $3-8 \mathrm{~cm}$. long, $1-2.5 \mathrm{~cm}$. wide; flower-clusters terminal and axillary; bracts linear-acuminate or subulate-tipped, not exceeding the clusters; calyx canescent or glabrate, its teeth subulate, sometimes with a few long hairs, about one-fourth the length of the tube. In dry soil, N. Y. and Penn. to Tenn. Aug.-Sept.
6. Koellia hyssopiòflia (Benth.) Britton. Hyssop Mountain-Mint. (I. F. f. 3159.) Puberulent or glabrate; stem slender, stiff, 3-9 dm. high. Leaves linear-oblong to lanceolate-oblong, short-petioled, or the upper sessile, narrowed at the base, entire or denticulate, $1-4 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide, glabrous or minutcly canescent; flower-clusters dense, minutely canescent, cymose, and usually also in the upper axils; bracts linear-oblong, terminated by an awn almost as long as the body; calyx glabrous or nearly so, nerved, its teeth bristle-pointed, nearly as long as the tube. In dry soil, Va. to Fla. June-Aug.
7. Koellia aristata (Michx.) Kuntze. Awnfd Mountain-Minf. (I. F. i. 3160.) Similar to the preceding; stem stiff, minutely canescent, 3-8 dm. high.

Leaves ovate, or some of them ovate-lanceolate, short-petioled, sharply serrate, serrulate, or the upper entire, acute, rounded at the base, $2-5 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide; bracts long-awned, appressed, the awn about one-third the length of the body; calyx canescent, its teeth equal, bristle-pointed, one-third to one-half as long as the tube. In dry pine barrens, N. J. to Fla. and La. July-Sept.
8. Koellia incàna (L.) Kuntze. Hoary Mountain-Mint. (I. F. f. 316i.) Stem pubescent, or glabrous below, 4-9 dm. high. Leaves thin, ovate to ovatelanceolate, petioled, acute, serrate or serrulate, white-canescent beneath, $3-8 \mathrm{~cm}$. long, or the uppermost smaller and sometimes canescent on both sides; clusters loose, terminal and in the upper axils, canescent, bracts linear, or the outer broader, canescent or slightly villous; calyx canescent, its teeth subulate, somewhat unequal. Dry thickets and hill-sides, Me. to Ont., Ohio and Fla. Aug-Oct.
9. Koellia pycnanthemoides (Leavenw.) Kuntze. Southern MountainMint. (I. F. f. 3162.) Stem pubescent nearly to the base, 6-9 dm. high. Leaves membranous, petioled, mostly ovate-lanceolate, acuminate or acute, serrate, pubescent beneath, puberulent or glabrate above, $3-10 \mathrm{~cm}$. long, the upper smaller and white-canescent on both sides; clusters loose, villous and canescent, terminal and axillary, $2-5 \mathrm{~cm}$. broad, the flowers often secund; bracts linear-oblong, acuminate or subulate-tipped; calyx-teeth very unequal, subulate, densely villous, the longer about equalling the tube. In dry woods and on hills, Va. to Ga. and Tenn. July-Sept.
10. Koellia albéscens (T. \& G.) Kuntze. White-leaved MountainMint. (I. F. f. 3163.) Stem soft-pubescent nearly to the base, 3-6 dm. high. Leaves ovate to ovate-lanceolate, petioled, acute or subacuminate, serrate or nearly entire, $2-6 \mathrm{~cm}$. long, white-canescent beneath, green above, or the upper canescent on both sides; clusters terminal and axillary, densely canescent; bracts linear, or the outer broader; calyx densely canescent, its teeth triangular, one-fifth to onefourth as long as the tube. In dry woods and thickets, Va. to Mo., Ark., Fla. and Tex. July-Sept.
ir. Koellia mùtica (Michx.) Britton. Short-toothed Mountain-mint. (I. F. f. 3164.) Stem stiff, puberulent, or glabrous below, 3-8 dm. high. Leaves short-petioled or sessile, ovate or ovate-lanceolate, firm, acute at the apex, rounded or sometimes subcordate at the base, sharply serrate or serrulate, $3-8 \mathrm{~cm}$. long, the uppermost white-canescent on both sides, much smaller; flower-clusters capitate, cymose, often also in the upper axils, pubescent or canescent, 8-14 ram. broad; bracts lanceolate-subulate or the outer broader; calyx pubescent, its teeth not much longer than wide, about one-fifth as long as the tube. In sandy soil, Me. to Va. and Fla., west to Mo. July-Sept.
12. Koellia montàna (Michx.) Kuntze. Thin-leaved Mountain-mint. (I. F. f. 3165.) Glabrous or nearly so, 6-9 dm. high. Leaves petioled, membranous, glabrous, ovate-lanceolate or the upper lanceolate, long-acuminate, sharply serrate, $5-\mathbf{I} 3 \mathrm{~cm}$. long, none canescent; flower-clusters terminal and in the upper axils, $\mathrm{I}-2.5 \mathrm{~cm}$. broad; bracts lanceolate or linear-lanceolate, acuminate, bearded more or less with long hairs; calyx tubular, its teeth triangular-subulate, one-fifth to one-fourth as long as the tube. In woods, mountains of Va. to Ga., Tenn. and Ala. July-Sept.

## 32. THỲMUS L.

Perennial herbs, or low creeping shrubs, with small leaves, and small purple flowers in terminal glomerules, or in the axils of the leaves. Calyx ovoid, villous in the throat, IO-I3-nerved, 2 -lipped, the upper lip erect-spreading. 3 -toothed, the lower 2-toothed, its teeth long and slender. Corolla-limb 2 -lipped, the upper lip erect, emarginate, the lower spreading, 3 -cleft. Stamens 4, mostly exserted; anthers 2-celled, the sacs parallel or divergent. Nutlets ovoid or oblong, smooth. [Greek, incense.] About 50 species, of the Old World.
I. Thymus Serpyllum L. Wild or Creeping Thyme. Mother of Thyme. (I. F. f. 3 166.) Stems more or less pubescent in lines, slender, procumbent, tough, much branched, $1-3 \mathrm{dm}$. long, commonly forming dense mats. Leaves oblong or ovate-oblong, petioled, obtuse, entire, glabrous, or ciliate, $4-10 \mathrm{~mm}$. long; bracts similar to the leaves, but smaller; calyx 2 -lipped, the tube usually
pubescent and the teeth ciliate; corolla longer than the calyx. In thickets, woods, and along roadsides, N. S. to Mass., N. Y., Penn. and N. Car. Nat. from Europe. June-Sept.

## 33. CUNìLA L.

Perennial aromatic herbs, or low shrubs, with rather small purple or white flowers. Calyx tubular-ovoid, 10-13-nerved, villous in the throat, equally 5 -toothed. Corolla 2-lipped, longer than the calyx, the upper lip erect, emarginate, the lower spreading, 3 -cleft. Anther-bearing stamens 2, long-exserted, straight, the posterior pair rudimentary, or wanting; anther sacs parallel. Nutlets smooth; scar of attachment basal and small. [Latin name of some plant.] About 15 species, natives of Am.
I. Cunila origanoìdes (L.) Britton. Stone Mint. American Dittany. (I. F. f. 3167.) Stem slender, stiff, glabrous, or pubescent at the nodes, 2-5 dm. high. Leaves ovate, sessile, or short-petioled, acute, sharply serrate, rounded, truncate or subcordate at the base, $1-4 \mathrm{~cm}$. long, densely punctate; flowers 10-12 mm . long, in terminal loose cymose clusters; corolla purple-pink; posterior pair of stamens usually rudimentary. In dry woods and thickets, N. Y. to Fla., Ohio and Ga. Plant very aromatic. Aug.-Sept.

## 34. LÝCOPUS L.

Herbs, perennial by slender stolons or suckers, with small white or purple flowers, bracted and verticillate in dense axillary clusters. Calyx campanulate, regular or nearly so, 4-5-toothed, not bearded in the throat. Corolla funnelformcampanulate to cylindric, the limb nearly equally 4 -cleft, or one of the lobes broader and emarginate. Perfect stamens 2, anterior, the posterior pair rudimentary, or altogether wanting; anther-sacs parallel. Nutlets truncate at the summit, narrowed below, trigonous, smooth. [Greek, wolf-foot.] About 15 species, of the north temperate zone. Besides the following, 3 or 4 others occur in western N. Am.

Calyx-teeth 4 or 5 , ovate, shorter than the nutlets.
Leaves mostly ovate, usually purple; base of stem not tuberous.
Leaves mostly lanceolate to oblong; base of stem tuberous. Leaves mostly firm, sessile or nearly so.
Leaves membranous, slender-petioled.

1. L. Virginicus.
2. L. communis.
3. L. membranaceus. Calyx-teeth mostly 5 , lanceolate or subulate, longer than the nutlets.

Bracts minute; corolla twice as long as the calyx.
Leaves sessile. 4 . L. sessizfolius.
Leaves narrowed into a manifest petiole. 5. L. rubellus.
Bracts lanceolate or subulate; corolla not twice as long as the calyx.
Leaves pinnatifid or deeply incised.
Leaves merely coarsely dentate or serrate (lower rarely incised).
Leaves oblong or oblong-lanceolate, serrate.
Leaves thin, narrowed at base.
Leaves firm, rounded at base.
Leaves ovate, coarsely dentate.
7. L. lucidus.
8. L. asper.
9. L. Europaeus.

1. Lycopus Virgínicus L. Purple Bugle-weed. Purplish, rarely green, stouter than the following species and more puberulent, the stem obtusely angled, not tuberous at the base, but the stolons bearing terminal tubers. Leaves ovate to ovate-oblong, usually abruptly narrowed to both ends, acuminate, $6-15 \mathrm{~cm}$. long, coarsely toothed, often slender-petioled; clusters dense, sulglobose; calyx cylindraceous, the erect lobes oblong to oblong-lanceolate, acutish; corolla 2 mm . long or less, not twice the length of the calyx, narrowly tubular, the short suhequal lohes erect or nearly so; stamens and style included; sterile stamens evident; nutlets r.5-2 mm . long, transversely notched and strongly denticulate. In moist soil, N. Y. to Ala.. Neb. and Kans. July-Sept.
2. Lycopus cómmunis Bicknell, n. sp. Common Bucile-weed. (I. F. f. 3168, as L. Virginicus.) Green, or sometimes purplish. roughish-puherulent, or the leaves glabrate; stem tuberous at base, $1-8 \mathrm{dm}$. high, subacutely angled with grooved sides; stolons rarely tuber-bearing. Leaves 2.5 .8 cm . long, oblong. narrowed to base and apex, serrate, very short-petioled; calvx campanulate, the lobes ovate to ovate-oblong, obtusish; corolla $2-3 \mathrm{~mm}$. long, abruptly dilated at the
throat, the lobes spreading; sterile stamens minute or obsolete; nutlets $\mathbf{I} \mathbf{I} .5 \mathrm{~mm}$. long, oblique at the top. In moist soil, Newf. to Br. Col., Va., Neb. and Ore. Type from Van Cortlandt, N. Y. Aug-Sept.
3. Lycopus membranàceus Bicknell, n. sp. Thin-leaved Bugle-weed. Puberulent to glabrate; stem slender from a tuberous base; stolons weakly developed, or wanting. Leaves very thin, lanceolate to oblong-lanceolate, mostly acuminate, narrowed into a slender petiole, coarsely toothed, $6-11 \mathrm{~cm}$. long; clusters very small; calyx-lobes ovate, abtuse; corolla 3-4 mm. long, with smaller and less spreading lobes than in L. communis; nutlets $\mathbf{I} .5 \mathrm{~mm}$. long, or more, oblique at the top. In wet woods, Me. to N. Y. and Mich. Type from Mt. Desert, Me. Aug.-Sept.
4. Lycopus sessilifòlius A. Gray. Sessile-leaved Water Hoarhound. (I. F. f. 3169 .) Glabrous, or puberulent above, perennial by stolons and suckers; stem 3-6 dm. high. Leaves ovate-lanceolate or oblong-lanceolate, sessile, acute or acuminate, sharply serrate, somewhat narrowed at the base, $2-5 \mathrm{~cm}$. long: bracts very small, acute; calyx-teeth usually 5, subulate, rigid, nearly as long as the tube; rudimentary posterior stamens oval. In wet soil, eastern Mass. to Fla. Aug.-Oct.
5. Lycopus rubéllus Moench. Stalked Water Hoarhound. (I. F. f. 3170.) Glabrous or minutely puberulent, perennial by long leafy stolons, 3-IO dm. high. Leaves ovate to oblong-lanceolate, or narrower, acuminate, sharply dentate, narrowed or cuneate at the base, $5-15 \mathrm{~cm}$. long; bracts minute, acute or acuminate; calyx-teeth triangular-subulate, herbaceous, one-half as long as the tube or more; rudimentary stamens small, oval to oblong, or obsolete. In wet soil, N. Y. to Fla., Ohio, Ark. and La. July-Oct.
6. Lycopus Americànus Muhl. Cut-leaved Water Hoarhound. (I. F. f. 3 171.) Puberulent or glabrous, perennial by suckers; stem stiff, sharply angled, r-9 dm. high. Leaves lanceolate or ovate-lanceolate, petioled, acuminate, incised, pinnatifid or the uppermost merely serrate, $3-10 \mathrm{~cm}$. long; bracts subulate; calyxteeth triangular-subulate, cuspidate, rigid; corolla little exceeding the calyx, dilated at the throat; rudimentary stamens thickened at their tips. In wet soil, Newf. to Br. Col., Fla., Tex., Utah and Cal. June-Oct.
7. Lycopus lùcidus Turcz. Western Water Hoarhound. (I. F. f. 3172.) Perennial by stolons; stem usually stout, strict, 3-9 dm. high. Leaves oblonglanceolate, acute, sessile, or short-petioled, $5-15 \mathrm{~cm}$. long, sharply serrate with acute ascending teeth; bracts ovate or lanceolate, acuminate-subulate; calyx-teeth 5, subulate-lanceolate, nearly as long as the tube; corolla little longer than the calyx; rudimentary stamens thickened at the tips. In wet soil, Neb. to Kans., Br. Col., Cal. and Ariz. Also in Asia. The American plant perhaps distinct from the Asiatic. July-Sept.
8. Lycopus ásper Greene. Rough Bugle-weed. Stems simple, 3-6 dm. high, obtusely angled, leafy. Leaves firm, narrowly lanceolate to oblong-lanceolate, acute, sessile, scarcely narrowed at the base, strongly and nearly equally serrate with very sharp teeth, $4-6 \mathrm{~cm}$. long, much longer than the internodes, conspicuously veiny, rough on both surfaces; calyx-teeth ovate-lanceolate, acuminate; nutlets very short, smooth. Minn. to the N. W. Terr. July-Aug.
9. Lycopus Europaèus L. Water or Marsh Hoarhound. Gipsì wort. Gipsy-herb. (I. F. f. 3I73.) Puberulent or pubescent, perennial by suckers, 3-8 dm. high. Leaves ovate, ovate-oblong, or oblong-lanceolate, short-petioled, or the upper sessile, coarsely dentate, or the lower incised at the base, $2-8 \mathrm{~cm}$. long, bracts subulate-lanceolate; calyx-teeth subulate-spinulose; corolla scarcely longer than the calyx; rudimentary posterior stamens obsolete. In waste places, N. Y. to Va. Nat. from Europe. July-Sept.

## 35. MÉNTHA L.

Odorous herbs, with simple mostly punctate leaves, and small whorled purple pink or white flowers, the whorls axillary or in terminal spikes. Calyx ro-nerved, regular, or slightly 2 -lipped, 5 -toothed. Corolla-tube shorter than the calyx, the limb 4 -cleft, the posterior lobe usually somewhat broader than the others, entire or emarginate. Stamens 4. equal, erect, included or exserted, sometimes imperfect; filaments glabrous; anthers 2 -celled, the sacs parallel. Nutlets ovoid, smooth.
[Name used by Theophrastus; from the nymph Minthe.] About 30 species, of the north temperate zone.

* Whorls of flowers in terminal spikes, or some in the upper axils.

Plants glabrous or very nearly so.
Spikes slim, narrow, mostly interrupted; leaves sessile, or nearly so.

1. M. spicata.

Spikes thick, mostly dense, at first short; leaves petioled. Leaves lanceolate or oblong, acute.
2. M. piperita.

Leaves ovate, obtuse, or the upper acute, subcordate.
3. M. citrata.

## Plants villous, hirsute or canescent, at least at the nodes.

Spikes slim or narrow, often interrupted.
Leaves lanceolate or ovate-lanceolate, acute. 4. M. longifolia.
Leaves elliptic or ovate-oblong, obtuse, reticulated beneath.
5. M. rotundifolia.

Spikes $10-12 \mathrm{~mm}$. thick, dense, elongated or short.
Leaves sessile; spikes $2-8 \mathrm{~cm}$. long; plant canescent. 6. M. alopecuroides.
Leaves distinctly petioled, or the uppermost sessile; spikes short.
Leaves simply serrate.
Leaves mostly incised, the margins crisped and wavy.

*     * Whorls of flowers all axillary.

7. M. aquatica.
8. M. crispa.

Leaves crenate-dentate; calyx-teeth triangular, short.
Leaves sharply serrate; calyx-teeth subulate.
Calyx-teeth ciliate, the tube glabrous; leaves ovate.
Calyx densely or sparsely pubescent all over.
Leaves ovate, pubescent on both sides; hairs of the stem reflexed.
II. M. sativa.

Leaves oblong or ovate-oblong, nearly or quite glabrous.
9. M. arvensis.

1. M. gentilis.
2. M. Canadensis.
3. Mentha spicàta L. Spearmint. (I. F. f. 3174.) Perennial by leafy stolons ; stem erect, 3-5 dm. high. Leaves lanceolate, sessile or short-petioled, sharply serrate, acute or acuminate, the largest about 7 cm . long; whorls of flowers in spikes which become $5-10 \mathrm{~cm}$. long in fruit, the one terminating the stem surpassing the lateral ones ; bracts subulate-lanceolate, ciliate; calyx campanulate, its teeth subulate, nearly as long as the tube ; corolla glabrous. In moist fields or waste places, N. S. to Ont., Minn., Utah, Fla. and Kans. Nat. from Europe. July-Sept.
4. Mentha piperita L. Peppermint. (I. F. f. 3175.) Perennial by subterranean suckers, 3-9 dm. high. Leaves lanceolate, petioled, dark green, acute, sharply serrate, glabrous on both sides, or pubescent on the veins beneath, the larger $3-8 \mathrm{~cm}$. long; whorls of flowers in spikes, which are obtuse, and become $2-8 \mathrm{~cm}$. long in fruit, the middle one at length overtopped by the lateral ones; bracts lanceolate, acuminate ; calyx tubular-campanulate, glabrous below, its teeth subulate, usually ciliate, one-half as long as the tube or more; corolla glabrous. In wet soil, N. S. to Minn., Fla. and Tenn. Nat. from Europe. July-Sept.
5. Mentha citràta Ehrh. Bergamot Mint. (I. F. f. 3176.) Perennial by leafy stolons; stem weak, decumbent or ascending, 3-6 dm. long. Leaves petioled, thin, ovate or ovate-orbicular, obtuse or the upper acute at the apex, sharply serrate, the larger about 5 cm . long ; whorls of flowers in terminal short obtuse spikes, and commonly also in the uppermost axils ; caly $x$ glabrous. its tecth subulate, one-half as long as the tube, or longer ; corolla glabrous. In wet soil, Staten Island, N. Y. and Ohio. Adventive from Europe. July-Sept.
6. Mentha longifòlia (L.) Muds. Horse Mint. (I. F. f. 3177. ) Peremial by suckers, canescent or puberulent. 3-8 dm. high. Leaves lanceolate, watelanceolate, or oblong-lanceolate, sessile or short-petioled, acute, sharply serrate, $2-8 \mathrm{~cm}$. long ; whorls of flowers in narrow acute spikes, which become $5-1,3 \mathrm{~cm}$. long in fruit; bracts lanceolate-subulate; calyx tomentose or cancesent. its tecth subulate, one-half as long as the tube ; corolla puberulent. In waste places. Comm. to Penn. and N. J. Nat. from Europe. July-Oct.
7. Mentha rotundifolia (L.) Huds. Round-meaten Minf. (I. F. f. 3I-S.) Perennial by leafy stolons, canescent or tomentose-puberulent. somewhat viscid. 3-8 dm. high. Leaves elliptic, or ovate-obhong, short-petioled, or sessile and somewhat clasping by the subcordate or rounded base, obtuse, crenate-serrate, $2-5 \mathrm{~cm}$. long, rugose-reticulated bencath; whorls of flowers in spikes which elen-
gate to 5-10 cm. in fruit; bracts lanceolate, acuminate; calyx-teeth setaceous, usually about one-half as long as the tube; corolla puberulent. In waste places, Me. to N. Car., Tex. and Mex. July-Sept.
8. Mentha alopecuroides Hull. Woolly Mint. (I. F. f. 3179.) Perennial by suckers, white-woolly, 3-9 dm. high. Leaves broadly oval, sessile, or partly clasping by a subcordate or rarely rounded base, obtuse, sharply and rather coarsely serrate, the lower $5-8 \mathrm{~cm}$. long; spikes dense, stout, obtuse, $5-8 \mathrm{~cm}$. long in fruit; bracts lanceolate; calyx-teeth setaceous, one-half as long as the campanulate tube, or more; corolla pubescent. Along roadsides, N. Y., N. J. and Penn. to Mo. Nat. from Europe. July-Oct.
9. Mentha aquática L. Water Mint. Fish Mint. (I. F. f. 3180.) Perennial by suckers, hirsute or pubescent, rarely glabrate ; stem 3-8 dm. high, its hairs reflexed. Leaves broadly ovate, petioled, acute, or the lower obtuse, rounded, subcordate or rarely narrowed at the base, sharply serrate, the larger $3-8 \mathrm{~cm}$. long and nearly as wide; whorls of flowers in dense short rounded spikes, and usually also in the upper axils; spikes seldom more than 2.5 cm . long in fruit ; bracts lanceolate, shorter than the flowers; calyx hirsute, its teeth lanceolate-subulate or triangular-lanceolate, one-third to one-half as long as the nearly cylindric tube: corolla sparingly pubescent. In wet places, N. S. to Penn. and Ga. Nat. from Europe. Aug.-Oct.
10. Mentha críspa L. Crisped-leaved, Curled or Cross Mint. (I. F. f. 3181.) Sparingly pilose-pubescent, at least at the nodes, petioles and veins of the lower surfaces of the leaves ; stem rather weak, 3-9 dm. long. Leaves petioled, or the uppermost sessile, ovate, mostly acute, rounded, truncate or subcordate at the base, their margins crisped, or the uppermost merely serrate ; whorls of flowers in thick rounded spikes, which become $2-4 \mathrm{~cm}$. long in fruit ; calyx sparingly pubescent or glabrous, its teeth subulate, more than one-half as long as the campanulate tube ; corolla glabrous. In swamps and roadside ditches, N. Y., N. J. and Penn. Aug.-Oct.
11. Mentha arvénsis L. Corn Mint. Field Mint. (I. F. f. 3182.) Perennial by suckers, pubescent or glabrate; stems 1.5-6 dm. high, slender. Leaves oblong-lanceolate, oval or ovate, petioled, acute or the lower obtuse, crenate-serrate, mostly narrowed at the base, $2-6 \mathrm{~cm}$. long, the upper not much smaller than the lower; whorls of flowers all axillary, usually about equalling the petioles; calyx pubescent, campanulate, its teeth triangular, about as long as the width of their base, acute or sometimes obtuse, one-third as long as the tube. In dry waste places, N. B. to N. Y., N. J., Penn. and Fla. Also in Cal. and Mex. Nat. JulySept.
12. Mentha gentìlis L. Creeping or Downy Whorled Mint. (I. F. f. 3183.) Perennial by suckers ; stem puberulent with short reflexed hairs, 3-6 dm. high. Leaves ovate or oval, short-petioled, sparingly pubescent with scattered hairs, often blotched, acute at both ends, sharply serrate, the larger $3-5 \mathrm{~cm}$. long, the upper sometimes much smaller than the lower ; whorls axillary ; pedicels glabrous ; calyx campanulate, glabrous below, its teeth subulate, ciliate, one-half as long as the tube ; corolla glabrous. In waste places and along streams, Me. to northern N. Y., N. J. and Penn. Nat. from Europe. Aug.-Oct.
II. Mentha sativa L. Marsh Whorled Mint. (I. F. f. 3 184.) Perennial by suckers ; stem ascending, usually widely branched, densely pubescent, 3-9 dm. long. Leaves ovate, short-petioled, pubescent on both sides, acute at the apex, mostly rounded at the base, sharply serrate, the larger $2-5 \mathrm{~cm}$. long, the upper sometimes much smaller ; whorls axillary, commonly surpassing the petioles; calyx campanulate, pubescent, its triangular-subulate teeth one-half as long as the tube. In waste places, N. S. to Penn. Nat. from Europe. July-Sept.
13. Mentha Canadénsis L. American Wild Mint. (I. F. f. 3185.) Perennial by suckers; stem more or less pubescent with spreading or scarcely reflexed hairs, or glabrate, $1.5-8 \mathrm{dm}$. high. Leaves oblong, ovate-oblong, or oblong-lanceolate, slender-petioled, acute, or the lower obtuse, sharply serrate, narrowed to a somewhat cuneate base, glabrous or sparingly pubescent, the larger $5-10 \mathrm{~cm}$. long, whorls axillary, often shorter than the petioles ; calyx oblong-campanulate, pubescent, its teeth one-fourth to one-third as long as the tube. In moist soil, N. B. to the N. W. Terr., Br. Col., Va., Kans., N. Mex. and Nev. Variable. July-Oct.

## 36. COLLINSÒNIA L.

Tall perennial aromatic herbs, with large membranous petioled leaves, and terminal loose panicled racemes of small yellowish mostly opposite flowers. Calyx campanulate, short, Io-nerved, 2 -lipped, declined in fruit, usually pubescent in the throat; upper lip 3 -toothed; lower 2 -cleft. Corolla longer than the calyx, obliquely campanulate, 5 -lobed, 4 of the lobes nearly equal, the 5 th pendent or declined, fimbriate or lacerate, much larger, appearing like a lower lip. Antherbearing stamens 2 , not declined, much exserted, coiled before anthesis; bases of the filaments connected by a woolly ring; anthers 2 -celled, or the sacs at length partially confluent. Nutlets smooth, globose. [Named for Peter Collinson, 16931768, an English botanist, and correspondent of Linnaeus.] Two or 3 species of eastern N. Am.

1. Collinsonia Canadénsis L. Horse-balm. Citronella. Rich-weed. (I. F. f. 3186.) Stem 6-15 dm. high, glabrous, or glandular-pubescent above. Leaves ovate or ovate-oblong, acuminate, the lower slender-petioled, I.5-2.5 dm. long, the upper nearly sessile, much smaller, all coarsely dentate ; terminal panicles sometimes 3 dm . long; pedicels ascending, $6-12 \mathrm{~mm}$. long in fruit, subulatebracteolate at the base; flowers lemon-scented; calyx-teeth subulate, those of the lower lip much longer than those of the upper ; corolla light yellow, $\mathbf{1}-1.5 \mathrm{~cm}$. long; fruiting calyx prominently ribbed, 6-8 mm. long. In moist woods, Me. and Ont. to Wis., Fla. and Kans. Root large, thick, woody. July-Oct.

## 37. PERÍLLA Ard.

Annual herbs, with petioled purple or discolored leaves, and small flowers in loose bracted racemes. Calyx campanulate, Io-nerved, 5 -cleft, nearly regular in flower, enlarging, declined and becoming 2-lipped in fruit, the upper lip 3-toothed, the lower 2 -cleft, the throat not bearded. Corolla-tube not longer than the calyx, the throat obliquely campanulate, the limb 5 -cleft, the lower lobe slightly the larger. Stamens 4, nearly equal, or the posterior pair shorter, erect, divergent ; anthers 2 -celled. Nutlets globose, reticulated. [The native name in India.] One or 2 species, natives of Asia.
I. Perilla frutéscens (L.) Britton. Perilla. (I. F. f. 3187.) Sparingly pubescent, 3-9 dm. high. Leaves long-petioled, broadly ovate, acuminate, coarsely dentate, $7-15 \mathrm{~cm}$. long and nearly as wide; racemes terminal and axillary, manyflowered, $7-15 \mathrm{~cm}$. long ; pedicels $3-6 \mathrm{~mm}$. long in fruit ; calyx minute in flower, much enlarged, gibbous at the base and densely pilose-pubescent in fruit; corolla purple or white, 3 mm . long, with a woolly ring within. In waste places, escaped from gardens, N. Y. to Ill. Native of India. July-Oct.

Perilla frutéscens Nankinénsis (Lour.) Britton. Leaves crisped and incised. Escaped from gardens, N. J. to W. Va.

## 38. ELSHÓLTZIA Willd.

Herbs, with thin leaves, and small or minute clustered flowers, in terminal bracted spikes. Calyx campanulate or ovoid, io-nerved, enlarging in fruit, not bearded in the throat, 5 -toothed, the teeth nearly equal. Corolla-tube little longer than the calyx, the limb oblique, or slightly 2 -lipped, 4 -lobed; upper lobe erect. concave, emarginate, the 3 others spreading. Anthers 2 -celled, or the sacs more or less confluent. Nutlets ovoid or oblong. [Named in honor of J. S. Elsholtz, a Prussian botanist.] About 20 species, natives of Asia.
I. Elsholtzia Patrínii (Lepech.) Kuntze. Elsholtzia. (I. F. f. 3 I88.) Annual, glabrous or nearly so ; stems erect or ascending, 3-6 dm. high. Leaves long-petioled, ovate or oblong, acute or acuminate, crenate-dentate, $2-8 \mathrm{~cm}$. long ; spikes dense, about 12 mm . thick; flowers several in the axils of each of the broadly ovate membranous reticulated mucronate bracts; calyx hirsute, shorter than the bract ; corolla 2 mm . long, pale purple. Notre Dame du Lac, Temiscouata Co., Quebec. Nat. from Asia. July-Aug.

## Family 8. SOLANACEAE Pers. Potato Family.

Herbs, shrubs, vines, or some tropical species trees, with alternate or rarely opposite estipulate leaves, and perfect regular or nearly regular cymose flowers. Calyx inferior, mostly 5 -lobed. Corolla gamopetalous, mostly 5 -lobed, the lobes induplicate-valvate or plicate in the bud. Stamens as many as the lobes of the corolla and alternate with them, inserted on the tube, all equal and perfect in the following genera, except in Petunia, where 4 are didynamous and the fifth smaller or obsolete; anthers 2 -celled, apically or longitudinally dehiscent. Ovary superior, 2 -celled (rarely 3 - 5 -celled); ovules numerous on the axile placentæ, anatropous or amphitropous; style slender, simple ; stigma terminal; fruit a berry or capsule. Seeds numerous; endosperm fleshy; cotyledons semiterete. About 70 genera and 1600 species, most abundant in tropical regions.

[^42]*** Fruit a capsule; corolla funnelform.
Capsule circumscissile toward the top, which separates as a lid; corolla irregular.
Capsule opening by valves.
Capsule generally prickly. 10. Datura.
Capsule not prickly.
Flowers paniculate or racemose; stamens nearly uniform in length.
11. Nicotiana.

Flowers solitary ; stamens very unequal.
12. Petunia.

## 1. PHYSALODES Boehm.

An annual erect glabrous herb, with alternate petioled thin sinuate-dentate or lobed leaves, and large light blue peduncled nodding flowers, solitary in the axils. Calyx-segments ovate, connivent, cordate or sagittate at the base, strongly reticulated. Corolla broadly campanulate, slightly 5 -lobed. Stamens 5 , included, inserted on the corolla near its base; filaments filiform, dilated and pilose below; anther-sacs longitudinally dehiscent. Style slender; stigma 3-5-lobed. Berry globose, nearly dry, enclosed in the calyx. [Greek, Physalis-like.] A monotypic genus.
I. Physalodes physalòdes (L.) Britton. Apple-of-Peru. (I. F. f. 3I89.) Stem angled, $6-15 \mathrm{dm}$. high. Leaves ovate or oblong, acuminate but blunt, nar-
rowed at the base, $0.7-2 \mathrm{dm}$. long; petioles longer than the peduncles; flowers $2.5-3.5 \mathrm{~cm}$. long and broad; corolla-limb almost entire; fruiting calyx $2.5-3.5 \mathrm{~cm}$. long and thick, its segments acute, their basal auricles acute or cuspidate; berry about 12 mm . in diameter, loosely surrounded by the calyx. In waste places, escaped from gardens, N. S. to Ont., south to Fla. Adventive from Peru. JulySept.

## 2. PHÝSALIS L.*

Herbs, sometimes a little woody below, with entire or sinuately toothed leaves. Peduncles slender, in ours solitary from the axils. Calyx campanulate, 5 -toothed, in fruit enlarged and bladdery-inflated, membranous, 5-angled, or prominently ioribbed and reticulate, wholly enclosing the pulpy berry. Corolla often with a brownish or purplish center, open-campanulate, or rarely campanulate-rotate, plicate. Stamens inserted near the base of the corolla; anthers oblong, opening by longitudinal slits. Style slender, somewhat bent; stigma minutely 2 -cleft. Seeds numerous, kidney-shaped, flattened. [Greek, bladder, referring to the inflated calyx.] The number of recognized species is about 50; 34 occur in the U. S.

## * Annuals with branched fibrous roots.

$\dagger$ Plants more or less pubescent (except P. Barabdensis obscura).
Fruiting calyx sharply 5 -angled, more or less acuminate at the summit and sunken at the base; calyx-lobes (at flowering time) lanceolate or acuminate, as long as the tube or longer.
Leaves ovate, oblique, acute or acuminate, subentire at the base; upper part repand or subentire; fruiting calyx small and short; stem slender, diffuse, sharply angled. 1. P. pubescens.

Leaves cordate, oblique, strongly sinuate to the base; stem stout, obtusely angled; fruiting calyx rounded.
2. P. pruinosa.

Leaves cordate, scarcely oblique, more or less abruptly acuminate, acutely repand dentate; stem tall, acutely angled; fruiting calyx larger, long-acuminate.
3. P. Barbadensis.

Fruiting calyx obtusely or indistinctly 5-10-angled; calyx-lobes (at flowering time) triangular, generally shorter than the tube. 4. P. Lagascae.
$\dagger$ † Plants glabrous, or the upper part sparingly beset with short hairs, or a little puberulent when young; fruiting calyx obtusely 5 -10-angled, not sunken at the base.
Corolla yellow, sometimes with the center a little darker but never brown or purple.
Peduncles generally much longer than the fruiting calyx; leaves sinuately toothed or subentire.
Peduncles scarcely exceeding the fruiting calyx; leaves sharply dentate.
6. P. angulata.

Corolla yellow, with a brown or purple center.
Peduncles short, scarcely as long as the flowers, which are $10-20 \mathrm{~mm}$. in diameter: calyx-lobes broadly triangular.
7. P. ixocarpa.

Peduncles longer than the flowers, which are $16-\mathbf{2 5} \mathrm{mm}$. in diameter; calyx-lobes lanceolate-triangular.
8. P. Philadelphica.

## * * Perennial by rootstocks and roots.

$\dagger$ Pubescence not stellate (although in P. pumila of branched hairs).
Pubescence on the leaves none, on the upper part of the stem and the calyx sparse and short, if any.
Fruiting calyx ovoid, nearly filled by the berry, scarcely sunken at the base.
Leaves ovate-lanceolate to broadly ovate, usually thin. 8. P. Philadelfhica.
Leaves lanceolate, oblanceolate, or linear.
9. P. longifolia.

Fruiting calyx pyramidal, very much inflated and deeply sunken at the base; leaves broadly ovate, usually coarsely dentate.
10. P. macrophysa.

Pubescence sparse, consisting of fat, sometimes jointed, and in P. pumila branched hairs; in P. Virginzana sometimes a little viscid.
Fruiting calyx ovoid, scarcely angled and scarcely sunken at the base; leaves thick, obovate or spatulate to rhomboid, subentire.
Leaves obovate or spatulate; hairs all simple. II. P. lanceolata.
Leaves broader, often rhomboid; hairs on the lower surface branched.
12. $P$. 力umila.

Fruiting calyx pyramidal, more or less 5 -ancled and deeply sunken at the base; leaves ovate to lanceolate, generally more or less dentate. ${ }^{13}$. $P$. lirsimiana.
Pubescence dense, short, more or less viscid or glandular, often mixed with long flat jointed hairs.

[^43]Leaves large ; blade generally over 5 cm . long and more or less cordate.
14. P. heterophylla.

Leaves less than 5 cm . long, round-ovate or rhombic, scarcely at all cordate at the base; calyx, peduncles and younger branches with long white flat and jointed hairs. 15. P. comata.

Leaves small, $2.5-4 \mathrm{~cm}$. in diameter, nearly orbicular, sometimes a little cordate at the base, not coarsely toothed; stem diffuse or prostrate. 16. $P$. rotundata. $\dagger \dagger$ Pubescence dense, cinereous, beautifully stellate. 17. P. viscosa.
I. Physalis pubéscens L. Low Hairy Ground-cherry. (I. F. f. 3190.) Stem generally diffuse or spreading, often a little swollen at the nodes, villouspubescent or nearly glabrous; leaves thin, $2.5-6 \mathrm{~cm}$. long, ovate, acute or acuminate, slightly cordate, upward repand-denticulate or entire, pubescent, sometimes becoming nearly glabrous except along the veins; peduncles short; calyx-lobes narrow but not with a subulate tip; corolla $6-10 \mathrm{~mm}$. in diameter, yellow with dark center; anthers usually purplish; fruiting calyx membranous, $2-3 \mathrm{~cm}$. long, pyramidal, ovoid-acuminate, retuse at the base. In sandy soil, Penn. to Fla. and Cal.; also in tropical Am. and India. July-Sept.
2. Physalis pruinòsa L. Tall Hairy Ground-cherry. (I. F. f. 3191.) Stout, generally erect, and more hairy than the preceding and the two following species; stem finely villous or somewhat viscid; leaves firm, $3-10 \mathrm{~cm}$. long, finely pubescent, ovate, cordate, and deeply sinuately toothed; calyx villous or viscid, its lobes as long as the tube, narrow but not subulate-tipped; corolla $4-8 \mathrm{~mm}$. in diameter; anthers yellow, or tinged with purple; fruiting calyx reticulate, 2-3 cm . long, ovoid, cordate; berry yellow or green. In cultivated soil, Mass. to Iowa, Mo. and Fla. July-Sept.
3. Physalis Barbadénsis Jacq. Barbadoes Ground-cherry. (I. F. f. 3192.) Stem stout, acutely 3-4-angled, pubescent or viscid; leaves $3-6 \mathrm{~cm}$. long, acute, or abruptly acuminate, sharply repand-dentate, pubescent with short hairs; peduncles short, but in fruit sometimes 2 cm . long; calyx generally densely viscidhirsute, lobes lanceolate, acuminate; corolla $5-10 \mathrm{~mm}$. in diameter; anthers generally purplish; fruiting calyx longer than in the two preceding species, reticulate. Sandy soil, N. Car., southern Ill. and Mex., the W. Ind. and S. Am. July-Sept.

Physalis Barbadénsis obscùra (Michx.) Rydberg. Greener, perfectly glabrous, or sometimes minutely pubescent. The distribution is about the same as that of the species.
4. Physalis Lagáscae R. \& S. Small-Flowered Ground-cherry. (I. F. f. 3193.) Stem spreading, often zigzag, striate, or slightly angled, villous with short hairs. Leaves I-9 cm. long, ovate, oblique and cuneate, obtuse, or cordate at the base, acute, repand or sinuately dentate, hairy, at least on the veins; peduncles in fruit $5-10 \mathrm{~cm}$., reflexed, shorter than the fruiting calyx; calyx villous, corolla $3-8 \mathrm{~mm}$. in diameter, yellow, generally with a dark center; anthers generally yellow; fruiting calyx $\mathbf{1 . 4 - 2} \mathrm{cm}$. long. round-ovoid, nearly filled by the berry, commonly rounded at the base. Native of Mex., the W. and E. Ind.; perhaps only introduced in the U. S. Mo. and Kans. to Ark. and Ind. Terr. JulySept.
5. Physalis lanceifòlia Nees. Lance-leaved Ground-cherry. (I. F. f. 3194.) Erect, generally $4-5 \mathrm{dm}$. high; stem angled, glabrous; leaves in the typical form lanceolate; calyx cylindric-campanulate, its lobes broadly triangular, shorter than the tube; peduncles filiform, about 2.5 cm . long, erect with nodding flower, in fruit reflexed; corolla $6-8 \mathrm{~mm}$. in diameter; campanulate, yellow, without a dark spot; anthers yellow, tinged with purple; fruiting calyx about 2 cm . long, ovoid, indistinctly Io-angled, purple-veined, nearly filled by the berry. I11. to Tex., Kans., Cal. and southward. Also in Mex. and Peru. July-Sept.
6. Physalis angulàta L. Cut-leaved Ground-cherry. (I. F. f. 3195.) Erect, 4-9 dm. high, glabrous; stem angled; leaves ovate, with cuneate base and long-acuminate teeth; blades $5-6.5 \mathrm{~cm}$. long, on slender petioles, thin, the veins not prominent: peduncles slender, $2-3 \mathrm{~cm}$. long, erect, in fruit often reflexed but seldom exceeding the fruiting calyx; calyx-lobes triangular to lanceolate, generally shorter than the tube; corolla $5-10 \mathrm{~cm}$. in diameter; anthers purplish tinged; fruiting calyx about 3 cm . long. ovoid, not prominently angled, at last nearly
filled by the yellow berry. In rich soil, Va. and N. Car. to Ill., the Ind. Terr., Tex., Cent. Am., Brazil and the W. Ind. Also in India. July-Sept.
7. Physalis ixocàrpa Brot. Tomatillo. Mexican Gruund-cherry. Strawberry Tomato. (I. F. f. 3196.) At first erect, later widely spreading; stem angled, glabrous, or the younger parts sparingly hairy, leaves from cordate to ovate, with a cuneate base, sinuately dentate or entire, $2.5-6.5 \mathrm{~cm}$. long; peduncles $2-5 \mathrm{~mm}$. long; calyx sparingly hairy; its lobes shorter than the tube; corolla bright yellow with purple throat, $\mathbf{I - 2} \mathrm{cm}$. in diameter; fruiting calyx round-ovoid, obscurely ro-angled, often purple-veined, at last filled by the purple berry. Native of Mex. Cultivated for its fruit and frequently escapes from cultivation.
8. Physalis Phildélphica Lam. Philadelphia Ground-cherry. (I. F. f. 3197.) Erect 7-15 dm. high; stem angled, dichotomously branched; blades ovate to ovate-lanceolate, often very oblique at the base and acuminate, entire or repand-denticulate, $6-10 \mathrm{~cm}$. long, often in pairs; peduncles slender, $1-2 \mathrm{~cm}$. long; calyx glabrous, or minutely ciliolate, lobes ovate-lanceolate or triangular, sometimes broadly ovate and unequal, generally equalling the tube; corolla yellow or greenish yellow with purplish throat, $1.5-2.5 \mathrm{~cm}$. in diameter; anthers tinged with purple; fruiting calyx at first somewhat io-angled and sunken at the base, at last often filled with the large red or purple berry. R. I. to Ga., Neb. and Tex. July-Sept.
9. Physalis longifòlia Nutt. Long-Leaved Ground-cherry. (I. F. f. 3 198.) Perennial by a thick rootstock; stem in the common form, stout, 4-9 dm. high, slightly angled. Leaves tapering into a petiole $\mathbf{1}-2 \mathrm{~cm}$. long, subentire or repand; peduncles $\mathbf{I}-\mathbf{2 c m}$. long, in fruit often recurved; calyx generally glabrous, its lobes triangul ir-lanceolate, about the length of the tube; corolla $1-2 \mathrm{~cm}$. in diameter, yellow with a dark center; anthers tinged with purple; fruiting calyx about 3 cm . long; berry yellow, the lower portion and the stipe glutinous. In rich soil, Iowa to Ark., Utah and Mex. July-Sept.
10. Physalis macróphysa Rydb. Large-bladder Ground-cherry. (I. F. f. 3 199.) Perennial; root somewhat fleshy; stem erect, 4-9 dm. high, comparatively slender, angled. Leaves thin, $3-9 \mathrm{~cm}$. long, the lower obtuse, the upper acute or acuminate; petioles $2 \sim 4 \mathrm{~cm}$. long; peduncles in fruit reflexed; calyx smooth, its lobes ovate-triangular or broadly lanceolate, generally a little shorter than the tube; corolla yellow with a dark center, about 2 cm . in diameter; anthers generally yellow, sometimes tinged with purple; fruiting calyx $3-4 \mathrm{~cm}$. long, indistinctly io-angled; berry small, in the center of the calyx. In rich soil, Tex. to Kans. and Ark. May-July. Rare.
II. Physalis lanceolata Michx. Prairie Ground-cherry. (I. F. f. 3200.) Rootstock apparently as a rule slender and creeping; stem 4-5 dm. high. first erect, later spreading or diffuse, slightly angled, sparingly hirsute with flat hairs. Leaves nearly always entire, rarely wavy, thickish, sparingly hairy with short hairs: peduncles $\mathbf{I}-2 \mathrm{~cm}$. long, in fruit reflexed; calyx-lobes triangular-lanceolate; corolla dullish yellow with a brownish center, about 1.6 cm . in diameter; fruiting calyx round-ovoid, not sunken at the base, indistinctly io-angled; berry yellow or greenish yellow. On dry prairies, common west of the Missouri River, extending eastward to III. and the Carolinas. July-Sept.
12. Physalis pùmila Nutt. Low Ground-cherry. (I. F. f. 3201.) Perennial by a slender rootstock, 4-9 dm. high; stem obscurely angled. Leaves broadly ovate to oblong, acute at both ends, somewhat rhomboid, the lower often obtuse and obovate; blades $5-10 \mathrm{~cm}$. long, entire or seldom sinuate; peduncles in fruit reflexed and $3-5 \mathrm{~cm}$. long; calyx densely hirsute, its lobes triangular, generally a little shorter than the tube; corolla ycllow with brown center, $1.5-2 \mathrm{~cm}$. in diameter; fruiting calyx $3-5 \mathrm{~cm}$. long, indistinctly ro-angled. Plains, Mo. to Colo. and Tex. July-Sept.

13 Physalis Virginiàna Mill. Virania Gruend-cherry. (I. F. f. 3zoz. Peremial; rootstock thick; stem 4-9 dm. high, erect, dichotomously branched. somewhat angular, strigose hairy with flat hairs, in some forms nearly glabrous. Leaves ovate-lanceolate, tapering to both ends, $3-6 \mathrm{~cm}$. long, gencrally sinuately dentate; peduncles in fruit curved but scarcoly reflexed; calix-lobes triangular or broadly lanceolate, nearly equalling the tube; corolla sulphur-ycllow with pur-
plish spots, $\mathbf{I} .8-2.5 \mathrm{~cm}$. in diameter; anthers yellow; berry reddish. Rich soil, especially in open places, N. Y. to Manitoba, Fla. and La. July-Sept.

Physalis Virginiàna intermèdia Rydberg. Leaves thin and subentire, gradually tapering into winged petioles; pubescence in the young plant somewhat viscid. Ind. to Ala. and Tex.
14. Physalis heterophýlla Nees. Clammy Ground-cherry. (I. F. f. 3203.) Perennial by a creeping rootstock, 4-9 dm. tall, viscid and glandular, and villous with long spreading jointed flat hairs; leaf blades often acute but very rarely with an acumination, thick, sinuately toothed, or sometimes subentire; calyx long-villous, its lobes triangular, generally shorter than the tube; corolla 1.6-2 cm. in diameter, greenish yellow with a brownish or purplish center: anthers mostly yellow; berry yellow. In rich soil, N. B. to Saskatch., Fla., Colo. and Tex.

Physalis heterophylla ambigua (A. Gray) Rydberg. Tall and generally upright, very long-villous, scarcely at all viscid; flowers commonly larger; anthers mostly purplish. Vt. to lowa and Tenn.

Physalis heterophýlla nyctagínea (Dunal) Rydberg. Leaves usually dark green and of a firm texture, more or less acuminate at the apex, often subentire, and pubescent mainly on the veins of the lower surface. R. I. to Iowa and La.

Physalis Peruviàna L. Strawberry Tomato. A native of South America; it is cultivated for its fruit in all warm and temperate regions, and often escapes. It resembles P. heterophylla, but differs in the leaves, which háve a long distinct acumination, and in the pubescence, which is shorter, denser, and not at all viscid.
15. Physalis comàta Rydberg. Hillside Ground-cherry. (I. F.f. 3204.) Erect, 4-5 dm. high; pubescence fine and short, that on the calyx, peduncles and upper branches mixed with long white flat jointed hairs. Leaf-blades not over 5 cm . long, round-ovate, scarcely at all cordate, thin, somewhat repand-dentate, or nearly entire; peduncles as long as the fruiting calyx, or longer; corolla greenish yellow, with brown center, $1.2-2 \mathrm{~cm}$. in diameter. Fruiting calyx thin, roundovoid, somewhat ro-angled, scarcely sunken at the base. Hillsides, Neb., Kans., Colo. and Tex.
16. Physalis rotundàta Rydberg. Round-leaved Ground-cherry. (I. F.f. 3205.) Zigzag, generally dichotomously branched, from a perennial rootstock, densely and finely viscid pubescent, usually more glandular than the preceding. Leaves nearly orbicular, cordate, $2.5-4.5 \mathrm{~cm}$. in diameter, with small teeth; petioles short, more or less winged; peduncies short; corolla 1.6 cm . in diameter, greenish yellow with a brownish center; fruiting calyx ovoid, slightly angled, scarcely sunken at the base. Dry plains, S. Dak. to Tex. and N. Mex. JulySept.

I7. Physalis viscòsa L. Stellate Ground-cherry. (I. F. f. 3206.) Perennial by a creeping rootstock; stems creeping, with a dense ashy stellate pubescence, or in age glabrate. Leaves elliptic, oval or ovate, obtuse, thinnish, entire or undulate, in the typical South American form often cordate at the base, but rarely so in our plant; peduncles $1-2.5 \mathrm{~cm}$. long; calyx-lobes triangular, generally shorter than the tube; corolla greenisn yellow with a darker center, $1.5-2 \mathrm{~cm}$. in diameter; fruiting calyx $2-3 \mathrm{~cm}$. long, round-ovoid, scarcely sunken at the base; berry orange or yellow. On sea beaches, or in sand near the coast, Va. and N. Car. to the Argentine Republic.

Physalis Alkekéngi L. Strawberry Tomato. Winter Cherry. A native of Europe and Asia, often cultivated for its fruit and sometimes escapes from cultivation. The flowers are whitish; corolla-limb more distinctly 5 -lobed; leaves broadly deltoid, acute at both ends, repand or angulately toothed.

## 3. QUÍNCULA Raf.

A low and diffuse somewhat scurfy herb, with a stout perennial root. Leaves sinuate to pinnatifid, somewhat fleshy. Peduncles commonly in pairs from the axils, sometimes solitary, or in fascicles of 3-5. Calyx campanulate, 5 -toothed, in fruit inflated, sharply 5 -angular and reticulate, enclosing the fruit, the lobes connivent. Corolla pentagonal in outline, veiny. Anthers opening by longitudinal
slits. Seeds comparatively few, kidney-shaped, somewhat flattened, with thick margins. [Name unexplained.] A monotypic genus.
I. Quincula lobata (Torr.) Raf. Purple-flowered Ground-cherry. (I. F. f. 3207.) Perennial, spreading or prostrate; stem obtusely angled and striate, much branched. Leaves oblanceolate or spatulate to oblong, sinuately toothed, or pinnatifid with rounded lobes, or rarely subentire, cuneate at the base, thickish and veiny, tapering into margined petioles; peduncles $2-5 \mathrm{~cm}$. long, in fruit reflexed; calyx-lobes triangular, acute, shorter than the tube; corolla $2-3 \mathrm{~cm}$. in diameter; anthers yellow, tinged with purple; fruiting calyx about as wide as long, sunken at the base. On high plains, Kans. to Cal. and Mex. May-Sept.

## 4. LEUCOPHÝSALIS Rydberg.

A tall erect viscid and villous annual, with entire leaves, the blade decurrent on the petiole. Peduncles generally in fascicles of $2-4$ in the axils. Calyx campanulate, 5 -lobed, at first a little inflated, but soon filled by and closely fitted to the berry, thin, neither angled nor ribbed, faintly veiny. Corolla rotate, white, sometimes tinged with purple and generally creamy or yellow in the center, the limb plicate. Stamens inserted near the base of the corolla; filaments long and slender; anthers oblong, opening by longitudinal slits. Style and stigma as in Physalis. Seeds kidney-shaped, flattened, punctate. [Greek, white Physalis.] A monotypic genus.
I. Leucophysalis grandifiora (Hook.) Rydberg. Large White-flowered Ground-cherry. (I. F. f. 3208.) Erect, 3-9 dm. high; stem more or less villous. Leaves I-2 dm. long, ovate to lanceolate-ovate, generally acute and entire, more or less villous and viscid; peduncles several from each axil, villous; calyxlobes lanceolate, equalling the tube; corolla $3-4 \mathrm{~cm}$. in diameter, rotate; anthers short, yellow, often tinged with purple; fruiting calyx ovoid, early filled by the berry. Vt. to Saskatch. and Minn. May-July.

## 5. CHAMAESÁRACHA A. Gray.

Perennials, the leaf-blade decurrent on the petiole. Peduncles solitary, or in fascicles of $2-4$ in the axils. Calyx campanulate, 5 -lobed, in fruit somewhat enlarged, but not bladdery-inflated, close-fitting to the berry, thin, not angled nor ribbed, and faintly if at all veiny, open at the mouth, not exceeding the berry. Corolla rotate, white or cream-colored, often tinged with purple, the limb plicate. Stamens inserted near the base of the corolla; filaments long and slender; anthers oblong, opening by longitudinal slits; style and stigma as in Physalis. Seeds kidney-shaped, flattened, rugose-favose or punctate. [Ground Saracha, the latter a genus named in honor of Isidore Saracha, a Spanish Benedictine botanist.] An American genus, of half a dozen species.
Pubescence dense, puberulent and hirsute. I. C. conioides.
Pubescence sparse, puberulent or stellate, hirsute (if at all) only on the calyx.
2. C. Coronopus.
x. Chamaesaracha conioìdes (Moricand) Britton. Haiky ChimatsarACHA. (I. F. f. 3209.) Much branched, at first upright, at length sprcading, cine-reous-puberulent with short branched somewhat glutinous or viscid hairs, generally also viscidly hirsute or villous with long and branched hairs, especially on the calyx; leaves oblanceolate to obovate-rhombic, usually acutish, subentire to pinnatifid; calyx-lohes triangular, generally acutish; corolla about 12 mm . in diameter, white or ochroleucous, or sometimes violet-purplish; herry $5-8 \mathrm{~mm}$. in diameter. In dry clayey soil, Kans. to Cal. and Mex. May-Sept.
2. Chamaesaracha Corónopus (Dunal) A. (iray. Smoothish Chamaesaracha. (I. F. f. 32 Io.) Branched and diffuse; stem obtusely angled; pubescence on the stem and leaves more or less roughish pruinose or stellate, often scarcely any; on the calyx stellate or sometimes hirsute. Leaves linear or lancolate, sinuately lobed, occasionally subentire, sometimes pimatifid; calyx-hobes triangular, acute; corolla white or ochroleucous, the appendages of the throat often protuberant; berry nearly whitc. In clayey soil, Kins. to Utah, Cal. and Mex. May-Sept.

## 6. SOLANUM L.

Herbs or shrubs, often stellate-pubescent, sometimes climbing. Flowers cymose, umbelliform, paniculate, or racemose. Calyx campanulate or rotate, mostly 5 -toothed or 5 -cleft. Corolla rotate, the limb plaited, 5 -angled or 5 -lobed, the tube very short. Stamens inserted on the throat of the corolla; filaments short; anthers linear or oblong, acute or acuminate, connate or connivent into a cone, each sac dehiscent by a terminal pore, or sometimes by a short introse terminal slit, or sometimes also longitudinally. Ovary usually 2 -celled; stigma small. Berry mostly globose, the calyx either persistent at its base or enclosing it. [Name, according to Wittstein, from solamen, quieting.] About 900 species, of wide geographic distribution. Besides the following, some 15 others occur in the southern and western U. S.

## * Glabrous or pubescent herbs, not prickly.

Plants green ; pubescence simple, or some of it stellate; flowers white.

Leaves repand or entire; ripe berries black.
Leaves deeply pinnatifid; ripe berries green.
Plant silvery stellate-canescent; flowers violet.

1. S. nigrum.
2. S. triflorum.
3. S. elaeagnifolium.

*     * Stellate-pubescent and prickly herbs.

Berry not enclosed by the calyx; perennials.
Hirsute; leaves ovate or oblong, sinuate or pinnatifid. . 3. S. Carolinense. Densely silvery-canescent; leaves linear or oblong, repand or entire.
4. S. elaeagnifolium.

Pubescent; leaves ovate, 5-7-lobed.
Berry invested by the spiny calyx; annuals.
Plant densely stellate-pubescent; corolla yellow. 6. S. rostratum.
Plant glandular-pubescent, with few stellate hairs; corolla violet.
7. S. heterodoxum.

*     *         * Climbing vine, not prickly; leaves hastate or 3-lobed. 8. S. Dulcamara.
i. Solanum nigrum L. Black or Garden Nightshade. (I. F. f. 3211.) Annual, glabrous, or somewhat pubescent with simple hairs, $3-8 \mathrm{dm}$. high. Leaves ovate, petioled, more or less inequilateral, $2-8 \mathrm{~cm}$. long, thin, acute, acuminate or acutish at the apex; peduncles lateral, umbellately 3-10-flowered; pedicels 6-14 mm. long; flowers $8-10 \mathrm{~mm}$. broad; calyx-lobes oblong, obtuse, much shorter than the corolla, persistent at the base of the berry; filaments somewhat pubescent; anthers obtuse; berries glabrous, globose, 8 -10 mm. in diameter, on nodding peduncles. In waste places or cultivated soil, N. S. to the N. W. Terr., Fla. and Tex. Widely distributed as a weed. July-Oct.

2. Solanum triflòrum Nutt. Cut-Leaved Nightshade. (I. F. f. 32I2.) Annual, sparingly pubescent with simple hairs, or glabrous, 3-9 dm. high. Leaves acute, petioled, $5-10 \mathrm{~cm}$. long, the lobes triangular-lanceolate, entire or dentate, the sinuses rounded; peduncles lateral, r-3-flowered; pedicels reflexed in fruit; calyx-segments lanceolate, shorter than the corolla, persistent at the base of the berry; corolla 8 -1o mm . broad; anthers obtuse; berries globose, glabrous, about 10 mm . in diameter. On prairies and in waste places, western Ont. to the N. W. Terr., Kans. and Ariz. May-Oct.
3. Solanum Carolinénse L. Horse-nettle. (I. F. f. 3213.) Stellatepubescent with 4-8-rayed hairs; stem erect, branched, 3-12 dm. high, armed with straight subulate yellow prickles. Leaves oblong or ovate, repand, lobed, or pinnatifid, $5^{-15} \mathrm{~cm}$. long; flowers cymose-racemose; pedicels $6-14 \mathrm{~mm}$. long, recurved in fruit; calyx-lobes lanceolate, acuminate, about one-half the length of the corolla, persistent at the base of the berry; corolla-lobes ovate-lanceolate, acute; anthers elongated; berries orange-yellow, glabrous, $1.5-2 \mathrm{~cm}$. in diameter. In dry fields and in waste places, Ont. to Mass., Fla.; Ill., Neb. and Tex. May-Sept.
4. Solanum elaeagnifòlium Cav. Silver-Leaved Nightshade. (I. F.f. 3214 .) Perennial, finely stellate-pubescent, silvery-canescent all over; stem 39 dm . high, armed with sharp prickles, or these wanting. Leaves lanceolate, oblong, or linear, petioled, $2-10 \mathrm{~cm}$. long, mostly obtuse, repand-dentate or entire; flowers cymose, $\mathbf{I} .5-2.5 \mathrm{~cm}$. broad; peduncles short and stout; calyx-lobes lanceolate or linear-lanceolate, acute; anthers linear; ovary white-tomentose; berries
globose, yellow or darker, glabrous, $8-\mathbf{1 2} \mathrm{mm}$. in diameter. On dry plains and prairies, Kans. to Tex. and Ariz. May-Sept.
5. Solanum Tórreyi A. Gray. Torrey's Nightshade. (I. F. f. 3215.) Perennial, hoary with a stellate pubescence of 8-12-rayed hairs, more or less armed with small subulate prickles. Leaves $7-15 \mathrm{~cm}$. long, the lobes entire or undulate, obtuse; cymes branched, loosely several-flowered; flowers showy; calyxlobes ovate, abruptly long-acuminate, persistent at the base of the berry; corolla violet, $2.5-4 \mathrm{~cm}$. broad, its lobes ovate, acute; berry globose, glabrous, 2.5 cm . or more in diameter, yellow. On dry plains and prairies, Kans. to Tex.
6. Solanum rostràtum Dunal. Sand Bur. Beaked Nightshade. (I. F. f. 3216.) Densely pubescent with 5-8-rayed hairs, usually copiously armed with yellow subulate prickles, $3-8 \mathrm{dm}$. high. Leaves ovate or oval in outline, irregularly pinnately $5-7$-lobed or $\mathbf{1 - 2}$-pinnatifid, $5-\mathbf{I} 3 \mathrm{~cm}$. long, petioled, the lobes obtuse; flowers racemose, about 2.5 cm . broad; racemes lateral; pedicels erect both in flower and fruit; calyx densely prickly, wholly enclosing the berry; calyxlobes lanceolate, acuminate; corolla about 2.5 cm . broad, slightly irregular, its lobes ovate, acute; stamens and style declined, the lowest stamen longer with an incurved beak; fruit 2 cm . in diameter or more. On prairies, S. Dak. to Tex. and Mex. Occasional in waste places as a weed, Ont. to N. H., Mass. and N. J., adventive from the West. May-Sept.
7. Solanum heterodóxum Dunal. Melon-leaved Nightshade. (I. F. f. 32 17.) Glandular-pubescent, or a few 4-5-rayed hairs on the leaves, copiously armed with slender yellow subulate prickles, diffusely branched, 3-9 dm. high. Leaves irregularly bipinnatifid, $5-\mathbf{1 5} \mathrm{cm}$. long; racemes lateral, several-flowered; flowers $2.5-4 \mathrm{~cm}$. broad; stamens and style declined; lowest anther violet, larger than the four other yellow ones; corolla somewhat irregular, its lobes ovate, acuminate; fruit similar to that of the preceding. In dry soil, Kans. (according to Smyth) to Tex., Mex. and N. Mex. July-Sept.
8. Solanum Dulcamàra L. Nightshade. Blue Bindweed. Fellonwort. Bittersweet. (I. F. f. 3218.) Perennial; stem climbing or straggling, somewhat woody below, 6-24 dm. long. Leaves petioled, ovate or hastate in outline, 5-10 cm . long, acute or acuminate, entire, 3-lobed, or 3-divided, with the terminal segment much the largest; cymes compound, lateral; pedicels slender, spreading or drooping; flowers blue, purple, or white, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. broad; calyx-lobes short, oblong, obtuse, persistent at the base of the berry; corolla deeply 5 -cleft, its lobes triangular-lanceolate, acuminate; berry oval or globose, red. In waste places or in thickets, N. B. to Minn. N. J., Penn. and Kans. Nat. from Europe. May-Sept.

## 7. LYCOPÉRSICON Mill.

Annual, or rarely perennial, coarse herbs, with I-2-pinnately divided leaves, and lateral irregular raceme-like cymes of small yellowish flowers opposite the leaves. Calyx 5 -parted, or rarely 6 -parted, the segments linear or lanceolate. Corolla rotate, the tube very short, the limb 5 -cleft or rarely 6 -cleft, plicate. Stamens 5 (rarely 6), inserted on the throat of the corolla; filaments short; anthers elongated, connate or connivent, introrsely longitudinally dehiscent. Ovary 2-3celled; style simple; stigma small, capitate. Berry in the wild plants globose or pyriform, much modified in cultivation, the calyx persistent at its base. [Greek, wolf-peach.] About 4 species, of S. Am.

1. Lycopersicon Lycopérsicon (L.) Karst Tomato. Love-apple. Cherry Tomato. (I. F. f. 3219.) Viscid-pubescent, much branched, 3-9 dm. high. Leaves petioled, $\mathbf{1} .5-5 \mathrm{dm}$. long, the segments stalked, the larger 7-9. ovate or ovate-lanceolate, mostly acute, dentate, lobed or again divided, with several or numerous smaller ones interspersed; flowers $10-16 \mathrm{~mm}$. broad; calyx-segments about equalling the corolla; berry the well-known tomato or love-apple. Escaped from cultivation, N. Y. and Penn. southward. June-Sept.

## 8. LÝCIUML.

Shrubs, or woody vines, often spiny, with small alternate entire leaves commonly with smaller ones fascicled in their axils, and white greenish or purple, solitary or clustered flowers. Calyx campanulate, 3-5-lobed or -toothed, not enlarged in fruit, persistent. Corolla tube short or slender, the limb 5 -lobed (rarely 4 -lohed).
the lobes obtuse. Stamens 5 (rarely 4); filaments filiform, sometimes dilated at the base; anther-sacs longitudinally dehiscent. Ovary 2-celled; style filiform; stigma capitate or 2 -lobed. Berry globose, ovoid, or oblong. [Named from the country Lycia.]. About 75 species, widely distributed. Besides the following, some 17 native species occur in southern and western N. Am.
I. Lycium vulgàre (Ait. f.) Dunal. Matrimony Vine. Box-thorn. (I. F. f. 3220.) Glabrous, spiny or unarmed; stems slender, climbing or trailing, 2-8 m . long, the spines, when present, slender. Leaves lanceolate, oblong, or spatulate, narrowed into short petioles, firm, $\mathrm{I}-4 \mathrm{~cm}$. long; peduncles filiform, $\mathbf{I - 2 . 5} \mathrm{cm}$. long; calyx-lobes ovate. 3 mm . long; corolla funnelform, purplish changing to greenish, $8-12 \mathrm{~mm}$. broad, its lobes ovate-oblong; stamens slightly exserted; berry oval, orange-red. In thickets and waste places, escaped from gardens, Ont. to Conn., Va., Minn. and Kans. Introduced from Europe. May-Aug.

## 9. HYOSCỲAMUS L.

Erect viscid-pubescent narcotic herbs, with alternate mostly lobed or pinnatifid leaves, and large nearly regular flowers, the lower solitary in the axils, the upper in a spike or raceme. Calyx urn-shaped or narrowly campanulate, 5 -cleft, striate, enlarged and enclosing the capsule in fruit. Corolla funnelform, the limb somewhat oblique, 5 -cleft, the lobes unequal. spreading. Stamens declined, mostly exserted; filaments filiform; anther-sacs longitudinally dehiscent. Orary 2-celled; style slender; stigma capitate. Capsule 2-celled, circumscissile above the middle. [Greek, hog-bean.] About 15 species, of the Mediterranean region.
I. Hyoscyamus niger L. Black Hevbane. Hog's-bean. (I. F.f. 322 I.) Annual or biennial; stem stout, 3-8 dm. high. Leaves ovate, lanceolate, or oblong in outline, $7-17 \mathrm{~cm}$. long, acute or acuminate, sessile, or the upper clasping. irregularly lobed, cleft or pinnatifid; flowers short-pedicelled, $2.5-5 \mathrm{~cm}$. broad; calyx-lobes triangular-ovate, acute; corolla greenish yellow, strongly reticulated with purple veins, its lobes ovate, obtusish; capsule globose-oblong, about I cm . high. Waste places, N. S. to Ont., N. Y. and Mich. Nat. from Europe. June-Sept.

## ro. DATÙRA L.

Tall narcotic herbs, some tropical species shrubs or trees. with alternate petioled leaves, and large solitary erect short-peduncled white purple or violet flowers. Calyx elongated-tubular or prismatic, its apex 5 -cleft or spathe-like, in the following species circumscissile near the base which is persistent and subtends the prickly capsule. Corolla funnelform, the limb plaited, 5 -lobed, the lobes broad, acuminate. Stamens included or little exserted: filaments filiform, very long, inserted at or below the middle of the corolla-tube. Ovary 2 -celled, or falsely 4 -celled; style filiform; stigma slightly 2 -lobed. Capsule 4 valved from the top, or bursting irregularly. [The Hindoo name, dhatura.] About 12 species, of wide distribution. The following are introduced weeds.
Glabrous or very sparingly pubescent; leaves lobed, calyx prismatic.
Stem green: flowers white; lower prickles of the fruit shorter. I. D. Stramonium.
Stem purple; flowers lavender or violet; prickles about equal. 2. D. Tatula. Finely glandular-pubescent; leaves entire; calyx tubular.
3. D. Metel.
I. Datura Stramònium L. Stramonium. Jamestown or Jimson-ifeed. ThORN-APPLE. (I. F. f. 3223.) Annual, glabrous or the young parts sparingly pubescent; stem stout. $3-15 \mathrm{dm}$. high. Leaves thin, ovate, acute or acuminate, mostly narrowed at the base, $0.7-2 \mathrm{dm}$. long, irregularly sinuate-lobed, the lobes acute; flowers white, about 1 dm . high; calyx prismatic, less than one-half the length of the corolla; capsule ovoid. densely prickly, about 5 cm . high. In fields and waste places. N. S. to Fla., Minn. and Tex. Nat. from tropical regions, probably from Asia. June-Sept.
2. Datura Tátula L. Purple Thorĩ-apple. Purple Stramonium. (I. F. f. 3223.) Similar to the preceding but usually a little more pubescent; stem commonly more slender, purple; leaves almost like those of $D$. Stramonium, but rather darker green or with a tinge of purple; flowers lavender colored or violet, or the tube nearly white. In fields and waste places, Ont. to Minn., N. Y., Fla. and Tex. Nat. from trop. Am. May-Sept.
3. Datura Mètel L. Entire-Leaved Thorn-apple. (I. F. f. 3224.) Annual, finely glandular-pubescent, $\mathbf{I}-3 \mathrm{~m}$. high. Leaves broadly ovate, acute, inequilateral, rounded or subcordate at the base, $\mathbf{I}-2.5 \mathrm{dm}$. long; flowers white, i.5-1.8 dm. high; calyx about one-half as long as the corolla; capsule globose or ovoid-globose, obtuse, prickly and pubescent, $2.5-4 \mathrm{~cm}$. in diameter. In waste places, R. I. to Fla. Native of trop. Am. July-Sept.

## ir. NICOTIÀNA L.

Viscid-pubescent narcotic herbs or shrubs, with large alternate entire or slightly undulate leaves, and white yellow greenish or purplish flowers, in terminal racemes or panicles. Calyx tubular-campanulate or ovoid, 5 -cleft. Corolla-tube usually longer than the limb, 5 -lobed, the lobes spreading. Stamens 5, inserted on the tube of the corolla; filaments filiform; anther-sacs longitudinally dehiscent. Ovary 2 -celled (rarely 4 -celled); style slender; stigma capitate. Capsule 2-valved, or sometimes 4 -valved at the summit. Seeds numerous, small. [Named for John Nicot, French ambassador to Portugal, who sent some species to Catherine de Medici, about 1560.] About 50 species, mostly natives of America. Besides the following, some 10 others occur in the southern and western U. S.

Corolla 2.5 cm . long, the tube cylindric; calyx-lobes triangular. Corolla $10-15 \mathrm{~cm}$. long, the tube very slender; calyx-lobes linear.

1, N. rustica.
2. N. longiflora.
I. Nicotiana rústica L. Wild Tobacco. (I. F. f. 3225.) Annual, 6-12 dm. high. Leaves broadly ovate, thin, entire, slender -petioled, o.5-2 dm. long; flowers greenish yellow, panicled; pedicels 6-12 mm . long; calyx-lobes acute, shorter than the tube; corolla-tube somewhat enlarged above, the lobes short, obtuse; capsule globose, glabrous, about $\mathbf{I} \mathrm{cm}$. in diameter, 2 -valved, longer than the calyx. In fields and waste places, Ont. to Minn., N. Y. and Fla. Cultivated by the Indians. June-Sept.
2. Nicotiana longifiòra Cav. Long-flowered Tobacco. (I. F. f. 3226.) Annual, minutely rough-puberulent and viscid, 4-9 dm. high. Basal leaves obtuse, $\mathbf{r} .5-2.5 \mathrm{dm}$. long, tapering into slender winged petioles; stem leaves linear or lanceolate, sessile; flowers short-pedicelled; calyx oblong, pubescent, its narrow lobes nearly as long as the tube; corolla white or purplish, viscid, the tube slender, $2-3 \mathrm{~mm}$. in diameter, expanding above, the lobes ovate-lanceolate, acute; capsule oblong. Near Harrisburg and Easton, Pa. Escaped from gardens. Native of S. Am. Aug.-Oct.

## 12. PETÙNIA Juss.

Viscid-pubescent herbs, with entire leaves, and white violet or purple flowers (in cultivation sometimes variegated). Calyx deeply 5 -cleft or 5 -parted. Corolla funnelform or salverform, the limb plicate, spreading, slightly irregular. Stamens 5, inserted on the throat of the corolla, 4 of them didynamous, perfect, the fifth smaller or obsolete; filaments slender; anthers 2-lobed. Disk fleshy. Ovary 2 celled; ovules numerous; style filiform; stigma 2 -lamellate. Capsule 2 -celled, 2 valved, the valves entire. Seeds small, the testa rugose. [Petun, an Indian name of tobacco.] About 12 species, of S. Am.

Corolla white, its tube cylindric.
Corolla violet-purple, its tube campanulate.

1. P. axillaris.
2. P. violacea.
3. Petunia axillàris (Lam.) B.S.P. White Petunia. (I. F. f. 3227.) Very viscid, about 3 dm . high. Leaves ovate to obovate, obtuse or blunt-pointed. 7-10 cm . long, sessile, or the lower narrowed into short margined petioles: peduncles slender, often longer than the leaves; calyx-segments linear-oblong, obtuse; corolla white, its tube slightly enlarged above, $2.5-4 \mathrm{~cm}$. long, $3-4$ times as long as the calyx, its limb abruptly spreading, the lobes rounded. In waste places, escaped from gardens, N. Y. and Penn. Native of southern Brazil. July-Sept.
4. Petunia violàcea Lindl. Violet Petunia. (I. F. f. 3228.) Similar to the preceding, but usually lower, and the stem slender. Leaves orate or oborate. all but the uppermost petioled, mostly obtuse, 2.5-6 cm. long: peduncles slender; calyx-segments linear; corolla violet-purple, its tube campamulate, I.S-3 cm. long,
the limb less abruptly spreading, the lobes subacute. In waste places, escaped from gardens, N. Y. and Penn. Native of southern Brazil and Paraguay. June-Sept.

Petunia parvifìra Juss., a prostrate pubescent annual, with small linear to spatulate leaves, and a funnelform corolla $8-10 \mathrm{~mm}$. long, is abundant on ballast about the eastern seaports.

## Family 9. SCROPHULARIÀCEAE Lindl.

Figwort Family.

Herbs, shrubs or trees, with estipulate leaves, and perfect mostly complete and irregular flowers (corolla wanting in one species of Synthyris). Calyx inferior, persistent, $4-5$-toothed, -cleft, or -divided, or sometimes split on the lower side, or on both sides, the lobes or segments valvate, imbricate or distinct in the bud. Corolla gamopetalous, the limb 2-lipped, or nearly regular. Stamens 2,4 or 5 , didynamous, or nearly equal, inserted on the corolla and alternate with its lobes; anthers 2-celled; the sacs equal, or unequal, or sometimes confluent into one. Disk present or obsolete. Pistil I, entire or 2-lobed ; ovary superior, 2 -celled, or rarely I-celled; ovules anatropous or amphitropous, on axile placentæ; style slender, simple; stigma entire, 2-lobed or 2 lamellate. Fruit mostly capsular and septicidally or loculicidally dehiscent. Seeds mostly numerous; endosperm fleshy; embryo small, straight or slightly curved; cotyledons little broader than the radicle. About 165 genera and 2500 species, widely distributed.
I. Anther-bearing stamens 5 ; corolla rotate; leaves alternate. I. Verbascum.
2. Anther-bearing stamens 2 or 4 ; leaves opposite, verticillate or alternate.

* Corolla spurred, saccate or gibbous on the lower side at the base.

Corolla spurred at the base.
Leaves palmately 3 -5-veined. 2. Cymbalaria.
Leaves pinnately veined.
Flowers solitary in the axils. 3. Kickxia.
Flowers in terminal racemes.
4. Linaria.

Corolla saccate or gibbous at the base.
5. Antirrhinum.

> * * Corolla neither spurred, saccate nor gibbous on the lower side.
> + Anther-bearing stamens 4 , the fifth sterile or rudimentary.

Sterile stamen a scale adnate to the upper side of the corolla.
6. Scrophutaria.

Sterile stamen elongated, longer or shorter than the others.
Corolla tubular, 2 -lipped, the lobes of the lower lip flat.
Sterile stamen shorter than the others; seeds winged.
7. Chelone.

Sterile stamen about equalling the others; seeds wingless.
8. Pentstemon.

Corolla 2 -cleft, declined; middle lobe of the lower lip conduplicate.
9. Collinsia.

> + + Stamens 4, all anther-bearing, or 2 sterile, or 2 only.
> a. Stamens 4 , all anther-bearing; farge Asiatic tree.

1o. Paulownia.
b. Stamens 4, all anther-bearing; herbs; corolla 2 -lipped; stamens not enclosed in upper lip of corolla.
Calyx prismatic, 5 -angled, 5 -toothed. II. Mimulus.
Calyx 5 -parted, not prismatic.
Calyx-segments equal; leaves pinnatifid in our species. 12. Conobea.
Calyx-segments unequal, the upper one the largest.
13. Monniera.
c. Stamens 4,2 anther-bearing and 2 sterile, or 2 only; corolla obviously 2 -lipped.

Calyx 5 -parted; upper lip of corolla present.
Sterile filaments short or none. 14. Gratiola.
Sterile filaments slender, 2 -lobed.
Calyx 4 -toothed; upper lip of corolla obsolete; low mud plant.
15. Ilysanthes.
d. Stamens 4, all anther-bearing; corolla nearly regular; flowers on scapes.
17. Limosella.
e. Stamens 2 only; corolla rotate, salverform, tubular, or none.

Leaves alternate; flowers spicate: corolla $2-3$-lobed or none.
Leaves, at least the lower, opposite or verticillate; corolla 4-lobed.
Corolla rotate; capsule obcordate or emarginate, compressed.
Corolla tubular-funnelform; capsule ovoid, not compressed.
18. Synthyris.
19. Veronica.
20. Leptandra.
f. Stamens 4, all anther-bearing; corolla campanulate, salverform or funnelform, scarcely 2 -lipped.
Leaves alternate: flowers in x -sided racemes. 21. Digitalis.
Leaves, at least the lower, opposite.
Corolla salverform; flowers in a long spike.
Corolla campanulate or funnelform.
Stamens nearly equal; calyx-lobes as long as the tube. 23. Afzelia. Stamens strongly didynamous, unequal; calyx-teeth shorter than the tube. Anthers awned at the base; corolla yellow. 24. Dasystoma. Anthers awnless; corolla purple, pink or rarely white. 25. Gerardia.
g. Stamens 4, all anther-bearing, ascending under the upper lip of the corolla. Ovules several or numerous; capsule many-seeded.

Anther-sacs dissimilar, the inner one pendulous by its apex; leaves mostly alternate. Upper lip of the corolla much longer than the lower.
26. Castilleja.

Upper lip of the corolla scarcely longer than the lower.
Anther-sacs similar and parallel; leaves mostly opposite.
Calyx 2-bracteolate at the base, 5 -toothed.
27. Orthocarpus.

Calyx not bracteolate, 4-5-toothed, or cleft or split.
Upper lip of the corolla 2 lobed, its margins recurved; calyx 4 -cleft.
29. Euphrasia.

Margins of the upper lip of the corolla not recurved.
Calyx scarcely or not at all inflated in fruit; galea entire.
Calyx 4 -toothed or 4 -cleft; capsule straight.
Seeds spreading, numerous.
Seeds pendulous, few.
30. Bartsia.
31. Odontites.

Calyx split on the lower side or on both sides; capsule oblique. Galea prolonged into a filiform curved beak.

Galea with a short beak or none.
Calyx ovoid, much inflated and veiny in fruit.
32. Elephantella.
33. Pedicularis.
34. Rhinanthus. Ovules only 1 or 2 in each cell of the ovary; capsule 1-4-seeded; leaves opposite.
35. Melampyrum

## 1. VERBÁSCUM L.

Biennial or rarely perennial, mostly tall herbs, with alternate leaves, and rather large flowers, in terminal spikes, racemes or panicles. Calyx deeply 5 -cleft or 5 -parted. Corolla flat-rotate or slightly concave, 5 -lobed, the lobes a little unequal, the upper exterior, at least in the bud. Stamens 5, inserted on the base of the corolla, unequal; filaments of the 3 upper stamens, or of all 5 , pilose; anther-sacs confluent into one. Ovules numerous; style dilated and flattened at the summit. Capsule septicidally 2 -valved, the valves usually 2 -cleft at the apex. Seeds rugose. [The Latin name of the great mullen; used by Pliny.] About 125 species, of the Old World.
Plants densely woolly ; flowers in dense terminal spikes, or spikelike racemes.
Leaves strongly decurrent on the stem.
Leaves not decurrent, or but slightly so.
Leaves white-tomentose beneath; flowers in large terminal panicles.
Plant glabrous or sparingly glandular; flowers racemose.

1. V. Thapsus.
2. $V$. phlomoides.
3. $I$ Lychnitis.
4. $I$. Blattaria.
I. Verbascum Thápsus L. Great Mullen. (I. F. f. 3229.) Simple or with some erect branches, densely woolly with branched hairs, 6-25 dm. high. Leaves oblong, thick, acute, narrowed at the base, dentate or denticulate, $1-3 \mathrm{dm}$. long, the basal ones margined-petioled; flowers yellow, $1.5-2.5 \mathrm{~cm}$. broad, sessile. numerous in dense elongated spikes; stamens unequal, the three upper shorter with white hairy filaments and short anthers, the two lower glabrous or nearly so with larger anthers; capsule about 6 mm . high. In fields and waste places, N. S. to S. Dak., Fla. and Kans. Nat. from Europe. June-Sept.
5. Verbascumi phlomoides I. Clasping-leaven Muliff. (I. F. f. 3230 .) Stem usually simple, $3-\mathbf{1 2} \mathrm{dm}$. high. Leaves oblong to orate lanceolate, crenate, crenulate, or entire, woolly-tomentose, sessile or somewhat clasping, or slightly decurrent on the stem, or the lower often petioled with truncate or subcordate bases;
flowers yellow, or cream-color, 2.5 cm . broad or more, usually in a tomentose spike-like raceme; pedicels clustered, shorter than the calyx; stamens as in $V$. Thapsus. Eastern Mass. Adventive or fugitive from Europe. June-Aug.
6. Verbascum Lychnitis L. White Mullen. (I. F. f. 323I.) Stem angled, branched above, 6-14 dm. high, densely covered with a white nearly stellate pubescence. Leaves oblong, ovate or oblong-lanceolate, crenate-dentate, $5-17 \mathrm{~cm}$. long, the upper acute, sessile, the lower narrowed into margined petioles; flowers in a large terminal panicle, racemose on its branches, white or cream-color, 10-12 mm . broad, nearly sessile; pilose hairs of the 3 shorter filaments white; capsule about 4 mm . high. In fields and waste places, Ont. to N. J. and Penn. Reported from Kans. Nat. from Europe. June-Sept.
7. Verbascum Blattària L. Moth Mullen. (I. F. f. 3232.) Stem terete, usually simple, $6-18 \mathrm{dm}$. high. Leaves oblong, ovate or lanceolate, dentate, laciniate, or pinnatifid, acute or acuminate, the upper truncate or cordateclasping at the base, the basal ones seldom present at flowering time; raceme 3-6 dm. long, loose; pedicels spreading, $1-2.5 \mathrm{~cm}$. long, bracted at the base; corolla yellow or white, about 2.5 cm . broad, with brown marks on the back; filaments all pilose with violet hairs; capsule depressed-glohose, 6 mm . in diameter. In fields and waste places, Quebec to Fla., Minn. and Kans. Nat. from Europe. June-Nov.

## 2. CYMBALARIA Medic.

Perennial creeping or spreading herbs, with long-petioled, mostly lobed, palmately veined leaves, and solitary axillary white to violet flowers. Calyx 5 -parted. Corolla irregular, 2 -lipped, short-spurred; upper lip 2-lobed, lower lip 3-lobed; throat nearly or quite closed by the palate. Stamens 4, didynamous, ascending, included, the filaments filiform. Style very slender. Capsule dehiscent by 2 terminal 3 -toothed pores. Seeds numerous, small. [From the Greek for cymbal.] About 9 species, of the Old World.
I. Cymbalaria Cymbalària (L.) Wettst. Kenilworth or Coliseum Ivy. (I. F. f. 3233.) Glabrous; stem trailing, often rooting at the nodes, $\mathrm{I}-3 \mathrm{dm}$. long. Leaves reniform-orbicular, $3-5$-lobed, $0.6-2.5 \mathrm{~cm}$. in diameter, the lobes broad and obtuse; flowers blue or lilac, $8-10 \mathrm{~mm}$. long; peduncles slender, recurved, shorter than the petioles; calyx-segments lanceolate, acute; palate yellowish; capsule globose; seeds rugose. Waste places and roadsides, adventive from Europe, N. Y., N. J. and Penn., and in seaport ballast. June-Aug.

## 3. KÍCKXIA Dumort. <br> [Elatinoides Wettst.]

Mostly annual spreading or creeping herbs, with pinnately veined, short-petioled leaves, and sólitary axillary white yellow or variegated flowers. Calyx 5parted. Corolla irregular, spurred, 2 -lipped, the throat closed by the palate. Stamens 4, didynamous, included; filaments filiform. Capsule opening by I or 2 terminal slits, pores, or valves. Seeds ovoid, mostly rough or tubercled. About 25 species, natives of the Old World. [In honor of Johann Kickx, professor in Ghent.]
Leaves ovate-orbicular, cordate or rounded at the base.
Leaves triangular, mostly hastate.
x. E. spuria.
r. Kickxia spùria (L.) Dumort. Round-leaved Toad-flax. (I. F. f. 3234.) Annual, pubescent; stems prostrate, o. $7-6 \mathrm{dm}$. long. Leaves ovate-orbicular, entire, or sometimes dentate, mucronulate, cordate or rounded at the base, $0.6-2.5 \mathrm{~cm}$. in diameter; petioles $2-4 \mathrm{~mm}$. long; flowers small; peduncles filiform, very pubescent, often much longer than the leaves; calyx-segments ovate, acute at the apex, cordate or rounded at the base, one-half as long as the corolla; corolla yellowish with a purple upper lip, the spur curved; capsule subglobose. In waste places and ballast, N. Y. to N. Car. Adventive from Europe. June-Sept. [Elatinoides spuria Wettst.]
2. Kickxia Elatine (L.) Dumort. Sharp-pointed Fluellin or Toad-flax. (I. F. f. 3235.) Annual, pubescent; stems prostrate, 1.5-6 dm. long. Leaves

1-2.5 cm. long, acute or acutish at the apex, triangular, hastate, truncate, or subcordate at the base, the basal auricles divergent, acute; flowers about 6 mm . long; peduncles filiform; calyx-segments narrowly lanceolate, acute; corolla yellowish, purplish beneath, its spur slender, straight, declined; capsule subglobose. In sandy waste places, Canada; N. Y. to N. Car. and Ga. Nat. from Europe. JuneSept. [Elatinoides Elatine Wettst.]

## 4. LINARIA Hill.

Herbs, some exotic species shrubby, with alternate leaves, or the lower and those of sterile shoots opposite or verticillate, the flowers in terminal bracted racemes or spikes or axillary. Calyx 5 -parted, the segments imbricated. Corolla irregular, spurred at the base, 2-lipped, the upper lip erect, 2 -lobed, covering the lower in the bud, the lower spreading, 3 -lobed, its base produced into a palate often nearly closing the throat. Stamens 4, didynamous, ascending, included; filaments and style filiform. Capsule opening by I or more mostly 3 -toothed pores or slits below the summit. Seeds numerous, angled or rugose. [Latin, linum, flax, which some species resemble.] About 150 species, of wide distribution. Besides the following, another occurs in southern Florida. The corolla, especially the terminal one of the raceme, occasionally has 5 spurs and is regularly 5 -lobed, and is then said to be in the Peloria state.
Flowers yellow, $\mathbf{r} .5-3 \mathrm{~cm}$. long.
Leaves linear; flowers $2.5-3 \mathrm{~cm}$. long ; seeds winged. 1. L. Linaria.
Leaves lanceolate; flowers $1.5-2 \mathrm{~cm}$. long; seeds wingless.
Flowers blue to white, $6-12 \mathrm{~mm}$. long.
Spur of corolla filiform, curved; native species.
Spur of corolla short, conic; European adventive species.
2. L. genistaefolia.
3. L. Canadensis.
4. L. repens.
r. Linaria Linària (L.) Karst. Ranstead. Butter-and-Eggs. Yellow Toad-flax. (I. F. f. 3236.) Perennial, pale green; stems erect, leafy, glabrous, or sparingly glandular-pubescent above, $3-9 \mathrm{dm}$. high. Leaves sessile, entire, mostly alternate, $1-4 \mathrm{~cm}$. long, $2-3 \mathrm{~mm}$. wide; flowers densely racemose, the palate orangecolored; pedicels $4-8 \mathrm{~mm}$. long, nearly erect; calyx-segments oblong, acutish; spur subulate, nearly as long as the body of the corolla; middle lobe of the lower lip shorter than the other two; capsule ovoid. In fields and waste places, N. S. to Manitoba, Va. and Kans. Nat. from Europe. June-Oct.
2. Linaria genistaefòlia (L.) Mill. Broom-leaved Toad-flax. (I. F. f. 3237.) Similar to the preceding but more glaucous, usually paniculately branched; leaves sessile, $2.5-9 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide, acute or acuminate; flowers loosely racemose; pedicels short; spur of the corolla nearly as long as the tube. Sparingly established on the northern part of N. Y. Island; station now nearly or quite obliterated. Nat. or adventive from Europe. June-Aug.
3. Linaria Canadénsis (L.) Dumont. Blue or ${ }^{\circ}$ Wild Toad-flax. (I. F.f. 3238.) Biennial or annual, glabrous; flowering stems erect or ascending, very slender, $1-8 \mathrm{dm}$. high; sterile shoots procumbent, leafy. Leaves linear or linearoblong, $8-30 \mathrm{~mm}$. long, entire, sessile. those of the sterile shoots, or some of them, usually opposite; flowers $6-8 \mathrm{~mm}$. long, in slender racemes; pedicels appressed in fruit; calyx-segments lanceolate, acute, or acuminate, about as long as the capsule; spur of the corolla as long as the tube or longer; palate a white convex 2 ridged projection; seeds wingless. In dry soil, N. S. to Fla., Ore, and Cal. Also in Cent. and S. Am. A dwarf form with no corolla is frequent. May-Sept.
4. Linaria rèpens (L.) Mill. Pale-blue Toad-flax. (I. F. f. 3239.) Glabrous, perennial by a creeping rootstock, $2-8 \mathrm{dm}$. high. Leaves linear, entire, short-petioled or sessile, $\mathbf{1}-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, narrowed to both ends, the lower crowded, sometimes whorled; flowers in slender terminal racemes; pedicels 4-10 mm . long; bracts narrowly linear, acute; corolla nearly white, but striped with blue or purple, about 12 mm . long; spur short, conic; capsule suhglobose; seeds wrinkled. Newf. and in ballast about the Atlantic seaports. Adventive from Europe. Summer.

Chaenorrhinum minus (L.) Lange (Linaria minor (L.) Desf), a lnw glandular branched annual, with solitary, axillary, long-peduncled, very small flowers, the palate not closing the throat of the corolla, the leaves linear, is reported from N. R. and Ont. Adventive from Europe.

## 5. ANTIRRHİNUM L.

Herbs, with alternate leaves, or the lower and those of sterile shoots opposite, and red purple yellow or white flowers, in terminal racemes, or solitary in the upper axils. Calyx 5 -parted, the segments imbricated. Corolla irregular, gibbous, or saccate, but not spurred, 2-lipped, the upper lip erect, 2 -lobed, the lower spreading, 3 -lobed, its base produced into a palate nearly or quite closing the throat. Stamens 4, didynamous, included. Style filiform. Capsule opening by chinks or pores below the summit. Seeds numerous, not winged. [Greek, noselike.]. About 40 species, natives of Europe, Asia and western N. Am. Besides the following some 18 others inhabit the western U. S.
Flowers $2.5-4 \mathrm{~cm}$. long; calyx-segments ovate, much shorter than the corolla.
Flowers $1-1.5 \mathrm{~cm}$. long; calyx-segments linear, as long as the corolla. 2. A. Orontium.

1. Antirrhinum majus L. Great Snapdragon. Lion's-mouth. (I. F. f. 3240.) Perennial, usually glandular-pubescent above, 3-9 dm. high. Leaves lanceolate, linear or oblong-lanceolate, entire, short-petioled, acute, glabrous, $2-8 \mathrm{~cm}$. long; flowers racemose, purplish-red (of a variety of colors in cultivated forms); pedicels rather stout, erect in fruit; calyx-segments obtuse, $4-6 \mathrm{~mm}$. long; capsule obliquely ovoid, 8 -10 mm . high, opening by 2 pores just below the summit or at length apically 2 -valved, much longer than the calyx. In waste places, escaped from gardens in the Atlantic States. Adventive from Europe. June-Sept.
2. Antirrhinum Oróntium L. Lesser Svapdragon. (I. F. f. 324I.) Annual, about 3 dm . high. Leaves narrowly linear, or the lower linear-spatulate, almost sessile, narrowed at both ends, $2-5 \mathrm{~cm}$. long; flowers solitary in the upper axils, purple, $I-I .5 \mathrm{~cm}$. long; peduncles shorter than the flowers; calyx-segments linear, unequal, as long as the corolla, elongated in fruit so as much to exceed the pubescent capsule. In fields and waste places, Ont., N. Eng. and N. Y. Also on Vancouver Island. Adventive from Europe. June-Aug.

## 6. SCROPHULARIA L.

Perennial strong-smelling herbs, some exotic species shrubby, with mostly opposite leaves, and small purple greenish or yellow proterogynous flowers, in terminal panicled cymes or thyrses. Calyx 5 -parted or 5 -cleft, the segments or lobes mostly obtuse. Corolla irregular. the tube globose to oblong, not gibbous nor spurred, the limb 5 -lobed, the 2 upper lobes longer, erect, the lateral ones ascending, the lower spreading or reflexed. Stamens 5, 4 of them anther-bearing and didynamous, declined; their anther-sacs confluent into one, the fifth sterile, reduced to a scale on the roof of the corolla-tube. Style filiform; stigma capitate or truncate. Capsule ovoid, septicịdally dehiscent. Seeds rugose, not winged. [Named for its repute as a remedy for scrofula.] About 120 species, of the northern hemisphere. Besides the following, 2 or 3 others occur in the western U.S.

Corolla dull outside; sterile stamen deep purple.
Corolla shining outside; sterile stamen greenish yellow.
I. S. Marylandica.
2. S. leporella.

1. Scrophularia Marylándica L. Maryland Figwort. Heal-all or Pilewort. (I. F. f. 3242.) Glabrous below, somewhat glandular-pubescent above; stem slender, 4 -angled with grooved sides, $1-3 \mathrm{~m}$. high. Leaves membranous, slender-petioled, usually puberulent beneath, ovate or ovate-lanceolate. acuminate, sharply serrate, $0.7-3 \mathrm{dm}$. long; flowers greenish purple, $6-8 \mathrm{~mm}$. long, numerous in the nearly leafless thyrses; bractlets mostly opposite; pedicels $8-25 \mathrm{~mm}$. long; calyx-lobes broadly ovate, obtuse. about the length of the tube: corolla brownish purple and shining within. little contracted at the throat, the two lateral lobes slightly spreading, the upper lip erect, its lobes short, rounded; capsule subglobose, with a slender tip. In woods and thickets, Me. to S. Dak., N. Car., Ga. and Tenn. July-Sept.
2. Scrophularia leporélla Bicknell. Hare Figwort. (I. F. f. 3243.) Stem viscid-glandular above, sharply 4 -angled with flat sides, $\mathrm{I}-2.8 \mathrm{~m}$. tall. Leaves short-petioled, ovate to lanceolate, acuminate, mostly narrowed at the base, glabrous on both sides when mature, usually incised-dentate, $5-25 \mathrm{~cm}$. long; flowers $8-10 \mathrm{~mm}$. long, in elongated narrow thyrses; bractlets mostly alternate; calyx.
lobes ovate; corolla contracted at the throat, green to purple and shining without, dull within, the two lateral lobes erect; lobes of the upper lip often narrowly oblong; capsule ovoid-conic. In woods and along roadsides, Vt. to Conn., Minn., Va. and Kans. May-July,

## 7. CHELONE L.

Perennial, mostly glabrous herbs, with opposite serrate petioled leaves, and large white red or purple flowers, in terminal and axillary dense spikes. Calyx 5farted, bracted at the base, the segments ovate or lanceolate. Corolla irregular, the tube elongated, enlarged above, the limb 2-lipped; upper lip concave, emarginate or entire, exterior in the bud; lower lip spreading, woolly within, 3-lobed. Stamens 5, included, 4 of them antheriferous, didynamous, the fifth sterile, smaller; filaments slender, woolly; anthers woolly, cordate. Style filiform; stigma small, capitate. Capsule ovoid, speticidally dehiscent. Seeds numerous, compressed, winged. [Greek, tortoise, the head of which the corolla resembles.] Three species, of eastern N. Am.
Corolla white; bracts not ciliolate. Corolla red or rose-purple ; bracts ciliolate.

Leaves oblong or lanceolate.
Leaves ovate, acuminate ; mountain plant.

1. C. glabra
2. C. obliqua.
3. C. Lyoni.
I. Chelone glàbra L. Snake-head. Turtle-head. (I. F. f. 3244.) Stem obtusely 4 -sided, simple or sometimes branched, 3-9 dm. high. Leaves lanceolate, sharply serrate with low appressed teeth, acuminate at the apex, narrowed at the base, short-petioled, $7-15 \mathrm{~cm}$. long, the principal veins about 10 on each side of the midvein; flowers white or faintly pink, about 2.5 cm . long; calyx-segments ovate-oblong, obtuse; capsule obtuse, about 12 mm . high, twice as long as the calyx. In swamps and along streams, Newf. to Fla., Manitoba and Kans. Lower leaves sometimes broadiy oval. July-Sept.
4. Chelone obliqua L. Red Turtle-head. (I. F. f. 3245.) Stem slender, ascending, $3^{-6} \mathrm{dm}$. high, the branches mostly spreading or ascending. Leaves oblong, or broadly lanceolate, acuminate at the apex, narrowed at the base, petioled, sharply serrate with somewhat spreading teeth, or laciniate, $5-15 \mathrm{~cm}$. long; petioles 4-12 mm . long; principal veins about 10 on each side; flowers red or rosepurple, about 2.5 cm . long; bracts and calyx-segments ciliolate and usually puberulent; capsule similar to that of the preceding. In wet thickets and along streams, Va. to Ill. and Fla. July-Sept.
5. Chelone Lỳoni Pursh. Lyon's Turtle-head. (I. F. f. 3246.) Stem erect or nearly so, 3-9 dm. high. Leaves ovate, acuminate at the apex, rounded, truncate or subcordate at the base, $7-18 \mathrm{~cm}$. long, usually slender-petioled, sharply serrate with divergent teeth, the principal veins 8 -10 on each side; flowers red or rose-purple, about 2.5 cm . long; bracts and calyx-segments ciliolate and puberulent. In swamps and wet thickets, mountains of Va. (?); N. Car. and Tenn. to Ga. July-Sept.

## 8. PENTSTEMON Soland.

Perennial herbs, mostly branched from the base only, with opposite or rarely verticillate leaves, or the upper occasionally alternate, and large, blue purple red or white flowers, in terminal thyrses, panicles, or racemes. Calyx 5-parted. the segments imbricated. Corolla irregular, the tube elongated, more or less enlarged above, the limb 2 -lipped; upper lip 2 -lobed; lower lip 3-lobed. Stamens 5 , included, 4 of them antheriferous and didynamous, the 5 th sterile, as long as or shorter than the others; anther-sacs divergent or connivent. Style filiform: stigma capitate. Capsule ovoid, oblong, or globose, septicidally dehiscent. Seeds numerous, wingless. [Greek, five stamens.] About 100 species, of N. Am. and Mex.
*More or less pubescent or glandular, at least the calyx and pedicels.
Corolla $2-3 \mathrm{~cm}$. long; leaves entire, serrate, or denticulate.
Stem pubescent or puberulent nearly or quite to the base.
Thyrsus open, panicle-like.
Corolla densely bearded in the throat ; pubescence villous.
x. $P$. hirsutus.

Corolla scarcely bearded in the throat; pubescence canescent.

Thyrsus narrow, raceme-like or spike-like.
Corolla-tube abruptly enlarged; sterile filament densely woolly.
3. P. cristatus.

Corolla-tube gradually enlarged; sterile filament slightly bearded.
4. P. albidus.

Only the inflorescence, or pedicels, or calyx pubescent, or puberulent.
Thyrsus open, panicle-like.
Stem leaves oblong, ovate, or lanceolate.
Calyx-segments merely acute.
Corolla white, abruptly enlarged, $2.5-3 \mathrm{~cm}$. long.
5. P. Digitalis.

Corolla purplish, gradually enlarged, $1.5-2 \mathrm{~cm}$. long.
6. P. Pentstemon

Calyx-segments with long acuminate tips. Stem leaves linear-lanceolate. Thyrsus narrow, interrupted; calyx viscid.
7. P. calycosus.
8. P.gracilis.
9. P. tubiflorus.

Corolla 5 cm . long, the tube much enlarged abore; leares dentate. 10. P. Cobaea.
** Completely glabrous throughout, mostly glaucous.
Leaves lanceolate, oblong, ovate, obovate, or orbicular.
Stem leaves rounded, clasping ; flowers 5 cm . long.
Stem leaves acute or acuminate; flowers $\mathrm{I} .8-3 \mathrm{~cm}$. long.
Corolla $1.8-2 \mathrm{~cm}$. long ; stem leaves lanceolate.
Corolla $2.5-3.5 \mathrm{~cm}$. long ; stem leaves mostly oblong.
Leaves linear or linear-lanceolate ; flowers densely thyrsoid.
Bracts lanceolate, small ; flowers $12-20 \mathrm{~mm}$. long.
Bracts ovate, acuminate, large : flowers 25 mm . long or more. 14. 15. P. Angustifolindeni.
I. Pentstemon hirsùtus (L.) Willd. Hairy Beard-tongue. (I. F. f. 3247.) Stem hairy nearly or quite to the base. 3-9 dm. high. Leaves puberulent or glabrous, denticulate or the uppermost entire the basal oblong or ovate, obtusish, $5-12 \mathrm{~cm}$. long, narrowed into petioles, the upper sessile, lanceolate, sessile or slightly clasping; inflorescence thyrsoid. rather loose. glandular-pubescent; pedicels mostly short; corolla purplish or violet. the tube gradually dilated above, 2 -grooved on the lower side, about 2 cm . long. the throat nearly closed by the villous palate at the base of the lower lip; sterile filament densely bearded for about one-half its length. In dry wouds and thickets. Me. to Ont.. Manitoba, Fla., Minn. and Tex. May-July.
2. Pentstemon canéscens Britton. Gray Beard-tongie. (I. F. f. 3248.) Densely and finely canescent or puberulent, or the leaves sometimes nearly gla. brous. 3-9 dm. high. Leaves denticulate, the lower and basal ones oval, obtuse. narrowed into long margined petioles, the next I or 2 pairs contracted below the middle and somewhat fiddle-shaped, $7-15 \mathrm{~cm}$. long. the upper ovate or ovatelanceolate, acuminate, clasping; thyrsus elongated, open. glandular-pubescent. leafy-bracted below; pedicels very short; calyx-segments lanceolate, acuminate; corolla purple or nearly white, about 2.5 cm . long. slightly or not at all bearded in the throat; sterile filament slightly bearded for about one-third its length; capsule ovoid. glabrous. longer than the calyx. In dry soil, N. Y. to Ya., W. Va., S. C. and Mo. May-June.
3. Pentstemon cristàtus Nutt. Crested Beard-toNgle. (I. F. f. 3249.) Puberulent below. glandular-villous and viscid abore; stem leafy, $1.5-4.5 \mathrm{dm}$. high. Leaves firm. entire or repand, the lower and basal ones oblong or spatulate. $5-10 \mathrm{~cm}$. long, narrowed into margined petioles, the upper sessile or somewhat clasping. acute or acuminate; thyrsus dense, narrow, leafy-bracted; flowers almost sessile; calyx-segments linear-lanceolate, acuminate; corolla about 2.5 cm . long, red or purple. its lower lip villous within. On plains, Manitoba and the N. W. Terr. to Neb. and Nev. May-July.
4. Pentstemon álbidus Nutt. White-flowered Beard-tongue. (I. F. f. 3250.) Stem puberulent below. densely glandular-pubescent above. I.5-2.5 dm. high. Basal and lower leaves spatulate or oblong, obtusish. mostly entire, the upper lanceolate or oblong, sessile, denticulate, acute or acuminate, 3-7 cm. long; thyrsus narrow. raceme-like, leafy-bracted. interrupted; calyx-segments lanceolate, acuminate, viscid. one-half as long as the corolla-tube; corolla white or nearly so. $1.5-2 \mathrm{~cm}$. long, the limb nearly equally 5 -lobed, the lobes spreading. On dry plains, S. Dak. to Colo., Neb. and Tex. June-Aug.
5. Pentstemon Digitalis (Sweet) Nutt. Foxglove Beard-tongue. (I. F.f. 325I.) Glabrous, except the glandular-pubescent inflorescence, 6-15 dm. high. Lower and basal leaves oblong or oval, entire or repand, 5-17 cm. long, narrowed into margined petioles; upper leaves ovate, lanceolate or ovate-lanceolate, sessile and more or less cordate-clasping at the base, acuminate, sharply denticulate; thyrsus many-flowered; pedicels $2-6 \mathrm{~mm}$. long; calyx-segments lanceolate; corolla limb moderately 2 -lipped, the throat open; sterile filament bearded above. In fields and thickets, Me. to Ill., Kans., Va. and Ark. Escaped from cultivation in its northeastern range. May-July.
6. Pentstemon Pentèstmon (L.) Britton. Smooth Beard-tongue. (I. F. f. 3252.) Glabrous, except the glandular-pubescent inflorescence, 6-9 dm. high. Basal and lower leaves oblong or oval, obtuse, $7-15 \mathrm{~cm}$. long, narrowed into margined petioles, denticulate; upper leaves sessile or slightly clasping, acute, oblong or lanceolate, denticulate; thyrsus usually many-flowered; flowers nearly sessile; calyx-segments lanceolate, acute, short; corolla purple or purplish, the throat wide open, scarcely or not at all bearded; sterile filament thinly bearded for about onehalf its length, or more densely above. In woods and thirkets, Penn. to Fla., Ky. and La. May-July.
7. Pentstemon calycòsus Small. Long-sepaled Beard-tongue. Glabrous except a few scattered hairs in the inflorescence and lines of puberulence on the internodes, deep green. Leaves various, the basal spatulate, $5-15 \mathrm{~cm}$. long, entire or undulate, with winged petioles; lower stem-leaves similar to the basal, the upper lanceolate or ovate-lanceolate, acute or acuminate, finely repand or distinctly serrate, rounded at the base and clasping; calyx-segments with a lanceolate base and a slender tip, becoming 1 cm . long; corolla purple, $2.5-3 \mathrm{~cm}$. long; sterile filament sparingly bearded. On bluffs, Ky. to Mo. and Ala. May-June.
8. Pentstemon grácilis Nutt. Slender Beard-tongue. (I. F. f. 3253.) Glabrous or nearly so up to the glandular-pubescent inflorescence; stem slender, 1.5-4.5 dm. high. Basal and lower leaves linear-oblong or spatulate, denticulate, or entire, $2-8 \mathrm{~cm}$. long, narrowed into margined petioles; upper leaves sessile, linear-lanceolate or the uppermost lanceolate, acuminate, denticulate; thyrsus open, several-many-flowered; pedicels $4-8 \mathrm{~mm}$. long; calyx-segments lanceolate, acute or acuminate; corolla purple, $1.8-2.5 \mathrm{~cm}$. long, its tube gradually enlarged above, its throat wide open; sterile filament bearded for about one-half its length. On moist prairies, Manitoba to Minn., Miss., the N.W. Terr. and Colo. May-July.
9. Pentstemon tubifiorus Nutt. Funnelform Beard-tongue. (I. F. f. 3254.) Glabrous, except the viscid-pubescent calyx and pedicels; stem 6-10 dm. high, leafless above. Leaves oblong, ovate, or lanceolate, $2-10 \mathrm{~cm}$. long, the basal narrowed into broad margined petioles, the upper sessile or clasping, entire or merely undulate; thyrsus narrow, interrupted, the clusters several-flowered; pedicels $2-6 \mathrm{~mm}$. long; calyx-segments ovate, acuminate, short, striate-nerved; corolla nearly funnelform, white or purplish, less than 2.5 cm . long, nearly as broad when expanded, its tube gradually enlarged, the limb nearly equally five-lobed: sterile filament short bearded above; capsule acute, about twice as long as the calyx. In moist soil, Mo. and Kans. to Ark. May-July.
10. Pentstemon Cobaèa Nutt. Cobaea Beard-tongue. (I. F. f. 3255.) Densely and finely pubescent below, glandular-pubescent above, 3-6 dm. high. Leaves oblong to ovate, firm, $7-\mathbf{1 3} \mathrm{cm}$. long, dentate, the lower mostly glabrous and narrowed into margined petioles, the upper sessile or cordate-clasping, usually pubescent; thyrsus short; calyx-segments lanceolate, acuminate, I-1.5 cm. lons; corolla purple, puberulent without, its tube narrow up to the top of the calyx, then abruptly dilated, the lobes short, rounded; sterile filament sparingly hearded; capsule ovoid, acute, pubescent, reticulate-veined. On dry prairies, Mo. and Kians. to Tex. May-July.
II. Pentstemon grandiforus Nutt. Large-flowered Beari-toxite. (I. F. f. 3256.) Somewhat glaucous, stout, 6-12 dm. high. Leaves entire, ohtuse, the basal obovate, narrowed into broad petioles, those of the lower part of the stem sessile, oblong or oval, $2.5-6 \mathrm{~cm}$. long, the upper nearly orbicular, cordate-clasping, shorter; thyrsus open, leafy-bracted, the bracts orbicular, cordate; calyxsegments lanceolate, acute, $6-8 \mathrm{~mm}$. long; corolla lavender-blue, the tube dilated above the calyx, the limb somewhat 2 -lipped; sterile filament incurved, villous
and capitate at the summit; capsule acute, $1.5 \mathbf{- 2} \mathbf{~ c m}$, high, three times as long as the calyx. On prairies, Ill. to Minn., S. Dak. and Kans. June-Aug.
12. Pentstemon acuminàtus Dougl. Sharp-leaved Beard-tongue. (I. F. f. 3257.) Glaucous, strict, 1.5-6 dm. high, leafy. Leaves firm, entire, the lower and basal ones oblong or spatulate, narrowed into petioles, the upper sessile or clasping, lanceolate or ovate-lanceolate, $5-8 \mathrm{~cm}$. long; thyrsus narrow, sometimes I-sided; calyx-segments lanceolate, acute, 4-6 cm. long; corolla blue, its tube rather gradually dilated, the limb 2-lipped; sterile filament bearded along the dilated summit; capsule acute, twice as long as the calyx. In dry soil, N.W. Terr. to Neb., Tex., Ore. and N. Mex. May-Aug.
13. Pentstemon glàber Pursh. Large Smooth Beard-tongue. (I. F. f. 3258.) Somewhat glaucous, leafy, 3-6 dm. high. Leaves entire, firm, the basal and lower ones narrowed into petioles, the upper oblong or oblong-lanceolate, acuminate; thyrsus narrow, elongated; pedicels $6 \mathbf{- 1 4} \mathrm{~mm}$. long in fruit; calyxsegments ovate-lanceolate, scarious margined, abruptly acuminate, $6-8 \mathrm{~mm}$. long; corolla blue or purple, rather abruptly expanded above the calyx, the limb somewhat 2-lipped, the lobes rounded; sterile filament bearded at the slightly enlarged summit; capsule narrowly ovoid, acute, about twice as long as the calyx. In moist soil, S. Dak. to Neb., Ariz., Ore. and Cal. May-Aug.
14. Pentstemon angustifòlius Pursh. Pale-blue Beard-tongue. (I. F.f. 3259.) Glaucous; stem slender, leafy, I.5-4 dm. high. Leaves linear, or linearlanceolate, entire, the lower narrowed into petioles, obtusish, the upper sessile, acute, $3-6.5 \mathrm{~cm}$. long, 3-4 mm . wide; thyrsus narrow, spike-like, mostly dense; bracts lanceolate, acuminate; pedicels very short; calyx-segments linear-lanceolate, acuminate, $4^{-6} \mathrm{~mm}$. long; corolla blue or nearly white, the tube gradually enlarged, the limb somewhat 2-lipped; sterile filament bearded at the summit. In dry soil, Neb. to N. Dak. and Mont. May-July.
15. Pentstemon Hàydeni S. Wats. Hayden's Beard-tongue. (I. F. f. 3260.) Not glaucous or slightly so; stem decumbent, leafy, $3-6 \mathrm{dm}$. high. Leaves linear or elongated-lanceolate, entire, sessile and slightly clasping, acute, acuminate, or the lowest obtusish, $5-13 \mathrm{~cm}$. long, 2-10 mm . wide; thyrsus narrow, dense; bracts ovate or ovate-lanceolate, large, cordate-clasping, acute, or acuminate; calyxsegments lanceolate, striate-nerved, acuminate, $6-10 \mathrm{~mm}$. long; corolla blue, the tube broadly dilated above the calyx, the limb nearly equally 5 -lobed; capsule acute, twice as long as the calyx. In moist soil, Neb., Kans. and Wyo.

## 9. COLLÍNSIA Nutt.

Winter-annual herbs, with opposite or verticillate leaves, and blue, pink, white or variegated flowers, verticillate, or solitary in the axils. Calyx campanulate, 5 -cleft. Corolla irregular, the tube short, the limb 2-lipped; upper lip 2-cleft, the lobes erect or recurved; lower lip larger, 3 -lobed, the lateral lobes spreading or drooping, flat, the middle one conduplicate, keel-like, enclosing the 4 declined stamens and the filiform style. Stamens didynamous. Corolla with a gland on the upper side of the tube near the base. Filaments filiform; anther-sacs confluent at the apex. Stigma small, capitate or 2 -lobed. Capsule ovoid or globose, septicidally 2 -valved, the valves 2 -cleft. Seeds few, large, peltate concave on the inner side. [Named for Zaccheus Collins, botanist, of Philadelphia, 1764-1831.] About 15 species, of N. Am.
Corolla $10-16 \mathrm{~mm}$. long, the throat shorter than the limb.
Leaves, at least the lower, ovate or oblong; corolla-lobes notched. 1. C. verna.
Leaves lanceolate; corolla-lobes obcordate.
2. C. violacea.

Corolla $4^{-6} \mathrm{~mm}$. long, the throat longer than the limb.
3. C. parviflora.
I. Collinsia vérna Nutt. Blue-eyed Mary. (I. F. f. 326I.) Glabrous or puberulent; stem weak, I. 5-6 dm. long. Leaves thin, opposite, the lower broadly ovate or orbicular, obtuse, crenate or entire, slender-petioled; middle leaves sessile or cordate-clasping, ovate or oblong, obtuse, dentate, $2-5 \mathrm{~cm}$. long, floral leaves ovate to spatulate, mostly acute; upper whorls 4-6-flowered; corolla $12-16 \mathrm{~mm}$. long, its lower lip blue, the upper purple or nearly white; capsule globose, $5-6 \mathrm{~mm}$. in diameter. In moist woods and thickets, western N. Y. and Ont. to Wis., Penn., Ky. and the Ind. Terr. April-June.
2. Collinsia violàcea Nutt. Violet Collinsia. (I. F. f. 3262.) Similar to the preceding, stem erect, 1.5-4 dm. high. Leaves lanceolate or oblong-lanceolate, rather thick, entire or denticulate, obtuse or obtusish, the lower opposite, petioled, the middle similar, sessile, $2-5 \mathrm{~cm}$. long, the floral linear or linear-lanceolate; upper whorls 2 - 5 -flowered; corolla $10-12 \mathrm{~mm}$. long, violet; capsule globose, about 4 mm . in diameter. Kans. and Ark. April-June.
3. Collinsia parviflòra Dougl. Small-flowered Collinsia. (I. F. f. 3263.) Diffusely branched, very slender, o.7-4 dm. long. Leaves oblong or lanceolate, mostly obtuse, $\mathbf{I}-2.5 \mathrm{~cm}$. long, entire, or sparingly toothed, the lower opposite, petioled, the floral sessile; upper whorls 2-6-flowered; corolla 4-6 mm . long, about twice as long as the calyx, blue or whitish; capsule globose, $2-3 \mathrm{~mm}$. in diameter. In moist places, Ont. to Br. Col., Mich., Colo., Ariz. and Utah. April-June.

## ro. PAULÒWNIA Sieb \& Zucc.

A large tree, with the aspect of Catalpa, with broad opposite petioled pubescent leaves, and large violet flowers in terminal panicles. Calyx deeply 5 -cleft, the lobes short. Corolla irregular, the tube elongated, enlarged above, the 5 lobes spreading, somewhat unequal. Stamens 4, didynamous, included; anther-sacs divaricate. Style slender, stigmatic on the inner side. Capsule coriaceous, ovoid, acute, loculicidally dehiscent. Seeds numerous, striate, winged. Flowers expanding before the leaves appear. [Named for Anna Paulowna, daughter of the Czar Paul I.] A monotypic Japanese genus.
I. Paulownia tomentòsa (Thunb.) Baill. Paulownia. (I. F. f. 3264.) Leaves broadly ovate, I.5-4 dm. long, long-petioled, canescent on both sides when young, glabrate above when old; flowers about 6 cm . long, numerous in large erect terminal panicles; pedicels stout, densely tomentose; calyx 5 -lobed, the lobes thick, tomentose; corolla slightly irregular, puberulent without; capsule 5 cm . high. Escaped from cultivation N. Y. and N. J. to D. C. and Ga. May-July.

## 1i. Mímulus L.

Herbs, with opposite leaves. Flowers axillary, solitary, peduncled, pink, violet, or yellow. Calyx prismatic, 5 -angled, 5 -toothed. Corolla irregular, its tube cylindric with a pair of ridges on the lower side within, its limb 2-lipped; upper lip 2 -lobed; lower lip spreading, 3 -lobed, the lobes rounded. Stamens 4, didynamous; anther-sacs divergent, or sometimes confluent at the summit. Style filiform; stigma 2-lamellate. Capsule loculicidally dehiscent, many-seeded, enclosed by the calyx. [Diminutive of mimus, a mimic actor.] About 30 species, natives of America. Besides the following, some 20 others occur in western N. Am.
Corolla violet, or rarely white; eastern species.
Leaves sessile, clasping; peduncles longer than the calyx.

1. M. ringens.
2. M. alatus.

Leaves petioled; peduncles shorter than the calyx.
Corolla yellow; western ; two species adventive in the East.
Plants glabrous or glabrate.
Erect; branches spreading; leaves ovate; flowers 2.5 cm . long.
3. M. guttatus.

Diffuse; leaves nearly orbicular; flowers about 1.2 cm . long.
Plant villous and viscid, diffuse, musk-scented.
4. M. Jamesii.
I. Mimulus ríngens L. SQUare-stemmed Monkey-flower. (I. F. f. 3265.) Glabrous, perennial by rootstocks; stem erect, 4 -sided or somewhat 4 -winged, 3-9 dm. high. Leaves oblong, lanceolate, or oblong-lanceolate, acuminate or acute, serrate, auriculate-clasping, or the lower merely sessile, $5-10 \mathrm{~cm}$. long; peduncles $2-5 \mathrm{~cm}$. long in fruit, 2-4 times as long as the calyx; calyx-teeth lanceo-late-subulate; corolla about 2.5 cm . long, the throat narrow, exceeding the calyx. the lower lip puberulent within at the base; fruiting calyx oblong. $12-16 \mathrm{~mm}$. long; seeds oblong, minute, slightly reticulated. In swamps and along streams, N. S. to Va., Tenn., Neb. and Tex. June-Sept.
2. Mimulus alàtus Soland. Sharp-winged Monkex-fiower. (I. F. f. $3=66$.) Similar to the preceding, stem sharply 4 -angled, the angles winged. Leaves ovate. ovate-lanceolate, or oblong, acute or acuminate, dentate-serrate, narrowed at the base, petioled, $5-13 \mathrm{~cm}$. long; petioles $6-25 \mathrm{~mm}$. long; peduncles stout; calyx-teeth
short, broad, abruptly mucronulate; seeds smooth. In swamps, Ont. to Conn., Ill., Ga., Kans. and Tex. June-Sept.
3. Mimulus guttatus DC. Yellow Monkey-flower. (I. F. f. 3267.) Perennial by stolons, glabrous or puberulent. Leaves ovate to obovate, dentate or denticulate, obtuse, $2-8 \mathrm{~cm}$. long, the lower short-petioled, the upper smaller, sessile or clasping; calyx oblique; corolla $2.5-5 \mathrm{~cm}$. long, the lower lip bearded at the base, often blotched with red or purple; fruiting calyx about 12 mm . long; seeds longitudinally striate. In wet meadows, Norfolk, Conn. and southern N. Y. Introduced from Cal. Summer.
4. Mimulus Jàmesii T. \& G. James' Mimulus. (I. F. f. 3268.) Perennial by stolons, glabrous or nearly so; stems slender, creeping, rooting at the nodes, r.5-5 dm. long. Leaves broadly ovate, orbicular or broader, very obtuse, denticulate or entire, membranous, truncate, subcordate, or rarely narrowed at the base, palmately veined, short-petioled or the upper sessile, $6-25 \mathrm{~mm}$. in diameter; peduncles slender, longer than the calyx in fruit; calyx oblique, scarcely toothed, $6-8 \mathrm{~mm}$. long at maturity ; corolla $8-12 \mathrm{~mm}$. long, the lower lip bearded at the base within, the throat broad; seeds nearly smooth. In brooks and swamps, Ont. to Neb., Mex., Mont. and Ariz. June-Sept.
5. Mimulus moschàtus Dougl. Musk-flower. Musk-plant. (I. F. f. 3269.) Perennial, viscid; stems creeping and ascending, $1.5-3 \mathrm{dm}$. long. Leaves ovate or oblong, short-petioled, denticulate, rounded or subcordate at the base, $2-5 \mathrm{~cm}$. long; peduncles slender, longer than the calyx; flowers 2.5 cm . long or less; calyx-teeth lanceolate, acuminate; corolla 2-3 times as long as the calyx. In wet places, N. S. and Ont. to N. Y. Adventive from the Pacific Coast. JuneSept.

## 12. CONOBEA Aubl.

Herbs, with opposite pinnately parted pinnatifid incised or serrate leaves, and small blue or white peduncled flowers, solitary or two together in the axils. Calyx 5 -parted, the segments narrow, equal. Corolla irregular, the tube cylindric, the limb 2 -lipped; upper lip emarginate or 2-lobed; lower lip 3-lobed. Stamens 4, didynamous, ascending, included; filaments filiform ; anther-sacs parallel. Style incurved at the summit; stigma 2-lamellate. Capsule septicidally dehiscent, the valves entire or 2 -cleft. Seeds numerous, oblong, striate. [Guiana name.] About 8 species, natives of America. Besides the following, another occurs in the southwestern U. S.
I. Conobea multífida (Michx.) Benth. Conobea. (I. F. f. 3270.) Annual, finely viscid-pubescent, I-2 dm. high, very leafy. Leaves petioled, I-2.5 cm. long, pinnately parted into 3-7 linear or linear-oblong obtuse segments; flowers greenish white, $4-5 \mathrm{~mm}$. long, about as long as their filiform peduncles; calyxsegments linear-subulate, slightly shorter than the corolla; capsule narrowly ovoid, glabrous, about equalling the calyx. Along streams and rivers, Ohio to Iowa, Kans., Ky. and Tex. Introduced along the Delaware below Phila. June-Sept.
13. MONNIERA P. Br.

Herbs, with opposite leaves, and small peduncled flowers, mostly solitary in the axils. Calyx 5 -parted, the upper segment the broadest. Corolla irregular or nearly regular, the tube cylindric or campanulate, the limb 2 -lipped or 5 -lobed; upper lip 2-lobed; lower lip 3-lobed. Stamens 4, didynamous, included. Style slender; stigma capitate, or 2 -lobed. Seeds numerous. [Named for Louis Guillaume le Monnier, 1713-1799, professor of botany in the Jardin du Rni. Paris.] About 60 species, of warm and tropical regions. In addition to the following, 2 others occur in the southern U. S.

Corolla almost regular, 5 -lobed; leaves spatulate.
Corolla manifestly 2 -lipped; leaves oblong to lanceolate or ovate.
Stem erect: leaves serrate, not clasping, black in drying.
Stem creeping or ascending; leaves ovate, punctate, entire or crenulate, clasping.
orolla almost regular; leaves obovate or orbicular.
I. Monniera Monnièra (L.) Britton. Monnier's Hedge-hyssop. (I. F. f. 3271.) Perennial, glabrous, fleshy; stem creeping, rooting at the nodes, $1.5-5 \mathrm{dm}$.
long. Leaves spatulate or cuneate-obcordate, sessile, rounded at the apex, entire, or sparingly denticulate, $6-20 \mathrm{~mm}$. long; peduncles mainly in alternate axils, 2 -bracteolate at the summit, in fruit longer than the leaves; flowers pale blue, about 1 cm . long; upper calyx-segment ovate, acute; corolla obscurely 2 -lipped; stamens nearly equal; capsule ovoid, acute, shorter than the calyx. On shores near the coast, Md. to Fla., Tex. and Mex. Widely distributed in tropical regions of both the Old World and the New. June-Oct.
2. Monniera acuminàta (Walt.) Kuntze. Purple Hedge-hyssop. (I. F. f. 3272.) Perennial, glabrous; stem 3-6 dm. high, very leafy. Leaves oblong or oblong-lanceolate, serrate, short-petioled or sessile, narrowed or cuneate at the base, $2-5 \mathrm{~cm}$. long, faintly veined; peduncles in alternate and opposite axils, in fruit longer than the leaves, not bracteolate at the summit; flowers $10-12 \mathrm{~mm}$. long, purple; upper calyx-segment lanceolate, acute; corolla 2-lipped, the lower lip longer than the upper; stamens approximate in pairs; capsule oblong, 4 -valved, 6-8 mm. high. In wet soil, Md. and D. C. to Fla. and Tex. Plant blackening in drying. June-Sept.
3. Monniera Caroliniàna (Walt.) Kuntze. Blue Hedge-hyssop. (I. F. f. 3273.) Perennial, pubescent, fleshy; stems creeping and ascending, rooting at the lower nodes, $\mathbf{I} .5-6 \mathrm{dm}$. long. Leaves ovate to oval, clasping by a subcordate base, obtuse, parallel-veined, punctate, entire; peduncles usually shorter than the calyx; upper calyx-segment ovate, cordate; flowers blue, 8 -10 mm. long, ephemeral; disk 10-12-toothed; stamens approximate in pairs. In wet pine barrens, N. J. to Fla. and La. March-July.
4. Monniera rotundifolia Michx. Round-leaved Hedge-hyssop. (I. F.f. 3274.) Perennial by stolons, succulent, creeping and spreading, villous-pubescent, 3-6 dm. long. Leaves obovate or orbicular, palmately veined, entire, or slightly undulate, narrowed to a sessile or clasping base, $\mathbf{I}-2.5 \mathrm{~cm}$. broad, glabrous; peduncles shorter than the leaves, longer than the flowers; flowers blue, $6-8 \mathrm{~mm}$. long; corolla scarcely 2 -lipped, longer than the calyx; stamens approximate in pairs; stigma 2-lobed ; disk obsolete ; capsule obtuse, 3 mm . high, at length 4 -valved, shorter than the calyx. On muddy shores. Ill. to S. Dak., Tenn. and Tex. Also in Cal. June-Sept.

## 14. GRATİOLA L.

Low herbs, with opposite leaves, and yellow or whitish peduncled flowers solitary in the axils. Peduncles 2 -bracteolate at the summit in the following species. Calyx 5 -parted, the segments narrow, slightly unequal. Corolla 2 -lipped; upper lip entire, emarginate, or 2 -cleft; lower lip 3 -lobed. Perfect stamenis 2, the anterior pair wanting, or rudimentary; filaments filiform; anther-sacs distinct. Style filiform; stigma dilated, slightly 2 -lobed. Capsule 4 -valved. Seeds numerous, striate. [Latin, grace or favor, from its reputed healing properties.] About 25 species, of wide distribution. Besides the following, some 7 others occur in southern and western N. Am.

Plants glabrous or glandular; anther-sacs transverse, separated.
Sterile filaments minute or none.
Glandular-puberulent ; flowers 8 -10 mm. long ; capsule ovoid.

Glabrous; flowers 14 mm . long ; capsule globose.

1. G. Virginiana.
2. G. sphaerocarpa.

Sterile filaments 2 , slender, capitate at the summit.
Leaves lanceolate, entire or remotely denticulate.
Leaves ovate or oblong, sharply serrate.
Plant hirsute; anther-sacs parallel, contiguous.
3. G. aurea.
4. G. viscosa.
5. G. pilosa.
x. Gratiola Virginiàna L. Clammy Helde-hyssor. (I. F. f. 3275.) Annual; stem glandular-puberulent, at least above, $0.7-3 \mathrm{dm}$. high. 1 caves oblong or oblong-lanceolate, sessile, narrowed to both ends, denticulate, $2-5 \mathrm{~cm}$. long. glabrous or nearly so; peduncles slender, glandular; flowers $\$-10 \mathrm{~mm}$. long: bractlets as long as the calyx, or longer; calyx about one-half as lony as the yellowish corolla-tube; limb of the corolla short, white; anther-sacs separated by a broad connective; capsule broadly ovoid, 4 mm . high, as long as the calyx. In wet places, Quebec to Br. Col., Mass., Fla., Tex. and Cal. May-Oct.
2. Gratiola sphaerocàrpa Ell. Round-fruited Hedge-hyssor. (I. F.f. 3276.) Annual, glabrous, 1.5-3 dm. high. Leaves oblong or obovate-oblong, sessile, dentate or denticulate, 3 - 5 -nerved, narrowed at the base, $2-5 \mathrm{~cm}$. long; peduncles little or not at all longer than the calyx; bractlets about equalling the calyx; calyx-lobes linear; calyx nearly one-half as long as the corolla; flowers about 1.5 cm . long; corolla-tube yellow, the limb paler; capsule 6 mm . in diameter. In wet places, N. J. to Fla., Ill., Tex. and Mex. June-Sept.
3. Gratiola aùrea Muhl. Goldenpert. Golden Hedge-hyssop. (I. F. f. 3277.) Annual, glandular-puberulent above, or glabrate, decumbent, creeping or ascending, $\mathbf{I}-3 \mathrm{dm}$. long. Leaves lanceolate, $\mathbf{1 - 2 . 5} \mathrm{cm}$. long, sparingly denticulate, scarcely narrowed to the sessile and somewhat clasping base: peduncles filiform, in fruit equalling or longer than the calyx; corolla bright yellow, 12-14 mm . long, 3 times as long as the calyx; capsule globose-ovoid. In sandy wet places, Quebec and Ont. to N. J. and Fla. June-Sept.
4. Gratiola viscòsa Schwein. Viscid Hedge-hyssop. (I. F. f. 3278.) Annual; stem weak, finely viscid-pubescent, slender, commonly simple, $1.5-5 \mathrm{dm}$. long. Leaves ovate, ovate-oblong, or ovate-lanceolate; sharply serrate, acute, sessile, cordate-clasping, $\mathbf{I}-2.5 \mathrm{~cm}$. long; peduncles slender; bractlets and calyx-segments foliaceous, one-third to one-half as long as the yellow or purplish corolla; flowers $10-12 \mathrm{~mm}$. long; capsule subglobose, shorter than the calyx. In brooks and swamps, Del. to Ky. and Ga. May-Sept.
5. Gratiola pilòsa Michx. Hairy Hedge-hyssop. (I. F. f. 3279.) Perennial ?), hirsute; stems slender, erect, strict, 1.5-6 dm. high. Leaves ovate or ovate-lanceolate, dentate or denticulate, sessile, rounded, truncate or subcordate at the base, $\mathbf{I}-2.5 \mathrm{~cm}$. long; flowers nearly or quite sessile, about 8 mm . long; corolla purplish or white, slightly longer than the calyx and bractlets; capsule oblongconic, acuminate, about the length of the calyx, or shorter. In dry soil, southern N. J. to Ark. and Tex. May-Aug.

## 15. ILYSÁNTHES Raf.

Annual or biennial glabrous slender herbs, with opposite, mostly dentate and sessile leaves, and small purplish peduncled flowers solitary in the axils. Calyx 5 -parted, the segments linear. Corolla irregular, the tube somewhat expanded above, the limb 2 -lipped; upper lip 2-cleft, erect; lower lip larger, 3-lobed, spreading. Fertile stamens 2, included, their anther-sacs divergent; sterile stamens 2, 2-lobed, one of the lobes capitate, glandular, the other glabrous, shorter. Style slender: stigma slightly 2 -lobed. Capsule septicidally dehiscent. Seeds numerous, wrinkled. [Greek, mud-flower.] About Io species, of wide distribution. Besides the following, 2 or 3 others occur in the southeastern U.S.
Peduncles longer than the leaves; calyx-segments shorter than the capsule.

$$
\text { 1. } I \text {. dubia. }
$$

Peduncles shorter than the leaves; calyx-segments mostly as long as the capsule, or longer. 2. I. attenuata.
I. Ilysanthes dùbia (L.) Barnhart. Long-stalked False Pimpernel. (I. F. f. 3280.) At length diffusely branched, o. 7-2 dm. long. Leaves ovate, ovate-oblong, or the lower obovate, sessile, or slightly clasping at the base, remotely denticulate or entire, thickish, 3-7-nerved, $1-2.5 \mathrm{~cm}$. long, the upper ones commonly much smaller; peduncles slender; flowers $6-10 \mathrm{~mm}$. long; calyx-segments linear, about one-half the length of the corolla; capsule narrowly ovoid-oblong, bluntish, 4-6 mm. high; seeds 2 mm . long, reddish, the ends usually truncate. In wet places, N. E. to Fla., Ont., S. Dak. and Tex. Also on the Pacific Coast. Lower leaves sometimes short-petioled. July-Sept. [I. gratioloides Benth.]
2. Ilysanthes attenuàta (Muhl.) Small. Short-Stalked False Pimpernel. (I. F. f. 3281.) Erect or ascending, 0.7-4 dm. long, the branches spreading. Leaves oblong to ovate, or sometimes obovate, $\mathbf{I}-4 \mathrm{~cm}$. long, thinnish, obtuse, serrate with a few low teeth, 3-5-nerved, narrowed into short petioles, or sessile; calyxsegments linear-subulate, as long as the capsule, or longer; corolla 4-12 mm. long; capsule narrowly ovoid, about 4 mm . long, pointed; seeds slightly curved, $3-4 \mathrm{~mm}$. long, yellowish brown, the ends usually rounded. In wet places, Me. and Ont. to Wis., Ark., Fla., Mo. and Kans. . May-Oc̣t.

## 16. MICRÁNTHEMUM Michx.

Creeping or ascending, small leafy annual glabrous herbs, with opposite obovate, oval or orbicular sessile entire leaves, and minute white or purplish short-peduncled flowers. solitary in the axils. Calyx $4-5$-lobed or $4-5$-parted. Corolla irregular, the tube short, the upper lip shorter than the lower, or wanting, the lower 3 -lobed, the middle lobe the largest. Stamens 2, anterior; filaments short, somewhat dilated or appendaged at the base; anthers small, their sacs distinct, parallel, or slightly divergent. Style short; stigma 2 -lobed. Capsule globose, 2 -celled by a membranous partition or becoming I-celled. Seeds numerous, minute. [Greek, small flower.] About 16 species, natives of America. Besides the following, another occurs in the southern U. S.
I. Micranthemum micranthemoìdes (Nutt.) Wettst. Nuttall's Micranthemum. (I. F. f. 3282.) Somewhat fleshy; stem filiform, creeping, the branches ascending, $\mathbf{I}-6 \mathrm{~cm}$. high. Leaves obovate to oval, obtuse, $2-5 \mathrm{~mm}$. long; flowers about I mm . long, on peduncles of about the same length; calyx campanulate in flower, obovoid in fruit, 4-lobed, usually split along one side; peduncles recurved in fruit; upper lip of the corolla nearly obsolete; middle lobe of the lower lip longer than the lateral ones; appendages at the bases of the stamens nearly as long as the filaments; stigma of 2 subulate lobes; capsule obovoid-globose, $\mathbf{1} \mathrm{mm}$. in diameter, as long as the calyx. In tidal mud, N. J. to Fla. Also in Cuba. Aug-Oct.

## 17. Limosélla l.

Low glabrous succulent floating or creeping, tufted annual herbs (or perennial by stolons?), with filiform stems rooting at their nodes, basal slender-petioled entire leaves, and filiform I-flowered scape-like peduncles, the flowers small, white, pink, or purple. Calyx campanulate; 5 -lobed. Corolla nearly regular, open-campanulate, the tube short, the limb 5-cleft. Stamens 4, inserted on the corolla-tube, scarcely exserted; filaments short; anther-sacs confluent. Style short; stigma capitate. Ovary 2 -celled at the base, $\mathbf{r}$-celled above. Capsule globose or oblong, becoming I-celled, many-seeded. [Greek, mud-seated.] About 6 species, of wide distribution.
Leaves expanded above into an oblong or linear-oblong blade. 1. L. aquatica.
Leaves filiform-linear, with little or no distinction between blade and petiole.
2. L. tenuifolia.
I. Limosella aquática L. Mudweed. MUDWORT. (I. F. f. 3283.) Leaves $2-13 \mathrm{~cm}$. long, the blade obtuse, one-fourth or one-third as long as the filiform petiole. Peduncles shorter than the leaves, arising from the base of the plant or from nodes of the stem; corolla pink or white, about 2 mm . broad, scarcely longer than the calyx; calyx-lobes ovate, acute or acutish, about the length of the tube; stamens inserted on the corolla-tube; filaments somewhat longer than the anthers; capsule obtuse, 3 mm . high, longer than the calyx. On muddy shores and in brooks, Lab. and Hudson Bay to the N. W. Terr., Colo. and Cal. Also in Europe, Australia and S. Am. June-Aug.
2. Limosella tenuifòlia Hoffm. Narrow-leaved Mudwort. (I. F. f. 3284.) Similar to the preceding but usually smaller, the leaves seldom over +cm . high, linear-filiform, with no distinction between blade and petiole, or sometimes slightly expanded toward the apex. In brackish mud, Lab. to N. J. Also in Europe, Australia and S. Am. Summer.

## 18. SÝNTHYRIS Benth.

Perennial herbs, with thick rootstocks, simple erect stems, large petioled hasal leaves, those of the stem much smaller, alternate, sessile, or clasping, hract like. Flowers small, pink or purple, in terminal dense spikes or racemes. Calyx 4-5parted. Corolla oblong or campanulate, 2-4-lobed, or parted, or wanting, the lateral lobes, when present, exterior in the bud. Stamens 2 (occasionally 4), posterior, inserted on the corolla, or on the outer side of the hypogynous disk. exserted; filaments slender. Ovary 2 -celled or rarely 3 -celled; style filiform; stirma capitate. Capsule compressed, obtuse, or emarginate, many-secded, loculicidally dehiscent. its valves adhering to the axis of the placentax; seeds that, oval. or orbicular. [Greck, loors closed, alluding to the capsule-valves] About 10 species,
of N. Am. and Europe. Our species have been erroneously referred to the Old World genus Wulfenia.
Corolla present, usually 2 -lobed.

1. S. Bullii.
2. S. rubra.

Corolla none.
I. Synthyris Bùllii (Eaton) Barnhart. Bull's Synthyris. (I. F.f. 3285.) Pubescent, 3-8 dm. high. Basal leaves ovate or orbicular, rounded at the apex, truncate, cordate or reniform at the base, crenulate, $5-13 \mathrm{~cm}$. long, $5-7$-nerved, petioled; stem leaves $\mathbf{I}-2.5 \mathrm{~cm}$. long, sessile or slightly clasping, crenulate, passing into the bracts of the dense spike; flowers greenish yellow, $4-6 \mathrm{~mm}$. long; corolla variously $2-4$-lobed (commonly 2 -lobed), somewhat longer than the calyx, its lobes obtuse: spike much elongated in fruit; capsule emarginate. On dry prairies, Ind. to Minn., Mich. and Iowa. May-July. [Wulfenia Houghtoniana (Benth.) Greene.]
2. Synthyris rùbra (Hook.) Benth. Western Synthyris. (I. F. f. 3286.) Similar to the preceding but seldom over 3 dm . high. Basal leaves ovate or oblong, $3-8 \mathrm{~cm}$. long, crenulate, petioled, indistinctly nerved; stem leaves ovate or lanceolate, acute, sessile, $0.6-2.5 \mathrm{~cm}$. long; spike $5-13 \mathrm{~cm}$. long in fruit, its bracts purplish; corolla none; capsule little compressed, emarginate. In dry soil, N. W. Terr. to S. Dak., Neb., Br. Col. and Utah. May-June. [Wulfenia rubra (Hcok.) Greene.]

## 19. VERÓNICA L.

Herbs (some exotic species shrubs or trees), with opposite and alternate, rarely verticillate leaves, and mostly small blue, purple, pink or white flowers, racemose, spicate, or solitary. Calyx mostly 4-parted, sometimes 5 -parted. Corolla rotate, its tube very short, deeply and more or less unequally 4 -lobed (rarely 5 -lobed), the lower lobe commonly the narrowest. Stamens 2, divergent; anthers obtuse, their sacs confluent at the summit. Ovary 2-celled; style slender; stigma capitate. Capsule compressed, sometimes very flat, emarginate, obcordate, or 2-lobed, loculicidally dehiscent. Seeds flat, plano-convex, or excavated on the inner side. [Named for St. Veronica.] About 200 species, of wide distribution. Besides the following, 4 others occur in northwest Am.

* Flowers racemose in the axils of the leaves, bracteolate.

Glabrous, or minutely glandular above (No. 3 rarely hairy); brook or swamp plants.
Leaves ovate, oval, oblong, or oblong-lanceolate; capsule compressed. Stem leaves sessile, partly clasping, serrulate or entire.

All the leaves petioled, serrate.
Leaves linear or linear-lanceolate; capsule very flat, Pubescent, dry soil plants; leaves crenate or dentate.

Leaves oval or obovate, petioled; pedicels shorter than the calyx.
4. V. officinalis.

Leaves ovate, nearly or quite sessile; pedicels longer than the calyx.
5. V. Chamaedrys.

*     * Flowers in terminal spikes or racemes, or solitary in the axils.

Flowers in terminal spikes.
Leaves all sessile; capsule elliptic, emarginate. 6. V. Wormskioldii.
Lower leaves petioled: capsule orbicular, obcordate.
7. V. serpyllifolia.

Flowers solitary in most of the axils; peduncles shorter than the leaves.
Erect; glabrous or glandular; capsule emarginate. 8. V. peregrina.
Diffuse; pubescent; capsule obcordate.
9. V. arvensis.

Flowers solitary in the axils; peduncles as long as the leaves, or longer.
Leaves ovate or oblong, crenate or dentate.
Corolla not longer than the calyx; capsule narrowly emarginate.
10. V. agrestis,

Corolla longer than'the calyx; capsule broadly emarginate.
11. V. Byzantina.
12. V. hederaefolia.

Leaves orbicular, or broader, 3-5-lobed or crenate
i. Veronica Anagállis-aquática L. Water Speedwell. Water Pimpernel. (I. F. f. 3287.) Perennial by stolons or leafy shoots; stem glabrous, or glandular-puberulent above, often rooting at the lower nodes, 3-9 dm. high. Leaves of sterile autumn shoots orbicular to obovate, obtuse, serrulate, narrowed into margined petioles, those of the flowering stems ovate, oblong, or lanceolate,
sessile and clasping or the lowest short-petioled, $3-10 \mathrm{~cm}$. long; racemes peduncled, $5-\mathrm{I} 3 \mathrm{~cm}$. long; flowers blue, or purplish striped, 4 mm . broad; capsule compressed, nearly orbicular, 2-lobed, emarginate, 3 mm . high; seeds flat. In brooks and swamps, N. S. to Br. Col., N. C., Tenn., Va., Neb. and N. Mex. Also in Europe and Asia. May-Sept.
2. Veronica Americàna Schwein. American Brooklime. (I. F. f. 3288.) Similar to the preceding, glabrous; stem decumbent, rooting at the lower nodes, 1.5-9 dm. long. Leaves oblong, ovate or oblong-lanceolate, all petioled, sharply serrate, truncate, rounded, or subcordate at the base, $2-8 \mathrm{~cm}$. long; racemes peduncled, loose, sometimes 1.5 cm . long; flowers blue or nearly white, usually striped with purple, 4 mm . broad; capsule nearly orbicular, compressed, emarginate, 3 mm . high; seeds flat. In brooks and swamps, Anticosti to Alaska, Penn., Neb., N. Mex. and Cal. April-Sept.
3. Veronica scutellàta L. Marsh or Skullcap Speedwell. (I. F. f. 3289.) Glabrous, or sparingly pubescent, rarely quite hairy, perennial by leafy shoots or stolons; stems slender, decumbent, or ascending, commonly rooting at the lower nodes, I.5-6 dm. high. Leaves linear or linear-lanceolate, sessile and slightly clasping, remotely denticulate, acute, $2-8 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide; racemes equalling or longer than the leaves; bractlets much shorter than the filiform spreading pedicels; flowers blue, $4-6 \mathrm{~mm}$. broad; capsule broader than high, deeply emarginate at the summit, slightly so at the base, $4-5 \mathrm{~mm}$. broad; seeds flat. In swamps, Lab. to Br. Col., N. Y., Minn. and Cal. Also in Europe and Asia. May-Sept.
4. Veronica officinàlis L. Common Speedwell. (I. F. f. 3290.) Perennial by stolons, pubescent; stem ascending, 0.7-2.5 dm. high. Leaves oblong, oval, or obovate, petioled, $\mathbf{I}-5 \mathrm{~cm}$. long, obtuse, serrate, narrowed into the petioles; racemes spike-like, narrow, much longer than the leaves; subulate bractlets and the calyx longer than the pedicels; flowers pale blue, 4-6 mm. broad; capsule obovate-cuneate, compressed, broadly emarginate, 4 mm . high; seeds flat. In dry fields and woods, N. S. to Ont., S. Dak., N. Car. and Tenn. Also in Europe and Asia. Appears, in most places, as if introduced. May-Aug.

Veronica longifolia L., an erect European species with lanceolate petioled acuminate sharply serrate leaves, has been found in a meadow near Appalachin, N. Y.
5. Veronica Chamaèdrys L. Germander Speedwell. (I. F. f. 329I.) Perennial; stem ascending, slender, pubescent in two lines, $\mathrm{I}-3 \mathrm{dm}$. high. Leaves ovate, sessile, or nearly so, pubescent, truncate, rounded or cordate at the base, incised-dentate, obtuse, $\mathrm{I}-3 \mathrm{~cm}$. long; racemes peduncled, pubescent, loose, $5-15 \mathrm{~cm}$. long; pedicels filiform; flowers light blue, $6-8 \mathrm{~mm}$. broad; capsule obcordate; seeds numerous, flattish. In fields and waste places, N. S. and Quebec to N. Y. and Penn. Nat. from Europe. May-July.

Veronica Téucrium L., also European, similar to V. Chamaedrys, but with oblong to lanceolate crenate leaves, has been found in Ohio.
6. Veronica Wormskiòldii R. \& S. Alpine Speenwell. (I. F. f. 3292 as $V$. alpina.) Perennial; stems slender, usually simple, $5-30 \mathrm{~cm}$. high. Leaves oblong, ovate, or elliptic, sessile, mostly rounded at both ends, crenulate or entire, $\mathbf{I}-2.5 \mathrm{~cm}$. long; flowers in a short narrow raceme, light blue, $4-6 \mathrm{~mm}$. broad; pedicels shorter than the calyx in fiower, $4^{-6} \mathrm{~mm}$. long in fruit; capsule ellipsoid or slightly obovoid, moderately compressed, emarginate, $f^{-6} \mathrm{~mm}$. high; seeds numerous, flattish. Lab., mountains of Quebec and N. Eng. to Alaskia, south in the mountains to Colo. and Nev. Apparently distinct from $I^{\prime}$. alpina 1 .. of Furope.
7. Veronica serpyllifolia L. Thyme-leaved Shemberi.. (1. F. f. 320.3.) Perennial, puberulent or glabrous; stems slender, decumbent, the branches ascending or erect, $5-25 \mathrm{~cm}$. high. Leaves opposite, petioled, or the uppermost sessile. oblong, oval, or ovate, $6-12 \mathrm{~mm}$. long, crenulate or entire; flowers in racemes; pedicels usually shorter than the bractlets; corolla pake whe with darker stripes, sometimes white, about 4 mm . broad; capsule broader than high, broadtr obcordate or emarginate, about 2 mm . long, about equalling the calyx: sceds that. In fields and thickets, Lab. to Alaska, (ia., N. Mex. and Cal. Also in Europe, Asia and S. Am. April-Aug.
8. Veronica peregrìna L. Purslane Speedwell. Neckweed. (I. F. f. 3294.) Annual, glabrous, or glandular-puberulent; stem 0.7-3 dm. high. Leaves oblong, oval, linear or slightly spatulate, 6-20 mm. long, the lowest opposite, short-petioled, or sessile, broader than the upper and usually denticulate, the upper alternate, sessile, mostly entire, each with a short pedicelled flower in its axil; flowers nearly white, about 2 mm . broad; pedicels much shorter than the calyx; capsule nearly orbicular, obcordate, usually a little shorter than the calyx, $2-3 \mathrm{~mm}$. high, the seeds flat. In moist places, and common as a weed in cultivated soil, N. S. to Br. Col., Fla., Mex. and Cal. Also in Cent. and S. Am., and as a weed in the Old World. May-Oct.
9. Veronica arvénsis L. Corn or Wall Speedwell. (I. F. f. 3295.) Annual, pubescent; stem slender, at length much branched and diffuse, $0.7-2.5 \mathrm{dm}$. long. Lower leaves ovate or oval, opposite, obtuse at both ends, crenate or crenulate, $4-12 \mathrm{~mm}$. long, the lowest petioled; upper leaves sessile, alternate, ovate or lanceolate, acute or acutish, commonly entire, each with a short-pedicelled flower in its axil; peduncles shorter than the calyx; corolla blue, or nearly white, 2 mm . broad or less; capsule broadly obovate, obcordate, 2 mm . high. In fields, woods and waste places and in cultivated soil, N. S. to Ont. and Wash., Fla., Kans. and Tex. Also in Bermuda. Nat. from Europe. March-Sept.
io. Veronica agréstis L. Field or Garden Speedwell. (I. F. f. 3296.) Annual, pubescent; stems creeping or procumbent, very slender, $0.7-2 \mathrm{dm}$. long, the branches ascending or spreading. Leaves broadly ovate or oval, obtuse at the apex, rounded, truncate or subcordate at the base, crenate, short-petioled, or the uppermost sessile, the lower opposite, the upper alternate and each with a slenderpeduncled small blue flower in its axil; capsule broader than high, compressed, narrowly emarginate, 4 mm . broad; seeds few, hollowed out on the inner side. In fields and waste places, N. S. to N. J. and La. Nat. from Europe. May-Sept.
II. Veronica Byzantina (Sibth. \& Smith) B.S.P. Buxbaum's Speedwell. (I. F. f. 3297.) Annual, pubescent; stems diffusely branched, 1.5-4 dm. long. Leaves ovate or oval, short-petioled, crenate-dentate or somewhat incised, $8-25 \mathrm{~mm}$. long, the lowest opposite, the upper alternate and each with a slenderpeduncled rather large blue flower in its axil; corolla $6-8 \mathrm{~mm}$. broad; capsule twice as broad as high, 6 mm . broad, with a wide and shallow emargination at the summit; seeds few or several, hollowed out on the inner side. In waste places, N. S. to N. Y. and Ohio. Adventive or nat. from Europe. May-Sept.
12. Veronica hederaefòlia L. Ivy-leaved Speedwell. (I. F. f. 3298.) Annual, pubescent; stems slender, diffusely branched, o.7-4.5 dm. long. Leaves orbicular or broader, truncate or subcordate at the base, $3-5$-lobed or 3-5-crenate, petioled, $0.6-2.5 \mathrm{~cm}$. in diameter, the lower opposite, the upper alternate and with slender peduncled small blue flowers in their axils; corolla 4 mm . broad, scarcely longer than the calyx; capsule little compressed, 2-lobed, broader than high, shorter than the densely ciliate sepals, $2-4$-seeded; seeds excavated on the inner side. In thickets, fields and waste places, N. Y., Penn. and N. J. to S. C. Nat. from Europe. April-Oct.

## 20. LEPTÁNDRA Nutt

Tall, erect perennial herbs, with verticillate or opposite leaves, and small minutely bracted white or blue flowers, in dense peduncled spike-like racemes, terminal, or in the upper axils. Calyx 4 -parted, short. Corolla tubular, or salverform, nearly regular, 4 -lobed, the tube cylindric, longer than the lobes. Stamens 2, exserted, inserted low down on the corolla-tube; filaments filiform; anthers obtuse. Style about as long as the stamens, stigma minute. Capsule narrowly ovoid, scarcely compressed, not emarginate nor obcordate, 4 -valved at the apex. Seeds numerous, oval, minutely reticulated. [Greek, slender stamens, referring to the filaments.] Two species, one native of eastern N. Am., the other of northeastern Asia.

1. Leptandra Virgínica (L.) Nutt. Culver’s-root. (I. F. f. 3299.) Stem glabrous, or nearly so, simple, strict, 6-2I dm. high. Leaves verticillate in 3 's9 's or some of the upper ones opposite, lanceolate or oblong-lanceolate, shortpetioled, long-acuminate, sharply serrulate, narrowed at the base, glabrous both sides, or pubescent beneath, $7-\mathbf{1 5} \mathrm{cm}$. long; racemes $7-23 \mathrm{~cm}$. long, very dense,
the terminal one first developing; pedicels and bractlets about as long as the calyx; calyx-segments ovate-lanceolate, acute; corolla tubular, white or bluish, 4 mm . long; capsule $2-3 \mathrm{~mm}$. long, $2-3$ times as long as the calyx. In meadows, moist woods and thickets, N. S. to Br. Col., Ala., Mo. and Kans. June-Sept.

## 21. DIGITALIS L.

Tall herbs, with alternate leaves, and large purple, yellowish or white flowers, in long terminal commonly 1 -sided racemes. Calyx 5 -parted, the segments imbricated. Corolla declined, somewhat irregular, the tube contracted above the ovary, then rather abruptly expanded, longer than the 4 - 5 -lobed slightly 2 -lipped limb; upper lip emarginate or 2 -cleft; lower lip 3 -lobed, the middle lobe largest, the lateral ones exterior in the bud. Stamens 4, didynamous, ascending, mostly included; anthers approximate in pairs. Style slender; stigma 2-lobed. Capsule ovoid, septicidally dehiscent. Seeds numerous, rugose. [Latin, digitale, the finger of a glove, which the flowers resemble.] About 20 species, of Europe and Asia.
I. Digitalis purpùrea L. Purple Foxglove. (I. F. f. 3300.) Usually biennial, pubescent; stem stout, erect, 6-15 dm. high. Basal and lower leaves ovate or ovate-lanceolate, $1.5-2.5 \mathrm{dm}$. long, slender petioled, acute, narrowed at the base, dentate; upper leaves similar, smaller, sessile; racemes 3 dm . long or more, dense, I-sided; flowers purple, $3-5 \mathrm{~cm}$. long, drooping; upper calyx-segment narrower than the four other foliaceous ones; corolla spotted within. Cape Breton Island, apparently nat. from Europe (according to Macoun) ; sparingly escaped from cultivation. Also in the Northwest. June-Aug.

## 22. BÙCHNERA L.

Erect, perennial or biennial, strict hispid or scabrous herbs, blackening in drying, the lower leaves opposite, the upper sometimes alternate. Flowers rather large, white, blue, or purple, in terminal bracted spikes, the lower commonly distant. Calyx tubular, or oblong, 5-10-nerved, 5-toothed. Corolla salverform, its tube cylindric, somewhat curved, its limb nearly equally 5 -cleft, spreading, the lateral lobes exterior in the bud. Stamens 4, didynamous; anther-sacs confluent into I. Style slender, thickened or club-shaped above; stigma small, entire or emarginate. Capsule loculicidally dehiscent. Seeds numerous, reticulated. [Named for J. G. Buchner.] About 30 species, of warm and temperate regions. Besides the following, another occurs in the southern U. S.
I. Buchnera Americàna L. Blue-hearts. (I. F. f. 3301.) Hispid and rough; stem slender, 3-8 dm. high. Leaves usually all opposite, prominently veined, the lowest obovate or oblong, obtuse, narrowed into very short petioles, the middle ones oblong or oblong-lanceolate, dentate, sessile, the upper lanceolate or linear-lanceolate, entire or nearly so ; spike peduncled, 1.5-2.5 dm. long in fruit, the flowers mostly opposite, nearly 2.5 cm . long; bractlets shorter than the calyx ; calyx strigose; corolla purple, its lobes obovate, obtuse; capsule ovoid, siightly oblique, 8 mm . high, a little longer than the calyx. In sandy or gravelly soil, N. J. to western N. Y., Minn., Va., La., Kans. and Ark. June-Sept.

## 23. AFZÈLIA J, G. Gmel.

Erect branched herbs, mostly with opposite leaves, at least the lower 1 -2-pinnately parted or dissected, and yellow fowers solitary in the axils, or in terminal bracted spikes or racemes. Calyx campanulate, 5 -cleft or 5 -parted. Corolla slightly irregular, campanulate or rotate, the tube short, the limh 5 -hoded, the lower lobe exterior in the bud. Stamens 4, slightly unequal; filaments shom, villous, at least near the base; anthers 2-celled, the sacs parallel, distinct. Capsule acute and more or less compressed at the summit. Seeds mumerous, reticulated. [Named for Adam Afzelius, 1750-1812, botanical professor at Lpata.] Thout 10 specties. of N. Am., Mex. and Madagascar. Besides the following. + others inhathit the southern U. S.

1. Afzelia macrophýlla (Nutt.) Kuntze. Munifn Foxglote. (I. F. f. 3.302.) Annual (?), puberulent or glabrate; stem sparingly hanched, or simple, $12-15$ dm. high. Lower leaves long-petioled, pinnately parted, $1.5+$ dm. long, their sers-
ments lanceolate, coarsely dentate, irregularly incised, or pinnatifid; upper leaves short-petioled or sessile, oblong or lanceolate, $2-8 \mathrm{~cm}$. long, entire, each with a sessile flower in its axil; flowers $\mathbf{I - 1 . 5} \mathrm{cm}$. long; calyx-lobes lanceolate or ovate, acute, about as long as the tube; corolla light yellow, $2-3$ times as long as the calyx, woolly in the throat; style short, club-shaped; capsule globose-ovoid, 6-8 mm . high, twice as long as the calyx. In moist thickets and along streams, Ohio to Iowa, Neb., Ky. and Tex. Aug-Oct.

## 24. DASÝSTOMA Raf.

Large herbs, partly parasitic on the roots of other plants, with opposite (rarely whorled) or some alternate leaves, and showy yellow flowers, in terminal mostly leafy-bracted racemes or panicles. Calyx campanulate or turbinate, 5 -lobed, the lobes longer than or equalling the tube. Corolla slightly irregular, funnelform, or campanulate-funnelform, the tube villous or pubescent within, the limb spreading, 5-lobed. Stamens 4, didynamous, included, villous or pubescent; filaments slender; anthers all alike, their sacs distinct, parallel, awned at the base. Style filiform. Capsule oblong, acute, loculicidally dehiscent, many-seeded, longer than the calyx. [Greek, thick or hairy mouth, referring to the corolla.] About 8 species, of eastern N. Am.
Plants glandular-pubescent; corolla pubescent without; leaves finely divided; annuals or biennials.
Glandular-pubescent above; leaves pinnatifid. $\quad$. D. Pedicularia.
Glandular-pubescent throughout ; leaves 2-pinnatifid.
Puberulent, cinereous or glabrous; corolla glabrous without; perennials. Cinereous-puberulent.

Leaves entire, dentate, or some of the lower pinnatifid.
Leaves entire, undulate, or the lower pinnatifid, with entire lobes.
3. D. fluva.

Upper leaves, or most of them, serrate, the lower pinnatifid with toothed lobes.
4. D. serrata.

Leaves all pinnatifid, thin. Glabrous or very nearly so throughout. Leaves entire, or the lowest dentate or incised.
5. D. grandiflora.

Leaves, at least all but the uppermost, pinnatifid.
6. D. laevigata.
7. D. Virginica.
I. Dasystoma Pediculària (L.) Benth. Fern-leaved False Foxglove. (I. F. f. 3303.) Viscid above; stem much branched, leafy, 3-12 dm. high. Leaves sessile, or the lower petioled, pinnatifid, ovate or ovate-lanceolate, usually broadest at the base, $2-8 \mathrm{~cm}$. long, the segments incised-dentate; pedicels slender, ascending, $2-5 \mathrm{~cm}$. long in fruit; calyx-lobes oblong, foliaceous, usually incised or pinnatifid, 6-8 mm. long; corolla $2.5-3.7 \mathrm{~cm}$. long, the limb about 2.5 cm . broad; capsule pubescent, $10-12 \mathrm{~mm}$. long, its beak flat. In dry woods and thickets, Me. and Ont. to Minn., Fla. and Mo. Aug.-Sept.
2. Dasystoma pectinàta (Nutt.) Benth. Cut-leaved False Foxglove. Similar to the preceding, but densely glandular-pubescent nearly to the base, and the leaves 2 -pinnatifid; calyx densely glandular-pubescent, its lobes pinnatifid. In dry soil, Ga. to Ky., Mo., Fla. and Tenn. May-Sept.
3. Dasystoma flàva (L.) Wood. Downy False Foxglove. (I. F. f. 3304.) Downy, grayish; stem strict, simple, or with a few nearly erect branches, $6-12 \mathrm{dm}$. high. Leaves oblong, lanceolate or ovate-lanceolate, firm, entire, or the lower sinuate-dentate or sometimes pinnatifid, $7-15 \mathrm{~cm}$. long, short-petioled, the lobes obtuse; the upper sessile, passing into the bracts of the raceme; pedicels stout, usually shorter than the calyx even in fruit; calyx-lobes lanceolate, entire, about as long as the tube; corolla $3-5 \mathrm{~cm}$. long, its tube much expanded above; capsule ${ }^{16}-20 \mathrm{~mm}$. long, pubescent, twice as long as the calyx. In dry woods and thickets, Mass. to Ont., Wis., Ga. and Miss. July-Aug.
4. Dasystoma serràta (Torr.) Small. Serrate False Foxglove. Puberulent, similar to the preceding and the following species. Lower leaves pinnatifid, their lobes serrate or incised; upper leaves small, serrate or entire. Calyx-teeth as long as the tube, or longer. Mo. to Ark. and La. July-Sept.
5. Dasystoma grandiflòra (Benth.) Wood. Western False Foxglove. (I. F. f. 3305.) Cinereous-puberulent and roughish; stem much branched, leafy to the top, 6-9 dm. high. Leaves short-petioled, thin, ovate or ovate-lanceolate in
outline, all pinnatifid or deeply incised, $5-10 \mathrm{~cm}$. long; upper leaves smaller, sessile; pedicels, even in fruit, shorter than the calyx; calyx-lobes oblong or ovate, about as long as the tube; corolla $3-5 \mathrm{~cm}$. long, its tube much expanded above. In dry woods and thickets, Minn. and Wis. to Tenn., Kans. and Tex. July-Aug.
6. Dasystoma laevigàta Raf. Entire-leaved False Foxglove. (I. F. f. 3306.) Glabrous or nearly so, not glaucous; stem simple, or sparingly branched, $3-9 \mathrm{dm}$. high. Leaves usually all petioled, lanceolate or ovate-lanceolate, $3-10 \mathrm{~cm}$. long, entire, or the lowest dentate or incised; pedicels shorter than the calyx, or in fruit longer; calyx-lobes ovate-lanceolate, equalling or shorter than the tube; corolla $2.5-4 \mathrm{~cm}$. long, the limb fully as broad, the tube much expanded above; capsule glabrous, twice as long as the calyx. In dry thickets, Penn. to Mich., south to Ga. July-Aug.
7. Dasystoma Virgínica (L.) Britton. Smooth False Foxglove. (I. F. f. 3307.) Glabrous and glaucous; stem usually branched, 9-18 dm. high. Leaves usually all petioled, ovate or ovate-lanceolate in outline, the lower 1-2-pinnatifid, 10-15 cm. long, the upper pinnatifid or deeply incised, the lobes lanceolate or oblong, acute; fruiting pedicels mostly longer than the calyx; calyx-lobes ovate or ovate-lanceolate, acute, entire, about equalling the tube; corolla $3 \cdot 5-5 \mathrm{~cm}$. long, its tube not widely expanded above; capsule glabrous, twice as long as the calyx. In dry or moist woods, Me. to Minn., Fla. and Ill. July-Sept.

## 25. GERARDIA Li.

Erect herbs, some South American species shrubby, mainly with opposite and sessile leaves. Flowers showy, usually large. Calyx campanulate, 5 -toothed, or 5 -lobed. Corolla somewhat irregular, campanulate, or funnelform, the tube broad, the limb 5 -lobed, slightly 2 -lipped, the lower lobes exterior in the bud. Stamens 4 , didynamous, included; filaments pubescent; anthers 2-celled, their sacs obtuse or mucronate at the base; style filiform. Capsule loculicidally dehiscent, manyseeded. Seeds mostly angled. [Named for John Gerarde, surgeon and botanist, author of the Herbal (1597), died 1612.] About 40 species, natives of America. Besides the following, some ro others occur in the southern U. S.

> * Flowers pedicelled; anthers all alike.

Pedicels in flower shorter than the calyx, or but 1-2 times as long.
Corolla $2-2.6 \mathrm{~cm}$. long.
Calyx-teeth minute; root perennial. I. G. linifolza.
Calyx-teeth triangular, lanceolate or oblong, acute; annuals.

Leaves very scabrous, filiform; capsule oblong.
Leaves slightly scabrous, linear; capsule globose.
Corolla $\mathrm{x}-\mathrm{I} .6 \mathrm{~cm}$. long.
Calyx-teeth triangular-subulate, acute.
Calyx-teeth broad, short, obtuse.
Pedicels in flower $2-6$ times as long as the calyx.
Leaves linear, spreading or ascending; capsule globose.
Leaves $0.5-2.5 \mathrm{~mm}$. wide, $\mathrm{I}-4 \mathrm{~cm}$. long.
Lobes of the corolla entire, or barely emarginate.
Corolla $12-20 \mathrm{~mm}$. long, pink to purple.
Leaves linear, 2.5 mm . wide or less.
Leaves filiform-linear, less than 1 mm . wide. Corolla less than io mm. long, yellowish-pink.
Lobes of the corolla all obcordate.
Leaves $2-4 \mathrm{~mm}$. wide, $4-9 \mathrm{~cm}$. long; pedicels ascending.
Leaves subulate-spatulate, short, nearly erect; capsule oblong.
2. G. aspera.
3. G. purpurea.
4. G. paupercula.
5. G. maritima.

* Flowers sessile; anthers of the shorter stamens smaller.

Leaves lanceolate or ovate-lanceolate, entire or nearly so.
Leaves pinnately divided into 3-7 linear-segments.
I. Gerardia linifòlia Nutt. Flax-leaten (ierardi. (I. F. f. 3jos.) Glabrous, 6-9 dm. high. Leaves narrowly linear, $2-5 \mathrm{~cm}$. long. $2-3 \mathrm{~mm}$. wide. erect, the upper much smaller and subulate; pedicels crect. in flower equalling or a little longer than the calyx, longer in fruit; caly $x$ campanulac, truncate; corolla purple, about 2.5 cm . long, narrower than that of the two following species, villous within, the lobes ciliate; filaments and anthers densely vilhous; anther-sacs mucronate at the base; capsule globose, 4-6 mm . in diameter. hut little longer than the calyx. In moist pine barrens, Del. to Fla. and Cuba. Aug.-Sept.
2. Gerardia áspera Dougl. Rough Purple Gerardia. (I. F. f. 3309.) Annual, 3-6 dm. high, hispidulous scabrous with stiff short whitish hairs, the branches nearly erect. Leaves $2.5-4 \mathrm{~cm}$. long, less than 2 mm . wide, erect or ascending; pedicels equalling or becoming longer than the turbinate calyx; calyxteeth triangular-ovate or triangular-lanceolate, acute, one-fourth to one-third as long as the tube; corolla deep purple, about 2.5 cm . long, nearly or quite glabrous within, very pubescent without, the lobes ciliate; filaments villous; anthers obtuse at the base; capsule oblong, 6-8 mm. high, considerably longer than the calyx. On dry plains and prairies, Ind. to S. Dak., Kans., Mo. and Ark. Aug.-Oct.
3. Gerardia purpùrea L. Large Purple Gerardia. (I. F. f. 33Io.) Glabrous, $3-8 \mathrm{dm}$. high. Leaves narrowly linear, usually widely spreading, $2.5-4 \mathrm{~cm}$. long, about 2 mm . wide, sometimes with smaller ones fascicled in their axils; flowers racemose on the branches, purple (rarely white), about 2.5 cm . long and broad; pedicels shorter than or but little longer than the campanulate calyx; calyx-teeth triangular-lanceolate to ovate-oblong, acute. one-third to one-half the length of the tube; corolla much expanded above, the lobes ciliolate; anther-sacs mucronulate at the base; filaments villous; capsule $4-6 \mathrm{~mm}$. in diameter. In moist fields and meadows, Me. and southern Ont. to Fla., mostly near the coast. Aug.-Oct.
4. Gerardia paupércula (A. Gray) Britton. Small-flowered Gerardia. (I. F. f. 33II.) Annual, smooth or nearly so, $1.5-4.5 \mathrm{dm}$. high, the branches nearly erect. Leaves narrowly linear, $1-2.5 \mathrm{~cm}$. long, $\mathbf{I}-2 \mathrm{n} \cdot \mathrm{m}$. wide; pedicels equalling the calyx, or longer in fruit; calyx campanulate, its teeth about one-half the length of the tube, acute, or acuminate; corolla $1.2-2 \mathrm{~cm}$. long, rose purple, its limb about as broad, somewhat villous in the throat, the lobes ciliate; stamens villous; anther-sacs mucronulate at the base; capsule 6 mm . high. In bogs and low meadows, Quebec to N. J., Manitoba and Wis. July-Sept.
5. Gerardia marítima Raf. Sea-side or Salt-marsh Gerardia. (I. F. f. 3312.) Annual, fleshy, I-4 dm. high, the branches ascending. Leaves linear, $\mathbf{I}-2.5 \mathrm{~cm}$. long, 2 mm . wide or less, obtuse, spreading, the uppermost very small and subulate; pedicels in flower shorter than or equalling the caly $\mathbf{x}$, about twice as long in fruit; calyx-teeth obtuse; corolla rose-purple, $\mathbf{I}-2 \mathrm{~cm}$. long, glabrous, the limb about as broad; anther-sacs mucronulate at the base, capsule 4-6 mm. high. In salt marshes, Me. to Fla. and La. July-Aug.
6. Gerardia tenuifòlia Vahl. Slender Gerardia. (I. F. f. 33I3.) Annual, glabrous; stem slender, paniculately branched, 1.5-6 dm. high, the branches spreading or ascending. Leaves linear, acute, $\mathbf{I}-4 \mathrm{~cm}$. long; pedicels mostly equalling or longer than the flowers; calyx campanulate, its teeth short, pointed; corolla light purple, spotted, rarely white, $\mathbf{I} \cdot \mathbf{2 - 2} \mathrm{cm}$. long, vertically compressed when fully expanded, minutely puberulent, or glabrous; anther-sacs mucronate at the base; capsule $4-5 \mathrm{~mm}$. in diameter. In dry woods and thickets, Quebec to Ga., Ont., Kans. and La. Aug.-Oct.

Gerardia tenuifolia aspérula A. Gray. Leaves scabrous on the upper surface, linearfiliform; corolla not compressed. On dry hills and banks, Ont. to Ind. and Mo.
7. Gerardia Holmiàna Greene. Holm's Gerardia. Slender, smooth or nearly so, paniculately branched, 3-5 dm. high. Leaves filiform-linear, spreading, about 2.5 cm . long, acute, minutely roughened; pedicels filiform, about as long as the leaves, ascending; calyx campanulate, its teeth very short. acute; corolla rosepurple, 1.5 cm . long, its lobes spreading, truncate or retuse, ciliate, its throat very villous within. In dry sandy woods, Long Island to D. C. Sept.-Oct.
8. Gerardia víridis Small. Small-flowered Gerardia. Annual, drying green. Stems 2-6 dm. tall, sharply angled; leaves mostly opposite, narrowly linear, $\mathrm{I}-2 \mathrm{~cm}$. long, acute, revolute, sessile or nearly so; pedicels ascending, 8-15 mm . long; calyx becoming $4-5 \mathrm{~mm}$. high, the tube turbinate or campanulate-turbinate, the segments acute, about one-third as long as the tube; corolla yellowishpink, less than 1 cm . long, the lobes ciliate, truncate, or barely emarginate. In sandy soil, Mo., Ark. and La. Summer and fall.
9. Gerardia decemlòba Greene. Ten-lobed Gerardia. Slender, about 3 dm . high, with a few branches above the middle. Leaves setaceous, about $\mathbf{~} \mathrm{cm}$. long, acute, roughish, the lower ascending, the upper spreading; pedicels about I8 mm. long, ascending, rather stiff; calyx-tube veiny, the teeth short; corolla
bright pink, about I cm. long, its lobes all spreading, obcordate. In grassy places, Brookland, D. C. Oct.
10. Gerardia Besseyàna Britton. Bessey's Gerardia. (I. F. f. 3314.) Annual, strict, 3-6 dm. high, the branches ascending or nearly erect. Leaves linear, $2-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, scabrous, acute, ascending; pedicels ascending, longer than the flowers; calyx campanulate, its teeth triangular-subulate, onethird to one-half the length of the tube; corolla purple, $10-12 \mathrm{~mm}$. long; capsule globose, 4-6 mm. in diameter. On dry hills and prairies, Iowa to S. Dak., Colo., La. and Kans. July-Sept.
if. Gerardia Skinneriàna Wood. Skinner's Gerardia. (I. F. f. 3315.) Annual, roughish; stem strict, striate, 1.5-4.5 dm. high, slender. Leaves ascending or commonly erect and appressed, $\mathbf{I}-\mathbf{2 . 5} \mathrm{cm}$. long, $\mathbf{I} \mathrm{mm}$. wide or less, the uppermost minute; pedicels longer than the calyx, scarcely longer than the flowers, 2-4 times the length of the capsule; calyx-teeth minute; corolla light purple, ro12 mm . long and about as broad, its lobes ciliolate; capsule oblong, 4-6 mm. high. In dry sandy woods and thickets, Mass. to Fla., Minn., Kans. and La. Aug.-Oct.
12. Gerardia auriculàta Michx. Auricled Gerardia. (I. F. f. 3316 .) Annual, scabrous, hirsute, 3-6 dm. high. Leaves acuminate, sessile, mostly rounded and 2 -lobed at the base, or entire, $2-5 \mathrm{~cm}$. long, the basal lobes obtusish, short; flowers solitary in the upper axils, sessile, purple, $\mathbf{I} \cdot 5-2 \mathrm{~cm}$. long; calyx 5 -cleft, its lobes lanceolate, acute, slightly unequal, as long as or longer than the tube; corolla densely puberulent outside, glabrous within; filaments glabrous; anthers of the shorter stamens smaller than those of the longer; anther-sacs obtuse at the base; capsule oval-oblong, about 1.2 cm . high, a little shorter than the calyx. In moist open soil, Penn. to Minn., N. Car. and Kans. Adventive at Woodbridge, N. J. July-Sept.
13. Gerardia densifiòra Benth. Cut-Leaved Gerardia. (I. F. f. 3317.) Annual, scabrous and short-hispid, stiff, 3-8 dm. high, very leafy. Leaves sessile, ovate in outline, ascending, about 2.5 cm . long, pinnately parted into $3-7$ acute rigid segments less than 2 mm . wide; flowers $2.5-3 \mathrm{~cm}$. long, rose-purple, sessile in the upper axils; calyx 5 -cleft, its lobes linear, acuminate, ciliate, about as long as the tube; corolla glabrous both outside and within; anthers of the shorter stamens smaller than those of the longer; capsule about 6 mm . high, shorter than the calyx. On dry prairies, Kans. to Tex. Aug.-Oct.

## 26. CASTILLĖJA Mutis.

Herbs, parasitic on the roots of other plants, with alternate leaves; flowers in dense leafy-bracted spikes, the bracts often brightly colored and larger than the flowers. Calyx tubular, laterally compressed, cleft at the summit on the upper side, or also on the lower. Corolla very irregular, its tube not longer than the calyx, its limb 2-lipped; upper lip (galea) arched, elongated, laterally compressed, entire, enclosing the 4 didynamous stamens; lower lip short, 3 -lobed. Anther-sacs unequal, the outer one attached to the filament by its middle, the inner one pendulous from its apex. Style filiform. Capsule loculicidally dehiscent, many-seeded. Seeds reticulated. [Named for Castillejo, a Spanish botanist.] About 50 species, mostly of the New World. In addition to the following, about 40 others occur in western N. Am.

## * Plants villous-pubescent.

Bracts broad, dilated, lobed, or entire.

Stem leaves deeply and irregularly cleft into narrow segments. Leaves linear-lanceolate, entire, or rarely with a few lobes.
Bracts linear or linear-lanceolate, entire.

1. C. coccinea.
2. $C$. indivisa.
3. C. minor.
** Plants glabrous, woolly at the summit, or cinereous-puberulent.
Glabrous, or tomentose at the summit; leaves lanceolate, mostly entire.
Cinereous-puberulent, pale; stem leaves cleft.
4. C. acuminata.
5. C. sessiliflora.
I. Castilleja coccínea (L.) Spreng. Scarlet Painted-cur. (I. F. f. $3: 3$ IS.) Annual or biennial; stem simple, or with few erect branches, 3-6 dm. high. Leaves sessile, parallel-veined, the basal oblong, obovate, or linear, tufted, mostly entire, $2-8 \mathrm{~cm}$. long, those of the stem 3 - 5 -cleft into obtusish segments, the hracts broader and shorter, 3-5-lobed or cleft, bright red or scarlet, conspicuous; flowers sessile,
$2-2.5 \mathrm{~cm}$. long, usually not exceeding the bracts; calyx cleft above and below into 2 entire or retuse oblong obtuse lobes, sometimes scarlet; corolla greenish yellow, its tube shorter than the calyx, its upper lip much longer than the lower; capsule oblong, acute, IO-12 mm. long. In meadows and thickets, Me. and Ont. to Manitoba, N. Car., Kans. and Tex. Bracts and calyx rarely yellow. May-July.
6. Castilleja indivisa Engelm. Entire-Leaved Painted-cup. (I. F. f. 3319.) Winter-annual; stem 2-4.5 dm. high. Leaves sessile, parallel-veined, linear to linear-lanceolate, $2.5-10 \mathrm{~cm}$. long, entire, or rarely with $2-4$ lateral lobes; no tuft of basal leaves; bracts obovate to spatulate, bright red; flowers sessile, 2.5 cm . long or less, not longer than the bracts; calyx cleft as in the preceding species, and corolla similar. In sandy soil, Kans. to Tex. Spring.
7. Castilleja mìnor A. Gray. Small-flowered Painted-cup. (I. F. f. 3320.) Annual, strict, simple, or with 1 or 2 erect branches, $3-8 \mathrm{dm}$. high. Leaves all linear-lanceolate and entire, parallel-veined, sessile, acuminate, $5-8 \mathrm{~cm}$. long, the bracts similar, smaller, red or red-tipped; narrow, equalling or longer than the short-pedicelled flowers; calyx green, cleft on both sides to about the middle, the lobes lanceolate, acute, entire, or 2 -toothed; corolla yellow, $\mathbf{1}-2 \mathrm{~cm}$. long, its upper lip much longer than the small lower one; capsule oblong, acute, $12-16 \mathrm{~mm}$. long. In moist soil, Neb. (according to Gray) to N. Mex., Nev. and Ariz. May-July.

4 Castilleja acuminàta (Pursh) Spreng. Lance-Leaved Painted-cup. (I. F. f. 332I.) Perennial; stems slender, 1.5-6 dm. high. Leaves sessile, 3-5-nerved, mostly entire, the lower linear, the upper lanceolate, acuminate or acute, $5-10 \mathrm{~cm}$. long; bracts oblong, oval or obovate, obtuse, yellowish, greenish-white or purple, as long as the sessile flowers; calyx cleft on both sides to about the middle, the lobes lanceolate, usually again 2-cleft; corolla $12-16 \mathrm{~mm}$. long, its upper lip 2-4 times as long as the lower; capsule oblong. In moist soil, Lab. to Alaska, the mountains of N. Eng., Ont., Minn., Colo. and Br. Col. June-Aug.
5. Castilleja sessilifiòra Pursh. Downy Painted-cup. (I. F. f. 3322. ) Perennial, cinereous-puberulent; stems stout, 1.5-4 dm. high, densely leafy. Leaves sessile, $2-5 \mathrm{~cm}$. long, the lowest commonly linear, obtuse and entire, the others laciniate into narrow segments; bracts green, similar to the upper leaves, shorter than the sessile flowers; calyx deeper cleft on the lower side than on the upper, its lobes linear-lanceolate, acute; corolla yellowish, 4 cm . long, the upper lip about twice as long as the lower, the lobes of the latter linear; capsule oblong-lanceolate. On prairies, Manitoba to the N. W. Terr., Ill., Neb., Wyo. and Tex. May-July.
27. ORTHOCARPUS Nutt.

Herbs, mostly with alternate leaves, and yellow white or purplish flowers, in bracted spikes. Calyx tubular or tubular-campanulate, 4 -cleft, or sometimes split down both sides. Corolla irregular, the tube slender, the limb 2-lipped; upper lip little if any longer than the 3 -lobed $\mathrm{I}-3$-saccate lower one. Stamens 4, didynamous, ascending under the upper lip; anther-sacs dissimilar, the outer one affixed by its middle, the inner pendulous from its upper end, commonly smaller. Style filiform; stigma entire. Capsule oblong, loculicidally dehiscent. many-seeded. Seeds reticulated. [Greek, erect-fruit.] About 30 species, natives of America, mostly of the western U. S.
I. Orthocarpus lùteus Nutt. Yellow Orthocarpus. (I. F. f. 3323.) Annual, rough-pubescent or puberulent; stem strict, 1.5-4.5 dm. high, densely leafy. Leaves erect or ascending, linear or lanceolate, entire, or sometimes 3-cleft, 2-4 cm . long; sessile, long-acuminate; bracts of the dense spike broader and shorter than the leaves, acute, green, mostly longer than the flowers; flowers bright yellow, 8 -1o mm. long; calyx-teeth acute, shorter than the tube; corolla about twice as long as the calyx, puberulent without, its upper lip ovate, obtuse, about as long as the saccate 3 -toothed lower one; capsule about as long as the calyx-tube. On dry plains, Manitoba to Minn., Neb., Br. Col. and Cal. July-Sept.

## 28. SCHWALBEA L.

A perennial erect finely pubescent and minutely glandular leafy herb, with sessile entire 3-nerved leaves, and rather large yellowish-purple flowers in a bracted spike. Calyx tubular, somewhat oblique, 10-12-ribbed, 2 -bracteolate at the base, 5 -toothed, the upper tonth much the smallest, the 2 lower ones partly connate;
corolla very irregular, the tube cylindric, the limb 2 -lipped; upper lip arched, concave, entire; lower lip somewhat shorter, 3-lobed, 2-plaited. Stamens 4, didynamous, ascending within the upper lip; anther-sacs equal. Style filiform. Capsule oblong, many-seeded. Seeds linear, with a loose reticulated testa. [Named for C. G. Schwalbe, of Holland, who wrote (1719) on Farther India.] A monotypic genus.
I. Schwalbea Americàna L. Chaff-Seed. (I. F. f. 3324.) Stem strict, 3-6 dm. high. Leaves oblong, or ovate-oblong, entire, acute at both ends, $2.5-4 \mathrm{~cm}$. long, the upper gradually passing into the bracts of the rather loose spike; flowers nearly sessile, $2.5-4 \mathrm{~cm}$. long, longer than the bracts; bractlets at the base of the calyx linear; corolla-tube slightly exceeding the lower lobes of the calyx, these connate to near their apices; capsule enclosed by the calyx. In wet sandy soil, eastern Mass. to Fla. and La., near the coast. May-July.

## 29. EUPHRASIA L.

Low herbs, parasitic on other plants, with opposite dentate or incised leaves, and small flowers in terminal leafy-bracted spikes. Calyx not bracteolate, 4 -cleft (rarely 5 -cleft, with one of the lobes much smaller than the others). Corolla very irregular, 2-lipped, the upper lip erect, 2-lobed, its margins recurved; lower lip larger, 3 -lobed, spreading, its lobes emarginate or obtuse. Stamens 4, didynamous. ascending under the upper lip; anther-sacs equal, parallel, mucronate at the base. Capsule oblong, loculicidally dehiscent, many-seeded. Seeds oblong, longitudinally ribbed. [Greek, delight.] About 110 species, of temperate and cold regions. Besides the following, another occurs in northwestern N. Am.
Bracts, and usually the leaves, glandular, at least beneath.

Spike short ; teeth of the bracts merely acute.
Spike elongated, dense ; lower teeth of the bracts aristate.

1. E. latifolia.
2. E. Canadensis. Neither bracts nor leaves glandular, but usually pubescent.

Spikes elongated; bracts sharply toothed; plant $10-25 \mathrm{~cm}$. high.
Spike short, capitate; bracts bluntly toothed; plant $2-5 \mathrm{~cm}$. high.
3. E. Americana.
4. E. Oakesii.

1. Euphrasia latifòlia Pursh. Glandular Eyebright. (I. F. f. 3325.) Stem erect, simple, or with a few erect branches, pubescent with crisped hairs, $5-18 \mathrm{~cm}$. high. Leaves ovate to obovate, obtuse, $2-5$-toothed on each side, the teeth sharp or blunt; spike $2-4 \mathrm{~cm}$. long, the bracts broadly oval to orbicular, cuneate at the base, sharply toothed, glandular-pubescent beneath or also on the margins; calyx-teeth acute; corolla $6-8 \mathrm{~mm}$. long, lilac, or variegated; capsule oblong-elliptic, ciliate on the margins, and more or less pubescent or pilose, about as long as the calyx. Greenland to Hudson Bay and N. B. Also in Europe. Summer.
2. Euphrasia Canadénsis Townsend. Spinulose Eyebright. Branched from near the base, $8-15 \mathrm{~cm}$. high, the stem and branches with crisped hairs. Leaves ovate-oblong, the teeth of the upper aristate; bracts about 5 -toothed; spike 3-7 cm. long; calyx-teeth triangular-lanceolate, aristate; corolla about 7 mm . long; capsule truncate or emarginate, mucronate. Fields, Quebec to Nich. Summer.
3. Euphrasia Americàna Wettst. Hairy Eyebright. (I. F. f. 33:6.) Pubescent with crisped hairs; stem often at length much branched, $10-25^{\circ} \mathrm{cm}$. high. Leaves sessile, ovate to oval, $3-5$-toothed on each side; the teeth acute; lracts dentate, pubescent, slightly shorter than the flowers; calyx-tecth lanceolate, acuminate; corolla $6-8 \mathrm{~mm}$. long, purplish or nearly white, its lobes cmarginate; capsule narrow, cuneate, $4^{-6} \mathrm{~mm}$. high, about equalling the calyx. In fields and on hills, Me. and N. B. to Newf. Summer.
4. Euphrasia Òakesii Wettst. Oakes' Eyfbright. (I. F. f. 3227.) Stem erect or ascending, very slender or filiform, simple. $2-5 \mathrm{~cm}$. high, somewhat pubescent. Stem leaves 2 or 3 pairs. Bracts and leaves orbicular or brodedr oval. narrowed or nearly truncate at the base, $4^{-6} \mathrm{~mm}$. long, whtuse, pubescent, with 2-5 blunt teeth on each side; spike short, capitate, only $0-10$ mm. long, the bracts densely imbricated; calyx-teeth triangular-lanceolate, short; corolla $i-4 \mathrm{~mm}$. long. purplish; capsule oblong-elliptic, ciliate, longer than the calyx. White Mountains of N. H.

Herbs, partly parasitic on the roots of other plants, with opposite leaves, and purple, pink, red or yellow flowers, in terminal leafy-bracted spikes. Calyx 4 -toothed or 4 -cleft. Corolla very irregular, the tube straight or recurved, the limb 2-lipped; upper lip erect, concave, entire; lower lip spreading, 3-lobei. Stamens 4, didynamous, ascending under the upper lip; anther-sacs similar, parallel. Capsule loculicidally dehiscent, several-many-seeded. Seeds horizontal, striate, or ribbed. [Named for John Bartsch, a Prussian botanist, died 1738.] About 6 species of the northern hemisphere.
I. Bartsia alpìna L. Alpine Bartsia. (I. F. f. 3328.) Perennial by short rootstocks, pubescent, leafy, simple, or rarely with I or 2 short branches, $\mathbf{I}-2.5 \mathrm{dm}$. high. Leaves sessile, ovate, or ovate-oblong, crenate-dentate, $\mathbf{I}-2.5 \mathrm{~cm}$. long; bracts similar, smaller, mostly shorter than the flowers; spike $2-5 \mathrm{~cm}$. long; flowers $1.5-2 \mathrm{~cm}$. long, sometimes borne also in the upper axils; calyx 4 -cleft; corolla purple, its tube much longer than the calyx; anthers pubescent, at least on the back; capsule ovoid-oblong, equalling or longer than the calyx. Lab. to Greenland and the Arctic Sea. Also in Europe. Summer.

## 31. ODONTÌTES Gmel.

Annual herbs, half parasitic on the roots of other plants, with small opposite leaves, and yellow or red flowers in terminal spikes or racemes. Calyx 4-toothed. Corolla with a narrow tube and a strongly 2 -lipped limb, the upper lip concave, entire, or 2-lobed, the lower 3-lobed, spreading. Stamens 4, didynamous, ascending; anther-sacs similar. Capsule loculicidally dehiscent. Seeds few, pendulous. [Greek, referring to its supposed value as a cure for toothache.] About 20 species, mostly of the Mediterranean region.
I. Odontites Odontites (L.) Wettst. Red Bartsia. Red Eyebright. (I. F. f. 3329.) Appressed-pubescent, roughish, slender, 1.5-4 dm. high, the branches erect or ascending. Leaves sessile, lanceolate, or oblong-lanceolate, acute or acuminate, serrate with low distant teeth, $1-4 \mathrm{~cm}$. long; spikes becoming 5-13 cm. long in fruit, somewhat I-sided; bracts similar to the leaves, but smaller; flowers numerous, $8-10 \mathrm{~mm}$. long; corolla red or pink, its tube somewhat longer than the calyx; anthers slightly pubescent; capsule oblong, shorter than the calyx. In fields and waste places, Me. to N. S. Nat. from Europe. June-Sept.

## 32. ELEPHANTELLA Rydb.

Herbs, blackening in drying, with pinnately divided leaves and toothed segments, and flowers in terminal many-flowered spikes. Calyx obliquely campanulate, 5 -toothed. Corolla 2-lipped, tube almost included in the calyx, the upper lip strongly arcuate, produced into a long filiform upturned beak, enclosing the long style, the throat with a tooth on each side; lower lip very broad, 3-lobed. Stamens and capsule as in Pedicularis. Three or four sub-arctic or sub-alpine species of the northern hemisphere. Another species is found in the Sierra Nevada.
I. Elephantella Groenlándica (Retz.) Rydb. Long-beaked Elephantella. (I. F. f. 3330.) Perennial, glabrous; stem simple, 3-5 dm. high. Leaves alternate, lanceolate in outline, acute or acuminate, pinnately parted or the lower pinnately divided into lanceolate crenulate or incised segments, the upper sessile, the lower slender-petioled, $5-15 \mathrm{~cm}$. long; spike very dense; calyx 5 -toothed, nearly as long as the corolla-tube, the teeth short, acutish; corolla red or purple, the galea decurved against the lower lip and upwardly recurved beyond it; body of the corolla 5-6 mm. long; capsule obliquely ovate, about 6 mm . long. In wet soil, Lab., Greenland and Hudson Bay to the N. W. Terr., Br. Col., N. Mex. and Cal. Summer. [Pedicularis Groenlandica Retz.]

## 33. PEDICULARIS L.

Herbs, with pinnately lobed cleft or pinnatifid leaves, the flowers in terminal spikes or spike-like racemes. Calyx tubular, cleft on the lower side or sometimes also on the upper, or $2-5$-toothed. Corolla strongly 2 -lipped, the upper lip (galea) laterally compressed, concave or conduplicate, sometimes beaked; lower lip erect or ascending, 3 -lobed, the lobes spreading or reflexed, the middle one the smallest.

Stamens 4, didynamous, ascending within the upper lip; anthers approximate in pairs, their sacs transverse, equal, parallel, obtuse or rarely mucronate at the base. Capsule compressed, oblique or curved, beaked, many-seeded, loculicidally dehiscent. Seeds reticulate, pitted, striate or ribbed. [Latin, pertaining to lice, long supposed to breed lice in sheep that feed on these plants.] About 125 species, mostly natives of the northern hemisphere. In addition to the following, some 25 others inhabit western N. Am.
Beak of the galea conic, decurved, 2 mm . long.

1. P. Lapponica.

Beak of the galea very short, or none.
Annuals or biennials; stems leafy, freely branching; northern.
Puberulent; upper leaves crenulate, lower pinnatifid. Glabrous or very nearly so; leaves all pinnatifid.
2. P. euphrasioides. 3. P. parviflora.

Perennials; stems leafy, simple (rarely branched in No. 6).
Corolla yellow, or the galea red; plants $1.5-9 \mathrm{dm}$. high; eastern species.
Leaves pinnately lobed; capsule ovate, scarcely longer than the calyx.
4. P. lanceolata.

Leaves pinnately parted; capsule lanceolate, 3 times as long as the calyx.

Lower leaves pinnately divided; capsule ovate.
Galea crimson or purple; plant $2.5-10 \mathrm{~cm}$. high ; arctic.
Perennial ; stem scapose, or r-leaved ; flowers capitate ; arctic.
5. P. Canadensis. 6. P. Furbishiae. 7. P. flammea. 8. P. capitata.

1. Pedicularis Lappónica L. Lapland Pedicularis. (I. F. f. 333 I.) Perennial, puberulent, leafy, $\mathbf{1 - 2} \mathrm{dm}$. high. Leaves sessile, or short-petioled, alternate or the lowest opposite, lanceolate or linear-lanceolate, obtuse or acutish, $\mathrm{r}-4 \mathrm{~cm}$. long, pinnately incised into numerous approximate oblong serrulate lobes; flowers almost capitate, light yellow, 12-14 mm. long; calyx cleft on the lower side, 2 -toothed on the upper; galea erect, arched. In open places, Lab. and Greenland to the Arctic Sea. Also in Arctic Europe and Asia. Summer.

Pedicularis pedicellàta Bunge, an Alaskan species is recorded by Bunge from Labrador. It is distinguished from the above by its scapose stem, deeply pinnatifid leaves and pedicellate lower flowers.
2. Pedicularis euphrasioides Steph. Evebright Pedicularis. (I. F. f. 3332.) Puberulent, 1.5-4 dm. high, the branches ascending. Lower leaves petioled, lanceolate or oblong-lanceolate in outline, $5-10 \mathrm{~cm}$. long, pinnatifid into oblong obtuse crenate-dentate segments; upper leaves sessile, linear or linearoblong, smaller, crenulate; flowers in a short terminal spike and solitary in the upper axils; calyx cleft on the lower side, 2-3-toothed on the upper, shorter than the corolla-tube; corolla yellow, or the galea purplish, about 12 mm . long; galea as long as the tube, tipped with a very short truncate beak, minutely 2 -toothed on the lower side at the apex. Lab. to Greenland, the Arctic Sea, Alaska and Br. Col. Also in northern Asia. Summer.
3. Pedicularis parvifiòra J. E. Smith. Purple Pedicularis. (I. F. f. 3333.) Glabrous, or the petiole-bases ciliate, $3-6 \mathrm{dm}$. high. Leaves $2-5 \mathrm{~cm}$. long, alternate, or some of them opposite, oblong-lanceolate in outline. pinnatifid into oblong crenate or incised segments; flowers in terminal rather loose spikes and solitary in the upper axils, $\mathbf{1 4 - 1 6 ~ m m}$. long; calyx 2 -cleft, the lobes with an incised crested border; corolla purple, its tube twice as long as the calyx, the lip much shorter, the galea arched at the top, not beaked, blunt, bearing a pair of minute teeth below its summit; capsule obliquely ovate, twice as long as the calyx. Lab. to Alaska, Quebec, the N. W. Terr. and Ore. Summer.

Pedicularis palústris L., which differs from this in its larger flowers and apiculate galea, is reported from Newf. and Lab.; it is widely distributed in Europe and Asia.
4. Pedicularis lanceolàta Michx. Swamp Lousewort. (I. F. f. 3334.) Glabrous or nearly so, 3-9 dm. high. Leaves alternate and opposite, lanceolate, or linear-lanceolate, $5-\mathbf{I} 3 \mathrm{~cm}$. long, pinnately lobed, the lower petioled, the upper sessile, the lobes oblong, obtuse, short, crenate-dentate, the margins cartilaginous; spikes short; calyx 2 -lobed, the lobes with foliaceous margins; comolla yellow, $\mathbf{1} .5^{-2} \mathbf{c m}$. long, the galea arched, terminated by a very short truncate beak, the lower lip erect-ascending; capsule ovate, little exceeding the cally. In swamps, Ont. to Conn., Va., Manitoba, Minn., Ohio, Mich. and Neb. (according to Williams). Aug.-Oct.
5. Pedicularis Canadénsis L. Wood Betony. Lousewort. (I. F. f. 3335.) Pubescent, or glabrate below; stems commonly tufted, 1.5-4.5 dm. high, simple. Leaves alternate or some of them opposite, oblong-lanceolate, $7-13 \mathrm{~cm}$. long, all but the uppermost slender-petioled, pinnately parted into obtuse incised or dentate lobes; spike I-2 dm. long in fruit, the lower bracts usually foliaceous, the others small; calyx cleft on the lower-side, 2-3-crenate on the upper, oblique; corolla yellow, or reddish (rarely white) $1.5-2 \mathrm{~cm}$. long, the tube much longer than the calyx, the galea arched, incurved, minutely 2 -toothed below the apex; capsule oblique, $14-16 \mathrm{~mm}$. long. In dry woods and thickets, N. S. to Manitoba, Fla., Miss., Colo. and Northern Mex. April-June.
6. Pedicularis Furbíshiae S. Wats. Miss Furbish's Pedicularis. (I. F. f. 3336.) Pubescent, at least above; stem strict, simple, 6-9 dm. high. Leaves lanceolate, alternate, or some of them opposite, the lower long-petioled, $\mathbf{1}-\mathbf{I} .5 \mathrm{dm}$. long, pinnately divided into ovate or oblong, pinnatifid or incised segments, the upper sessile, pinnately parted or lobed; calyx 5 -lobed, the lobes entire or dentate, narrow, somewhat unequal; corolla yellow, $14-18 \mathrm{~mm}$. long, the galea arched, truncate, not beaked, 2 -cuspidate at the apex. In swamps and along streams, Me. and N. B. July-Sept.
7. Pedicularis flámmea L. Red-tipped Pedicularis. (I. F. f. 3337.) Glabrous or somewhat wooly; stem simple, $5-10 \mathrm{~cm}$. high with several linearoblong, pinnately parted leaves. Basal and lower leaves slender-petioled, $2.5-4 \mathrm{~cm}$. long, the uppermost sessile, the lobes ovate or oblong, incised-serrate; flowers about $\mathbf{1} 2 \mathrm{~mm}$. long, pedicelled in a short spike-like raceme, longer than the narrow bracts; calyx 5 -toothed, the teeth lanceolate, acute, unequal; corolla-tube and the lower lip greenish-yellow, the galea slightly arched, blunt, much longer than the lower lip; capsule lanceolate, $12-16 \mathrm{~mm}$. long, $2-3$ times as long as the calyx; fruiting pedicels $6-10 \mathrm{~mm}$. long. Lab. to Greenland and Alaska. Also in arctic and alpine Europe. Summer.
8. Pedicularis capitàta Adams. Capitate Pedicularis. (I. F. f. 3338.) Stem scapose, leafless, or I-leaved, $2.5-13 \mathrm{~cm}$. high. Leaves slender-petioled, pinnately divided, the segments ovate or oblong, incised; flowers several in a capitate cluster, $2.5-4 \mathrm{~cm}$. long; calyx 5 -cleft, the lobes foliaceous, incised or crenate; corolla described as white; galea scarcely broadened above, slightly curved, obtuse, twice as long as the lower lip; capsule oblong, a little longer than the calyx beaked on the outer side near the summit. Hudson Bay to Alaska. Summer.

## 34. RHINÁNTHUS L.

Annual erect herbs, with opposite leaves, and yellow, blue, violet, or variegated flowers, in terminal I-sided leafy-bracted spikes, or solitary in the upper axils. Calyx compressed, 4 -toothed, much inflated, membranous and conspicuously veiny in fruit. Corolla irregular, 2-lipped, the upper lip (galea) compressed, arched, minutely 2 -toothed below the entire apex, the lower lip 3 -lobed, shorter, the lobes spreading. Stamens 4, didynamous, ascending under the galea; anthers pilose, the sacs obtuse at the base, transverse, distinct. Capsule orbicular, flat, loculicidally dehiscent, several-seeded. Seeds nearly orbicular, winged. [Greek, noseflower, from the beaked corolla.] About 3 species, of the northern hemisphere.
I. Rhinanthus Crísta-Gâlli L. Rattle. Rattle-box. Yellow or Penny Rattle. (I. F. f. 3339.) Glabrous, or pubescent above; stem usually branched, 1.5-4.5 dm. high. Leaves lanceolate or oblong-lanceolate, sessile, coarsely serrate-dentate, $2-5 \mathrm{~cm}$. long; bracts broader, ovate, or ovate-lanceolate, incised-dentate, the teeth acuminate or subulate-tipped; flowers yellow, $12-16 \mathrm{~mm}$. long; corolla-tube longer than the calyx, commonly with a purple spot on one or both lips; fruiting calyx $8-12 \mathrm{~mm}$. in diameter; capsule nearly as broad as the calyx. Newf. and Lab. to Alaska, Ore., Quebec, N. H., N. Y,, Ont. and in the Rocky Mts. to N. Mex.; on the Atlantic Coast from R. I. to N. B. Common in northern Europe and Asia. June-Aug.

## 35. MELAMPỲRUM L.

Annual herbs, with opposite leaves, and small flowers solitary in the upper axils, or in bracted spikes. Calyx 4 -toothed, the 2 upper teeth somewhat the longer.

Corolla irregular, 2 -lipped, the tube gradually enlarged above, the upper lip compressed, obtuse or emarginate with a groove behind the margins, or these recurved or with a tooth on each side; lower lip 3-toothed, 2.grooved beneath. Stamens 4, didynamous, ascending under the upper lip; anther-sacs distinct, parallel, obtuse or mucronulate at the base. Capsule flat, oblique, loculicidally dehiscent, 2-4seeded. Seeds smooth, strophiolate. [Greek, black wheat.] About io species, of the northern hemisphere. Only the following are known in N. Am.
Leaves lanceolate or linear-lanceolate, the floral 2-4-toothed at the base.

\author{

1. M. lineare. <br> 2. M. latifolium.
}
2. Melampyrum lineàre Lam. Narrow-leaved Cow-wheat. (I. F. f. 3340.) Puberulent; stem obscurely 4 -sided above, at length widely branched, I.5-5 dm. high. Leaves lanceolate to linear-lanceolate, short-petioled, acuminate or acute, $2.5-6.5 \mathrm{~cm}$. long, the lower all entire, the upper floral ones ovate or lanceolate, with 2-6 bristle-pointed teeth near the base; flowers short-peduncled, $8-12 \mathrm{~mm}$. long; calyx about one-third the length of the corolla, its subulate teeth longer than its tube; corolla white or whitish, puberulent, the lower lip yellow; capsule $8-10 \mathrm{~mm}$. long, twice as long as the calyx. In dry woods and thickets, N. S. to Br. Col., N. Car., Ky. and Minn. Variable. May-Aug.
3. Melampyrum latifòlium Muhl. Broad-leaved Cow-wheat. (I. F. f. 3341.) Similar to the preceding, $3-5 \mathrm{dm}$. high, but the leaves all entire, shortpetioled, the lowest small, spatulate, obtuse, the middle ones lanceolate or ovate, acuminate, narrowed at the base, $5-8 \mathrm{~cm}$. long, the floral ovate or ovate-lanceolate, shorter, acute, mostly rounded at the base; corolla purple, veiny. In dry woods, Del. (according to Muhlenberg); Va. to Ga. and Tenn. June-Aug.

## Family 10. LENTIBULARIÀCEAE Lindl.*

## Bladderwort Family.

Aquatic plants, or terrestrial on moist ground, with the leaves basal and tufted, or borne on branching stems, or reduced to minute scales. Scapes erect. Flowers perfect, irregular, the pedicels bracteolate. Calyx inferior, $2-5$-parted. Corolla 2 -lipped, the upper lip usually erect, concave, or the sides plicate, entire, or 2-lobed, interior in the bud; lower lip larger, spreading or reflexed, 3 -lobed, with a palate projecting into the throat and a nectariferous spur beneath, Stamens 2 ; anther-sacs confluent into I. Ovary superior, ovoid or globose, I-celled; ovules numerous; style short, or none; stigma 2-lamellate. Fruit a capsule, irregularly bursting, or dehiscent by valves. Seeds anatropous, rugose, reticulated, or bristle-bearing; endosperm none. About 4 genera and I8o species, widely distributed.
Aquatic or bog plants; foliage often dissected and bladder-bearing. Terrestrial ; leaves basal, tufted, entire.
x. C゙tricularia.
2. Pinguicula.

## x. UTRICULARIA L.

Herbs, floating, or rooting in the mud, the aquatic species with stems usually bearing finely divided leaves and covered with minute bladders; marsh species with a few bladder-bearing leaves or rootlets under ground. Bladders contracted at the mouth, closed by an operculum and furnished with a few projecting bristles. Fiowers racemose or solitary at the summits of slender scapes, the pedicels z-bracteolate. Calyx deeply z-lobed, the lobes equal or nearly so. Corolla z-lipped, the upper lip usually erect and entire, the lower larger, 3 -lobed, spured at the base and with a prominent palate, commonly bearded in the throat. Capsule many. seeded. [Latin, utriculus, a bag, or little bladder.] About 150 species, of wide distribution. Besides the following, some 4 others occur in the southern L'. S.

[^44][^45]* Branches and finely divided leaves floating, or creeping on the mud, bladderbearing.
$\dagger$ Scape bearing a whorl of leaves with inflated petioles. $\dagger \dagger$ Scape leafless, or with a few minute scales.
Leaves verticillate; corolla purple.
Leaves crowded, $2-3$-pinnately divided; corolla yellow, large.
Leaves scattered, dichotomously divided.
Cleistogamous flowers among the leaves.
No cleistogamous flowers.
Bladders mainly or entirely on leafless branches.
Leaf-segments linear, flat
Leaf-segments capillary.
Flowers 2-8; spur usually reduced to a short protuberance.

12. $U$. minor.

Flowers 1-2; spur shorter than the lower lip, conic, gibbous.
Flowers 1-3; spur oblong, as long as the lower lip.
I4. U. biflora.
I. Utricularia cornùta Michx. Horned Bladderwort. (I. F. f. 3342.) Scape strict, o. 7-4 dm. high, with or without a few scattered scales, rooting in the mud. Stems and branches root-like, sometimes with a few entire leaves and few bladders, or several; flowers I-6, yellow, fragrant; pedicels $2-4 \mathrm{~mm}$. long; lower lip of the corolla large, somewhat galeate, the sides strongly reflexed, with a prominent palate which projects inwardly and is pubescent at the throat; upper lip smaller, obovate; spur acute, curved; seeds black, rugosely pitted. On borders of ponds, or in bogs, Newf. to Ont., Minn., Fla. and Tex. June-Aug.
2. Utricularia júncea Vahl. Rush Bladderwort. (I. F. f. 3343.) Scape strict, 1.5-4 dm. high, rooting in the mud, bearing few or several minute scales. Flowers 3-10, bright yellow; pedicels 2 mm . long, or less; lower lip of the corolla obovate, pointed, mainly composed of the palate, the upper little smaller, obovate, emarginate; spur linear-subulate, slightly curved, or straight. In bogs, Va. to Fla. and Tex., mostly near the coast. Also in the W. Ind. and S. Am. July-Aug.
3. Utricularia resupinàta B. D. Greene. Reversed Bladderwort. (I. F.f. 3344.) Scape $5-18 \mathrm{~cm}$. high, 2-bracted near the flower, arising from creeping rooting shoots which rise $2-5 \mathrm{~cm}$. above the ground and bear a few branches and bladders. Flower resting transversely upon the summit of the scape and so appearing resupinate; corolla $6-10 \mathrm{~mm}$. long, the limb deeply 2 -parted, remote from the conic spur. In sandy bogs and borders of ponds, Me. to Fla., west to Mich. July-Aug.
4. Utricularia subulàta L. Tiny or Zig-zag Bladderwort. (I. F. f. 3345.) Scape $2.5-20 \mathrm{~cm}$. high, the racemes zig-zag. Leaves few, entire, they and the bladders seldom found; pedicels 4-12 mm. long, slender; corolla $4-6 \mathrm{~mm}$. broad, the lower lip 3 -lobed, the upper smaller, ovate; spur conic, appressed to the lower lip and equalling it in length, or shorter. In wet, sandy soil, Mass. to Fla., west to Tex., Mex. and Ark. Also in Cuba. March-Aug.
5. Utricularia cleistógama (A. Gray) Britton. Closed Bladderwort. (I. F. f. 3346 .) Scape hair-like, $2-8 \mathrm{~cm}$. high, I-2-flowered. Stems root-like, sparse, sending a few minute simple shoots above ground; bladders minute, seldom seen; flowers on short bracted pedicels; corolla $1-2 \mathrm{~mm}$. broad, strictly cleistogamous, spurless, the lips nearly equal. the lower varying from purplish to yellow, the upper white; seeds rugosely pitted; capsule globose. In wet soil, eastern Mass. and in the pine-barrens of N. J. August.
6. Utricularia inflàta Walt. Swollen Bladderwort. (I. F. f. 3347.) Scapes stout, $0.7-5 \mathrm{dm}$. high, bearing a whorl of 5-9 leaves at about the middle. Branches long, floating, crowded with dichotomously divided leaves and covered
with bladders; leaves of the scape finely dissected, their petioles cylindric, inflated, dilated upward; flowers 2-10, yellow, about 2 cm . broad; upper lip of the corolla broadly ovate, obscurely lobed or crenate, the lower 3-lobed; spur conic, emarginate, appressed to the lower lip and about one-half its length; capsule nodding in fruit. In ponds, Canada (according to Pursh); Me. to Fla. and Tex., near the coast. March-Aug.
7. Utricularia purpùrea Walt. Purple Bladderwort. (I. F. f. 3348.) Scape $2.5-15 \mathrm{~cm}$. high, $\mathbf{x}-4$-flowered. Branches floating, long, with numerous dichotomous capillary leaves in verticils of 4's and 5's, and many large bladders; corolla violet-purple, $6-16 \mathrm{~mm}$. broad, the lower lip 3 -lobed, the lateral lobes saccate; upper lip truncate, emarginate; spur nearly conic, appressed to the lower lip and one-half its length, or more. In ponds, Me. to Fla., near the coast; also in Ind. May-Aug.
8. Utricularia vulgàris L. Greater Bladderwort. Hooded Watermilfoil. Pop-weed. (I. F. f. 3349.) Scapes stout, o.7-3.5 dm, high. Leaves 2-3-pinnately divided, usually crowded, the segments setaceous; branches floating, sometimes 3 dm . long, the leaves sometimes $\mathbf{1 2 - 1 4} \mathrm{mm}$. long, with numerous bladders; flowers $3-20$, racemose, yellow; pedicels $8-16 \mathrm{~mm}$. long, recurved in fruit; corolla 12 mm . broad or more, the sides of the lips reflexed; palate prominent; upper lip nearly entire, the lower slightly 3 -lobed and longer than the conic somewhat curved spur. In brooks and ponds, Newf. to Fla., Br. Col. and Cal. Also in Europe, Asia, Cuba and Mex. June-Aug.
9. Utricularia clandestina Nutt. Hidden-fruited Bladderwort. (I. F. f. 3350.) Scape slender, $5-\mathbf{1 3} \mathrm{cm}$. high, arising from long floating branches. Leaves scattered, repeatedly forked, the divisions capillary, bearing numerous bladders. Flowers of two kinds; those of the scape 3-5, complete, those among the leaves cleistogamous, numerous, their pedicels reflexed in fruit; corolla of the upper complete flowers yellow, spreading, $8-10 \mathrm{~mm}$. broad when expanded, the lips nearly equal in length, the lower broader and 3 -lobed; spur shorter than the lower lip, thick, obtuse, approximate to it. In shallow ponds, N. B. to N. J. July.
io. Utricularia intermèdia Hayne. Flat-leaved Bladderwort. (I. F. f. 335 I.) Scape capillary, $5-25 \mathrm{~cm}$. high. Branches floating, $5-15 \mathrm{~cm}$. long; leaves 6-12 mm. long, more or less scattered, 2-ranked, repeatedly dichotomous, the segments 0.25 mm . wide or less, the margins bristly-serrulate. Bladders, with rare exceptions, borne on leafless branches; flowers $1-5$, yellow; corolla 12 mm . broad, its lower lip broad with a large palate and exceeding the upper; spur conic, subacute, nearly as long as the lip, to which it is appressed. In shallow water, Cape Breton to Br. Col., N. J., Minn. and Cal. Also in Europe. June-Aug.
if. Utricularia fibròsa Walt. Fibrous Bladderwort. (I. F. f. 3352.) Scape slender, o. $7-3 \mathrm{dm}$. high. Leaves scattered, small or sometimes scarcely any, bladders often on leafless branches, sometimes none; flowers i-6, yellow: corolla $8-\mathbf{I} 2 \mathrm{~mm}$. broad, the lips nearly equal, broad, the upper undulate or 3 -lobed, the middle lobe striate; spur nearly linear, obtuse, ascending, nearly equalling or sometimes exceeding the lower lip. In shallow ponds and swamps, L. I. to Fla. and La. June-July.
12. Utricularia minor L. Lesser Bladnerwort. (I. F. f. 3353.) Scapes slender, $0.5-\mathbf{1} .8 \mathrm{dm}$. high. Branches floating, short; leaf-divisions few and setaceous; bladders borne along the leaves, few, often none, the largest not over 2 mm . long; flowers $1-10$, pale yellow, racemose; corolla $4^{-6} \mathrm{~mm}$. broad, ringent, the upper lip smaller than the lower; spur usually reduced to a blunt broad protuberance, shorter than the lips; pedicels reflexed in fruit. In shallow ponds and in bogs. Greenland and Lab. to Br. Col., N. J., Ark., Utah and Cal. Also in Europe. June-July.
13. Utricularia gibba L. Humped Blannerwort. (T. F. f. 3354.) Scapes filiform, $2.5-13 \mathrm{~cm}$. high, arising from sparingly lafy, floating or creeping branches. Leaves root-like, in the mud or just above it, usimally delicate the divisions often only 1 or 2 , capillary; bladders few and minute, the largest ahout $\mathbf{1} \mathrm{mm}$. long, or often none; flowers $\mathbf{I}$ or 2 . yellow: corolla 6 ( $\$ \mathrm{~mm}$. brad. its lips rounded, broad, entire, or undulate, about equal; spur thick. conic, ascending. gibbous at the hase, obtuse, shorter than the lips. In shallow water, Ont. to Me., Mich., Ala. and Ill. July-Aug.
14. Utricularia bifiòra Lam. Two-flowered Bladderwort. (I. F. f. 3355.) Scapes filiform, $5-13 \mathrm{~cm}$. high, arising from long floating branches. Leaves scattered, their divisions few, finely capillary, often copiously bladder-bearing; flowers r-3, yellow; corolla $8-12 \mathrm{~mm}$. broad, the lips rounded, nearly equal; spur narrowly oblong, blunt, curved upward, equalling the lower lip. In shallow water, eastern Mass. and R. I. to Ill., La. and Tex.

## 2. PINGUÍCULA L.

Acaulescent herbs, with fibrous roots, naked i-flowered circinate scapes, and basal tufted entire leaves, the upper surface covered, with a viscid secretion to which insects adhere, and are captured by the involution of the sensitive leaf-margins. Calyx 4-5-parted, or 2-lipped, the lower lip 3-parted, the upper 2-parted. Corolla 2 -lipped, the upper lip 2-cleft, the lower 3 -cleft; base of the corolla saccate and contracted into a nectariferous spur. Capsule 2-valved or 4 -valved. Seeds oblong, wrinkled or reticulated. [Latin, pinguis, fat, the leaves seeming greasy to the touch.] About 30 species, of wide distribution. Besides the following, 4 others are found in the southern U.S.
Scapes villous, $2-5 \mathrm{~cm}$. high; leaves oval, 6-12 mm. long. 1. P. villosa. Scapes glabrous or minutely downy ; leaves ovate or elliptic, $2-5 \mathrm{~cm}$. long.
2. P. vulgaris.
I. Pinguicula villòsa L. Hairy Butterwort. (I. F. f. 3356.) Scapes slender. Leaves 3 or 4 , obtuse, $6-12 \mathrm{~mm}$. long, $4-6 \mathrm{~mm}$. wide; petioles short, villous; corolla pale violet with a yellowish-striped throat, 2 -lipped, the upper lip 2parted, the lower larger, 3 -parted, the tube abruptly contracted into a straight linear or oblong blunt spur $3-4 \mathrm{~mm}$. long. Lab. and Hudson Bay to Alaska. Also in Greenland. Summer.
2. Pinguicula vulgàris L. Butterwort. Bog or Marsh Violet. (I. F. f. 3357.) Scapes 5-15 cm. high. Leaves 3-7, greasy to the touch on the upper surface, obtuse, $2-5 \mathrm{~cm}$. long, $6-20 \mathrm{~mm}$. wide, short-petioled, or sessile; corolla violet-purple, $6-8 \mathrm{~mm}$. broad, the upper lip 2 -lobed, the lower 3 -lobed, larger, the tube gradually contracted into a nearly straight spur $4-8 \mathrm{~mm}$. long; capsule glo-bose-ovoid, longer than the calyx. On wet rocks or in gravelly rivulet beds, Greenland to Alaska, Vt., N. Y., Minn. and Br. Col. . Also in Europe and Asia. July-Aug.

## Family II. OROBANCHÀCEAE Lindl.

## Broom-rape Family.

Erect root-parasites, the leaves reduced to alternate appressed scales, the flowers perfect, irregular (rarely cleistogamous,) sessile in terminal bracted spikes, or solitary and peduncled in the axils of the scales. Calyx inferior, gamosepalous, 4-5-toothed, 4-5-cleft, or split nearly or quite to the base on one or both sides. Corolla gamopetalous, oblique, the limb 2-lipped, 5-lobed. Stamens 4, didynamous, inserted on the tube of the corolla and alternate with its lobes, a fifth rudimentary one occasionally present ; filaments slender; anthers 2-celled, the sacs parallel, equal. Ovary superior, i-celled, the four placentæ parietal; ovules numerous, anatropous; style slender; stigma discoid, 2 -lobed, or sometimes 4 -lobed. Capsule I-celled, 2 -valved. Seeds numerous, reticulated, wrinkled or striate ; embryo minute ; cotyledons scarcely differentiated. About II genera and 200 species of wide distribution.
Flowers all complete and perfect.
Calyx 2-5-toothed.

$$
\text { Calyx about equally } 5 \text {-cleft; no bracts on pedicels nor calyx. I. Thalesia. }
$$ Calyx unequally toothed, or split on both sides; flowers bracted.

2. Orobanche.

Calyx spathe-like, split on the lower side, 3-4-toothed on the upper.
Lower flowers cleistogamous, fertile ; upper complete, mostly sterile. 4. Conopholis. Leptamnium.

Glandular or viscid-pubescent simple-stemmed herbs, parasitic on the roots of various plants, with scattered scales, and long-peduncled flowers. Calyx campanulate or hemispheric, the lobes acute or acuminate. Corolla-tube elongated, curved, the limb slightly 2 -lipped, the upper lip erect-spreading, 2 -lobed, the lower spreading, 3 -lobed, the lobes all nearly equal. Stamens included; anther-sacs mucronate at the base. Ovary ovoid; style slender, deciduous; stigma peltate, or transversely 2-lamellate. [Dedicated to Thales.] About 3 species, of N. Am.
Stem very short ; peduncles I-4, erect ; calyx-lobes lanceolate, acuminate.

> I. T. uniflora.

Stem erect, $5^{-13} \mathrm{~cm}$. high; peduncles several; calyx-lobes broad, acute.

2. T. fasciculata.

r. Thalesia uniflòra (L.) Britton. Pale or Naked Broom-rape. Oneflowered Broom-rape. Cancer-root. (I. F. f. 3358.) Stem usually less than 2.5 cm . long, nearly subterranean, bearing several ovate-oblong scales and I-4 erect scape-like glandular-puberulent i-flowered peduncles, $7-20 \mathrm{~cm}$. high. Calyx campanulate, pubescent, glandular, $8-10 \mathrm{~mm}$. high, less than one-half the length of the corolla, its lobes as long as the tube or longer, lanceolate, acuminate; corolla white or violet, puberulent without, $\mathbf{I} \cdot 5-2.5 \mathrm{~cm}$. long, the tube about 3 times as long as the limb, the short lobes oval or obovate, obtuse; placentæ nearly equidistant; capsule ovoid, longer than the calyx. In woods and thickets, Newf. to Br. Col., Va., Ohio, Tex. and Cal. April-June.
2. Thalesia fasciculàta (Nutt.) Britton. Clustered or Yellow Cancerrоот. (I. F. f. 3359.) Stem densely glandular-pubescent, bearing several scales and 3-15 naked I-flowered peduncles $2-8 \mathrm{~cm}$. long. Calyx glandular, broadly campanulate, 6 -10 mm . high, about one-third the length of the corolla, its lobes triangular-lanceolate or triangular-ovate, acute, equalling or shorter than the tube; corolla nearly 2.5 cm . long, purplish yellow, puberulent without, the tube 3 times as long as the limb, the lobes oblong, obtuse, the limb more manifestly 2-lipped than in the preceding species; capsule ovoid to globose. In sandy soil, Ind. to the N. W. Terr., Br. Col., Neb., Ariz. and Cal. April-Aug.

Thalesia fasciculàta lùtea (Parry) Britton. Whole plant light yellow. Western Neb. and Wyo.

## 2. OROBÁNCHE L.

Glandular-pubescent herbs, parasitic on the roots of various plants, with scattered scales, and spicate or racemose, bracted and sometimes bracteolate flowers. Calyx split both above and below, nearly or quite to the base, the divisions 2 -cleft or rarely entire, or unequally 2 - 5 -toothed. Corolla oblique, strongly 2 -lipped; upper lip erect, emarginate or 2-lobed; lower lip spreading, 3-lobed. Stamens included; anther-sacs mostly mucronate at the base. Style slender, commonly persistent until after the dehiscence of the capsule; stigma peltate to funnelform, entire, or laterally 2-lamellate. [Greek, Choke-vetch.] About 90 species, of the Old World and western Am. Besides the following, some 6 others occur in western N. Am.

Calyx 4-toothed; stems mostly branched. Calyx split on both sides; stem simple.
Calyx 5-cleft; stem simple.

1. O. ramosa.
2. O. minor.
3. O. Ludoviciana.
4. Orobanche ramòsa L. Hemp or Branched Broom-rape. (I. F. f. 3360.) Plant yellowish; stem branched, or rarely simple, $0.7-4$ dm. high, the scales few and distant, $4-$ ro mm . long. Spike loosely many-flowered, denser above than below, the lowest flowers short-pedicelled; bracts usually 3, the longest about equalling the calyx; calyx-teeth triangular-ovate, acute, or acuminate, about as long as the tube; corolla $1-2 \mathrm{~cm}$. long, the tube yellow, slightly constricted above the ovary, the limb bluish. Parasitic on the roots of hemp and tobacco, Ky: Adventive or nat. from Europe. Summer.
5. Orobanche minor J. E. Smith. Lasser or Cinyer Broom-rate: Herbbane. (I. F. f. 336 I.) Plant rellowish-brown; stem 1 - 5 dm . high; hwer scales numerous, ovate-oblong, the upper lanceolate, acute, scittered, $6-20 \mathrm{~mm}$. long.

Spike dense, or the lower flowers separated, o.7-2 dm. long; bracts lanceolate, equalling or longer than the flowers; flowers $\mathrm{I}-2 \mathrm{~cm}$. long; calyx split both above and below, each of the lateral segments 2 -cleft, the teeth lanceolate-subulate; corolla-tube yellowish, scarcely constricted above the ovary, the limb bluish. Parasitic on the roots of clover, N. J. to Va. Nat. from Europe. May-July.
3. Orobanche Ludoviciàna Nutt. Louisiana Broom-Rape. (I. F. f. 3362.) Stems stout, simple, viscid-puberulent, I-3 dm. high, scaly. Flowers $\mathbf{1 2 - 1 6 ~ m m}$. long, numerous in dense terminal spikes, I-2-bracted under the calyx; calyx-lobes somewhat unequal, linear-lanceolate, acuminate; corolla 2-lipped, purplish, its tube narrow, about twice as long as the limb; anthers woolly; capsule ovoid-oblong, shorter than the calyx. In sandy soil, Ill. to the N. W. Terr., Tex., Ariz. and Cal. June-Aug.

## 3. CONÓPHOLIS Wallr.

An erect stout simple glabrous, densely scaly, light-brown herb, parasitic on the roots of trees, with yellowish flowers 2-bracteolate under the calyx, in a thick dense bracted spike, the bracts similar to the scales of the stem. Corolla strongly 2 -lipped, the tube slightly curved, the upper lip concave, nearly erect, emarginate, the lower spreading, 3 -lobed. Stamens exserted; anther-sacs bristly pubescent. Placentæ about equidistant; stigma capitate, obscurely 2-lamellate. Capsule ovoid-globose. [Greek, signifying a scaly cone.] Two known species, one of eastern N. Am., the other Mexican.
I. Conopholis Americàna (L. f.) Wallr. SQuaw-Root. (I. F. f. 3363). Plants $7-25 \mathrm{~cm}$. high from a thickened base, light brown, usually clustered, covered with stiff imbricated scales. Upper scales lanceolate or ovate, acute, I-2 cm. long, the lowest much shorter; flowers about 12 mm . long, exceedingly numerous in the dense spike which is $\mathbf{I - 2} \mathbf{~ c m}$. thick; corolla pale yellow, somewhat exceeding the calyx; anthers sagittate; capsule ovoid-globose, $8-10 \mathrm{~mm}$. high. In rich woods at bases of trees, Canada ?; Me. to Mich. and Fla. April-Aug.

## 4. LEPTÁMNIUM Raf.

An erect slender glabrous, purplish or yellowish, rather stiff branching herb, parasitic on the roots of the beech, with few small scattered scales, and sessile dimorphous flowers, distantly spicate on the branches, the lower cleistogamous, abundantly fertile, the upper complete but mostly sterile. Calyx short, 5 -toothed. Corolla of the upper flowers cylindric, slightly flattened laterally, the tube much longer than the 4 -lobed limb, the upper lobe concave, larger than the three lower ones; stamens not exserted; anther-sacs mucronulate at the base; style filiform, 2-lobed; ovary with an adnate gland on the upper side near the base. Corolla of the lower flowers minute, not unfolding, borne like a hood on the summit of the ovary; style very short; placentæ contiguous in pairs; capsule at length 2-valved at the summit. [Greek, referring to the small calyx.] A monotypic genus.

1. Leptamnium Virginiànum (L.) Raf. BEECH-DROPS. (I. F. f. 3364.) Plant 1.5-6 dm. high from a thick scaly base, the roots brittle, fibrous. Branches straight, ascending; corolla of the upper flowers $8-10 \mathrm{~mm}$. long, striped with purple and white, the limb not spreading; stamens about as long as the corolia; style slightly exserted; lower flowers 3 mm . long, the corolla resembling the calyptra of a moss; capsule 6 mm . high, somewhat oblique and compressed, manyseeded. In beech woods, N. B. to Fla., Ont., Mich., Mo. and La. Aug-Oct.

## Family 12. BIGNONIÀCEAE Pers.

## Trumpet-creeper Family.

Trees, shrubs or woody vines, a few exotic species herbs, with opposite (rarely alternate) leaves, and mostly large and showy, clustered, more or less irregular flowers. Calvx inferior, gamosepalous. Corolla gamopetalous, 5-lobed, somewhat 2-lipped, at least in the bud. Antherbearing stamens 2 or 4, inserted on the tube of the corolla and alternate with its lobes; anthers 2 -celled, the sacs longitudinally dehiscent. Disk
annular or cup-like. Ovary mostly 2 -celled; placentæ parietal, or on the partition-wall of the ovary ; ovules numerous, horizontal, anatropous; style slender; stigma terminal, 2-lobed. Capsule 2-valved. Seeds flat, transverse, winged in our genera; endosperm none; cotyledons broad and flat, emarginate or 2-lobed; radicle short, straight. About 60 genera and 500 species of wide distribution in tropical regions, a few in the temperate zones.
Leaves compound; anther-bearing stamens 4; our species vines.
Calyx-limb undulate; capsule flattened parallel with its partition-wall.

1. Bignonia.

Calyx 5 -toothed ; capsule compressed at right angles to its partition-wall.
2. Tecoma.

Leaves simple; anther-bearing stamens mostly 2 ; trees.
3. Catalpa.

## 1. BIGNÒNIA L.

Woody vines, with opposite $2-3$-foliolate leaves, the terminal leaflet usually reduced to a tendril (some tropical species with decompound or even simple leaves), and large flowers. Calyx campanulate, the limb undulate, truncate or slightly 5 -toothed. Tube of the corolla much expanded ahove the calyx, the limb somewhat 2-lipped, 5 -lobed, the lobes rounded. Anther-bearing stamens 4, didynamous, included; anther-sacs glabrous, divergent. Capsule linear, septifragally dehiscent, the margins of the valves more or less thickened. Seeds in I or 2 rows on both margins of the partition, winged, much broader than high, the wing entire, or erose at the end. [Named after the Abbe Bignon, 1662-1743, librarian to Louis XV.] About 150 species, natives of America. The following is the only one known in the U. S.
I. Bignonia crucígera L. Tendrilled Trumpet-flower. Cross-vine. (I. F. f. 3365.) Glabrous, climbing, the stems sometimes I dm. in diameter, exhibiting a cross in the transverse section. Leaves petioled, commonly with small simple stipule-like ones in their axils, 2 -foliolate, terminated by a branched tendril; leaflets stalked, oblong or ovate, entire, acute or acuminate at the apex, cordate at the base, $7-17 \mathrm{~cm}$. long; cymes numerous, short-peduncled, $2-5$-flowered; pedicels $2-5 \mathrm{~cm}$. long; calyx membranous; corolla 5 cm . long, orange and puberulent without, yell $\cdot w \cdot$ within; capsule $13-17 \mathrm{~cm}$. long, very flat, each valve longitudinally $\mathbf{1}$-nerved; seeds broadly winged laterally, narrowly winged above and below. In moist woods, Va. to Fla., La., Ohio and Ill. April-June.
2. TECÒMA Juss.

Climbing woody vines with aerial rootlets, or erect shrubs, with opposite pin. nately compound or sometimes simple leaves, and large red or orange flowers. in terminal corymbs, racemes, or panicles. Calyx tubular-campanulate, unequally 5 -toothed. Corolla-tube elongated, enlarged above the calyx, narrowly campanulate, the limb slightly 2 -lipped, 5 -lobed, the lobes spreading. Anther-bearing stamens 4, didynamous, ascending under the upper lip; anther-sacs divergent, glabrous or slightly pubescent. Capsule elongated, loculicidally and septicidally dehiscent. Seeds in 1,2 or several rows on each side of the margins of the partition, winged, the wing translucent. [From the Aztec name Tecomaxochitl.] About 80 species, of warm and temperate regions. Besides the following, another occurs in the southern U. S.
I. Tecoma radicans (L.) DC. Trumpet-flower. Trumifet-creeffr. (I. F. f. 3366.) Leaves petioled, odd-pinnate, not tendril-bearing. 2-4 dm. long; leaflets $7-\mathbf{I I}$, ovate to lanceolate, short-stalked, sharply serrate, reticulate-veined. glabrous, or pubescent on the veins beneath, acute or acuminate, $3-7 \mathrm{~cm}$. long; flowers corymbose, short-pedicelled; corymbs 2-9-flowered; calyx coriacenas, about 2.5 cm . long; corolla scarlet, $6-7 \mathrm{~cm}$. long, the tube veined within. 3 times as long as the limb; anther-sacs glabrous; stigma spatulate; (apsule stalked, 10-15 cm . long, 2 cm . in diameter, narrowed at both ends. little flattened. ritsed above and below by the margins of the valves; seeds in several rows on cach surface of the partition, broadly winged laterally, the wing eroded. ln moist woods and
thickets, N. J. and Penn. to Fla., Tex., Kans. and Ill. Escaped from cultivation further north. Aug.-Sept.

## I. CATÁLPA Scop.

Trees, or some exotic species shrubs, with opposite or rarely verticillate simple petioled leaves, and large white or mottled flowers in terminal panicles, or corymbs. Calyx closed in the bud, splitting irregularly or into 2 lips in opening. Corollatube oblique, expanded above, 2 -lipped, 5 -lobed, the lobes all spreading, their margins crisped. Anther-bearing stamens 2, ascending under the upper lip of the corolla; anther-sacs glabrous, linear or oblong, divergent; sterile stamens (staminodia) 3, short (or occasionally 4 perfect didynamous stamens and I staminodium). Disk obsolete. Ovary sessile, 2 -celled; ovules in 2-several rows on the sides of the partition. Capsule elongated-linear, terete, loculicidally dehiscent. Seeds flat, the large lateral wings dissected into capillary processes. [The American Indian name of the first species below.] About 7 species, the following in N. Am., 2 in eastern Asia, 2 or 3 in the W. Ind.
Corolla thickly spotted within, $2.5-4 \mathrm{~cm}$. long, the lower lobe entire.

1. C. Catalpa. Corolla little spotted, 5 cm . long, the lower lobe emarginate.
2. C. speciosa.
I. Catalpa Catálpa (L.) Karst. Catalpa. Indian Bean. Candle-tree. Bean-tree. (I. F. f. 3367 .) A tree, with thin flaky bark, the branches spreading. Leaves strong-scented, broadly ovate, entire, or 3 -lobed, acute or acuminate, densely pubescent beneath, becoming glabrous above, obtuse at the base, 1.5-3 dm. long, the lobes, when present, acuminate; petioles stout, nearly as long as the blade; flowers white, numerous, mottled with yellow and purple within, in large terminal erect panicles; corolla-tube campanulate, the lower lobe entire; capsules $2.5-3.3 \mathrm{dm}$. long, $8-10 \mathrm{~mm}$. thick, thin-walled, drooping. In woods in the Gulf States. Escaped from cultivation northward as far as Penn. and southern N. Y. June-July.
3. Catalpa speciòsa Warder. Catawba Tree. Larger Indian Bean. (I. F. f. 3368.) A tree, with thick rough bark, similar to the preceding. Leaves not unpleasantly scented, broadly ovate, commonly entire, long-acuminate; panicles few-flowered; corolla faintly mottled within, the tube obconic, the limb only slightly oblique, the lower lobe emarginate; capsule thick-walled, $2.5-5 \mathrm{dm}$. long, nearly 2 cm . in diameter. In woods, Ill. to Tenn., Mo. and Ark. May-June.

## Family 13. MARTYNIÀCEAE Link. <br> Unicorn-plant Family.

Herbs, with opposite leaves, or the upper alternate, and perfect irregular flowers, racemose in our species. Calyx inferior, 4-5-cleft or $4-5$-parted, or sometimes split to the base on the lower side. Corolla gamopetalous, irregular, the tube oblique, the limb slightly 2 -lipped, 5 -lobed, the lobes nearly equal, the 2 upper ones exterior in the bud. Anther-bearing stamens 4, didynamous, or the posterior pair sterile; anthers 2 -celled, the sacs longitudinally dehiscent. Ovary i-celled, with 2 parietal placentæ expanded into broad surfaces, or $2-4$-celled by the intrusion of the placentæ or by false partitions; ovules, anatropous; style slender; stigma 2 -lobed or 2 -lamellate. Seeds compressed; endosperm none; embryo large; cotyledons fleshy, flat; radicle short, straight. Three genera and io species, mainly tropical.

## r. MARTÝNIA L.

Coarse glandular-pubescent and viscid strong-scented herbs, with long-petioled leaves, and large flowers in short terminal racemes. Calyx i-2-bracteolate at the base. campanulate, inflated, deciduous. Corolla funnelform-campanulate. Anthers gland-tipped, their sacs divergent. Ovary I-celled, the 2 parietal placentæ intruded and expanded in the center of the cavity into broad surfaces bearing the pvules in I or 2 rows. Fruit an incurved beaked loculicidally 2 -valved capsule,
the exocarp somewhat fleshy, the endocarp fibrous, woody, crested below or also above, 4 -celled by the extension of the placentæ. Seeds numerous, tuberculate. [Named for John Martyn, 1693-1768, professor of botany at Cambridge, England.] About 8 species, natives of America. Besides the following, 2 others occur in the southwestern U. S.
I. Martynia Louisiàna Mill. Unicorn-plant. Elephant's Trunk. Dou. bied.CLAW. (I. F. f. 3369.) Annual; stem stout, the branches prostrate or ascending, $3-10 \mathrm{dm}$. long. Leaves broadly ovate to orbicular, rounded at the apex, cordate at the base, repand, undulate or entire, $0.7-3 \mathrm{dm}$. in diameter, the petiole stout; calyx somewhat cleft on the lower side; racemes several-flowered; pedicels slender; corolla whitish or yellowish, mottled with purple or yellow within, $3-5 \mathrm{~cm}$. long, the lobes obtuse; fruit curved, $\mathbf{1}-\mathbf{1} .5 \mathrm{dm}$. long, the beak longer than the body, splitting into 2 elastically diverging segments, the endocarp crested on the under side. In waste places, escaped from gardens, Me. to N. J. and N. Car. Native from Iowa, Ill. and Kans. southward. July-Sept.

Family 14. ACANTHÀCEAE J. St. Hil.

## Acanthus Family.

Herbs, or some tropical genera shrubs or small trees, with opposite simple exstipulate leaves, and irregular or nearly regular perfect flowers. Calyx inferior, persistent, 4-5-parted or $4-5$-cleft, the sepals or segments imbricated. Corolla gamopetalous, nearly regularly 5 -lobed, or 2 -lipped. Anther-bearing stamens 4, didynamous, or 2 only; anther-sacs longitudinally dehiscent. Disk annular, or cup-like. Ovary 2-celled ; ovules 2-Io in each cavity, anatropous or amphitropous; style filiform, simple; stigmas I or 2. Capsule dry, 2 -celled, loculicidally elastically 2 -valved. Seeds not winged, borne on curved projections (retinacula) from the placentæ, the testa close, mostly roughened, often developing spiral threads and mucilage when wetted. Endosperm in the following genera none; cotyledons flat, commonly cordate. About 175 genera and 1800 species, natives of temperate and tropical regions.
Corolla convolute in the bud, nearly regular; stamens 4. Ovules 2 in each cavity; capsule $2-4$-seeded.

Ovules 3 -roin each cavitv; capsule 6-20-seeded.
Corolla imbricated in the bud, strongly 2 .lipped; stamens 2.
Lower lip of the corolla 3 -cleft; flowers bracted, not involucrate.
Lower lip of the corolla entire or 3 -toothed; flowers involucrate.

1. Calophanes. 2. Ruellia.
2. Dianthera.
3. Diapedium.

## 1. CALÓPHANES D. Don.

Perennial herbs or shrubs, with entire leaves (smaller ones sometimes fascicled in their axils), and blue or purple, rather large, axillary bracted flowers. Calyx deeply 5 -cleft, the lobes setaceous. Corolla funnelform, the tube slightly curved, the limb spreading, 5 -lobed, somewhat 2 -lipped, the lobes rounded. Stamens included; anther-sacs mucronate at the base. Summit of the style recurved; stigma simple, or of 2 unequal lobes. Capsule oblong. linear, narrowed at the base. Seeds flat, orbicular, attached by their edges to the retinacula. [Greek, beautiful appearance.] About 30 species, of wide distribution. Besides the following, 4 others occur in the southern U. S.
I. Calophanes oblongifòlia (Michx.) D. Don. Calophanes. (I. F. f. 3370.) Rootstocks horizontal, slender. Stems slender below. pubescent or puberulent, obtusely 4 -angled, $\mathbf{I}$.5-4 dm. high. Leaves ascending or erect. oblong or oval, rounded at the apex, short-petioled, or sessile, $1.5-3 \mathrm{~cm}$. long; flowers commonly solitary in the axils; calyx-segments filiform, hirsute, excceding the ohbong obtuse bractlets; corolla blue, or mottled with purple. $1.5-2.5 \mathrm{~cm}$. lomis. its tube enlarged above; capsule oblong, about one-half the length of the cilyx: anther-sacs mucronatearistate at the base. In sandy pine barrens, Va. to Fla. June-Scpt.

## 2. RUELLIA L.

Perennial herbs, or shrubs, mostly pubescent, with entire or rarely dentate leaves and large flowers, solitary or clustered in the axils, or cymose in terminal panicles. Calyx 5 -cleft, or 5 -parted, the segments narrow. Corolla funnelform or salverform, the tube usually narrow, slightly enlarged above, the limb spreading, 5lobed, the lobes obtuse. Anther-sacs not mucronate at the base. Apex of the style recurved; stigma simple, or of 2 unequal lobes. Capsule oblong or club-shaped. Seeds compressed, ovate or orbicular, attached by their edges to the retinacula. [Named for I. De la Ruelle, 1474-1537, an early French herbalist.] About 200 species, mainly of tropical America. Besides the following, some 5 others occur in the southern U. S.
Flowers sessile or nearly so.
Calyx-segments linear-lanceolate, scarcely exceeding the capsule. I. R. strepens.
Calyx-segments filiform-linear, exceeding the capsule.
Leaves sessile or very short-petioled.
Leaves slender-petioled.
2. R. ciliosa.
3. R. parvifora.

Flowers peduncled; peduncle with two large bracts at the summit.
I. Ruellia strèpens L. Smooth Ruellia. (I. F. f. 337 I.) Glabrate, or somewhat pubescent; stem 4 -sided, 3-12 dm. high. Leaves oblong, oval, or ovate, petioled, acute or subacute at the apex, narrowed at the base, $7-15 \mathrm{~cm}$. long; flowers solitary or several together in the axils: calyx-segments linear-lanceolate, shorter than the corolla-tube, slightly pubescent or ciliate, $\mathbf{I} .5-2.5 \mathrm{~cm}$. long, $\mathbf{x}-2 \mathrm{~mm}$. wide; corolla blue, $3-5 \mathrm{~cm}$. long, the limb nearly as broad, the tube about as long as the throat and limb; capsule club-shaped. In dry woods, Penn. to Wis., Fla. and Tex. May-July.

Ruellia strèpens micrántha (Engelm. \& Gray) Britton. Flowers mostly cleistogamous; leaves often narrower. Range of the type.
2. Ruellia ciliòsa Pursh. Hairy Ruellia. (I. F. f. 3372.) Hirsute or pubescent, 3-6 dm. high. Leaves hairy, ciliate, oblong, oval, or ovate, sessile or short-petioled, obtuse or subacute, 3-7 cm. long; flowers clustered or solitary in the axils, sometimes cleistogamous; calyx-segments filiform, hirsute, $2-2.5 \mathrm{~cm}$. long, 0.5 mm . wide; corolla blue, $3.5-5 \mathrm{~cm}$. long, the tube equalling or longer than the obconic throat and nearly regular limb; capsule shorter than the calyx, In dry soil, N. J. and Penn. to Fla., Mich., Kans. and La. June-Sept.
3. Ruellia parvifiòra (Nees) Britton. Southern Ruellia. Less pubescent than the preceding, sometimes merely puberulent. Leaves ovate to lanceolate, 5-12 cm . long, acute, or the lower obtuse ; calyx-segments nearly filiform, ciliate. In woods and thickets Md. to W.Va., Fla. and Tex. May-Aug.
4. Ruellia pedunculàta Torr. Stalked Ruellia. (I. F. f. 3373.) Finely pubescent, 3-8 dm. tall. Leaves ovate to oblong-lanceolate, acute or acuminate at the apex, narrowed at the base, short-petioled, the larger $5-8 \mathrm{~cm}$. long; peduncles $2-8 \mathrm{~cm}$. long, with 2 leaf-like bracts at the summit which subtend a solitary flower, or 2 or 3 slender-pedicelled ones with pedicels similarly bracted; calyx-segments awnlike, equalling the narrow corolla-tube, or shorter; corolla funnelform, $3-5 \mathrm{~cm}$. long; capsule about 2 cm . long, puberulent, longer than the calyx. In dry soil, Mo. to Ark. and La. June-Sept.

## 3. DIANTHERA L.

Herbs, mostly perennial, with entire or rarely dentate leaves, and very irregular flowers, variously clustered or solitary in the axils. Calyx deeply $4-5$-parted, the segments narrow. Corolla-tube slender; upper lip interior in the bud, erect or ascending, concave; lower lip spreading, 3 -cleft. Stamens 2, inserted on the throat of the corolla, not exceeding the upper lip: anther-sacs slightly divergent, not mucronate, separated by a rather broad connective. Ovules 2 in each cavity of the ovary; style slender. Capsule contracted at the base into a long stipe, about 4seeded. Seeds flat, orbicular or ovate, the placentæ not separating from the walls of the capsule. [Greek, double anthers.] About 100 species, mostly of tropical Am. Besides the following, 4 others occur in the southern U. S.

Flowers capitate, the heads dense, at length oblong. Flowers in loose spikes.

Flowers in pairs in the spikes.
Flowers scattered singly along the spikes.

1. D. Americana.
2. D. ovata.
3. D. lanceolata.

## I. Dianthera Americàna L. Dense-flowered Water Willow. (I. F. f.

 3374.) Perennial, glabrous; stem erect, angled, slender, usually simple, 3-9 dm. high. Leaves lanceolate or linear-lanceolate, gradually acuminate, $7-15 \mathrm{~cm}$. long, entire, narrowed at the base into short petioles, or sessile; flowers violet, or nearly white, capitate-spicate at the ends of slender axillary peduncles; bractlets linearsubulate, shorter than the flowers; corolla $10-12 \mathrm{~mm}$. long, its tube shorter than the lips, the base of the lower lip rough and palate-like; capsule 12 mm . long, exceeding the calyx, its stipe about the length of the slightly compressed body. In water and wet places, Ont. to Mich., Kans., Ga. and Tex. May-Aug.2. Dianthera ovàta Walt. Loose-flowered Water Willow. (I. F. f. 3375.) Perennial, glabrous; stem ascending or erect from a horizontal base, I.5-5 dm. high, simple, or sparingly branched. Leaves short-petioled, or sessile, ovate, oblong, oval to elliptic-obovate, $2-8 \mathrm{~cm}$. long, $8-35 \mathrm{~mm}$. wide; flowers in loose slender-peduncled axillary spikes; peduncles shorter than or little exceeding the leaves; calyx-segments narrowly linear, much longer than the bracts and bractlets; corolla pale purple, $8-10 \mathrm{~mm}$. long; capsule $10-\mathbf{1 2} \mathrm{mm}$. long. In wet soil, Va. to Fla. and Tex. June-Aug.
3. Dianthera lanceolàta (Chapm.) Small. Narrow-leaved Water WilLow. Perennial, often minutely puberulent; stems erect or spreading, $1-3 \mathrm{dm}$. long. Leaves linear to linear-elliptic or elliptic-lanceolate, $3-10 \mathrm{~cm}$. long, often acuminate, undulate, sessile, or nearly so; spikes slender, $3-10 \mathrm{~cm}$. long, the flowers scattered singly and quite evenly along one side of the peduncle; calyxsegments narrowly linear, 5-7 mm. long; corolla about 1 cm . long, the lips nearly as long as the tube, which is saccate at the base; capsules about 1.5 cm . long, the body as long as the stipe-like base or shorter. In swampy grounds, Mo. to Tenn., Fla. and Tex. May-Aug. (D. ovata var. lanceolata Chapm.)

## 4. DIAPEDIUM Konig.

Herbs, with entire petioled leaves, and blue, red, or violet flowers, subtended by involucres of $2-4$ bracts, the inflorescence mostly cymose or spicate, the involucres subtending I flower or several. Calyx 4-5-cleft, the lobes linear or subulate. Corolla-tube slender, slightly enlarged above; upper lip erect, concave, interior in the bud; lower lip spreading, entire or 3 -toothed. Stamens 2; anther-sacs parallel, sometimes unequal, separated by .a narrow connective. Style filiform; ovules 2 in each cavity of the ovary. Capsule flattened, ovate or suborbicular, $2-4$-seeded. Placentæ separating elastically from the walls of the capsule. Seeds compressed, nearly orbicular. About 60 species, of warm and tropical regions. Besides the following, 4 others occur in the southern U. S.
I. Diapedium brachiàtum (Pursh) Kuntze. Diapedium. (I. F. f. 3376.) Annual (?), glabrate, or pubescent; stem slender, 6-grooved, erect, much branched, 3-6 dm. high. Leaves ovate, membranous, long-petioled, acuminate or acute, $7-15 \mathrm{~cm}$. long; inflorescence paniculate, the involucres 1-4-flowered, each of 2 oblong or obovate, opposite bracts; corolla $1.5-2.5 \mathrm{~cm}$. long, pink or purple, the lips about as long as the slender tube; upper lip 2-3-toothed, the lower entire; capsule oblong, 4-6 mm. high, a little longer than the involucre, the valves slightly divergent in dehiscence, the placentæe curving upward and remaining attached to their summits. In moist thickets, Kans. and Ind. Terr. to Tex., Fla. and N. Car. July-Oct.

Family 15. PHRYMÀCEAE Schauer.
Lopseed Family.
An erect perennial herb with divaricate branches, opposite membranous simple leaves, and small irregular purplish flowers, distant in slender elongated spikes. Calyx cylindric, z-lipped; upper lip z-cleft, the teeth setaceous; lower lip much shorter, 3 -toothed, the teeth subu-
late. Corolla-tube cylindric, the limb 2 -lipped; upper lip erect, concave, emarginate ; lower lip larger, spreading, convex, 3 -lobed, the lobes obtuse. Stamens 4, didynamous, included. Ovary oblique, I-celled; ovule I, orthotropous, ascending; style slender; stigma 2 -lobed. Calyx reflexed in fruit, enclosing the dry achene, becoming prominently ribbed, closed and its teeth hooked at the ends. Cotyledons convolute; radicle superior. Consists of the following:

## 1. PHRỲMA L.

A monotypic genus of eastern N. Am., eastern and central Asia.
I. Phryma Leptostàchya L. Lopseed. (I. F. f. 3377.) Puberulent; stem somewhat 4 -sided, sometimes constricted above the nodes, branched above, the branches slender, elongated, divergent. Leaves ovate, acute or acuminate, coarsely dentate, $5-15 \mathrm{~cm}$. long, the lower petioled, the upper often nearly sessile; spikes very narrow, $7-15 \mathrm{~cm}$. long; flowers about 6 mm . long, mostly opposite, distant, borne on very short minutely 2 -bracteolate pedicels, at first erect, soon spreading, the calyx, after flowering, abruptly reflexed against the axis of the spike. In woods and thickets, Can. to Minn., Fla. and Kans. June-Aug.

## Order 6. PLANTAGINÀLES.

Only the following family :

## Family 1. PLANTAGINÀCEAE Lindl.* <br> Plantain Family.

Herbs, with basal, or, in the caulescent species, opposite or alternate leaves, and small perfect polygamous or monœcious flowers, bracteolate in spikes or heads, or rarely solitary. Calyx 4-parted, inferior, peristent, the segments imbricated. Corolla hypogynous, scarious or membranous, mostly marcescent, 4 -lobed. Stamens 4 or 2 (only 1 in an Andean genus), inserted on the tube or throat of the corolla; filaments filiform, exserted or included; anthers versatile, 2 -celled, the sacs logitudinally dehiscent. Ovary sessile, superior, I-2-celled, or falsely $3-4$-celled. Style filiform, simple, mostly longitudinally stigmatic. Ovules I-several in each cavity of the ovary, peltate, amphitropous. Fruit a pyxis, circumscissile at or below the middle, or an indehiscent nutlet. Seeds r-several in each cavity of the fruit ; endosperm fleshy; cotyledons narrow ; radicle short, mostly straight. Three genera and over 200 species, of wide distribution.
Flowers in spikes or heads; fruit a pyxis. $\quad$ I. Plantago. Flowers monœecious, the staminate solitary, peduncled, the pistillate sessile among the linear leaves ; fruit indehiscent.
2. Littorella.

## I. PLANTAGOL.

Leafy-stemmed, short-stemmed or acaulescent herbs, with opposite, alternate or basal leaves, bearing axillary or terminal spikes or heads of small greenish or purplish flowers (flowers solitary in a few exotic species). Calyx-segments equal, or two of them larger. Corolla salverform, the tube cylindric, or constricted at the throat, the limb spreading in anthesis, erect, spreading or reflexed in fruit, 4-lobed or 4 -parted. Stamens 4 or 2. Ovary 2 -celled, or falsely 3 -4-celled; ovules r-several in each cavity. Fruit a membranous pyxis, mostly 2 -celled. Seeds various, sometimes hollowed out on the inner side. [The Latin name.] Over 200 species, of wide geographic distribution. Besides the following, some 28 others

[^46]occur in the western and southwestern parts of N. Am. Known as Plantain, Ribwort or Road-weed.

* Stem acaulescent; flowers spicate or capitate at the ends of scapes.

Corolla-lobes spreading or reflexed in fruit, not closed over the top of the pyxis. Leaves ovate, lanceolate or oblong.

Seeds several or many in each pyxis.
Pyxis ovoid, circumscissile at about the middle. r. P. major.
Pyxis oblong, circumscissile much below the middle. 2. P. Rugelii.
Seeds 2-4 in each pyxis.
Leaves all narrowed at the base, parallel-ribbed. Seeds excavated on the inner side.
3. P. lanceolata. Seeds flat or but slightly concave on the inner side. Capsule equalling or a little longer than the calyx. Spike very dense ; leaves pubescent. 4. P. media. Lower flowers scattered; leaves glabrous or very nearly so.
5. P. eriopoda. Capsule twice as long as the calyx.
6. P. sparsiflora.

Leaves, or some of them, cordate ; veins starting from the midrib.
7. P. cordata.

Leaves linear or filiform.
Leaves fleshy; plant maritime.
8. P. maritima.

Leaves not fleshy ; plants not maritime.
Spike densely tomentose ; bracts usually not longer than flowers.
9. P. Purshii.

Plant light green and villous ; bracts twice as long as the flowers. 1о. $P$. spinulosa.
Plant dark green and pubescent ; bracts much longer than the flowers. 11. P. aristata.

Corolla-lobes erect and closed over the top of the pyxis. Leaves spatulate to obovate ; stamens 4.
12. $P$. Virginica.

Leaves linear-filiform ; stamens 2.
Capsule about 4 -seeded, slightly exceeding the calyx.
13. $P$. elongata.

Capsule 8-20-seeded, twice as long as the calyx.
14. P. heterophylla.

* Stem erect, leafy; flowers capitate at the ends of axillary peduncles.

15. P. arenaria
16. Plantago màjor L. Common, or Greater Plantain. (I. F. f. 3378 .) Perennial, glabrous or pubescent; rootstook short, thick, erect. Leaves longpetioled, mostly ovate, entire, or coarsely dentate, $2.5-25 \mathrm{~cm}$. long, $3-1$-ribbed; scapes $0.5-9 \mathrm{dm}$. high; spike linear-cylindric, usually dense, commonly blunt, $5-25 \mathrm{~cm}$. long, $6-8 \mathrm{~mm}$. thick; flowers perfect, proterogynous; sepals broadly ovate to obovate, scarious margined, one-half to two-thirds as long as the obtuse or subacute, $5-16$-seeded pyxis; stamens 4 . In waste places, nearly throughout N. Am. Nat. from Europe, or perhaps indigenous in the far North and on salt meadows. May-Sept.
17. Plantago Rugèlii Dec. Rugel's Plantain. (I. F. f. 3379.) Similar to the preceding, the spikes less dense, at least toward the base, usually long-attenuate at the summit, sometimes $\mathbf{I} \mathrm{cm}$. thick. Sepals oblong, prominently keeled on the back; pyxis 4-6 mm. long, twice as long as the sepals, circumscissile much below the middle and entirely within the calyx, 4-10-seeded; corolla-lobes spreading or reflexed on the summit of the pyxis; stamens 4. In fields, woods and waste places, Me. and Ont. to S. Dak., Fla., Neb. and Tex. Petioles commonly purple at the base. Usually brighter green and with thinner leaves than $l$. major. June-Sept.
18. Plantago lanceolàta L. Ribwort. Rib-grass. (I. F. f. 33So.) Perennial or biennial, pubescent; rootstock short, erect, with tufts of brown hairs at the bases of the leaves. Leaves narrowly oblong-lanceolate, shorter than the scapes, entire, acute or acuminate, gradually narrowed into petiole's, 35 -ribbed, $5-30 \mathrm{~cm}$. long; scapes slender, channelled, sometimes 7.5 dm . tall; spikes dense. at first ovoid, becoming cylindric, blunt and $1-10 \mathrm{~cm}$. long in fruit. S-12 mm . thick; flowers perfect, proterogynous; sepals ovate, with a narrow green midrib and broad scarious margins, the two lower ones commonly united; corolla glabrous; filaments white; pyxis oblong, very obtuse, z-sceded. slighty longer than the calyx, circumscissile at about the middle. In fields and waste places. N. B. to the N. W. Terr., Br. Col., Fla. and Kans. Nat. from Europe. April-Nov.
19. Plantago mèdia L. Hoary Playtain. (I. F. f. 338r.) Perennial, the short rootstock clothed with brown hairs. Leaves spreading. ovate, oblong or elliptic, entire, or repand-dentate. densely canescent. 5-7-ribbed, narrowed into margined petioles; scapes slender, much longer than the leaves, 3-6 dm. tall; spikes dense, cylindric, $2-8 \mathrm{~cm}$. long in fruit; flowers perfect; sepals all distinct, oblong, with a narrow green midrib and broad scarious margins; corolla glabrous; stamens pink or purple; pyxis oblong, obtuse, $2-4$-seeded, the seeds concave on the face; stamens 4. In waste places, Me., R. I., Ont. and N. I. Adventive from Europe. May-Sept.
20. Plantago eriópoda Torr. Saline Plantain. (I. F. f. 3382.) Perennial, succulent; rootstock usually covered with long brown hairs among the bases of the leaves. Leaves oblong, oblong-lanceolate, or oblanceolate, entire, or repand-dentate, acute, narrowed into petioles, $5-9$-ribbed. $0.7-3 \mathrm{dm}$. long, glabrous or nearly so; scapes stout, pubescent. longer than the leaves. 1.5-4.5 dm. high; spikes $2-13 \mathrm{~cm}$. long. dense above, the lower flowers scattered; flowers perfect; sepals distinct, oblong-obovate with broad scarious margins; corolla glabrous, its lobes spreading or reflexed; pyxis ovoid-oblong, very obtuse. one-third longer than the calyx, 2-4-seeded. circumscissile below the middle. In maritime or saline soil, N. S. and Quebec to Minn., Cal. and the N. W. Terr. June-Sept.
21. Plantago sparsifiòra Michx. Southern Plantain. (I. F. f. 3383.) Perennial, pubescent. or glabrate; scapes slender. sometimes 6 dm . tall. Leaves thin, oblong-lanceolate, $0.7-2.5 \mathrm{~cm}$. long, 5-7-ribbed, acute or acuminate, entire, narrowed into slightly margined petioles; spikes loosely flowered, sometimes 3 dm . long; flowers perfect; sepals oblong or oval. rather rigid, with narrow scarious margins; corolla glabrous, its lobes not erect over the fruit; prxis oblong, 5 mm . long, 2 -seeded, circumscissile below the middle; seeds convex on the back. slightly concave on the face. In sandy dry soil, N. Car. to Fla. and in southern Ill.
22. Plantago cordáta Lam. Heart-leated Plantain. Nater Plantain. (I. F. f. 3384.) Perennial. glabrous, purple-green; rootstock short. stout. Leaves broadly ovate or nearly orbicular. pinnately reined, entire or dentate, rounded, abruptly narrowed, or cordate at the base. often 2.5 dm . long; petioles stout. margined above; scapes longer than the leaves; spikes loosely flowered, sometimes 3 dm . long, with interrupted clusters; flowers perfect; sepals ovate to obovate, obtuse. green; corolla-lobes spreading; prxis ovoid-globose. obtuse. circumscissile at or slightly below the middle. I-4-seeded; seeds not excavated on the face. In swamps and along streams, N. Y. to Ala., Mo. and La. March-July.
23. Plantago marítima L. Sea or Seliside Plaitain. (I. F. f. 3385.) Annual, biennial, or perennial, fleshy; rootstock sometimes with tufts of whitish hairs among the bases of the leaves. Leaves linear. glabrous, obscurely nerved, sessile, or narrowed into short margined petioles, $5-25 \mathrm{~cm}$. long. entire, or with a very few small teeth. $2-5 \mathrm{~mm}$. wide; scapes slender. more or less pubescent, longer than or equalling the leaves; spikes dense. linear-cylindric. blunt, $2.5-13 \mathrm{~cm}$. long; flowers perfect; sepals ovate-lanceolate to nearly orbicular. green, somewhat keeled; corolla pubescent without, its lobes spreading; pyxis ovoid-oblong, obtuse, $2-4$-seeded, circumscissile at about the middle. nearly twice as long as the caly; seeds nearly flat on the face. In salt marshes and on seashores, Lab. to N. J., and on the Pacific Coast from Alaska to Cal. Also on the coasts of Europe and Asia. JuneSept.
24. Plantago Púrshii R. \& S. Pursh's Plantain. (I. F. f. 3386.) Annual, woolly or silky, pale green; scapes slender. $5-35 \mathrm{~cm}$. tall. Leaves ascending, linear, acute or acuminate, narrowed into margined petioles. 3 -nerved, $3-8 \mathrm{~mm}$. wide, entire, or rarely with a few small teeth; spikes usually dense, cylindric, obtuse, $2.5-13 \mathrm{~cm}$. long, about 6 mm . in diameter. exceedingly villous; bracts rigid, equalling or slightly exceeding the flowers; flowers perfect but heterogonous, many of them cleistogamous; sepals oblong. obtuse. scarious-margined; corollalobes broadly ovate, spreading: stamens. 4; pyxis oblong, obtuse. 2.5 mm . long, little exceeding the calyx. 2 -seeded, circumscissile at about the middle; seeds convex on the back, deeply concave on the face. On dry plains and prairies, Ill. and western Ont. to Br. Col., Tex. and Mex. May-Aug.
io. Plantago spinulòsa Decne. Spinclose Plavtain. Intermediate in aspect between the preceding and the following species. Annual, pubescent, pale
green, scapes $5-10 \mathrm{~cm}$. high. Leaves nearly linear, acuminate, entire, 3-ribbed, 3-6 mm. wide; spikes rather interrupted, cylindric, villous; bracts pubescent, linear, rather spreading, two to five times as long as the flowers; sepals spatulateoblong, obtuse, scarious, with green midribs; corolla-lobes ovate, obtuse, reflexed; pyxis equalling the calyx, oval, obtuse, 2.5 mm . long, circumscissile at the middle. Assiniboia to Mont. and S. Dak., southward to Tex.
ir. Plantago aristàta Michx. Large-bracted Plantain. (I. F. f. 3387.) Annual, dark green, pubescent; scapes stout, erect, $7-30 \mathrm{~cm}$. tall, exceeding the leaves. Leaves linear, acuminate at the apex, entire, narrowed into slender petioles, sometimes prominently 3 -ribbed $\mathbf{I}-5 \mathrm{~mm}$. wide; spikes very dense, cylindric, 3-12 cm . long, pubescent; bracts puberulent, linear, elongated, ascending, the lower often 10 times as long as the flowers; pyxis 2 -seeded; the seeds concave on the face. On dry plains and prairies, Ill. to La. and Tex., S. Dak., Br. Col. and N. Mex. Also widely adventive as a weed in the eastern States from Me. to Ga. May-Oct.
25. Plantago Virgínica L. Dwarf or White Dwarf Plantain. (I. F. f. 3388.) Annual or biennial, pubescent or villous; scapes erect, $2.5-45 \mathrm{~cm}$. high, much longer than the leaves. Leaves spatulate or obovate, thin, entire, or repanddenticulate, narrowed into margined petioles, or almost sessile, 3-5-nerved; spikes dense, or the lower flowers scattered, linear-cylindric, obtuse, 6-8 mm. thick, flowers imperfectly diœcious; corolla-lobes of the fertile plants erect and connivent on the top of the pyxis, those of the sterile spreading; stamens 4 ; pyxis oblong, about as long as the calyx, 2-4-seeded. In dry soil, Conn. to Fla., Ill., Mo., Ariz. and Mex. March-July.

Plantago occidentàlis Decne. (P. Virginica var, longifolia A. Gray), of the Southwest, with larger leaves, longer spikes, and larger flowers may be specifically distinct. It is reported from Missouri.
13. Plantago elongàta. Pursh. Slender Plantain. (I. F. f. 3389.) Annual, puberulent; scapes filiform, $5-18 \mathrm{~cm}$. high, longer than the linear-filiform, mostly entire, blunt, obscurely r-nerved leaves. Leaves about I mm. wide; spikes slender, linear, rather loosely flowered, $\mathbf{x}-8 \mathrm{~cm}$. long, $3-4 \mathrm{~mm}$. thick; flowers imperfectly diœcious, or polygamous; sepals oblong, obtuse, about as long as the bract, scarious-margined; corolla-lobes of the more fertile plants becoming erect over the pyxis; pyxis ovoid-oblong, obtuse, circumscissile at about the middle; seeds nearly flat on both sides. In dry sandy soil, Conn. to N. Y., Va., La., Ill., S. Dak. and Tex. April-Aug.
14. Plantago heterophýlla Nutt. Many-seeded Plantain. (I. F. f. 3390.) Annual, similar to the proceding, but glabrous or slightly puberulent; scapes 5-25 cm . long. Leaves narrowly linear or filiform, the larger about 4 mm . wide, entire or often with distant small teeth or linear lobes; spikes loose, linear, $\mathrm{I}-\mathrm{I} 3 \mathrm{~cm}$. long; sepals oblong, obtuse, scarious-margined, mostly shorter than the bract; corollalobes in the more fertile plants becoming erect over the pyxis; pyxis oblong, subacute, circumscissile rather below the middle; seeds somewhat angled. scarcely concave on the face. In moist soil, N. J. to Fla., Tenn., Tex. and Cal. AprilJuly.
15. Plantago arenària W. \& K. Sand Plantain. (I. F. f. 3301.) Amual, pubescent, somewhat viscid; stem commonly becoming much branched, leafy, 0.7-廿 dm. high. Leaves opposite, or whorled, narrowly linear, entire, sessile, 2.8 cm . hong. about 2 mm . wide; peduncles axillary, often umbellate at the ends of the hranches. slender; heads of flowers $\mathbf{I}-2 \mathrm{~cm}$. long, about $\mathbf{I c m}$. thick; lower bracts acute or acuminate; calyx-lobes unequal: corolla-lobes acute; capsule 2-seeded. Dayton, Ohio. Adventive or fugitive from Europe. Summer.

## 2. Littorélla i.

A low perennial succulent herb, with linear entire basal leaves and monoccious flowers, the staminate solitary or two together at the summits of slemder scapes, the pistillate sessile among the leaves. Sepals $f$. Corolla of the staminate flowers with a somewhat urceolate tube, and a spreading f-hoded limb. Corolla of the pistillate flowers urn-shaped, $3-4$ toothed. Staminate flowers with + lomg-exserted stamens, their filaments filiform, the anthers ovate. Pistillate flowers with a single
ovary and a long-exserted filiform style. Fruit an indehiscent $\mathbf{1}$-seeded nutlet. [Latin, shore.] A monotypic genus of Europe and N. Am.
I. Littorella unifìra (L.) Rusby. Plantain Shore-weed. Shore-grass. (I. F. f. 3392.) Tufted, usually growing in mats; leaves bright green, $2-8 \mathrm{~cm}$. long, $\mathbf{I}-\mathbf{2} \mathrm{mm}$. wide, spreading or ascending, mostly longer than the scapes of the staminate flowers, which bear a small bract at about the middle; sepals lanceolate, mostly obtuse, sometimes only 3 in the fertile flowers; stamens conspicuous, $8-12$ mm . long; corolla-lobes ovate, subacute; pistillate flowers very small; nutlet about 2 mm . long. Borders of lakes and ponds, Me. and Vt. to N. S. and Ont. JulyAug.

## Order 7. RUBIÀES.

Corolla gamopetalous. Anthers separate, the stamens as many as the corolla-lobes and alternate with them (one fewer in Linnca of the Caprifoliaceae) or twice as many. Ovary compound, inferior, adnate to the calyx-tube. Ovules I or more in each cavity of the ovary. Leaves opposite or verticillate.
Stamens as many as the corolla-lobes.
Leaves always stipulate, usually blackening in drying.
Fam. 1. Rubiaceae.
Leaves usually estipulate, not blackening in drying.
Fam. 2. Caprifoliuceae. Stamens twice as many as the corolla-lobes; low herb with ternately divided leaves.

Fam. 3. Adoxaceae.

## Family I. RUBIÀCEAE B. Juss.

Madder Family.
Herbs, shrubs, or trees, with simple, opposite or sometimes verticillate, mostly stipulate leaves, and perfect, often dimorphous or trimorphous, regular and nearly symmetrical flowers. Calyx-tube adnate to the ovary, its limb various. Corolla funnelform, club-shaped, campanulate, or rotate, 4-5 lobed. Stamens as many as the lobes of the corolla and alternate with them, inserted on its tube or throat. Ovary i-ro-celled ; style simple or lobed; ovules $1-\infty$ in each cavity. Fruit a capsule, berry, or drupe. Seeds various ; seed-coat membranous or crustaceous; endosperm fleshy or horny (wanting in some exotic genera); cotyledons ovate, cordate, or foliaceous.

About 355 genera and 5500 species of wide distribution.

* Leaves opposite, stipulate (sometimes verticillate in No. 3),

Ovules numerous in each cavity of the ovary; herbs.

Top of the capsule free from the ovary; seeds few, peltate.
Capsule wholly adnate to the ovary; seeds minute, angular. Ovules I in each cavity of the ovary.

Shrubs or small trees; flowers in dense globular heads.
Low evergreen herbs; flowers 2 together, their ovaries united.
Herbs; flowers axillary, nearly sessile, distinct. Capsule separating into 2 dehiscent carpels. Capsule separating into 2 (or 3 ) indehiscent carpels.
** Leaves appearing verticillate; herbs (some of the leaves rarely opposite in No. 7.

1. Houstonia.
2. Oldenlandia.
3. Cephalanthus.
4. Mitchella.
5. Spermacoce.
6. Diodia.
7. Galium.

Corolla funnelform.
Flowers in involucrate heads.
Flowers in panicles.
8. Sherardia.
9. Asperula.

## 8. HOUSTÒNIA L.

Usually tufted herbs, with opposite entire often ciliate leaves, and small blue purple or white, mostly dimorphous flowers. Calyx-tube globose or ovoid, 4-lobed, the lobes distant. Corolla funnelform or salverform, 4 -lobed, the lobes valvate. Stamens 4, inserted on the tube or throat of the corolla. Ovary 2-celled. Style slender ; ovules numerous; stigmas 2, linear. Capsule partly inferior, its summit
free from the calyx, globose-didymous, or emarginate at the apex, loculicidally dehiscent above. Seeds peltate, concave, not angled. Seed-coat reticulate or roughened; endosperin horny; embryo club-shaped. [Named in honor of Dr. William Houston, botanist and collector in South America, died 1733.] About 25 species, of N. Am. and Mex.

* Plants $2.5-18 \mathrm{~cm}$. high; peduncles r -flowered.

Peduncles filiform, $2.5^{-6} \mathrm{~cm}$. long.
Erect; leaves obovate or spatulate, narrowed into petioles. 1. H1. coerulea.
Diffuse or spreading; leaves nearly orbicular.
2. H. serpyllifolia.

Peduncles o.6-3.5 cm. long, stouter.
Calyx-lobes narrow, about equalling the capsule.
3. $H$. minor.

Calyx-lobes broad, much exceeding the capsule.
4. H. minima.
** Plants $10-45 \mathrm{~cm}$. high; flowers cymose.
Calyx-lobes lanceolate-subulate, 2 to 3 times as long as the capsule. 5. H. lanceolata.
Calyx-lobes linear-subulate, scarcely longer than the capsule.
Leaves broad, ovate, ovate-lanceolate, or lanceolate.
6. $H$ purpurea.

Leaves oblong or spatulate, ciliate.
7. H. ciliolata.

Leaves linear-lanceolate or oblanceolate, not ciliate.
8. H. longifolia.

Leaves filiform or narrowly linear.
Flowers loosely cymose on filiform pedicels; leaves not fascicled.
9. H. tenuifolia.

Flowers densely cymose on very short pedicels; leaves usually fascicled. 10. H. angustifolia.
I. Houstonia coerùlea L. Bluets. Innocence. (I. F. f. 3393.) Erect, $7-18 \mathrm{~cm}$. high, glabrous, or nearly so, perennial by slender rootstocks, forming dense tufts. Lower and basal leaves spatulate or oblanceolate, about 12 mm . long, sometimes hirsute or ciliate, narrowed into a petiole, the upper oblong, sessile; flowers solitary on filiform peduncles; corolla salverform, violet, blue, or white, with a yellow center, $8-12 \mathrm{~mm}$. broad, its tube slender and about the length of the lobes; capsule didymous, compressed, about 4 mm . broad, broader than long, the upper half free from the calyx and shorter than its lobes. In open grassy places, or on wet rocks, N. S. t. Quebec, Mich., Ga. and Ala. April-July, or producing a few flowers through the summer.
2. Houstonia serpyllifolia Michx. Thyme-Leaved Bluets. (I. F. f. 3394.) Perennial ; stems prostrate or diffuse, slender, glabrous, $\mathbf{I}-2.5 \mathrm{dm}$. long. Leaves orbicular or broadly oval, abruptly petioled, $6-8 \mathrm{~mm}$. long, sometimes hispidulous, or those of the flowering stems narrower, distant ; corolla usually deep blue, $8-\mathbf{1 2} \mathbf{~ m m}$. broad, its tube rather shorter than the lobes; capsule similar to that of the preceding, but usually slightly larger, nearly as long as the calyx. Mountains of Penn., Va. and W. Va. to S. Car. and Tenn. May.
3. Houstonia minor (Michx.) Britton. Small Bluets. (I. F. f. 3305.) Annual, glabrous or nearly so, branched from the base, $2-15 \mathrm{~cm}$. high. Lowerand basal leaves oval or ovate, $10-12 \mathrm{~mm}$. long, narrowed into petioles, the upper narrower and sessile; corolla violet-blue or purple, $6-8 \mathrm{~mm}$. broad, its tube about equalling the lobes; capsule compressed, didymous, $5-6 \mathrm{~mm}$. broad, its upper part free from the calyx. In dry soil, Va. to Fla., Ark. and Tex. March-April.
4. Houstonia mínima Beck. Least Bluets. (I. F. f. 3396.) Annual, spreading or diffuse, $2.5-6.5 \mathrm{~cm}$. high, roughish. Lower and basal leaves oval or ovate, the upper oblong, sessile; flowers 8 -10 mm . broad; corolla violet or purple. the tube longer than the lobes; capsule didymous, compressed, about 6 mm . hroad, its upper part free from the calyx. In dry soil, Mo. and Ill. to Kans, Ark. and Tex. March-April.
5. Houstonia lanceolata (Poir.) Britton. Cabyeose Hofstonia. Glabrous, or pubescent, peremial, r.5-3 dm. high. Leaves lanceolate to linear-lanceolate, sessile or the lowest spatulate and narrowed into petioles. Corolla little exceeding the calyx; capsule about 3 mm . in diameter, much shorter than the lanceolate rigid calyx-lobes. N. C. to Ala., Ky., Tenn. and Mo. May June. [11. hurpurea calycosa, A. Gray.]
6. Houstonia purpùrea L. Large Houstonia. (I. F. f. 3307.) Perennial, tufted, glabrous or somewhat pubescent, $1+5 \mathrm{dm}$. high. 1.eaves sessile, or the lower ones short-petioled, 3 - 5 -nerved, $\mathrm{x}-5 \mathrm{~cm}$. long, the margins often ciliate; pedicels $2-8 \mathrm{~mm}$. long; corolla purple or lilac, funnelform, $0-8 \mathrm{~mm}$. long, the tube
at least twice as long as the lobes; capsule compressed-globose, 3 mm . broad, somewhat didymous, its upper half free, shorter than the subulate-linear calyx-lobes. In open places, Md. to Ky., Ga. and Ala. May-Sept.

Houstonia purpùrea pubéscens Britton. Pubescent; leaves lanceolate to oblonglanceolate. Va.
7. Houstonia ciliolàta Torr. Fringed Houstonia. (I. F. f. 3398.) Perennial, tufted, I-2 dm. high. Lower and basal leaves petioled, thick, Inerved, obovate or oblanceolate, obtuse, $\mathbf{I}-\mathbf{2} \mathrm{cm}$. long, their margins conspicuously ciliate; stem leaves oblong or oblanceolate, sessile or nearly so; pedicels filiform, $2-8 \mathrm{~mm}$. long; corolla funnelform, lilac or pale purple, about 6 mm . long, the lobes about one-third the length of the tube; capsule little compressed, obscurely didymous, 3 mm . wide, overtopped by the linear-lanceolate calyx-lobes. On rocks and shores, Me (?), Ont. to Mich., Penn., W. Va., Ky. and Ark. May-Aug.
8. Houstonia longifòlia Gaertn. Long-Leaved Houstonia. (I. F. f. 3399.) Perennial, usually tufted, erect, glabrous, 1.2-2.5 dm. high. Basal leaves spatulate or oblanceolate, obtuse, not ciliate, short-petioled; stem leaves linear or linearoblong, I-nerved, $\mathbf{x}-2.5 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide; corolla pale purple or nearly white, 5-6 mm . long, its lobes about one-third the length of the tube; capsule little compressed, globose-ovoid, about 2 mm . in diameter, its upper half free and much exceeded by the subulate calyx-lobes. In dry open places, Me. and Ont. to Manitoba, Ga. and Mo. May-Sept.
9. Houstonia tenuifòlia Nutt. Slender-leaved Houstonia. (I. F. f. 3400.) Perennial, somewhat tufted, slender, branching, erect, glabrous, 1.5-3 dm. high, sometimes pubescent below. Basal and lowest stem leaves ovate or oval, obtuse, petioled, $8-12 \mathrm{~mm}$. long; upper leaves narrowly linear or filiform, blunt, $1-3 \mathrm{~cm}$. long, $\mathbf{I}-3 \mathrm{~mm}$. wide; pedicels filiform, $4-\mathbf{1 2} \mathrm{mm}$. long: corolla purple, narrow, 4-6 mm. long, its lobes short; capsule compressed-globose, didynamous, about 2 mm . in diameter, its upper half free and slightly exceeded by the subulate calyx-lobes. In dry soil, Va. to Ohio, N. Car. and Tenn. May-July.
10. Houstonia angustifòlia Michx. Narrow-leaved Houstonia. (I. F. f. 3401.) Perennial by a deep root, erect, stiff, glabrous, usually branched, $3-6 \mathrm{dm}$. high. Leaves linear, $\mathbf{I}-3.5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, or the lowest narrowly spatulate, usually with smaller ones fascicled in the axils, or on short axillary branches; corolla white or purplish, between funnelform and salverform, about 4 mm . long, its lobes shorter than the tube; capsule compressed-obovoid, 3 mm . wide, its summit free and scarcely exceeded by the calyx-lobes. In dry open places, Ill. to Mo., Kans., Tex., Tenn. and Fla. May-July.

## 2. OLDENLÁNDIA L.

Herbs, with opposite leaves, and small white or pink flowers. Calyx-tube obovoid or subglobose, the limb 4 -toothed. Corolla rotate or salverform, 4 -lobed. Stamens 4 , inserted on the throat of the corolla; anthers oblong. Ovary 2-celled; ovules numerous in each cavity; style slender, 2 -lobed. Capsule small, ovoid, topshaped, or hemispheric, wholly adnate to the calyx-tube, loculicidally dehiscent at the summit. Seeds angular, not peltate; endosperm fleshy; embryo club-shaped. [Named for H. B. Oldenland, a Danish botanist.] About 175 species, mostly of tropical distribution. Besides the following, 2 others occur in the Southern States and x in N . Mex.
r. Oldenlandia unifiòra L. Clustered Bluets. (I. F. f. 3402.) Annual, weak, usually tufted, more or less hirsute-pubescent, diffuse or ascending; stems $2.5-35 \mathrm{~cm}$. long. Leaves short-petioled or sessile, mostly thin, entire, 3-5-nerved, ovate, oblong, or oval, acute at the apex, narrowed at the base, $\mathbf{1}-2.5 \mathrm{~cm}$. long; flowers sessile or nearly so, white, about 2 mm . broad, terminal and axillary, clustered or solitary; calyx hirsute, hemispheric in fruit, the ovate or oval lobes erect and nearly equalling the tube. In low grounds, N. Y. to Fla. and Tex. Also in Cuba. June-Sept.

## 3. CEPHALÁNTHUS L.

Shrubs, or sometimes small trees, with opposite or verticillate entire deciduous leaves, and densely capitate, bracteolate small white or yellow flowers. Calyxtube obpyramidal, its limb with 4 obtuse lobes. Corolla tubular-funnelform, with

4 short lobes. Stamens 4, inserted on the throat of the corolla; filaments short; anthers oblong, 2 -cuspidate at the base. Ovary 2 -celled; ovules solitary in each cavity, pendulous; style filiform, exserted; stigma capitate. Fruit dry, obpyramidal, 1-2-seeded. Endosperm cartilaginous; cotyledons linear-oblong. [Greek, head-flower.] About 7 species, natives of America and Asia.
I. Cephalanthus occidentàlis L. Button-Bush. (I. F.f. 3403.) A shrub, or rarely a small tree, glabrous, or somewhat pubescent. Leaves petioled, ovate or oval, entire, acuminate or acute, $7-15 \mathrm{~cm}$. long, $2-6.5 \mathrm{~cm}$. wide; peduncles $2-8 \mathrm{~cm}$. long; heads globose, about 2.5 cm . in diameter, the receptacle pubescent; flowers sessile, white, $8-12 \mathrm{~mm}$. long; style about twice the length of the corolla; calyx-tube prolonged beyond the ovary. In swamps and low grounds, N. B. to Ont., Wis., Neb., Fla. and Tex. Also in Cuba. June-Sept.

## 4. MÍTCHELLA L.

Creeping herbs, with opposite petioled, entire or undulate, evergreen leaves, and white peduncled geminate dimorphous flowers, their ovaries united. Calyxtube ovoid, the limb 3-6-lobed (usually 4-lobed). Corolla funnelform, usually 4 -lobed, the lobes recurved, bearded on the inner side. Stamens as many as the lobes of the corolla and inserted on its throat; filaments short and style exserted, or filaments exserted and style short. Ovary 4-celled; stigmas 4, short, filiform; ovules I in each cavity, erect, anatropous. Fruit composed of 2 united drupes usually containing 8 roundish nutlets. Seed erect; cotyledons short, obtuse; embryo minute. [Named after Dr. John Mitchell, botanist and correspondent of Linnaeus in Virginia.] Two species, one N. American, the other Japanese.
i. Mitchella rèpens L. Partridge-berry. Twin-berry. (I. F. f. 3404.) Stems slender, rooting at the nodes, I.5-3 dm. long, branching, glabrous, or slightly pubescent. Leaves ovate-orbicular, petioled, obtuse at the apex, rounded or somewhat cordate at the base, $6-20 \mathrm{~mm}$. long, dark green, shining; peduncles shorter than the leaves, bearing 2 sessile flowers at the summit; corolla $10-12 \mathrm{~mm}$. long; drupes red (rarely white), broader than high, 4-8 mm . in diameter, persistent through the winter, edible. In woods, N. S. to Fla., Ont., Minn., Ark. and Tex. April-June, sometimes flowering a second time in the autumn.

## 6. SPERMACÒCE L.

Herbs, with 4 -sided stems, opposite stipulate leaves, and small white flowers, in dense axillary and terminal clusters. Calyx-tube obovoid or obconic, its limb 4-toothed. Corolla funnelform, 4-lobed. Stamens 4, inserted on the tube of the corolla. Ovary 2 -celled; ovules I in each cavity; style slender; stigma capitate, or slightly 2 -lobed. Capsule coriaceous, didymous, of 2 dehiscent carpels, or one dehiscent, the other indehiscent. Seeds oblong, convex on the back; endosperm horny; embryo central; cotyledons foliaceous. [Greek, seed-point, from the sharp calyx-teeth surmounting the carpels.] Two species, natives of America.
i. Spermacoce glàbra Michx. Smooth Button-weed. (I. F. f. 3405.) Glabrous, decumbent or ascending, 2.5-5 dm. long. Leaves lanceolate or ellipticlanceolate, petioled, or the uppermost sessile, $2-8 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide, acute at each end, the margins rough; corolla pubescent in the throat, about 3 mm . long, scarcely exceeding the ovate-lanceolate acute calyx-teeth; stamens and style included; capsule obovoid, about 4 mm . long, glabrous; seeds black. punctate. On river-banks and in wet soil, southern Ohio and Ky. to Fla., Kans. and Tex. Also in tropical Am. June-Sept.

## 6. DIÒDIA L.

Herbs, with opposite, mostly sessile, entire stipulate leaves, and small axillary white lilac or purple flowers. Calyx-tube obconic or obowoid, the limb $=4$-lobed (sometimes $\mathbf{x}$ - 6 -lobed), often with minute teeth between the lobes. Comlla fumelform or salverform, mostly -lobed. Stamens usually 4 . inserted on the theoat of the corolla; filaments slender: anthers versatile, oblong-linear. exsorted. Brary 2-celled (rarely 3-4-celled); ovules I in cach cavity; style filifurm, simple. or 2-cleft; stigmas 2. Fruit 2-celled, finally separating into 2 indehiscent carpels. Seed oblong, convex on the back; endosperm horny; cotyledons foliacens; embreo
straight. [Greek, thoroughfare, where the species are frequently found.] About 35 species, mostly American. Besides the following, another occurs in the Southern States.
$\begin{array}{ll}\text { Leaves linear-lanceolate; style entire; stigmas capitate. } & \text { I. D. teres. } \\ \text { Leaves lanceolate or oval; style 2-cleft; stigmas filiform. } & \text { 2. D. Virginiana. }\end{array}$
I. Diodia tères Walt. Rough Button-weed. (I. F. f. 3406.) Rigid, usually rough, much branched from near the base, the branches prostrate or ascending, 4 -sided above, I- 7.5 dm . long. Leaves linear or linear-lanceolate, very rough, 1-4 cm. long, acute, the margins revolute when dry; flowers lilac or purple, 4-6 mm . long, usualiy solitary in the axils; style entire; stigmas capitate; fruit obovoid or top-shaped, hispid, about 4 mm . high, the usually 4 persistent calyxlobes ovate to lanceolate. In dry or sandy soil, Conn. to Fla., Ill., Kans., Tex., N. Mex. and Sonora. July-Sept.
2. Diodia Virginiàna L. Larger Button-weed. (I. F. f. 3407.) Hispidpubescent or glabrate, much branched from near the base, the branches procumbent or ascending, 3-6 dm. long. Leaves lanceolate to narrowly oval, narrowed at the base, acute, or the lowest obtuse, $2-8 \mathrm{~cm}$. long; flowers 1 or 2 in each axil, about 12 mm . long, the corolla-tube very slender; fruit somewhat fleshy, but becoming dry, hirsute or glabrous, oval, $6-8 \mathrm{~mm}$. high, furrowed, crowned with the 2 or 3 persistent lanceolate calyx-lobes. In moist soil, southern N. J. to Fla., Ark. and Tex. June-Aug.

## 7. GÀLIUM L.

Herbs, with 4 -angled slender stems and branches, apparently verticillate leaves, and small flowers, mostly in axillary or terminal cymes or panicles, the pedicels usually jointed with the calyx. Flowers perfect, or in some species diœcious. Calyx-tube ovoid or globose, the limb minutely toothed, or none. Corolla rotate, 4 -lobed (rarely 3 -lobed). Stamens 4, rarely 3; filaments short; anthers exserted. Ovary 2-celled; ovules one in each cavity. Styles 2, short; stigmas capitate. Fruit didymous, separating into 2 indehiscent carpels, or sometimes only I of the carpels maturing. Seed convex on the back, concave on the face, or spherical and hollow; endosperm horny; embryo curved; cotyledons foliaceous. [Greek, milk, from the use of G. verum for curdling.] About 225 species, of wide distribution. Besides the following, about 27 others occur in southern and western N. Am. The leaves are really opposite, the intervening members of the verticils being stipules.

## * Fruit dry, smooth, hispid, or roughened. <br> $\dagger$ Annuals (except Nos. 1 and 2).

1. Flowers yellow; leaves narrowly linear. I. G. verum.
2. Flowers white or greenish white.
a. Fruit smooth and glabrous. $\quad$ 2. G. Mollugo.
b. Fruit bristly, tubercled, granular or papillose (or smooth in No. 3). Flowers in axillary cymules, or panicled.

Fruit granular or tubercled, not bristly.
Fruit slightly granular, or smooth, $\mathbf{x} \mathrm{mm}$. broad; pedicels not recurved; stem very slender.
3. G. Parisiense.

Fruit granular-tubercled, 3 mm . broad ; fruiting pedicels recurved; stem stout.
4. G. tricorne.

Fruit densely bristly-hispid.
Cymes few-flowered; leaves $2-8 \mathrm{~cm}$. long; fruit fully 4 mm . broad.
5. G. Aparine.

Cymes mostly several-flowered; leaves $1-2.5 \mathrm{~cm}$. long; fruit smaller.
6. G. Vaillantii.

Flowers solitary in the axils, subtended by 2 foliaceous bracts; fruit bristly.
7. G. virgatum.

## $\dagger \dagger$ Perennials.

1. Fruit bristly-hispid (or becoming glabrous in No. 12).
a. Leaves in 4's, r-nerved.
b. Leaves in 4's, 3 -nerved.

Leaves lanceolate, oval, or ovate; flowers in open cymes.
Upper leaves lanceolate to ovate-lanceolate, acuminate.
9. G. lanceolatum.

Upper leaves ovate, oblong, oval, ovate-lanceolate or obovate, obtuse.
Corolla usually hirsute ; plant mostly pubescent; leaves oblong to ovate-lanceolate.
10. G. circaezans.

Corolla glabrous; plant little pubescent; some leaves obovate.
II. G. Kamtschaticum.

Leaves linear to lanceolate; flowers in terminal panicles.
12. G. boreale.
13. G. triflorum.
2. Fruit smooth and glabrous, or warty in No. I5.
a. Flowers brown-purple.

Leaves lanceolate, 3 -nerved; fruit smooth.
14. G. latifolium.

Leaves narrowly lanceolate, r-nerved; fruit warty.
15. G. Arkansanum.
b. Flowers white, yellowish, or greenish.

Endosperm of seed annular in cross-section.
Corolla 4-parted, its lobes acute; stems smooth, or nearly so.
16. G. tinctorium.

Corolla mostly 3 -parted, its lobes obtuse; stems minutely retrorse-hispid.
Pedicels slender, rough; leaves mostly in 4's. , 17. G. trifidum.
Pedicels rather stout, smooth; leaves mostly in 5 's and 6 's.
18. G. Claytoni.

Endosperm of seed lunate in cross-section.

Leaves obtuse.
Leaves acute, or cuspidate.
Stem nearly or quite smooth.
Stem strongly retrorse-hispid.
** Fruit fleshy, resembling a double berry. 22. G. hispidulum.

1. Galium vèrum L. Yellow Bedstraw. Lady's Bedstraw. (I. F. f. 3408.) Perennial from a somewhat woody base, erect or ascending, $1.5-7.5 \mathrm{dm}$. high. Stems smooth or minutely roughened; leaves in 6's or 8's, narrowly linear, $8-25 \mathrm{~mm}$. long, about I mm . wide, rough on the margins, at length deflexed; flowers yellow, the cymes in dense narrow panicles; fruit usually glabrous, less than 2 mm . broad. In waste places and fields, Ont. to Mass., N. Y. and N. J. Adv. or nat. from Europe. May-Sept.
2. Galium Mollùgo L. Wild Madder. White, or Great Hedge BedStraw. (I. F. f. 3409.) Glabrous or nearly so, diffusely branched, 3-9 dm. long; leaves in 6 's or 8 's, oblanceolate or linear, cuspidate, $12-30 \mathrm{~mm}$. long, $2-4 \mathrm{~mm}$. wide, sometimes roughish on the margins; flowers small, white, very numerous in terminal panicled cymes; pedicels filiform; fruit smooth, glabrous, nearly 2 mm . broad. In fields and waste places, Newf. to Vt., N. Y., Penn., Nı J. and Del. Adv. or nat. from Europe. May-Sept.
3. Galium Parisiénse L. Wall Bedstraw. (I. F.f. 34io.) Very slender, much branched; stem rough on the angles, 1.5-3 dm. high. Leaves in verticils of about $6(4-7)$. linear or linear-lanceolate, cuspidate, minutely scabrous on the margins and midrib, 4-8 mm . long; cymes several-flowered, on filiform peduncles; flowers minute, greenish white; fruit glabrous, smooth or finely granular, less than 2 mm . wide. Roadsides, Va. and Tenn. Adv. or nat. from Europe. June-Aug.
4. Galium tricórne Stokes. Rough-fruited Corn Bedstraw. (I. F. f. 34II.) Rather stout, decumbent or ascending, I.5-3 dm. high. simple, or little branched. Stem rough with reflexed prickles; leaves in 6's or 8 's, linear or narrowly oblanceolate, 2.5 cm . long or less, 3-4 mm . wide, rough on the margins and midrib; peduncles axillary, shorter than the leaves; pedicels thickened and curved downward in fruit; cymes axillary, usually 3- (1-3-) flowered; fruit tuberculate or granular, 8 -10 mm . broad. In waste places or cultivated fields, eastward (according to Gray); Ont., and in ballast about the eastern seaports. Introduced from Europe. May-Aug.
5. Galium Aparíne L. Cleavers. Goosegrass. Cleaver-wort. (I. F. f. 34 I2.) Weak, scrambling over bushes, $6-15 \mathrm{dm}$. long, the stems retrorsely hispid on the angles. Leaves in 6's or S's, oblanceolate to linear. cuspidate, 2.5-S cm . long, 4-10 mm . wide, the margins and midrib very rough; flowers in i-3flowered cymes in the upper axils; peduncles $1-2.5 \mathrm{~cm}$. long: fruiting pedicels straight; fruit 4-6 mm. broad, densely covered with hooked bristles. In various situations, N. B. to S. Dak., Fla., Mo. and Tex. Nat. from Furope. May-Sept.
6. Galium Vaillàntii DC. Lesser Goosegrass of Clealfos. il. F. f. 3413 as $G$. spurium.) Similar to the preceding species but smaller, the stem equal-
ly rough-angled. Leaves smaller, 2.5 cm . in length or less, linear-oblong or slightly oblanceolate, cuspidate, rough on the margins and midrib; cymes $2-9$-flowered; fruit $2-3 \mathrm{~mm}$. broad, usually less hispid. In low grounds, Ont. to Br. Col., south in the Rocky Mts. to Ariz. and to Cal. Also in Europe. G. spurium L., of Europe, appears to have uniformly smooth fruit. May-Aug.
7. Galium virgàtum Nutt. Southwestern Bedstraw. (I. F. f. 3414.) Annual, 1-3 dm. high, usually hispid, sometimes nearly glabrous; stem slender, 4 -angled. Leaves in 4's, oblong or linear-oblong, $5-10 \mathrm{~mm}$. long, 2 mm . wide, or less; peduncles axillary, I-flowered, less than 2 mm . long, recurved in fruit; flower white, subtended by 2 large oblong to lanceolate bracts which closely resemble the leaves; fruit about 2 mm . in diameter, covered with slender barbed bristles. Tenn. and Mo. to Ark., La. and Tex. April-June.
8. Galium pilòsum Ait. Hairy Bedstraw. (I. F. f. 3415.) Perennial, hirsute-pubescent; stems ascending, branched, 3-7 dm. long. Leaves in 4's, oval or oval-ovate, punctate, I-nerved, obtuse, or obscurely 3 -nerved at the base, mucronulate, $\mathbf{1}-2.5 \mathrm{~cm}$. long, $6-10 \mathrm{~mm}$. wide, the lower usually smaller; peduncles axillary and terminal; cymes numerous, few-flowered; pedicels $2-12 \mathrm{~mm}$. long, flowers yellowish purple; fruit densely hispid, nearly 4 mm . in diameter. In dry or sandy soil, Mass. to Ind., Kans., Fla. and Tex. June-Aug.

Galium pilòsum puncticulossum (Michx.) T. \& G. Glabrous or nearly so ; leaves smaller, ciliate. Southern N. J. to Fla. and Tex.
9. Galium lanceolàtum Torr. Torrey's Wild Liquorice. (I. F. f. 3416.) Perennial, glabrous or nearly so, the stems minutely roughened, 3-6 dm. high. Leaves in 4's, lanceolate or ovate-lanceolate, acutish or acuminate, 3 -nerved, ciliate on the margins and nerves, $2.5-6.5 \mathrm{~cm}$. long, $\mathrm{I}-2.2 \mathrm{~cm}$. wide, the lower smaller and obtuse or obtusish; cymes rather few-flowered, loose, widely branched; flowers sessile or nearly so; corolla glabrous, yellowish green to purple, its lobes acuminate; fruit hispid with long hairs, $4-5 \mathrm{~mm}$. broad. In dry woods, Quebec and Ont. to Minn., N. J., Va., Penn. and Mich. June-Aug.
io. Galium circaèzans Michx. Wild Liquorice. Cross-cleavers. (I. F.f. 3417.) Perennial, more or less pubescent, branched, 3-6 dm. high. Leaves in 4's, oval, oval-lanceolate or ovate, obtuse or obtusish, 3 -nerved, $1-3.6 \mathrm{~cm}$. long, $8-16 \mathrm{~mm}$. wide, usually somewhat pubescent on both surfaces, the lower smaller; cymes divaricately branched; flowers sessile or nearly so, greenish; corolla hirsute without, its lobes acute ; fruit hispid, similar to that of the preceding species, at length deflexed. Iǹ woods, Quebec and Ont. to Minn., Fla., Kans. and Tex. May-July.

Galium circaèzans glabèllum Britton. Foliage nearly or quite glabrous; corolla glabrous. N. Y.
i i. Galium Kamtscháticum Steller. Northern Wild Liquorice. (I. F. f. 3418.) Similar to the preceding species, but weak, smaller; stems $1-4 \mathrm{dm}$. long. Leaves in 4's, broadly oval, orbicular or obovate, thin, 3 -nerved, obtuse, mucronulate, $\mathrm{I}-3.6 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide, glabrate, or pubescent with short scattered hairs on the upper surface and on the nerves beneath, sometimes ciliate; flowers few, all on pedicels $4-12 \mathrm{~mm}$. long; corolla glabrous, yellowish green, its lobes acutish; fruit hispid, 4 mm . broad. In mountainous regions, Quebec, northern N. E. and northern N. Y. Also in northeastern Asia. Summer.
12. Galium boreàle L. Northern Bedstraw. (I. F. f. 3419.) Erect, perennial, smooth and glabrous, strict, leafy, $3-7 \mathrm{dm}$. high. Leaves in 4 's, lanceolate or linear, 3 -nerved, $2.5-6.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, the margins sometimes ciliate; panicles terminal, dense, many-flowered, the flowers white in small compact cymes; fruit hispid, at least when young, sometimes becoming glabrate when mature, about 2 mm . broad. In rocky soil or along streams, Quebec to Alaska, N. J., Penn., Mich., Mo., Neb., N. Mex. and Cal. Also in Europe and Asia. May-Aug.
13. Galium triflòrum Michx. Sweet-scented or Fragrant Bedstraw. (I. F. f. 3420.) Perennial, diffuse, procumbent or ascending, glabrous or nearly so, shining, fragrant in drying, the stems and margins of the leaves sometimes roughened. Leaves in 6's, narrowly oval or slightly oblanceolate, 1-nerved. cuspidate, narrowed at the base, $2.5-9 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide; peduncles slender, often exceeding the leaves, 3 -flowered or branched into 3 pedicels which are 1-3flowered; flowers greenish; fruit 3-4 mm. broad, hispid with hooked hairs; seed
almost spherical, the groove obsolete. In woods, N. S. to Alaska, Fla., La., the Ind. Terr., Colo. and Cal. Also in Europe and Asia. June-Aug.
14. Galium latifolium Michx. Purple Bedstraw. (I. F. f. 342I.) Perennial, erect, smooth and glabrous, branched, 3-6 dm. high. Leaves in 4's, lanceolate, 3 -nerved, acuminate, $2-5 \mathrm{~cm}$. long, $8-16 \mathrm{~mm}$. wide, the midrib sometimes pubescent beneath, the margins minutely roughened, the lower smaller and sometimes opposite; peduncles slender, usually shorter than the leaves; flowers purple; cymes loosely many-flowered, the pedicels slender, $4-12 \mathrm{~mm}$. long, smooth or nearly so; fruit smooth, slightly fleshy, 4 mm . broad, usually only one of the carpels developing. In dry woods, Penn. to Tenn, and Ga. May-Aug.
15. Galium Arkansànum A. Gray. Arkansas Bedstraw. (I. F. f. 3422.) Similar to the preceding, but usually lower, the leaves linear-lanceolate, $\mathbf{I}-2.5 \mathrm{~cm}$. long, 2-6 mm. wide, the lateral nerves obscure or none, the midrib sometimes pubescent beneath, and the margins ciliate; fruiting pedicels roughish, 6-25 mm . long; flowers brown-purple, the numerous cymes loosely several-manyflowered; fruit glabrous, warty, somewhat fleshy, each carpel $2-3 \mathrm{~mm}$. in diameter. Southern Mo. and Ark. June-July.
16. Galium tinctòrium L. Stiff Marsh Bedstraw. Wild Madder. (I. F. f. 3423.) Perennial; stem erect, 1.5-4 dm. high, rather stiff, branched almost to the base, the branches commonly solitary, strict; stem 4 angled, nearly glabrous; leaves commonly in 4 's, linear to lanceolate, $\mathbf{I}-2.5 \mathrm{~cm}$. long, broadest below the middle, obtuse, cuneate at the base, dark green and dull, 1 -nerved, the margins and midrib roughish; flowers terminal, in clusters of 2 or 3 ; pedicels slender, not much divaricate in fruit; corolla white, $2-3.5 \mathrm{~mm}$. broad, 4-parted, its lobes oblong, acute; disk large; fruit smooth; seed spherical, hollow, annular in cross-section. Damp shady places, wet meadows and swamps, Can. to N. Car., Tenn., Mich., Neb. and Ariz. May-July.

Galium tinctòrium filifolium Wiegand. More slender than the type and often more diffuse; leaves almost filiform, 2 mm . wide or less, not broader below the middle, strongly cellular-papillose; inflorescence more open; pedicels slender; bracts minute; flowers in 2's or 3's; corolla larger. Sanḍy places in swamps, Va. to Fla.

Galium tinctòrium Labradöricum Wiegand. Low and strictly erect, $5-25 \mathrm{~cm}$. high; branches few, ascending, mostly from the upper nodes; leaves small, $6-8 \mathrm{~mm}$. long, linear, reflexed; flowers large. In sphagnous bogs, Conn., N. Y. and Wis. to Lab.
17. Galium trífidum L. Small Bedstraw. Small Cleavers. (I. F. f. 3424.) Perennial, slender and weak; stem ascending, 4 dm . long or less, much branched and intertangled; stem sharply 4 -angled, rough; branches commonly in 2's; leaves in 4's, linear-spatulate, $5-14 \mathrm{~mm}$. long, obtuse, cuneate at the base, I-nerved, dark green and dull, scarcely papillose, the margins and midrib retrorsescabrous; flowers small, on pedicels which are capillary and much longer than the leaves, commonly two at each node, or three terminal; corolla very small, white, 0.5 mm . long, trifid, its lobes broadly oval, very obtuse: fruit glabrous; seed spherical and hollow, annular in cross-section. Sphagnous bogs and cold swamps, Me. to N. Y., Ohio, Neb., Colo. and northward. Summer.
18. Galium Clàytoni Michx. Clayton's Benstraw. (I. F. f. 3425.) Perennial; stem diffuse when old, I.5-6 dm. high; stem slender or sometimes quite stout, sharply 4 -angled, rough, the diffuse branches in 2's: leaves $8-16 \mathrm{~mm}$. long, commonly in 5's or 6's, linear-spatulate or spatulate-oblong, obtuse, cuneately narrowed into a short petiole, rather firm in texture, scabrous on the margin and midrib, dark green and dull above, discolored in drying: flowers in clusters of $z^{\prime}$ s or 3's, terminal, provided with $x$ or 2 minute bracts; pedicels straight, in fruit strongly divaricate, glabrous and rather stout; corolla minute, white. 3-parted. the lobes broadly oval, obtuse; fruit glabrous; seed spherical and hollow, ammular in crosssection. Swamps, Mass. and N. Y. to Fla.. Mich.. Mo, and Tex. May-Tuly.
19. Galium palústre L. Marsu Benstraw. (I. F. f. shz6.) Perennial: stem erect, slender, about 4 dm . high; internomes very long: short bramehes mostly in 2's. Stem 4 -angled, smooth or roughish; leaves in 2 's to $6{ }^{\circ} \mathrm{s}$. linear-elliptic to spatulate, cuneate at the hase, ohtuse, 6-16 mm. long, 2-4 mm. wite, the rathor firm margins and the midrib slightly scabrous: flowers numerous in terminal and lateral cymes; bracteoles in the inflorescence minute; pedicels in flower ascending,

3-5 mm. long, in fruit strongly divaricate; corolla white, $2-3.5 \mathrm{~mm}$. broad, 4-parted, the lobes oblong, acute; disk almost obsolete; fruit glabrous; endosperm of the seed grooved on the inner face, in cross-section lunate. In damp places, Newf. and Quebec to Mass., Conn. and N. Y. Also in Europe. Summer.
20. Galium concínnum Torr. \& Gray. Shining Bedstraw. (I. F. f. 3427.) Perennial, glabrous, shining, usually much branched, the angles of the stem and edges of the leaves minutely scabrous. Leaves usually all in 6's, linear or sometimes broader above the middle, narrowed at the base, blunt-pointed, or minutely cuspidate, $8-12 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. wide, green in drying; peduncles filiform; pedicels short; flowers minute, white, numerous in open cymes; fruit small, glabrous; endosperm deeply grooved. In dry woodlands, N. J. to Va., Minn., Kans. and Ark. June-Aug.
21. Galium aspréllum Michx. Rough Bedstraw. (I. F. f. 3428.) Perennial, weak, much branched and reclining on bushes, or sometimes erect; stem retrorsely hispid, 6-18 dm. long. Leaves in 6's or 5's, or those of the branches rarely in 4's, narrowly oval or slightly oblanceolate, cuspidate, narrowed at the base, $8-16 \mathrm{~mm}$. long, $2-4 \mathrm{~mm}$. wide, their margins and midribs rough ; cymes several-many-flowered; flowers white; fruit smooth and glabrous, about 2 mm . broad; endosperm with a shallow gronve. In moist soil, Newf. to Ont., N. Car., Ill., Wis. and Neb. June-Aug.
22. Galium hispídulum Michx. Coast Bedstraw. (I. F. f. 3429.) Perennial, much branched, hirsute, hispid or nearly glabrous, 3-6 dm. high. Leaves in 4's, I-nerved, oval, mucronate, rather thick, $6-20 \mathrm{~mm}$. long, $3-8 \mathrm{~mm}$. wide, the margins more or less revolute in drying; flowers few, terminating the branchlets, white; pedicels 6-8 mm. long, rather stout, becoming deflexed in fruit; fruit fleshy, minutely pubescent, about 4 mm . broad. In dry or sandy soil, southern N. J. to Fla. and Ga. May-Aug. This species has been referred, on account of its fleshy fruit, to the genus Relbunium Endl., but it lacks the characteristic involucre of the typical species.

## 8. SHERARDIA L.

Slender annual procumbent or diffuse herbs, with verticillate spiny-pointed leaves, and small nearly sessile pink or blue flowers, in involucrate heads. Calyxtube ovoid, its limb 4-6-lobed, the lobes lanceolate, persistent. Corolla funnelform, $4-5$-lobed, the tube as long as the lobes or longer. Stamens 4 or 5 , inserted on the tube of the corolla; filaments slender; anthers linear-oblong, exserted. Ovary $2-$ celled; style 2 -cleft at the summit; ovules I in each cavity. Fruit didymous, the carpels indehiscent. Seed erect. [Námed for Dr. Wm. Sherard, 1659-1728, patron of Dillenius.] A monotypic genus.
i. Sherardia arvénsis L. Blue Field-Madder. Herb Sherard. Spurwort. (I. F. f. 3430.) Tufted, roughish; stems numerous, prostrate, ascending, or decumbent, $0.7-2.5 \mathrm{dm}$. long. Leaves in 4's, 5's or 6's, the upper linear or lanceolate, acute and sharp-pointed, rough-ciliate on the margins, 6-16 mm . long, 2-4 mm. wide, the lower often obovate, mucronate; flowers in slenderpeduncled involucrate heads, the involucre deeply 6-8-lobed, the lobes lancenlate, sharp-pointed; corolla-lobes spreading; fruit crowned with the 4-6 lanceolate calyx-teeth. In waste places, Ont. and Mass. Also in Bermuda. Adv. from Europe. June-July.

## 9. ASPÉRULA L.

Perennial herbs, with 4 -angled stems, verticillate leaves, and small white, pink or blue flowers in terminal or axillary. mostly cymose clusters. Calyx-tube somewhat didymous, the limb obsolete. Corolla funnelform, 4 -lobed. Stamens 4, inserted on the tube or throat of the corolla; anthers linear or oblong. Ovary 2. celled: ovules I in each cavity; style 2 -cleft. Fruit globose-didymous, the carpels indehiscent. Seed adherent to the pericarp; endosperm fleshy; embryo curved. [Latin diminutive of asper, rough, referring to the leaves.] About 80 species, natives of the Old World.
I. Asperula odoràta L. Sweet Woodruff. (I. F. f. 3431.) Stems erect, slender, smooth. Leaves usually in 8's (6's-9's), thin, oblong-lanceolate, mucronate, I-nerved, roughish on the margins, $1-3.5 \mathrm{~cm}$. long, the lower smaller, often
obovate or oblanceolate; peduncles slender; cymes several-flowered; flowers white or pinkish, 3 mm . long; pedicels $2-4 \mathrm{~mm}$. long; fruit hispid, about 2 mm . broad. In waste places, New Brunswick, N. J. Fugitive from Europe. May-July.

Asperula arvénsis L., another European species, with terminal capitate flowers and linear obtuse leaves, has been found in waste places on Staten Island.

## Family 2. CAPRIFOLIÀCEAE Vent.

## Honeysuckle Family.

Shrubs, trees, vines, or perennial herbs, with opposite leaves and perfect, mostly cymose flowers. Stipules none, or sometimes present. Calyxtube adnate to the ovary, its limb 3-5-toothed or 3-5-lobed. Corolla gamopetalous, the limb 5-lobed, sometimes 2-lipped. Stamens 5 (rarely 4), inserted on the tube of the corolla and alternate with its lobes; anthers versatile. Ovary inferior, i-6-celled; style slender; stigma capitate, or $2-5$-lobed, the lobes stigmatic at the summit; ovules anatropous. Fruit a $1-6$-celled berry, drupe, or capsule. Seeds oblong, globose, or angular ; seed-coat membranous or crustaceous, embryo usually small, placed near the hilum ; radicle terete; cotyledons ovate. About io genera and 260 species, mostly of the northern hemisphere.
Corolla rotate to urn-shaped; flowers in compound cymes; style deeply $2-5$-lobed; shrubs or trees
Leaves pinnate ; drupe 3-5-seeded. 1. Sambucus.
Leaves simple; drupe i-seeded.
Corolla tubular to campanulate, often 2 -lipped; style slender.
Erect perennial herbs; leaves connate.
2. Viburnum.
3. Triosteum.

Creeping, somewhat woody herb; flowers long-peduncled, geminate.
4. Linnaea.

Shrubs or vines.
Fruit a few-seeded berry.
Corolla short, campanulate, regular, or nearly so. 5. Symphoricarpos.
Corolla more or less irregular, tubular or campanulate. 6. Lonicera.
Fruit a 2-celled capsule; corolla funnelform.
7. Diervilla.

## I. SAMBỦCUS L.

Shrubs or trees (or some exotic species perennial herbs), with opposite pinnate leaves, serrate or laciniate leaflets, and small white or pinkish flowers in compound depressed or thyrsoid cymes. Calyx-tube ovoid or turbinate, 3-5-tonthed or 3-5lobed. Corolla rotate or slightly campanulate, regular, 3-5-lobed. Stamens 5, inserted at the base of the corolla; filaments slender; anthers oblong. Ovary 3-5celled; style short, 3-parted; ovules I in each cavity, pendulous. Drupe berrylike, containing 3-5, I-seeded nutlets. Endosperm fleshy; embryo nearly as long as the seed. [Latin name of the elder.] About 20 species, of wide geographic distribution. In addition to the following, 3 or 4 others occur in western N. Am.

Cyme convex; fruit purplish black.
Cyme thyrsoid-paniculate, longer than broad; fruit red.

1. S. Canadensis.
2. S. pubens.
3. Sambucus Canadénsis L. American Elder. Sweet Eunfr. (I. F. f. 3432 .) A shrub, $\mathbf{I}-3.5 \mathrm{~m}$. high, glabrous or nearly so, the stems but little woodr. the younger ones with large white pith. Leaflets 5-II, usually 7 , owate or oval, acuminate or acute, short-stalked, glabrous above, sometimes slightly pubescent on the veins beneath, $5-13 \mathrm{~cm}$. long, sharply serrate, sometimes stipellate; cymes broader than high; flowers white, about 3 mm . broad: drupe nearly 6 mm . in diameter: nutlets roughened. In moist soil, N. B. and N. S. to Fla., Manitoba. Kans. and Tex. June-July.
4. Sambucus pùbens Michix. Red-berkien Eider. (I. F. f. 3433.) A shrub, o.6-4 m. high, the twigs and leaves commonly pubescent; stems wody, the younger with reddish-brown pith. Leaflets 5-7. ovate-lancolate or owal, acuminate at the apex, often narrowed and usually incepuilateral at the basc, 5-1 3 cm. long. not stipellate, sharply serrate ; cymes longer than broad; flowers whitish, turning
brown in drying ; drupe scarlet or red, $4-6 \mathrm{~mm}$. in diameter ; nutlets minutely roughened. In rocky places, N. B. to Alaska, Br. Col., Ga., Colo. and Cal. Fruit rarely white. April-May.

Sambucus pùbens dissécta Britton. Leaflets laciniate. Lake Superior and Penn.
Sambucus nìgra laciniàta (Mill.) DC., a cut-leaved variety of the related European species has been found at Cape May, N. J., perhaps escaped from cultivation.

## 2. VIBÚRNUM L.

Shrubs or trees, with entire dentate or lobed, sometimes stipulate leaves, and white or rarely pink flowers in compound cymes, the outer flowers sometimes radiant and neutral. Calyx-tube ovoid or turbinate, its limb short, 5 -toothed. Corolla rotate or short-campanulate in our species, regular, 5 -lobed. Stamens 5, inserted on the tube of the corolla; anthers oblong, exserted. Ovary 1-3-celled; style short, 3-lobed or 3-parted ; ovules solitary in each cavity, pendulous. Drupe ovoid or globose, sometimes flattened, I-seeded. Seed compressed; endosperm fleshy; embryo minute. [The ancient Latin name.] About roo species, of wide distribution. Besides the following, about 5 others occur in southern and western N. Am.

* Outer flowers of the cyme large, radiant; drupe red.

Leaves doubly serrate, pinnately veined.

1. $V$. alnifolium.

Leaves 3 -lobed, palmately veined.
2. V. Opulus.

*     * None of the flowers radiant; drupe blue or black (red in No. 3).

1. Leaves palmately veined, or 3 -ribbed.

Cymes $1-2.5 \mathrm{~cm}$. broad, the rays short ; drupe red.
3. V. pauciflorum.

Cymes $3.5-6 \mathrm{~cm}$. broad, the rays slender; drupe nearly black. 4. $V$. acerifolium.
2. Leaves pinnately veined.
a. Leaves coarsly dentate, the veins prominent beneath.

Leaves very short-petioled, pubescent.
5. V. pubescens.

Petioles $0.6-4 \mathrm{~cm}$. long.
Leaves glabrous, or with tufts of hairs in the axils beneath. 6. V. dentatum.
Leaves pubescent beneath, the pubescence more or less stellate.
Drupe globose-ovoid; eastern and southern.
Veins of leaves not very prominent. 7. V. molle.
Veins very prominent on the under surfaces of the leaves.
8. V. venosum.

Drupe oblong, twice as long as thick; western.
9. V. Demetrionis.
b. Leaves entire, crenulate, or serrulate, the veins not prominent.

Cymes manifestly peduncled.
Peduncle shorter than the cyme; leaves crenulate. Io. V. cassinoides.
Peduncle equalling or longer than the cyme. II. V. nudum.
Cymes sessile, or nearly so.
Leaves slender-petioled, large.
Leaves prominently acuminate. $\quad$ 12. V. Lentago.
Leaves obtuse, or merely acute.
Leaves and scarcely winged petioles glabrous, or nearly so.
13. V. prunifolium.

Veins of lower leaf-surfaces and winged petioles tomentose.
Leaves nearly sessile, obovate, small.
14. $V$. rufotomentosum.
15. $V$. obovatum
r. Viburnum alnifòlium Marsh. Hobble-bush. American Warfaring Tree. (I. F. f. 3434.) A shrub, with smooth purplish bark, widely and irregularly branching, the branches often procumbent, the youngest twigs scurfy. Leaves orbicular, or very broadly ovate, short-acuminate or acute, usually cordate, finely stellate-pubescent, or at length glabrous above, scurfy with stellate pubescence on the veins beneath, finely serrate all around, o. $7-2 \mathrm{dm}$. broad, petioles $\mathbf{1}-3 \mathrm{~cm}$. long; cymes sessile, $7-13 \mathrm{~cm}$. broad, the exterior flowers usually about 2 cm . broad; drupes red, becoming purple, ovoid-oblong, $10-12 \mathrm{~mm}$. long; stone 3 -grooved on one side, I-grooved on the other. In low woods, N. B. to N. Car., western N. Y. and Mich. Leaves of shoots from cut stumps thin, ovate, coarsely toothed. May-June.
2. Viburnum Ópulus L. Cranberry-tree. Wild Guelder-rose. High Bush-cranberry. (I. F. f. 3435.) A shrub sometimes 4 m . high, with smooth branches. Leaves broadly ovate, sometimes broader than long, glabrous, or with scattered hairs above, more or less pubescent on the veins beneath, rather deeply 3 -lobed, rounded or truncate and 3 -ribbed at the base, the lobes acuminate, coarsely dentate; petioles $\mathbf{I}-2.5 \mathrm{~cm}$. long; cymes peduncled, $7-10 \mathrm{~cm}$. in diameter,
the exterior flowers radiant, neutral ; drupes globose, or oval, $8-10 \mathrm{~mm}$. in diameter, red, very acid, translucent; stone orbicular, flat, not grooved. In low grounds, N. B. to Br. Col., N. J., Mich., S. Dak. and Ore. Also in Europe and Asia. June-July.
3. Viburnum pauciflòrum Pylaie. Few-flowered Cranberry-tree. (I. F. f. 3436 .) A straggling shrub, $6-18 \mathrm{dm}$. high, with twigs and petioles glabrous or nearly so. Leaves broadly oval, obovate, or broader than long, 5 -ribbed, truncate or somewhat cordate at the base, mostly with 3 rather shallow lobes, coarsely and unequally dentate, glabrous above, pubescent on the veins beneath, $3-8 \mathrm{~cm}$. broad; cymes peduncled, short-rayed, $\mathbf{x}-2.5 \mathrm{~cm}$. broad; flowers all perfect and small; drupes globose to ovoid, light red, acid, $8-10 \mathrm{~mm}$. long; stone flat, orbicular, scarcely grooved. In cold mountain woods, Newf. to Alaska, Me., N. H., Vt., Penn., Colo. and Wash. June-July.
4. Viburnum acerifòlium L. Maple-leaved Arrow-wood. Dockmakie. (I. F. f. 3437.) A shrub, I-2 m. high, with smooth gray branches, and somewhat pubescent twigs and petioles. Leaves ovate, orbicular, or broader than long, cordate or truncate at the base, pubescent on both sides, or becoming glabrate, 5-13 cm . broad, mostly rather deeply 3 -lobed, coarsely dentate, the lobes acute or acuminate; petioles $1-2.5 \mathrm{~cm}$. long; cymes long-peduncled, $3-8 \mathrm{~cm}$. broad; flowers all perfect, $4-6 \mathrm{~mm}$. broad ; drupe nearly black, $6-8 \mathrm{~mm}$. long, the stone lenticular, faintly 2 -ridged on one side and 2 -grooved on the other. In dry woods, N. B. to N. Car., Ont., Mich. and Minn. May-June.
5. Viburnum pubéscens (Ait.) Pursh. Downy-leaved Arrow-wood. (I. F. f. 3438.) A shrub, 6-15 dm. high, with straight gray branches. Leaves sessile, or with petioles less than 6 mm . long, ovate or oval, rounded or slightly cordate at the base, acute or acuminate, coarsely dentate, $3-8 \mathrm{~cm}$. long, densely velvetypubescent beneath, glabrous, or with scattered hairs above, or rarely glabrate on both surfaces ; cymes peduncled, $3-7 \mathrm{~cm}$. broad, the flowers all perfect; drupes oval, nearly black, about 8 mm . long; stone slightly 2 -grooved on both faces. In rocky woods, Quebec and Ont. to Manitoba, Ga., Ill., Iowa and Mich. June-July.
6. Viburnum dentatum L. Arrow-wood. (I. F. f. 3439.) A shrub with glabrous gray branches, sometimes 5 m . high. Petioles $6-25 \mathrm{~mm}$. long; leaves ovate, broadly oval or orbicular, rounded or slightly cordate at the base, acute or short-acuminate, prominently veined, coarsely dentate, $3-8 \mathrm{~cm}$. broad, glabrous on both sides, or pubescent with simple hairs in the axils of the veins beneath; cymes long-peduncled, $5-8 \mathrm{~cm}$. broad; drupe globose-ovoid, about 6 mm . in diameter, blue, becoming nearly black; stone rather deeply grooved on one side, rounded on the other. In moist soil, N. B. to Ont.; Ga., western N. Y., Mich. and Minn. May-June.
7. Viburnum mólle Michx. Soft-leaved Arrow-wood. (I. F. f. 3440.) Similar to the preceding species, but the twigs, petioles, rays of the cyme and lower surfaces of the leaves more or less stellate-pubescent ; petioles short and stouter; leaves usually larger, crenate or dentate, commonly somewhat pubescent above; drupe globose-ovoid, blue, 8 mm . in diameter, its stone similar to that of $I$. dentatum. S. Penn. ? ; Ky. to Fla. and Tex.
8. Viburnum venòsum Britton, n. sp. Coast Arrow-wood. A shrub. similar to the two preceding species. Twigs and lower surfaces of the leaves very densely steliate-tomentose; petioles stout, $\mathbf{I}-2 \mathrm{~cm}$. long; blades broadly ovate to orbicular, $5-10 \mathrm{~cm}$. long, coarsely toothed, glabrous or with a few scattered hairs on the upper surface; cymes $6-8 \mathrm{~cm}$. broad; drupe orbicular or short-oval, about 7 mm . in diameter, the veins very prominent on the lower surfaces. E. Mass. to N. J. Type collected by E. P. Bicknell on Nantucket Island.
9. Viburnum Demetriònis Deane \& Robinson. Demetrio's Viburnum. (I. F. f. 344I.) A shrub about 4 m . high, the older twigs ash-gray, or at length grayish black, the bark exfoliating. Bud-scales acutish, ciliolate; leaves broadly ovate or nearly orbicular, short-acuminate, cordate or truncate at the hase, \& I3 cm . long, coarsely dentate, glabrous and bright green above, soft-pubescent and paler beneath, some of the pubescence stellate; petioles $1.5-2 \mathrm{~cm}$. long. channeled: stipules linear-filiform; cymes peduncled, 4-7-rayed, glandular-puberulent: calyxteeth ciliate; drupe oblong, obtuse at both ends, about 1 cm . long and 0.5 cm . broad, much flattened, with 2 grooves when dry. Bluffis, Benton Co., Mo.
10. Viburnum cassinoìdes L. Withe-rod. Appalachian Tea. (I. F. f. 3442 .) A shrub, o. $6-4 \mathrm{~m}$. high, with ascending gray branches, the twigs somewhat scurfy, or glabrous. Leaves ovate or oval, thick, narrowed or sometimes rounded at the base, acute, $2-8 \mathrm{~cm}$. long, generally crenulate, glabrous or very nearly so; peduncle shorter than or equalling the cyme; drupe pink, becoming dark blue, globose to ovoid, 6 -10 mm . long; stone round or oval, flattened. In swamps and wet soil, Newf. to Manitoba, N. J., Ga. and Ala. June-July.
if. Viburnum nùdum L. Larger Withe-rod. (I. F.f. 3443.) Similar to the preceding, but usually larger. sometimes 5 m . high. Leaves oval, ovallanceolate, or obovate, entire or obscurely crenulate, mostly larger (sometimes 2.2 dm . long), narrowed at the base, acute or obtuse, more prominently veined, sometimes scurfy on the upper surface; peduncle equalling or exceeding the cyme. In swamps, L. I. to Fla., Ky. and La. Blooms a little later than the preceding species.
12. Viburnum Lentàgo L. Nanny-berry. Sheep-berry. (I. F. f. 3444.) A shrub, or often a small tree. Winter buds acuminate, glabrous; leaves slenderpetioled, ovate, mostly rounded at the base, acuminate, $5-10 \mathrm{~cm}$. long, glabrous on both sides, or rarely a little pubescent beneath, sharply serrulate; petioles often broadened and wavy-margined, $1.8-2.5 \mathrm{~cm}$. long; cyme several-rayed, $5-13 \mathrm{~cm}$. broad; drupes oval, bluish-black with a bloom, IO-12 mm. long; stone very flat, circular or oval. In rich soil, Hudson Bay to Manitoba, N. J., Ga., Kans., Ind. and Mo. Fruit sweet, edible. May.

I3. Viburnum prunifolium L. Black Haw. Stag-bush. Sloe. (I. F. f. 3445.) A shrub or small tree, similar to the preceding; but the winter buds smaller, less acute, often reddish-pubescent. Leaves ovate or broadly oval, obtuse or acutish, $2-8 \mathrm{~cm}$. long, finely serrulate, glabrous or nearly so; petioles rarely margined; cyme several-rayed, $5-10 \mathrm{~cm}$. broad; drupe oval, bluish black and glaucous, 8 -10 mm . long; stone very flat on one side, slightly convex on the other, oval. In dry soil, Conn. to S. Car., Mich., Kans. and Tex. April-June. Fruit ripe in September, sweet and edible.

Viburnum prunifolium globòsum Nash. Drupe globose, about 6 mm . in diameter; cymes smaller; flowers expanding before the leaves. N. J. and Penn.
14. Viburnum rufotomentòsum Small. Southern Black Haw. (I. F. f. 3446.) A small tree. Leaves elliptic to obovate, mostly obtuse, finely and sharply serrate or serrulate, the veins brown-tomentose beneath; petioles $6-16 \mathrm{~mm}$. long, winged, brown-tomentose; cymes large, the principal rays mostly 4 ; flowers 6-7 mm . broad; drupe oval, $10-14 \mathrm{~mm}$. long, blue with a bloom: seed nearly orbicular. In woods and thickets, Va. to Ill., Mo., Fla. and Tex. April-May.

I5. Viburnum obovàtum Walt. Small Viburnum. (I. F. f. 3447.) A shrub, $0.6-2.5 \mathrm{~m}$. high, the twigs, petioles and rays of the cyme slightly pubescent, or at length glabrate. Leaves obovate, oblanceolate or spatulate, obtuse or retuse, short-petioled, glabrous or very nearly so, entire, or obscurely crenate toward the apex, $1-4 \mathrm{~cm}$. long; cymes $3-5$-rayed, $2-5 \mathrm{~cm}$. broad; drupe oval, black, $6-8 \mathrm{~mm}$. long; stone lenticular, slightly furrowed on both sides. In swamps and along streams, Va. (according to Gray) to Fla. April-May.

## 3. TRIÓSTEUM L.

Perennial herbs, with simple terete stems and opposite connate-perfoliate or sessile leaves narrowed below the middle. Flowers axillary, perfect, sessile, yellowish, green or purplish, 2-bracted. Calyx-tube ovoid, its limb 5-lobed, the lobes elongated, persistent and sometimes foliaceous in our species. Corolla-tube narrow or campanulate, gibbous at the base, the limb oblique, unequally lobed. Stamens 5. inserted on the corolla-tube; filaments very short; anthers linear. included. Ovary 3-5-celled; ovules I in each cavity; style filiform; stigma 3-5-lobed. Drupe coriaceous, orange or red, enclosing 2 or 3 (rarely 4-5) I-seeded nutlets. Endosperm fleshy; embryo minute. [Greek, three-bone, from the 3 bony nutlets.] Five known species, the following of eastern N. Am., two Japanese, one HimaLayan.
Leaves ovate or oval; flowers purplish or dull red.
Leaves, or some of them, connate-perfoliate; fruit orange-yellow. 1. T. perfoliatum.
Leaves narrowed to a sessile base; fruit orange-red.
2. T. aurantiacum.

Leaves lanceolate or oval-lanceolate; flowers yellowish.
3. T. angustifolium.

1. Triosteum perfoliàtum L. Fever-wort. Horse-Gentian. Stem erect, stout, finely glandular-pubescent, ${ }^{6}$ 6-10 dm. high. Leaves ovate to broadly oval, $\mathbf{I}-\mathbf{2 . 2} \mathrm{cm}$. long, acute or acuminate at the apex, abruptly narrowed at the base, soft-pubescent and rugose beneath, sometimes puberulent above, the margins entire; bracts linear; corolla purplish, $12-15 \mathrm{~mm}$. long, viscid-pubescent, about the length of the calyx-lobes; filaments bearded; drupe $8-12 \mathrm{~mm}$. long, obovoid to globose, densely and finely pubescent In rich soil, N. Y. to Minn., Ala., Ky. and Kans. May-July.
2. Triosteum aurantiàcum Bicknell. Scarlet-fruited Horse-Gentian. (I. F. f. 3448, as T. perfoliatum.) Stem 5-12 dm. tall, glandular-puberulent to subhirsute; leaves thin, $1.5-2.5 \mathrm{dm}$. long, broadly ovate-oblong to oblong-lanceolate, acuminate, contracted below the middle into a narrow base, sometimes slightly connate but never broadly perfoliate, minutely soft-pubescent beneath, thinly appressed-hirsutulous to glabrate above; corolla dull red, $14-20 \mathrm{~mm}$. long, with larger, more spreading lobes than in $T$. perfoliatum, the stamens shorter and style less exserted; calyx-lobes linear, obtuse, $10-20 \mathrm{~mm}$. long; fruit $12-14 \mathrm{~mm}$. long, larger and more obovoid-oblong than in $T$. perfoliatum, and bright orange-red instead of orange-yellow. Quebec to Minn., Mass., N. Car., Ky. and Iowa. Type from Van Cortlandt, N. Y. Similar to T. perfoliatum, but less finely pubescent and less leafy, the larger leaves greener, thinner and not rugose; the flowers and fruit markedly different. Flowers 2-3 weeks earlier than T. perfoliatum.
3. Triosteuin angustifòlium L. Yellow or Narrow-leaved HorseGentian. (I. F. f. 3449.) Stem slender, hirsute-pubescent, 3-9 dm. high. Leaves lanceolate or oval-lanceolate, acute or acuminate, $7-13 \mathrm{~cm}$. long, $1-4 \mathrm{~cm}$. wide, rough-pubescent, tapering to the sessile base, or the lower smaller, obtuse and spatulate; corolla yellowish, 12-14 mm. long; flowers commonly solitary in the axils. In rich soil, Conn. and L. I., to N. J., Penn., Ala., Ill. and La. May-Aug.

## 4. LINNAEA L.

Creeping, somewhat woody herbs, with opposite evergreen petioled obovate or orbicular leaves, and perfect pink or purplish flowers borne in pairs at the summit of elongated terminal peduncles. Calyx-tube ovoid, the limb 5-lobed. Corolla campanulate to funnelform, regular, 5 -lobed, the lobes imbricate. Stamens 4, inserted near the base of the corolla-tube, didynamous, included. Ovary 3-celled, 2 of the cavities with several abortive ovules, the other with I perfect pendulous ovule. Fruit nearly globose, 3 -celled, 2 of the cells empty, the other with a single oblong seed. Endosperm fleshy; embryo cylindric. [Named by Gronovius for Linnæus, with whom the plant was a favorite.] About 4 species of the north temperate zone.
i. Linnaea Americàna Forbes. American Twin-flower. Groundvine. Branches slender, slightly pubescent, trailing, I.5-6 dm. long; petioles 2-4 mm . long; leaves obscurely crenate, thick, $6-15 \mathrm{~mm}$. wide, sometimes wider than long; peduncles slender, erect, 2 -bracted at the summit, 2 -flowered (or rarely proliferously 4 -flowered); pedicels filiform, $6-20 \mathrm{~mm}$. long, 2 -bracteolate at the summit; flowers nodding, $8-12 \mathrm{~mm}$. long, fragrant; corolla funnelform; calyx-segments 2 mm . long; ovary subtended by a pair of ovate glandular scales which are comnivent over the fruit or adnate to it. In cold woods, Newf. to Alaska, s. Dak., Colo. and Md., Penn., Mich., Utah. The European and Asiatic L. boralis has an almost campanulate corolla, and calyx-segments 3 mm . long. June-Aug.

## 5. SYMPHORICÀRPOS Juss.

Shrubs, with opposite deciduous short-petioled simple leaves, and small, white or pink, perfect flowers, in axillary or terminal clusters. Calyx tube nearly globular. the limb 4-5-toothed. Corolla campanulate or salverform, sometimes githerus at the base, $4-5$-lobed; stamens 4 or 5, inserted on the corolla. Ovary t-celled, 2 of the cavities containing several abortive ovules, the other two cach with a single suspended ovule; style filiform; stigma capitate, or 2 -lohed. Fruit a 4 -celled 2 seeded berry. Seeds oblong; endosperm theshy; embryominute. |Greek, fruit borne together, from the clustered berries.] About 10 species, of N. Am, and Miex.

Fruit white ; style glabrous.
Stamens and style included; clusters usually few-flowered.
Erect shrub; leaves $2.5-5 \mathrm{~cm}$. long; clusters several-flowered.

> 1. S. racemosus.

Diffuse shrub; leaves $1-2.5 \mathrm{~cm}$. long; clusters 1-2-flowered. 2. S. pauciflorus.
Stamens and style somewhat exserted; clusters many-flowered. 3. S. occidentalis. Fruit red, style bearded.
4. S. Symphoricarpos.

1. Symphoricarpos racemòsus Michx. Snowberry. (I. F.f. 345r.) An erect shrub, glabrous or nearly so. Petioles about 4 mm . long; leaves oval, obtuse at each end, sometimes a little pubescent beneath, entire, undulate, or those of young shoots sometimes dentate; axillary clusters few-flowered, the terminal one mostly interruptedly spicate; corolla campanulate, about 6 mm . long, slightly gibbous at the base, bearded within; style glabrous; berry snow-white, globose, loosely cellular, $6-10 \mathrm{~mm}$. in diameter. In rocky places and on river shores, N. S. to Br. Col., Penn., Ky., S. Dak. and in Cal. Commonly planted and sometimes escaped from cultivation. June-Sept.
2. Symphoricarpos paucifìrus (Robbins) Britton. Low Snowberry. (I. F. f. $345^{2}$.) A low spreading diffusely branched shrub, 1.5-2.5 dm. high. Leaves broadly oval to orbiculate, entire, softly pubescent, especially along the veins beneath; flowers $4-6 \mathrm{~mm}$. long, solitary in the upper axils and 2 or 3 in the terminal spike; corolla campanulate, 5 -lobed, bearded within; berry oval when young, becoming globose, white, $4-6 \mathrm{~mm}$. in diameter. In rocky places, Ont. and Vt. to N. Y., Penn., S. Dak., Br. Col., Neb. and Colo. June-July;
3. Symphoricarpos occidentàlis Hook. Wolfberry. (I. F. f. 3453.) Similar to S. racemosus but stouter, with larger paler leaves $2-8 \mathrm{~cm}$. long, more or less pubescent beneath, entire, or often undulate-crenate; axillary clusters spicate, many-flowered; corolla campanulate, 6 mm . long, lobed to beyond the middle; berry nearly globular, white, $8-10 \mathrm{~mm}$. in diameter. Mich. and Minn. to Br. Col., Kans, and Colo. June-July.
4. Symphoricarpos Symphoricàrpos (L.) MacM. Coral-berry. (I. F. f. 3454.) A shrub, 6-15 dm. high, the branches, purplish, usually pubescent. Petioles $2-4 \mathrm{~mm}$. long; leaves oval or ovate, entire or undulate, mostly obtuse at each end, glabrous or nearly so above, usually soft-pubescent beneath, $2-4 \mathrm{~cm}$. long; clusters dense, many-flowered, at length spicate, shorter than the leaves; corolla campanulate, sparingly pubescent within, pinkish, about 4 mm . long; stamens included; herry purplish red, ovoid-globose, $3-4 \mathrm{~mm}$. long. Along rivers and in rocky places, N. J. and Penn. to western N. Y., Dak., Neb., Ga. and Tex. Also sparingly escaped from cultivation farther east. July.

## 6. LONICERA L.

Erect or climbing shrubs, with opposite mostly entire leaves; flowers spicate, capitate or geminate, usually somewhat irregular. Calyx-tube ovoid or nearly globular, the limb slightly 5 -tonthed. Corolla often gibbous at the base, the limb 5 -lobed, more or less oblique, or 2-lipped. Stamens 5, inserted on the tube of the corolla. Ovary $2-3$-celled; ovules numerous, pendulous; style slender, stigma capitate. Berry fleshy, 2-3-celled or rarely I-celled, few-seeded. Seeds with fleshy endosperm and a terete embryo. [Named for Adam Lonitzer, 1528-1586, a German botanist.] About 100 species, of the north temperate zone, a few in tropical regions. Besides the following, some 8 others occur in western N. Am.

* Climbing or trailing vines; flowers in heads, or interrupted spikes; upper leaves connate-perfoliate.

## Corolla 2-lipped, the upper lip 4-lobed, the lower entire.

Corolla glabrous within.

1. L. Caprifolium.

Corolla pubescent within.
Leaves pubescent, at least beneath; corolla yellow.
Leaves pubescent on both sides, at least when young, ciliate ; corolla slightly gibbous at base. 2. L. hirsuta.
Leaves glabrous above, pubescent beneath; corolla-tube strongly gibbous at the base.
3. L. glaucescens.

Leaves glabrous on both sides, very glaucous beneath.
Corolla greenish yellow, the tube somewhat gibbous.
Corolla-tube 6-10 mm. long: filaments hirsute at the base.

Corolla-tube $10-14 \mathrm{~mm}$. long; filaments nearly glabrous.
5. L. Sullivantii.

Corolla bright yellow or orange, its slender tube not gibbous.
6. L. flava.
7. L. sempervirens. Corolla tubular, the short limb nearly equally 5 -lobed.

* Climbing vines; flowers in pairs on short axillary peduncles.

8. L. Japonica.

*     *         * Shrubs; flowers in pairs on axillary bracted peduncles (Genus Xylosteum).

Bracts of the peduncle subulate, linear, minute, or none.
Leaves rarely cordate, more or less pubescent, or ciliate.
Leaves pale or glaucous, thick, strongly reticulate-veined.
Peduncles shorter than the flowers; fruit blue ; leaves ciliate.
9. L. coerulea.

Peduncles equalling the flowers; fruit red ; leaves not ciliate.
10. L. oblongifolia.

Leaves bright green, thin, ciliate, not strongly reticulate ; fruit red.
11. L. ciliata.

Leaves pale, densely pubescent beneath, even when old.
Leaves cordate, glabrous.
Bracts of the peduncle broad, foliaceous.
12. L. Xylosteum.
13. L. Tatarica.
I. Lonicera Caprifòlium L. Italian or Perfoliate Honeysuckle. (I. F. f. 3455.) Climbing high, glabrous, somewhat glaucous. Upper pairs of leaves connate-perfoliate, glaucous beneath, the others sessile or short-petioled, oval or obovate, rounded at the base, entire; flowers in terminal capitate sessile clusters; corolla $2.5-3.7 \mathrm{~cm}$. long, purple without, the limb white within; upper lip 4-lobed, the lower one narrow, reflexed; tube slightly curved, not gibbous; stamens and style much exserted; berries red. Thickets, N. Y., N. J. and Penn. to Mich., and in the Southern States. Nat. from Europe. May-June.
2. Lonicera hirsùta Eaton. Hairy Honeysuckle. (I. F.f. 3456.) Twining; branches hirsute-pubescent. Upper one or two pairs of leaves connate-perfoliate, the others oval or ovate, short-petioled or sessile, softly pubescent beneath, dark green and appressed-pubescent above, ciliate, obtuse or obtusish, 5-9 cm. long; flowers verticillate in short terminal interrupted spikes; corolla about 2.5 cm . long, viscid-pubescent without, orange-yellow, the tube slender, somewhat gibbous at the base, the limb strongly 2 -lipped, about as long as the tube; stamens and style exserted; filaments hirsute below. In woodlands, Vt. and Ont. to Manitoba, Penn., Ohio and Mich. June-July.
3. Lonicera glaucéscens Rydb. Douglas' Honeysuckle. (I. F. f. 3457.) Similar to the preceding, the branches glabrous. Leaves glabrous above, pubescent, at least on the veins, beneath, 3-9 cm. long, chartaceous-margined, not ciliate, usually only the upper pair connate-perfoliate; flowers verticillate in a short interrupted spike; corolla yellow, changing to reddish, pubescent or puberulent without, pubescent within, 2.5 cm . long, or less, the 2 -lipped limb shorter than the tube; stamens nearly glabrous, or somewhat pubescent; style hirsute; both exserted. Ont. to Saskatchewan, Penn., N. Car., Ohio and Kans. May-June.
4. Lonicera diòica L. Smooth-leaved or Glaucous HoNeysuckle. (I. F. f. 3458.) Glabrous, twining or shrubby, $\mathbf{I}-3 \mathrm{~m}$. long. Leaves glaucous beneath, $3-8 \mathrm{~cm}$. long, the upper connate-perfoliate, oval, obtuse; the lower sessile or short-petioled, narrower; flowers several in a terminal cluster, yellowish green and tinged with purple, pubescent within, the tube gibbous at the base, scarcely longer than the 2 -lipped limb; stamens exserted with the style; herries red. 6-S mm . in diameter. In rocky and usually dry situations, Quebec to Manitoba, N. Car., Ohio and Mich. May-June.
5. Lonicera Sullivántii A. Gray. Sullivant's Honeysuckie. (I. F. f. 3459.) Similar to the preceding, very glaucous. Leaves oval or obovate, glaucous and commonly pubescent beneath, obtuse; flowers larger than those of the preceding species, the tube slightly exceeding the limb, pale yellow; fruit vellow, 6 mm . in diameter. In woodlands, Tenn., Ohio and western (Ont. (?) to Wis. and Manitoba. May-June.
6. Lonicera flàva Sims. Yellow Honetsuckle. (I. F. f. 3460 .) Twining or trailing, glabrous. Leaves broadly wal, or elliptic, entire, whtuse, shortpetioled, or the upper sessile, green above, glaucous beneath, the pairs subtending
flowers connate-perfoliate; flowers fragrant, in a terminal interrupted spike: corolla $2.5-3.7 \mathrm{~cm}$. long, the slender tube pubescent above within, the limb strongly $2-$ lipped, about half as long as the tube; filaments and style glabrous, exserted; fruit about 6 mm . in diameter. N. Car. to Ky., Ga. and Ala. April-May.
7. Lonicera sempérvirens L. Trumpet or Coral Honeysuckle. (I. F. f. 346 r.) Glabrous, high climbing, evergreen in the South. Leaves oval, obtuse, $5-8 \mathrm{~cm}$. long, or the lower ones smaller, narrower and acutish, the upper pairs connate-perfoliate, all glaucous and sometimes slightly pubescent beneath, dark green above; flowers verticillate in terminal interrupted spikes; corolla scarlet or yellow, $2-3.7 \mathrm{~cm}$. long, glabrous, the tube narrow, slightly expanded above: stamens and style scarcely exserted; berries scarlet, about 6 mm . in diameter. In low grounds, or on hillsides, Conn. to Fla., Neb. and Tex. Escaped from cultivation farther north. April-Sept.
8. Lonicera Japónica Thumb. Japanese or Chinese Honeysuckle. (I. F. f. 3462.) Pubescent, climbing or trailing. Leaves short-petioled, ovate, entire, $2.5-8 \mathrm{~cm}$. long, acute at the apex, rounded at the base, dark green and glabrous above, pale and usually sparingly pubescent beneath; flowers leafy-bracted at the base, white or pink, fading to yellow, pubescent without, the tube longer than the strongly 2 -lipped limb; stamens and style exserted; berries black, $6-8 \mathrm{~mm}$. in diameter. Freely escaped from cultivation, N. Y. and Penn. to N. Car., Fla. and W. Va. Nat. from eastern Asia. June-Aug.
9. Lonicera coerùlea L. Blue or Mountain Fly-Honeysuckle. (I. F. f. 3463 .) Shrubby, 3-9 dm. high, the twigs sometimes slightly pubescent. Leaves oval or obovate, $2.5-4 \mathrm{~cm}$. long, obtuse, thick, pale and pubescent beneath, glabrous above, at least when mature, ciliate; flowers short-peduncled, subulate-bracted, yellow, 12-16 mm. long; corolla-tube gibbous at the base, the limb nearly regular, its lobes oblong, equalling or slightly exceeding the tube; ovaries of the two flowers becoming united and forming a bluish-black 2 -eyed berry about 5 mm . in diameter. In low grounds, Newf. to Alaska, R. I., Penn., Wis. and Cal. Also in Europe and Asia. June.
io. Lonicera oblongifòlia (Goldie) Hook. Swamp Fly-Honeysuckle. (I. F. f. 3464.) Leaves oval-oblong, $2-5 \mathrm{~cm}$. long, glabrous or nearly so when mature, downy-pubescent when young; flowers in pairs on long slender peduncles; corolla yellow, or purplish within, $16-\mathbf{1 8} \mathrm{mm}$. long, gibbous at the base, deeply 2 lipped; bracts of the peduncle minute or none; ovaries remaining distinct, or becoming united, the berries red or crimson. In swamps, Quebec to Manitoba, Vt., N. Y., Penn. and Mich. May-June.
in. Lonicera ciliàta Muhl. American Fly Honeysuckle. (I. F. f. 3465.) Shrubby, 9-I5 dm. high, the twigs glabrous. Petioles 4-6 mm. long, very slender; leaves ovate or sometimes oval, acute or acutish, rounded or cordate at the base, villous-pubescent beneath when young, glabrous or nearly so when mature, but the margins strongly ciliate; flowers about 16 mm . long; peduncles long-filiform; bracts very small, subulate; corolla-limb nearly regular, its lobes short; berries separate, ovoid, light red, about 6 mm . in diameter. In moist woods, N. S. to Manitoba, Conn., Penn. and Mich. May.
12. Lonicera Xylósteum L. Fly Honeysuckle. (I. F. f. 3466.) A shrub, 9-2I dm. high, the foliage densely appressed-pubescent when young. Leaves ovate, oval, or obovate, entire, short-petioled, rather pale green, obtuse, or the upper acute, persistently pubescent beneath, $2.5-8 \mathrm{~cm}$. long; peduncles about as long as the flowers, or longer; flowers yellowish white; bracts linear-subulate; berries scarlet. Escaped from cultivation in N. Y. Native of Europe and Asia. May-June.
13. Lonicera Tatárica L. Tartarian Bush-Honeysuckle. (I. F. f. 3467 .) A glabrous shrub, $\mathbf{I} .5-3 \mathrm{~m}$. high. Leaves ovate, rather thin, cordate, not ciliate; flowers in pairs on slender axillary peduncles; corolla pink to white, $14-16 \mathrm{~mm}$. long, the tube gibbous at the base, the limb irregularly and deeply 5 -lobed, somewhat 2 -lipped; peduncles 2.5 cm . long; bracts linear, sometimes as long as the corolla-tube; stamens and style scarcely exserted; berries separate, red. Escaped from cultivation, Ont. and Vt. to N. Y., N. J. and Ky. Native of Asia. May.
14. Lonicera involucràta (Richards.) Banks. Involucred Fiy-Honeysuckle. (I. F. f. 3468.) A glabrate or pubescent shrub, i-3 m. high. Leaves. short-petioled, ovate, oval, or obovate, $5-15 \mathrm{~cm}$. long, acute or acuminate, pubes-
cent, at least when young: peduncles axillary, $2-5 \mathrm{~cm}$. long, $2-3$-flowered; bracts ovate or oval, often cordate; bractlets large, at length surrounding the frut; flowers yellow; corolla pubescent, funnelform, the limb nearly equally 5 -lobed; berries separate, globose, or oval, nearly black, about 8 mm . in diameter. In woodlands, Quebec to Ont., Mich., Alaska, Ariz., Utah and Cal. June-July.

## 7. DIERVíLLA Moench.

Shrubs, with opposite leaves, and yellow cymose or solitary flowers. Calyxtube slender, narrowed below, the limb with 5 linear persistent lobes. Corolla narrowly funnelform, the tube slightly gibbous at the base, the limb nearly regular, $5^{-}$ lobed. Stamens 5 ; anthers linear. Ovary 2 -celled; ovales numerous; style filiform; stigma capitate. Fruit a linear-oblong capsule, narrowed or beaked at the summit, septicidally 2 -valved, many-seeded. Seed-coat minutely reticulated; endosperm fleshy; embryo minute. [Named for Dr. Dierville, who brought the plant to Tournefort.] Three species, the following and two in the mountains of the Southern States.
i. Diervilla Diervílla (L.) MacM. Bush Honeysuckle. (I. F. f. 3469.) A shrub, $6-12 \mathrm{dm}$. high, glabrous or nearly so, with terete branches. Leaves short-petioled, ovate or oval, acuminate, usually rounded at the base, $5-14 \mathrm{~cm}$. long, irregularly crenulate and often slightly ciliate; peduncles terminal, or in the upper axils, slender, $1-5$-flowered; flowers about 18 mm . long; corolla more or less pubescent both without and within, 3 of its lobes somewhat united; capsule glabrous, slender, beaked. In dry or rocky woodlands, Newf. to the N. W. Terr., N. Car. and Mich. May-June.

## Family 3. ADOXÀCEAE Fritsch. <br> Moschatel Family.

Glabrous slender herbs, with scaly or tuberiferous rootstocks, basal and opposite ternately compound leaves, and small green flowers in terminal capitate clusters. Calyx-tube hemispheric, adnate to the ovary, the limb 2-3-toothed. Corolla rotate, regular 4-6-lobed. Stamens twice as many as the lobes of the corolla, inserted in pairs on its tube ; filaments short; anthers peltate, I-celled. Ovary 3-5-celled: style 3-5parted; ovules I in each cavity, pendulous. Fruit a small drupe with 3-5-nutlets. Endosperm cartilaginous. The family contains only the following monotypic genus.

## r. ADóxA L.

Characters of the family. [Greek, without glory, i.e., insignificant.]
I. Adoxa Moschatéllina L. Musk-root. Hollow-root. Moschatel. (I. F. f. 347 o.) Stems simple, weak, erect, $7-15 \mathrm{~cm}$. high, bearing a pair of opposite ternate leaves usually above the middle. Basal leaves 1-4, long-petioled. ternately compound, the segments broadly ovate or orbicular, obtuse, thin, 3 -cleft or 3 parted, the lobes obtuse and mucronulate; head $6-8 \mathrm{~mm}$. in diameter. of $3-6$ flowers: corolla of the terminal flower $4-5$-lobed, those of the others usually $5-6$-lobed; drupe green, bearing the persistent calvx-lobes above the middle. In shaded rocky places, Arctic Am. to Iowa, Wis., S. Dak. and Colo. Also in Europe and Asia. Odor musky. May.

## Order 8. VALERIANÀLES.

Herbs, the corolla gamopetalous. Stamens mostly fewer than the corolla-lobes; anthers separate. Ovary inferior, I-celled with I pendulous ovule, or 3 -celled with 2 of the cavities without ovules.

## Valerian Family.

Herbs, with opposite leaves, no stipules, and usually small flowers, in corymbed panicled or capitate cymes. Calyx-tube adnate to the ovary, its limb inconspicuous or none in flower, often becoming prominent in fruit. Corolla epigynous, somewhat irregular, its tube narrowed, and sometimes gibbous or spurred at the base, its limb spreading, mostly $5^{-}$ lobed. Stamens i-4, inserted on the corolla and alternate with its lobes. Ovary inferior, I-3-celled, one of the cavities containing a single anatropous ovule, the others empty. Fruit indehiscent, dry, containing a single suspended seed. Endosperm little or none; embryo straight; cotyledons oblong. About 9 genera and 275 species, of wide distribution. Fruit x-celled ; persistent calyx-lobes becoming awn-like; tall herbs. i. Valeriana.
Fruit 3-celled; calyx-lobes minute or none; low herbs.
2. Valerianella.

## 1. VALERIANA L.

Perennial strong-smelling herbs, the leaves mainly basal and the cymose flowers paniculate in our species. Calyx-limb of 5-15 plumose teeth, short and inrolled in flower, but elongated, rolled outward and conspicuous in fruit. Corolla funnelform or tubular, usually more or less gibbous at the base, the limb nearly equally 5 lobed. Stamens commonly 3. Style entire, or minutely $2-3$-lobed at the summit. Fruit compressed, i-nerved on the back, 3-nerved on the front. [Name Middle Latin, from valere, to be strong.] About 185 species, mostly in the north temperate zone and the Andes. Besides the following, 6 or 7 others occur in southern and western N. Am.
Corolla-tube very slender, $\mathrm{I}-2 \mathrm{~cm}$. long; basal leaves cordate. r. V. paucifora. Corolla-tube $2-6 \mathrm{~mm}$. long; basal leaves not cordate.

Leaves thick, parallel-veined, entire, or the segments not dentate.
2. V. edulis.

Leaves thin, reticulate-veined, the segments dentate.
Lower leaves spatulate, often entire; plant glabrous.
Segments of middle stem-leaves 9-13, usually sinuate-dentate; corolla 3.5-5 mm . wide.
3. V. uliginosa.

Segments of middle stem-leaves 5-7, entire ; corolla $2.5-3 \mathrm{~mm}$. wide.
4. $V$. septentrionalis. All the leaves pinnately divided; plant pubescent, especially at the nodes.
5. V. officinalis.
r. Valeriana pauciflòra Michx. Large-flowered Valerian. (I. F. f. 347 1.) Rootstocks slender, usually horizontal. Stem glabrous, 3-9 dm. high. often sending out runners; leaves thin, the basal ones slender-petioled, simple, or sometimes with a pair of small segments on the petiole, broadly ovate, cordate, acute, crenate or dentate; stem leaves pinnately 3-7-divided, the terminal segment larger than the others; cymes terminal, clustered; corolla pink; bracts linear; fruit oblong or oblong-lanceolate, about 6 mm . long, glabrous or puberulent; bristies of the calyx at length elongated and plumose. In moist soil, Penn. to W. Va., Ill., Ky. and Mo. May-June.
2. Valeriana édulis Nutt. Edible Valerian. Tobacco-root. (I. F. f. 3472.) Erect, 3-12 dm. high, from a deep carrot-shaped root. Stem glabrous, or nearly so, the young leaves commonly pubescent and the older ones ciliate, sometimes glabrous; basal leaves spatulate or oblanceolate, o.7-3 dm. long, obtuse, narrowed into margined petioles, parallel-veined, entire or with a few obtuse entire lobes; stem leaves few, sessile, pinnately parted into linear or lanceolate segments; flowers yellowish white, 4 mm . long, polygamo-diœcious, paniculate; bracts lanceolate, short; fruit narrowly ovate, glabrous or nearly so, 4 mm . long, at length exceeded by the plumose calyx-teeth. In wet open places, Ont. to Br. Col., Ohio, Wis., Ariz. and N. Mex. May-Aug.
3. Valeriana uliginòsa (T. \& G.) Rydb. Wood or Swamp Valerian. (I. F. f. 3473.) Erect, glabrous or nearly so, 3-7.5 dm. high. Rootstocks creeping or ascending; basal leaves petioled, oblong or spatulate, obtuse, entire, or with a few
obtuse lobes, reticulate-veined, $5-25 \mathrm{~cm}$. long; stem leaves 3 or 4 pairs, petioled, sparingly hairy when young, pinnately parted into $3-13$ ovate to lanceolare, dentate or rarely entire segments; inflorescence cymose-paniculate; flowers pink or nearly white, $6-8 \mathrm{~mm}$. long; bracts linear-lanceolate; fruit ovate, glabrous, 4-5 mm . long. In wet soil, Me. to N. Y., Ont. and Mich. May-Aug. [V. sylvatica uliginosa T. \& G.: V. sylvatica Beck, not Banks.]
4. Valeriana septentrionàlis Rydb. Northern Valerian. Erect, perfectly glabrous throughout or the inflorescence minutely puberulent, 2-4 dm. high. Basal leaves petioled, spatulate or oval, $2-10 \mathrm{~cm}$. long, entire; stem-leaves usually 3 pairs, the lower petioled, the upper sessile; segments $5-7$, oval to linear-lanceolate, entire or merely undulate on the margins; inflorescence cymose-paniculate, in flower usually congested, flowers white, about 5 mm . long; fruit glabrous, 3-4 mm . long. In wet soil on hillsides, Newf., subarctic America to Br. Col. and south in the Rockies to N. Mex. [V. sylvatica Banks; not F. W. Scmidt.]
5. Valeriana officinàlis L. Garden Valerian. (I. F. f. 3474.) Erect, 6-15 dm. high. Leaves pinnately parted into 7-25 thin reticulate-veined lanceolate acute or acuminate segments, sharply dentate, or those of the upper leaves entire, usually with some scattered hairs beneath; flowers pink or nearly white, about 4 mm . long; inflorescence of several rather compact corymbed cymes; bracts linearlanceolate; fruit glabrous, ovate, about 3 mm . long. Escaped from gardens to roadsides, N. Y. and N. J. Native of Europe and Asia. June-Aug.

## 2. VALERIANÉLLA Poll.

Annual dichotomously branched herbs, the basal leaves tufted, entire, those of the stem sessile, often dentate, the flowers in compact or capitate cymes, in our species corymbed or panicled. Corolla small, white, blue, or pink, nearly regular. Calyx-limb short or obsolete in flower, often none. Corolla-tube narrowed at the base, the limb spreading, 5 -lobed. Stamens 3 ; style minutely 3 -lobed at the summit. Fruit 3 -celled, 2 of the cells empty, and in our species about as large as the fertile one. [Name a diminutive of Valerian.] About 50 species, of the northern hemisphere. Besides the following, some 8 others occur in western N. Am.
Corolla funnelform, the short tube not longer than the limb or about equalling it.

Fruit flattened, twice as broad as thick.
Fruit triangular-pyramidal.
Fruit oblong-tetragonal or ovoid-tetragonal, grooved.
Groove of the fruit broad and shallow.
Groove of the fruit narrow.
Fruit globose or saucer-shaped.
Corolla salverform, the slender tube much longer than the limb.
I. V. Locusta.
2. V. chenopodifolia.
3. V. radiata.
4. $V$. stenocarpa.
5. V. Woodsiana.
6. V. longiflora.
r. Valerianella Locústa (L.) Bettke. European Corn Salad. (I. F. f. 3475.) Glabrous, or pubescent at the nodes, 1.5-3 dm. high, usually repeatedly forked. Basal leaves spatulate or oblanceolate, rounded and obtuse at the apex, $3-5 \mathrm{~cm}$. long, entire; upper stem leaves oblong lanceolate, usually dentate; peduncles short; cymes $6-12 \mathrm{~mm}$. broad, almost capitate; bracts linear or linear-oblong; corolla blue, about 2 mm . long; fruit flattened. rounded on the edges, 2 mm . long, glabrous, depressed-orbicular in outline, the two empty cavities smaller thay the fertile one, which has a corky mass at its back. In waste places, N. Y., N. J. and Penn. to Va. and La. Nat. from Europe. April-July.
2. Valerianella chenopoditòlia (Pursh) DC. GOose-FOOT Corn SAiAD., (I. F. f. 3476.) Glabrous, 3-6 dm. high. Leaves entire, or the hasal and lower ones repand, spatulate, obtuse; upper stem leaves oblong or lanceolate, 2.58 cm . long; cymes dense, $\mathbf{1 2 - 1 8} \mathrm{mm}$. broad, at length slender-peduncled; bracts lanceolate or oblong lanceolate; corolla white, about 2 mm . long; fruit triangular-pyramidal. 4 mm . long, 2 mm . thick, glabrous or minutely pubescent, the 1 wo empty cavities narrower than the fertile one but about as deep. In moist soil, western N. Y. to Va., Wis, and Ky. May-July.
3. Valerianella radiàta (L.) Dufr. Beaken Corn Salal. (I. F. f. 3477.) Glabrous, or minutely pubescent below, $1.5-4.5 \mathrm{dm}$. high. Basal and lower leaves spatulate, obtuse, entire, the upper lanceolate, usually dentate; ames $\$ 12$ mim. broad, dense; bracts small, lanceolate or oblong-lanceolate; comolla white. : mm. long; fruit finely pubescent or sometimes glabrous, 2 mm . long, I mm. thick, the
empty cavities as thick as or thicker than the beaked fertile one and separated from each other by a broad shallow groove. In moist soil, N. Y. to Fla., Mich., Mo. and Tex. May-July.
4. Valerianella stenocàrpa (Engelm.) Krok. Narrow-celled Corn Salad. (I. F. f. 3478 .) Similar to the preceding. Fruit oblong-tetragonal, slightly smaller, glabrous or sometimes pubescent; sterile cavities not as thick as the oblong seed-bearing one, and separated from each other by a narrow groove. Kans. and Mo. to Tex. March-June.
5. Valerianella Woodsiàna (T. \& G.) Walp. Woods' Corn Salad. (I. F. f. 3479.) Usually larger than any of the preceding species, sometimes 9 dm . high, glabrous or nearly so. Basal and lower leaves spatulate, obtuse, entire; upper leaves lanceolate to linear-oblong, usually dentate; cymes $6-12 \mathrm{~mm}$. broad, few-flowered; bracts comparatively large, lanceolate; corolla white, about 2 mm . long; fruit glabrous, nearly globular, about 2 mm . in diameter, the empty cavities inflated, introrse with a depression or concavity between them, as broad as the fertile one. In moist soil, N. Y., Penn. and Ohio to Tenn. and Tex. May-July.

Valerianella Woodsiàna umbilicàta (Sulliv.) A. Gray. Empty cells of the fruit bladdery-inflated, curved together at the ends, forming a deep concavity. Same range.

Valerianella Woodsiàna patellària (Sulliv.) A. Gray. Empty cells divergent, the fruit becoming saucer-shaped. Ohio and Penn.
6. Valerianella longiflora (T. \& G.) Walp. Long-flowered Corn Salad. (I. F. f. 3480.) Glabrous, I.5-3 dm. high. Leaves very obtuse, the basal ones spatulate, $2.5-7 \mathrm{~cm}$. long, those of the stem oblong or spatulate-oblong, smaller, somewhat clasping; cymes dense, corymbed; corolla salverform, pink or purplish, about 12 mm . long, the almost filiform tube 3-4 times as long as the limu, the lobes linear-oblong; bracts with small gland-tipped teeth; fruit broadly ovate or nearly orbicular, the empty cavities divergent, larger than the oblong seed-bearing one. In moist rocky situations, Mo. and Ark. April-May.

## Family 2. DIPSACÀCEAE Lindl. <br> Teasel Family.

Herbs, with opposite or rarely verticillate leaves, and perfect flowers in dense involucrate heads. Stipules none. Flowers borne on an elongated or globose receptacle, bracted and involucellate. Calyx-tube adnate to the ovary, its limb cup-shaped, disk-shaped, or divided into spreading bristles. Corolla epigynous, the limb 2-5-lobed. Stamens 2-4, inserted on the tube of the corolla and alternate with its lobes; filaments distinct ; anthers versatile. Ovary inferior, i-celled; style filiform ; stigma undivided, terminal, or oblique and lateral ; ovule i, anatropous. Fruit an achene, its apex crowned with the persistent calyx-lobes. Seedcoat membranous; endosperm fleshy; embryo straight. About 7 genera and 140 species, of the Old World.
Scales of the elongated receptacle prickly pointed.

1. Dipsacus
Scales of the receptacle not prickly, herbaceous, capillary, or none.
2. Scabiosa.

## r. DÍPSACUS L.

Rough-hairy or prickly tall biennial or perennial herbs, with usually large leaves, and blue or lilac flowers in dense terminal peduncled oblong heads in our species. Bracts of the involucre and scales of the receptacle rigid or spiny pointed. Involucels $4-8$-ribbed, with a somewhat spreading border. Limb of the calyx cup-shaped, 4 -toothed or 4 -lobed. Corolla oblique or 2 -lipped, 4 -lobed. Stamens 4. Stigma oblique or latera]. [Greek, to thirst, the leaves of some species holding water.] About 15 species, of the Old World.

## Scales of the receptacle straight-pointed. <br> Scales of the receptacle hooked at the apex. <br> x. D. sylvestris.

I. Dipsacus sylvéstris Huds. Wild Teasel. (I. F. f. 348ı.) Biennial, stout, with numerous prickles, otherwise glabrous or nearly so, $\mathbf{I}-2 \mathrm{~m}$. high. Leaves sessile, or the upper connate-perfoliate, lanceolate or oblong, the upper acuminate and generally entire, the lower crenate or sometimes pinnatifid, often 3 dm . long; heads becoming cylindric, at length $7-10 \mathrm{~cm}$. long; flowers lilac,

8-12 mm. long; leaves of the involucre linear, curved upward, as long as the head or longer; scales of the receptacle ovate, tipped with a straight subulate barbed awn, usually exceeding the flowers. In waste places, Me. and Ont. to Va., west to Mich. Nat. from Europe. July-Sept.
2. Dipsacus fullònum L. Fuller's Teasel. (I. F. f. 3482.) Similar to the preceding species. Leaves of the involucre, or some of them, shorter than the heads, spreading or at length reflexed; scales of the receptacle with hooked tips, about equalling the flowers, which are usually paler than in $D$. sylvestris. About wool mills, Eastern and Middle States. Fugitive from Europe.

## 2. SCABIOSA L.

Herbs, with opposite leaves, no prickles, and blue, pink, or white flowers in peduncled involucrate heads. Bracts of the involucre herbaceous. Scales of the receptacle small, capillary, or none. Involucels 2-8-ribbed, the margins 4 -toothed or expanded. Calyx-limb 5 -toothed. Limb of the corolla $4-5$-cleft, oblique or 2-lipped. Stamens 4 (rarely 2). Stigma oblique or lateral. Achene adnate to the involucel, crowned with the persistent calyx. [Latin, scale, from its repute as a remedy for scaly eruptions.] About 100 species, natives of the Old World.
Leaves, or some of them, pinnatifid; receptacle hairy, not scaly.

1. S. arvensis.

Leaves entire, or toothed ; receptacle scaly.
2. S. australis.

1. Scabiosa arvénsis L. Field Scabious. (I. F. f. 3483.) Perennial, pubescent, simple or little branched, 3-9 dm. high. Basal and lower leaves petioled, lanceolate, acute or acuminate, entire, lobed, or pinnatifid, o.7-2 dm. long; upper leaves sessile, often deeply pinnatifid; heads long-peduncled, depressedglobose, $2.5-3.7 \mathrm{~cm}$. broad; flowers lilac-purple, about 12 mm . long; receptacle depressed-hemispheric; achene angled, crowned with the 8 or o linear-subulate calyx-teeth. In cultivated fields and waste places, Mass., Vt., N. Y. and Penn. Adventive from Europe. June-Sept.
2. Scabiosa austràlis Wulf. Southern Scabious. (I. F. f. 3484.) Perennial, puberulent, at least above, slender, 4-9 dm. high. Basal leaves oblanceolate to oblong, mostly obtuse, $\mathbf{r}-3 \mathrm{dm}$. long, the petiole often as long as the blade, or longer; stem leaves distant, lanceolate or eblong-lanceolate, entire, or toothed, short-petioled, or the upper sessile, acute or acuminate; heads of purple flowers long-peduncled, rather less than 2.5 cm . in diameter, oblong-ovoid in fruit; bracts of the involucre glabrous; receptacle scaly; achene crowned with 5 calyx-teeth. Nat. from Europe in N. Y. and Mass. Summer.

Scabiosa succisa L., similar to the preceding species, but with globose fruiting heads and hirsute involucre, is reported from Cape Breton Island.

## Order 9. CAMPANULÀLES.

Herbs, rarely shrubs, the corolla gamopetalous, or petals sometimes separate in Cucurbitaceae. Stamens as many as the corolla-lobes (fewer in the Cucurbitaceae) ; anthers united except in Campanuldy and Specularia of the Campanulaceae, in Ambrosiaceae, and in Kuthnic of the Compositae. Ovary inferior.
Flowers not in involucrate heads; juice mostly milky.
Endosperm none; flowers monœecious or diœcious; our species vines.
Enaosperm present, fleshy; flowers perfect.
Fam. 1. Cucurbitaceae.
Fam. 2. Campanulaceae.
Flowers in involucrate heads.
Flowers all expanded into rays (ligulate) ; juice milky. Fam. 3. Cichorizceac.
Flowers all tubular, or the outer expanded into rays; juice very rarelv milk.
Stamens distinct, or nearly so. Fam. 4. Ambrosiaceae.
Stamens united by their anthers into a tube around the style (except in $\left.\kappa^{-} u h n i z\right)$. Fam. 5. Compositae.

## Family I. CUCURBITÀCEAE B. Juss. Gourd Family.

Herbacenus vines, usually with tendrils. Leaves alternate, netinled. generally palmately lobed or dissected, Flowers monocious or diœ-
cious. Calyx-tube adnate to the ovary, its limb usually 5 -lobed, the lobes imbricated. Petals usually 5, inserted on the limb of the calyx, separate, or united into a gamopetalous corolla. Stamens mostly 3 (sometimes I), 2 of them with 2 -celled anthers, the other with a i-celled anther; filaments short, often somewhat monadelphous. Ovary I-3celled; style terminal, simple, or lobed; ovules anatropous. Fruit a pepo, indehiscent, or rarely dehiscent at the summit, or bursting irregularly ; or sometimes dry and membranous. Seeds usually flat; endosperm none. About 90 genera and 650 species, mainly of tropical regions.

Flowers large, yellow ; prostrate vine.
Flowers small, white or greenish; climbing vines.
Fruit glabrous; seeds numerous, horizontal.

1. Cucurbita.

Fruit prickly ; seeds 1 or few, erect or pendulous.
Fruit dehiscent at the apex or bursting irregularly; several-seeded.
Leaves $3-7$-lobed; anthers 3.
3. Micrampelis.

Leaves digitately compound; anther 1 .
Fruit indehiscent, 1 -seeded.
4. Cyclanthera.
5. Sicyos.

## 1. CUCÚRBITA L.

Rough prostrate vines, rooting at the nodes, with branched tendrils, usually lobed leaves mostly cordate at the base, and large yellow axillary monœecious flowers. Calyx-tube campanulate, usually 5 -lobed. Corolla campanulate, 5 -lobed to about the middle, the lobes recurving. Staminate flowers with three stamens, the anthers linear, more or less united, and no pistil. Pistillate flowers with I pistil; ovary oblong with 3-5 many-ovuled placentæ; style short, thick; stigmas 3-5, each 2 -lobed, papillose; staminodia 3. Fruit large, fleshy, with a thick rind, many-seeded, indehiscent. [The Latin name of the gourd.] About io species, natives of America, Asia, and Africa. Besides the following, some 6 others occur in the southern U. S.
I. Cucurbita foetidíssima H. B. K. Missouri Gourd. (I. F. f. 3485.) Stem stout, rough, hirsute. Root large, carrot-shaped. Petioles stout, very rough; leaves ovate-triangular, thick, somewhat fleshy, cordate or truncate at the base, acute, 1-3 dm. long, usually slightly 3-5-lobed, denticulate, rough above, canescent beneath; peduncles $2-5 \mathrm{~cm}$. long; flowers mostly solitary; corolla $6-10 \mathrm{~cm}$. long; pepo globose or globose-ovoid, $5-8 \mathrm{~cm}$. in diameter, smooth, its pulp fibrous and bitter. Dry soil, Neb. to Tex. and Mex., west to southernCal. May-Sept.

Cucurbita Pèpo L., the PUMPKin, is found occasionally in waste places.
Citrullus Citrúllus (L.) Karst., the Watermelon, is found escaped from cultivation along river shores in Va. and W. Va. and in the Southern States.

## 2. MELOTHRIA L.

Slender vines, with simple or rarely bifid tendrils, thin leaves, and small white or yellow monœcious flowers, the staminate clustered, the pistillate often solitary. Calyx campanulate, 5 -toothed. Corolla campanulate, deeply 5 -parted. Stamens 3 in the staminate flowers, the anthers distinct or slightly united, the pistil wanting or rudimentary. Fertile flowers with I pistil; ovary ovoid, constricted below the corolla; placentæ 3; ovules numerous; style short; stigmas 3, linear. Fruit small, berry-like, pulpy. [From the Greek for some vine, probably Bryonia Cretica.] About 64 species, natives of warm and tropical regions. Besides the following 2 or 3 others occur in the southern U. S.
I. Melothria péndula L. Creeping Cucumber. (I. F. f. 3486.) Root perennial. Stem slender, branched, glabrous, grooved; leaves nearly orbicular in outline, finely pubescent or scabrousion both sides, cordate at the base, 5 -lobed or 5 -angled, denticulate or dentate; tendrils puberulent; staminate flowers 4-7, racemose, borne on a peduncle $\mathbf{I}-2.5 \mathrm{~cm}$. long; fertile flowers solitary, slender-peduncled; corolla greenish white, about 4 mm . broad; fruit ovoid, green, $8-12 \mathrm{~mm}$. long. In thickets, Penn. (Schweinitz, according to Cogniaux), Va. to Fla., Ind., Ky., La. and Mex. June-Sept.

## 3. MICRÁMPELIS Raf.

Mnstlv annual climbing herbs, with branched tendrils, lobed or angled leaves, and small white monocious flowers. Calyx-tube campanulate, 5-6-lobed. Corolla
deeply 5-6-parted. Stamens 3 in the staminate flowers, the anthers more or less coherent. Pistillate flowers with a 2 -celled ovary; ovules 2 in each cavity; style very short; stigma hemispheric or lobed. Fruit fleshy or dry at maturity, densely spiny, I-2-celled, usually with 2 seeds in each cavity, dehiscent at the summit. Testa of the seed roughened. [Greek, small-vine.] About 25 species, natives of America. Besides the following, about $\mathbf{1 0}$ others occur in the western U. S.
r. Micrampelis lobàta (Michx.) Greene. Wild Balsam Apple. Mock Apple. (I. F. f. 3487.) Stem nearly glabrous, angular and grooved, climbing to a height of $4.5-7.5 \mathrm{~m}$., sometimes villous-pubescent at the nodes. Leaves thin, roughish on both sides, deeply cordate, $3-7$-lobed to about the middle, the lobes triangular-lanceolate, acute or acuminate, remotely serrulate; staminate flowers very numerous in narrow compound racemes; pistillate flowers solitary, or rarely 2 together; fruit ovoid, green, about 5 cm . long, armed with slender spines. Along rivers, and in waste places, Me. to Ont., Mont., Va., Ky. and Tex. July-Sept.
4. CYCLANTHERA Schrad.

Climbing, mostly glabrous vines, with usually digitately compound leaves and small white or greenish monœecious flowers. Calyx cup-shaped, 5 -toothed. Corolla rotate, deeply 5 -parted. Staminate flowers racemose or panicled, the stamens united into a central column; anther I, annular in our species. Pistillate flowers solitary; ovary obliquely ovoid, beaked, I-3-celled, with 2 ovules in each cavity; style short; stigma large, hemispheric. Fruit spiny, obliquely ovoid, beaked, at length irregularly dehiscent, few-seeded. [Greek, circle-anther.] About 40 species, natives of America.
I. Cyclanthera dissécta (T. \& G.) Arn. Cut-leaved Cyclanthera. (I. F. f. 3488.) Annual; stem grooved and angular, glabrous, branching, climbing to a height of 9-12 dm., or straggling. Leaves digitately $3-7$-foliolate, the leaflets oval or oblong, acute at each end, $1-5 \mathrm{~cm}$. long, rough on both sides, dentate, or somewhat lobed; staminate flowers racemose, borne on a peduncle $\mathbf{I}-5 \mathrm{~cm}$. long; pistillate flowers solitary, very short-peduncled; fruit narrowed at the base, slightly oblique, about 2.5 cm . long, armed with slender spines. Thickets, Kans. to Tex., La. and northern Mex. July-Sept.

## 5. SÍCYOS L.

Annual climbing vines, with branched tendrils, angled or lobed leaves, and small white or green monœcious flowers. Calyx-tube campanulate or cup-shaped, 5-toothed. Corolla campanulate or rotate, 5 parted nearly to the base. Staminate flowers corymbose or racemose, with 3 stamens, the filaments united into a short column, the anthers coherent. Pistillate fiowers several together in capitate longpeduncled clusters; ovary oblong or fusiform, I-celled; ovule I, pendulous; style short, slender; stigmas usually 3. Fruit spiny, indehiscent, I-seeded. [Greek, a cucumber or gourd.] About 35 species, of America and Australasia. Besides the following, 2 others occur in the southwestern States.
I. Sicyos angulàtus L. One-seeded Bur-Cucumber. Star Cuclmber. Nimble Kate. (I. F. f. 3489.) Stem angled, more or less viscid-pubescent, climbing to a height of $4.5-7.5 \mathrm{~m}$., or trailing. Leaves nearly orbicular, rough on both sides, rather thin, deeply cordate at the base, 5 -angled or 5 -lobed, the lobes acute or acuminate, denticulate; staminate flowers loosely corymbose or racemose. borne on elongated peduncles; fertile flowers capitate, their peduncles shorter; fruits sessile, 3-10 together, yellowish, about 1.3 cm . long, pubescent, armed with slender rough spines. Along river banks and in moist places, Quebec and Ont. to Fla., S. Dak., Kans. and Tex. Nat. in eastern Europe. June-Sept.

## Family 2. CAMPANULACEAE Juss.

 Bell-flower Family.Herbs (some tropical species shrubs or even trees), with alternate exstipulate simple leaves, acrid and usually milky juice, and perfect flowers. Calyx-tube adnate to the ovary, its limb mostly 5-lobed or 5 -parted, the lobes equal or slightly unequal, valvate or imbricate in the bud, commonly persistent. Corolla gamopetalous, regular or irregular, inserted at the line where the calyx becomes free from the orary, its
tube entire, or deeply cleft on one side, its limb 5-lobed, regular, or more or less 2 -lipped, or corolla rarely divided into separate petals. Stamens 5, alternate with the corolla-lobes, inserted with the corolla; filaments separate or connate ; anthers 2 -celled, introrse, separate, or united into a ring or tube. Ovary 2-5-celled (rarely 6-10-celled), with the placentæ projecting from the axis, or 1 -celled with two parietal placentæ; style simple; stigma mostly $2-5$-lobed, pilose by a tuft or ring of hairs, or ${ }^{\circ}$ glabrous; ovules anatropous. Fruit a capsule or berry. Seeds numerous, small; embryo minute, straight; endosperm fleshy. About 60 genera and 1500 species, of wide distribution.
Corolla regular, campanulate or rotate ; anthers separate.
Capsule opening by lateral pores or valves.
Corolla campanulate, rarely rotate; flowers all complete.
Corolla rotate; earlier flowers cleistogamous.
Capsule opening by terminal pores or valves.
Corolla irregular; anthers connate around the style.

1. Campanula.
2. Specularia.
3. Jasione.
4. Lobelia.

## r. CAMPÁNULA L.

Perennial or annual herbs, with alternate or basal leaves. Flowers regular, complete, blue, violet, or white. Calyx-tube hemispheric, turbinate, obovoid, or prismatic, adnate to the ovary, the limb deeply 5 -lobed or 5 -parted (rarely $3-4$ parted). Corolla campanulate or rotate, 5 -lobed or 5 -parted. Stamens 5, free from the corolla; filaments usually dilated at the base. Ovary inferior, 3-5-celled; stigma $3-5$-lobed. Capsule wholly or partly inferior, crowned by the persistent calyx-lobes, opening on the sides, either near the top, middle or bottom by 3-5 small valves or perforations, or tending to be indehiscent in some species. [Diminutive of the Latin campana, a bell.] About 250 species, natives of the northern hemisphere. Besides the following, some 12 others occur in southern and western N. Am.

* Corolla campanulate; flowers solitary, racemose, glomerate, or panicled.

Flower solitary at the end of the stem; arctic and alpine plants.
Corolla $8-12 \mathrm{~mm}$. long; capsule-openings near the summit.
Corolla $12-25 \mathrm{~mm}$. long; capsule-openings near the base.

1. C. unifora.
lowers racemose, glomerate, or paniculate.
Corolla $14-30 \mathrm{~mm}$. long.
Stem leaves linear, the basal orbicular, mostly cordate. 2. C. rotundifolia.
Leaves all ovate to lanceolate; plants pubescent or scabrous.
Flowers pedicelled in I-sided racemes. $\quad$ 3. C. rapunculoides.
Flowers sessile in terminal and axillary clusters. 4. C. glomerata.
Corolla $4^{-12} \mathrm{~mm}$. long.
Plant rough; style not exserted.
Flowers white, sometimes tinged with blue, $5-8 \mathrm{~mm}$. long; leaves mostly linear-lanceolate, crenulate.
2. C. aparinoides.

Flowers blue, ro-12 mm. long; leaves linear, denticulate with minute callous teeth.
6. C. uliginosa.

Plant smooth, glabrous, slightly viscid; style long-exserted.
7. C. divaricata.
** Corolla rotate; flowers spicate $\quad$ 8. C. Americana.
i. Campanula unifiòra L. Arctic Harebell or Bellflower. (I. F. f. 3490 .) Perennial, glabrous or nearly so; stem simple, 1 -flowered, $3-15 \mathrm{~cm}$. high. Leaves linear or linear-oblong, acute, sessile, thickish, entire or sparingly dentate, $18-35 \mathrm{~cm}$. long, or the lower and basal ones spatulate, obtuse and narrowed into petioles; flower erect; calyx-tube turbinate, glabrous or pubescent, shorter than or equalling the lobes; corolla campanulate, $8-12 \mathrm{~mm}$. long, blue; capsulr cylindric or club-shaped, about 12 mm . long, erect, opening by valves near the summit. Lab. and Arctic Am. to Alaska, south in the Rocky Mountains to Colo. Also in northern Europe and Asia. Summer.
2. Campanula rotundifòlia L. Harebell. Blue Bells of Scotland. (I. F. f. 349 I.) Perennial by slender rootstocks, glabrous or nearly so; stems erect or diffuse, often several from the same root, I.5-9 dm. high. Basal leaves nearly orbicular or broadly ovate, usually cordate, slender-petioled, $6-25 \mathrm{~mm}$. wide, den-
tate or entire, often wanting at flowering time; stem leaves linear or linear-oblong, acute, mostly entire, sessile, or the lower narrowed into short petioles and somewhat spatulate; flowers, racemose (rarely solitary), drooping or spreading; calyxlobes subulate, spreading, longer than the short-turbinate tube; corolla blue, campanulate; capsule obconic or ovoid, pendulous, ribbed, opening by short clefts near the base. On moist rocks and in meadows, Lab. to Alaska, south to N. J., Neb., in the Rocky Mts. to Ariz. and in the Sierra Nevada to Cal. Also in Europe and Asia. June-Sept.

Campanula rotundifolilia Langsdorfiàna (A. DC.) Britton. Flower commonly solitary and erect, nearly or quite 2.5 cm . long; calyx-lobes nearly filiform, spreading or deflexed. Summits of the White Mts. of N. H.; Quebec to Lab. and Arctic Am.

Campanula rotundifolia velùtina DC. Stem and leaves pubescent or canescent. Sarid hills, Burt Lake, Mich. (according to A. Gray); Newcastle, N. Y. (according to J. M. Bates).
3. Campanula rapunculoìdes L. Creeping or European Bellflower. (I. F. f. 3492.) Perennial by slender rootstocks; stem glabrous or pubescent, simple or rarely branched, leafy, erect, rather stout, 3-9 dm. high. Leaves pubescent or puberulent, crenate-denticulate, ovate or ovate-lanceolate, acute or acuminate, the lower and basal ones mostly cordate, $7-15 \mathrm{~cm}$. long, $3-5 \mathrm{~cm}$. wide, slenderpetioled, the upper short-petioled or sessile, smaller; flowers short-pedicelled, drooping, $25-35 \mathrm{~mm}$. long; corolla deeply 5 -lobed, much longer than the linear spreading calyx-lobes; capsule globose, nodding, about 8 mm . in diameter, opening near the base. In fields and along roadsides, N. B. to Ont., southern N. Y. and Ohio. Nat. from Europe. July-Sept.
4. Campanula glomerata L. Clustered Bellflower. Dane's Blood. (I. F. f. 3493.) Perennial by short rootstocks; stem stout, simple, erect, pubescent, leafy, 3-6 dm. high. Leaves pubescent on both sides, crenulate, the lower and basal ones oblong or ovate, mostly obtuse, sometimes cordate, $5-10 \mathrm{~cm}$. long, the upper lanceolate or ovate-lanceolate, acute, sessile or clasping, smaller; flowers about 25 mm . long, sessile, erect and spreading; corolla deeply 5 -lobed; calyx-lobes lanceolate, acuminate; capsule ovoid or oblong, erect, about 6 mm . high, opening near the base. In fields and along roadsides, eastern Mass. Nat. from Europe. June-Aug.
5. Campanula aparinoides Pursh. Marsh or Bedstraw Bellflower. (I. F. f. 3494.) Perennial; stems very slender or filiform, weak, reclining or diffuse, rough with short retrorse bristles, leafy, paniculately branched, I.5-6 dm. long. Leaves lanceolate, or linear-lanceolate, sessile, sparingly crenulate with low teeth, or entire, rough on the margins and midrib, acute at both ends, $12-35 \mathrm{~mm}$. long, $2-6 \mathrm{~mm}$. wide; flowers paniculate, $5-8 \mathrm{~mm}$. long; corolla deeply 5 -cleft, its tube equalling or longer than the triangular-lanceolate acute calyx-lobes; capsule subglobose, opening near the base. In grassy swamps, N. B. to the N. W. Terr., south to Ga., Ky. and Colo. June-Aug.
6. Campanula uliginòsa Rydb. n. sp. Blue Marsh Bellflower. Perennial; similar to the preceding but branches less spreading; stem 3-6 dm. high, retrorsely hispidulous on the angles. Leaves linear, $2.5-6 \mathrm{~cm}$. long, $\mathrm{I}-4 \mathrm{~mm}$. wide, retrorsely hispidulous on the margins and midribs, acute, minutely denticulate with callous teeth or entire; corolla blue with darker veins, cleft to below the middle into lanceolate lobes; capsule subglobose, about 5 mm . long and nearly as broad, opening near the base. In wet meadows, Me. and northern N. Y. to Minn. and Iowa; type collected by B. C. Taylor at Chisago City, Minn.
7. Campanula divaricàta Michx. Panicled Bellflower. (I. F. f. 3495.) Perennial, glabrous but somewhat viscid; stem erect, paniculately branched, slent der, 3-9 dm. high. Leaves lanceolate, ovate or oblong-lanceolate, the uppermossometimes linear, sharply serrate, acuminate at the apex, narrowed to the base, the upper sessile, the lower petioled, $5-7 \mathrm{~cm}$. long, 6-25 mm. wide: flowers in compound panicles, drooping; corolla light blue, about 6 mm . long; calyx-lobes lanceolate, acute, often dentate; capsule turbinate, about 5 mm . long, opening near the middle. On rocky banks, Va. and W. Va. to Gra. and Tenn. June-Sept.
8. Campanula Americana L. Tall Bridflower. (I. F. f. 3406.) Annual or biennial, more or less pubescent; stem erect or nearly so, simple or rarely with a few long branches, $6-18 \mathrm{dm}$. high. Leaves thin, ovate, oblong or lanceolate, serrate, acuminate at the apex, narrowed at the base, petioled, or the upper sessile,
$7-15 \mathrm{~cm}$. long, the lowest sometimes cordate; flowers in a sometimes leafy spike, which is often $3-6 \mathrm{dm}$. long; lower bracts foliaceous, the upper subulate; corolla blue, or nearly white, about 25 mm . broad, deeply 5 -cleft; calyx-lobes linear-subulate, spreading; style declined and curved upward, long-exserted; capsule narrowly turbinate, ribbed, erect, $8-10 \mathrm{~mm}$. long, opening near the summit. In moist thickets and woods, N. B. to Ont., S. Dak., Fla., Ky., Ark. and Kans. July-Sept.

## 2. SPECULARIA Heist.

[Legouzia Durand.]
Annual herbs, with alternate toothed or entire leaves, the stem and branches long, slender. Flowers axillary, sessile or nearly so, 2-bracted, or the upper panicled in some exotic species, the earlier (lower) ones small, cleistogamous, the later with a blue or purple nearly rotate corolla. Calyx-tube narrow, the lobes in the earlier flowers 3 or 4 , in the later 4 or 5 . Corolla 5 -lobed or 5 -parted, the lobes imbricated in the bud. Filaments flat; anthers separate, linear. Ovary 3-celled (rarely 2 - or 4 -celled); ovules numerous; stigma usually 3 -lobed. Capsule prismatic, cylindric, or narrowly obconic, opening by lateral valves. Seeds ovoid, oblong, or lenticular. About Io species, natives of the northern hemisphere, one extending into South America. [Name derived from Speculum Veneris, the ancient name of the European Venus' Looking-glass.] The generic name Specularia Heist., used by Fabricius in 1759, antedates Legouzia Durand, 1782.
Capsule narrowly oblong or turbinate.

> Leaves sessile; capsule-valves near the top.

1. S. biflora.

Leaves cordate-clasping; capsule-valves at about the middle.
Capsule linear-cylindric; leaves sessile; western.
2. S. perfoliata.
3. S. leptocarpa.
I. Specularia bifiòra (R. \& P.) A. Gray. Small Venus' Looking-glass. (I. F. f. 3497.) Glabrous, or nearly so; stem simple or branched, very slender, roughish on the angles, $1.5-3 \mathrm{dm}$. high. Leaves ovate, oblong, or the upper lanceolate, sessile, acute or obtuse at the apex, crenate with a few teeth, or entire, $8-20 \mathrm{~mm}$. long, or the upper smaller: earlier flowers with 3 or 4 ovate to lanceolate calyx-lobes, those of the later flowers 4 or 5, lanceolate-subulate, longer; capsule oblong-cylindric, $6-10 \mathrm{~mm}$. long, opening by valves close under the calyxteeth. In dry soil, Va. to Mo., Kans., Fla. and Texas. Also in Cal. and S. Am. April-July.
2. Specularia perfoliàta (L.) A. DC. Venus' Looking-glass. (I. F. f. 3498.) More or less pubescent; stem densely leafy, slender, sometimes prostrate, retrorse-hispid on the angles, or nearly smooth, I.5-6 dm. long. Leaves orbicular or broadly ovate, crenate-dentate or sometimes éntire, $6-25 \mathrm{~mm}$. wide; flowers solitary or $2-3$ together in the axils, the later (upper) ones with 5 (rarely 4) trian-gular-lanceolate acuminate rigid calyx-lobes, and a rotate blue or violet corolla I-2 cm . broad, the earlier ones with 3 or 4 shorter calyx-lobes longer than the rudimentary corolla; capsule oblong, or narrowly turbinate, 4-6 mm. long; seeds lenticular. In dry woods, Me. and Ont. to Br. Col., Fla., La.. Mex., Utah and Ore. May-Sept.
3. Specularia leptocàrpa (Nutt.) A. Gray. Western Venus'Looking-Glass. (I. F. f. 3499.) Hirsute, or nearly glabrous; stem slender, I.5-4.5 dm. high. Leaves linear-lanceolate to oblong, not clasping, acute at both ends, or the lowest obtuse at the apex, entire or sparingly denticulate, $1-2.5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide; flowers usually solitary in the axils. the later ones with 4 or 5 subulate calyx-lobes and a rotate corolla $10-18 \mathrm{~mm}$. broad, the earlier ones with 3 shorter calyx-lobes and rudimentary corolla; capsule $8-16 \mathrm{~mm}$. long, less than 2 mm . thick, the upper at length opening near the summit; seeds oblong. In dry soil, western Mo. to Mont. and Tex. May-Aug.

## 3. JASIÒNE L.

Herbs, the flowers in terminal heads subtended by a many-leaved involucre. Calyx tube campanulate, adnate to the ovary, the limb 5-divided. Corolla at first tubular, splitting later to the base into 5 linear or linear-oblanceolate segments. Filaments subulate. Anthers united at the base, free above. Ovary inferior, 2-celled; stigma club-shaped. Capsule 2-celled, dehiscent by two terminal pores. [Greek name of some medicinal plant.] Five species of central Europe and the Mediterranean Region.
r. Jasione montàna L. Sheep's-bit. Annual or biennial, with several stems from a simple root. Stems $\mathbf{I} .5-2.5 \mathrm{dm}$. high, branched above, leafy below; leaves linear, rough-hairy, sessile; flowers in hemispherical heads; corolla blue, seldom white or pink. In waste places, R. I. and Conn. Adventive from Europe. JuneSept.

## 4. LOBELLIA L.

Herbs (some tropical species shrubs), with alternate or basal leaves, and racemose spicate or paniculate, often leafy-bracted, red, yellow, blue, or white flowers. Calyx-tube turbinate, hemispheric or ovoid, adnate to the ovary. Corolla-tube straight, oblique, or incurved, divided to the base on one side, 2 -lipped in our species, the lobe on each side of the cleft erect or recurved, turned away from the other 3 which are somewhat united. Stamens free from the corolla-tube, monadelphous, at least above, 2 or all the 5 anthers with a tuft of hairs at the tips, 3 of them usually larger than the other 2, all united into a tube or ring around the style. Ovary 2-celled, the 2 placentæ many-ovuled; stigma 2-lobed or 2-cleft. Capsule loculicidally 2-valved. [Named after Matthias de L'Obel, 1538-1616, a Flemish botanist.] About 225 species of wide geographic distribution. Besides the following, some 12 others occur in the southern and western U. S.

* Aquatic; stems simple, nearly naked; flowers light blue.

Leaves terete, hollow, obtuse, all tufted at the base. I. L. Dortmanna. Leaves flat, linear-oblong or spatulate, entire or glandular-denticulate.
2. L. paludosa.
** Terrestrial plants of wet or dry soil; stems leafy.

1. Corolla-tube $10-25 \mathrm{~mm}$. long.

Flowers bright scarlet (rarely white); corolla-tube $20-25 \mathrm{~mm}$. long. 3. L. cardinalis. Flowers blue, white, or blue and white; corolla-tube $10-15 \mathrm{~mm}$. long.

Leaves ovate, lanceolate, or the lower ones obovate.
Leaves glabrous or sparingly pubescent.
Calyx-lobes hirsute; sinuses with large deflexed auricles.
4. L. syphilitica.

Calyx-lobes glabrous or glandular, usually without auricles.

Leaves densely puberulent; calyx hirsute; auricles small.
Leaves elongated-linear, strongly glandular-denticulate.
2. Corolla-tube only $4-8 \mathrm{~mm}$. long.

Stems mostly simple; flowers in terminal spike-like racemes.
Sinuses of the calyx without auricles.
Sinuses of the calyx with reflexed subulate auricles. Stems mostly paniculately branched; flowers in loose racemes. Stem stout, pubescent; leaves ovate or oblong, dentate.
Stems slender, glabrous; stem-leaves narrow, the basal wider.
Pedicels mostly longer than flowers, 2 -bracteolate near the middle.
11. L. Kalmiz.

Pedicels not longer than flowers, not bracteolate, or only so at the base.
Corolla $5-7 \mathrm{~mm}$. long ; calyx-tube hemispheric in fruit. 12, L. Nutíalliz. Corolla $9-11 \mathrm{~mm}$. long; calyx-tube turbinate. 13 . L. Canbyi.

1. Lobelia Dortmánna L. Water Lobelia. Water Gladiole., (I. F. f. 3500.) Perennial, aquatic, glabrous thoughout, somewhat fleshy; roots numerous, white, fibrous; stem slender, simple, erect, hollow, minutely scaly, 1.5-4.5 dm . high. Leaves all submersed, longitudinally divided by a partition. $2-5 \mathrm{~cm}$. long, about 4 mm . thick; flowers in a loose terminal raceme, blue. $12-16 \mathrm{~mm}$. long; pedicels filiform, shorter than or equalling the flowers; calyx-lohes subulate or lanceolate, the sinuses usually not at all appendaged; corolla-tube $6-8 \mathrm{~mm}$. long, its lower lip glabrous or nearly so. Borders of ponds, N. J. and Penn. to N. S., N. B., the N. W. Terr. and Br. Col. Also in Europe. July Sept.
2. Lobelia paludòsa Nutt. Swamp Lobelia. (I. F. f. 350I.) Perennial. aquatic, glabrous throughout; roots few and thick; stem nearly naked, slender. sim. ple, or branched above, 3-12 dm. high. Leaves emersed, obtuse or acutish, those of the stem few, small and sessile, the basal ones $5-22 \mathrm{~cm}$. long. $4^{-8} \mathrm{~mm}$. Wide. narrowed into petioles; flowers pale blue, racemose, $10-12 \mathrm{~mm}$. long: calyx-lobes narrowly lanceolate, the sinuses commonly not at all appendaged; corolla-tube o-8
mm . long, its lower lip pubescent at the base. In swamps and ponds, Del. to Fla. and La., mostly near the coast. May-July.
3. Lobelia cardinàlis L. Cardinal-Flower. Red Lobelia. (I. F. f. 3502.) Perennial by offsets; stem slightly pubescent, or glabrous, leafy, 6-I 3 dm . high. Leaves oblong, oval, ovate-lanceolate, or lanceolate, thin, glabrous or sparingly pubescent, $5-15 \mathrm{~cm}$. long, $6-35 \mathrm{~mm}$. wide, acuminate or acute at both ends, crenulate or denticulate, the upper sessile, the lower petioled; flowers racemose, commonly numerous, bright scarlet or red (rarely white), $25-37 \mathrm{~mm}$. long; bracts usually glandular; calyx-lobes linear, elongated, acute; larger anthers glabrous. In moist soil, N. B. to Fla., the N. W. Terr., Kans. and Tex. July-Sept.
4. Lobelia syphilítica L. Great Lobelia. Blue Cardinal-flower. (I. F. f. 3503.) Perennial by short offsets; stem sparingly pubescent, rather stout, very leafy, usually simple, $3-9 \mathrm{dm}$. high. Leaves thin, green, $5-15 \mathrm{~cm}$. long, $1-5 \mathrm{~cm}$. wide, acute or acuminate at the apex, narrowed at the base, repand-denticulate, or irregularly crenate-dentate, sessile or the lower petioled; flowers densely racemose, leafy-bracted; calyx-lobes lanceolate, acuminate, pubescent or ciliate; corolla bright blue, or occasionally white, $20-25 \mathrm{~mm}$. long, the lobes of its larger lip oblong-oval, obtuse, glabrous; larger anthers glabrous. In moist soil, Me. and Ont. to S. Dak., Ga., La. and Kans. July-Oct.

Lobelia syphilítica Ludoviciàna A. DC. Glabrous or very nearly so ; leaves thick, pale green, oblong or lanceolate, nearly entire, the lower obtuse and spatulate; calyxlobes sparingly pubescent; lobes of the larger lip of the corolla acutish. Neb. to La.
5. Lobelia amoèna Michx. Southern Lobelia. (I. F. f. 3504.) Nearly glabrous throughout, perennial; stem simple, slender, leafy, 3-12 dm. high. Leaves thin, oblong-lanceolate to oval, repand-dentate or denticulate, the lower petioled and mostly obtuse, $5-15 \mathrm{~cm}$. long, the upper sessile, acute or acutish, smaller; flowers blue, racemose, nearly 25 mm . long; bracts narrow and small, or the lower foliaceous, glandular; calyx-lobes linear-subulate, acuminate, glabrous, elongated; corolla-tube $10-14 \mathrm{~mm}$. long, 3-4 mm. thick; larger anthers glabrous, or puberulent at the tip; lobes of the larger lip of the corolla broadly ovate to oval, obtuse, glabrous. In swamps, N. Car. to Fla.; probably within our area, though not reported. July-Sept.

Lobelia amoèna glandulifera A. Gray. Smaller; stem very slender; leaves $2-5 \mathrm{~cm}$. long, mostly obtuse, glandular-dentate; bracts small, very glandular; raceme somewhat secund; sinuses of the calyx sometimes slightly auricled, the lobes commonly glandular. Del, and Va. to Fla. and Ala.
6. Lobelia pubérula Michx. Downy Lobelia. (I. F. f. 3505.) Perennial, densely and finely puberulent all over, slightly viscid; stem mostly simple, leafy, 3-9 dm. high. Leaves oval, oblong, ovate, or obovate, rather thick, the lower petioled, all obtuse or the uppermost acute, denticulate or crenate-dentate, the teeth often glandular; flowers blue, $\mathbf{1 6} \mathbf{- 2 0 ~ m m}$. long, in long spike-like racemes: lower bracts, or sometimes all of them, foliaceous, glandular; calyx hirsute or pubescent, its lobes narrowly lanceolate, elongated, usually with small short rounded auricles at the sinuses; corolla-tube about $\mathbf{I} \mathbf{~ c m}$. long, $2-3 \mathrm{~mm}$. thick, the lobes of its larger lip broadly ovate, glabrous; larger anthers minutely bearded. In moist sandy soil, southern N. J. to Fla., west to Ill., Kans. and Tex. Aug.-Oct.
7. Lobelia glandulòsa Walt. Glandular Lobelia. (I. F. f. 3506.) Perennial; stem slender, leafy below, nearly naked above, simple, glabrous, or sparingly pubescent, 3-12 dm. high. Leaves thick, glabrous, the lower petioled, obtuse, often 17 cm . long and 8 mm . wide, the upper sessile, acutish, shorter; flowers racemose-spicate, secund, often few and distant, blue, nearly 25 mm . long; bracts narrow, glandular; calyx-tube often densely hirsute, its lobes subulate, the sinuses not appendaged; corolla-tube $10-12 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. thick, about twice as long as the calyx-lobes; larger lip of the corolla pubescent within at the base, its lobes ovate, acutish; anthers all bearded at the tip. In swamps near the coast, Va. to Fla. July-Sept.
8. Lobelia spicata Lam. Pale Spiked Lobelia. (I. F. f. 3507.) Perennial or biennial, puberulent; stem strict, simple, leafy, 3-12 dm. high. Leaves thickish, pale green, repand-dentate, crenulate, or entire, the basal ones broadly oblong, oval, or obovate, very obtuse, narrowed into short petioles, $3-7 \mathrm{~cm}$. long,
$3-5 \mathrm{~cm}$. wide; stem leaves sessile, oblong, lanceolate, or spatulate, obtuse, the uppermost gradually smaller and acutish; flowers pale blue, $8-10 \mathrm{~mm}$. long, race-mose-spicate, bracts linear, entire; calyx-tube turbinate, usually glabrous, shorter than its subulate spreading lobes; corolla-tube about 5 mm . long and 2 mm . thick. In dry, mostly sandy soil, or in meadows, N. S. and Ont. to the N. W. Terr., N. C., La. and Ark. June-Aug.

Lobelia spicàta hirtélla A. Gray. Rough or roughish; bracts and calyx-lobes hirsute or ciliate. Manitoba to the N. W. Terr., south to Mich. and Kans.

Lobelia spicàta parviflòra A. Gray. Glabrous or nearly so; stem low, very slender; flowers only about 6 mm . long; calyx-lohes broadly subulate. In swamps, Lancaster, Pa.
9. Lobelia leptóstachys A. DC. Spicked Lobelia. (I. F. f. 3508.) Similar to the preceding species; stem usually stouter, puberulent or glabrous, 6-12 dm. high. Basal leaves oval or obovate, obtuse; stem leaves spatulate, oblong, or lanceolate, obtuse, sometimes slightly scabrous, denticulate or entire, or the uppermost narrower and acute; bracts linear, glabrous; pedicels very short; calyx-lobes linear-subulate, nearly as long as the corolla-tube; flowers blue, 8 -10 mm. long. In dry soil, Va. to Ohio and Ill., Ga. and Kans. June-Aug.
10. Lobelia inflàta L. Indian Tobacco. Wild Tobacco. (I. F. f. 3509.) Annual, pubescent or hirsute, very acrid: stem leafy commonly paniculately branched, 3-9 dm. high. Leaves thin, repand-dentate or denticulate, the lower oval or obovate, obtuse, $3-6 \mathrm{~cm}$. long, narrowed into short petioles, the upper sessile, oval, oblong, ovate, or ovate-lanceolate, obtuse, or the uppermost acute; flowers light blue, 4-6 mm. long, lower bracts foliaceous, the upper subulate; calyx glabrous or nearly so, its subulate lobes about as long as the corolla; capsule inflated, $6-8 \mathrm{~mm}$. long, finely transversely veined between the ribs. In fields and thickets, Lab. to the N. W. Terr., Ga., Neb., Ark. and Kans. July-Nov.
ir. Lobelia Kàlmii L. Brook or Kalm's Lobelia. (I. F. f. 35io.) Perennial by short offsets, glabrous throughout, or sparingly pubescent below; stem leafy, erect, slender, ${ }^{15-25} \mathrm{~cm}$. high. Lower and basal leaves spatulate, obtuse, short-petioled, sparingly repand-denticulate, or entire, $12-25 \mathrm{~mm}$. long, $3-5 \mathrm{~mm}$. wide; upper leaves sessile, linear, linear-oblong, or narrowly spatulate, the uppermost acute; flowers light blue, 8 -10 mm . long; lower bracts linear-lanceolate, the upper subulate; pedicels nearly filiform; calyx-lobes lanceolate-subulate, longer than the turbinate tube, the sinuses not appendaged; capsule wholly inferior, not inflated, campanulate or subglobose, about 4 mm . long. On wet banks, and in wet meadows, N. S. to N. J., west to Ont., the N. W. Terr., Ohio and Mich. July-Sept.
12. Lobelia Nuttallii R. \& S. Nuttall's Lobelia. (I. F. f. 35 If.) Annual, or perhaps biennial, glabrous throughout, or puberulent below; stem weak, usually reclining, very slender, loosely branched, at least when old, 3-9 dm. long. Basal leaves spatulate to oval, obtuse, mostly petioled, $\mathbf{1 2 - 2 5} \mathrm{mm}$. long, slightly repand, or entire; stem leaves distant, linear, linear-oblong, or slightly spatulate, entire or sparingly glandular-denticulate; flowers pale blue, loosely racemose; bracts linear or the upper subulate; calyx-lobes subulate, longer than the depressed-hemispheric strongly ribbed tube, the sinuses unappendaged; capsule depressed-globose, halfinferior, about 2 mm . long. Sandy soil, L. I. to Penn., Fla. and Ga. June-Sept.
13. Lobelia Cánbyi A. Gray. Canby's Lobelia. (I. F. f. 35 12.) Annual, slightly puberulent, usually glabrous; stem erect, slender, 6-9 dm. high. Stem leaves linear or linear-oblong, $\mathbf{I}-4 \mathrm{~cm}$. long, $\mathbf{I}-3 \mathrm{~mm}$. wide, the lower obtuse. sometimes slightly repand-denticulate, the upper acute, narrower, entire; flowers racemose, blue; lower bracts linear, the upper subulate; calyx-lobes linear-subulate, glandular-denticulate, equalling or somewhat ionger than the narrowly turbinate tube, mostly shorter than the tube of the corolla; capsule otiong turbinate, 4 mm . long, shorter than the calyx-tube. Swamps, N. J. to S. Car. July-Sept.

Family 3. CICHORIACEAE Reichenb.
Chicory Family.
Herbs (two Pacific Island genera trees), almost always with milky, acrid or bitter juice, alternate or basal leaves, and yellow, rarely pink, blue, purple, or
white flowers in involucrate heads (anthodia). Bracts of the involucre in $I$ to several series. Receptacle of the head flat or flattish, naked, scaly (paleaceous), smooth, pitted, or honeycombed. Flowers all alike (heads homogamous), perfect, Calyx-tube completely adnate to the ovary, its limb (pappus) of scales, or simple or plumose bristles, or both, or wanting. Corolla gamopetalous, with a short or long tube, and a strap-shaped (ligulate) usually 5 -toothed limb (ray). Anthers connate into a tube around the style, the sacs sagittate or auricled at the base, not tailed, usually appendaged at the summit, the simple pollen•grains usually 12 -sided. Ovary I-celled; ovule 1, anatropous; style very slender, 2 -cleft, or 2 -lobed, the lobes minutely papillose. Fruit an achene. Seed erect; endosperm none; radicle narrower than the cotyledons. About 65 genera and 1400 species, of wide geographic distribution. The family is also known as Liguliflorae, and is often regarded as a tribe of the Compositae.

* Pappus of scales, or of scales and bristles, or none (see No. 18).

Flowers blue or white ; pappus of blunt scales.
I. Cichorium.

Flowers yellow.
Bracts of the involucre membranous, or herbaceous.
Pappus none; achenes 20-30-nerved.
2. Lapsana.
Pappus none; achenes 8-10-ribbed.
3. Serinea.

Pappus of rounded scales, with or without an inner series of bristles.
4. Adopogon.

Bracts of the involucre thickened and keeled after flowering ; pappus none.

*     * Pappus, at least some of it, of plumose bristles.

Receptacle chaffy.
5. Arnoseris.

Receptacle naked.
6. Hypochaeris.

Plume-branches of the pappus not interwebbed.
Flowers yellow ; plants scapose, the leaves basal. 7. Leontodon.
Flowers yellow; plants leafy-stemmed.
8. Picris.

Flowers pink.
9. Ptiloria.

Plume-branches of the pappus interwebbed. Io. Tragopogon.
*** Pappus of simple bristles (of soft white scales with or without bristles in No. 18.)
$\dagger$ Receptacle with a few deciduous bristles; flowers yellow.
11. Malacothrix.

## $\dagger \dagger$ Receptacle naked.

1. Achenes spinulose, or with short processes near the summit.

Heads few- (6-15-) flowered, yellow; stem branching.
12. Chondrilla.

Heads many-flowered, yellow, solitary on scapes.
13. Taraxacum.
2. Achenes smooth, or papillose, not spinulose toward the summit.
(a) Achenes flattened.

Achenes truncate, not beaked; flowers yellow.
14. Sonchus.

Achenes narrowed at the summit, or beaked; flowers blue or yellow.
15. Lactuca.
(b) Achenes cylindric, or prismatic.

Achenes terete, not narrowed either at the base or summit ; flowers pink or purple.
16. Lygodesmia.

Achenes narrowed at the base, narrowed or beaked at the summit; flowers yellow.
Achenes slender-beaked.
Pappus-bristles not surrounded by a villous ring at base.
Pappus of slender simple bristles. 17. Agoseris.
Pappus of narrow soft scales, with or without some slender bristles.
18. Nothocalais.

Pappus-bristles surrounded by a villous white ring at base. Achenes merely narrowed above, not beaked.
19. Sitilias.
20. Crepis.

Achenes narrowed at the base, otherwise columnar, truncate (except in two species of Hieracium).

Flowers yellow, orange, or red.
Flowers white, cream-colored, or purple.
21. Hieracium.
22. Nabalus.

## 1. CICHÒRIUM L.

Erect branching herbs, with alternate and basal leaves, those of the stem and branches usually very small and bract-like, and large heads of blue, purple, pink, or white flowers, peduncled, or in sessile clusters along the branches. Involucre of 2 series of herbaceous bracts, the outer somewhat spreading, the inner erect and subtending, or partly enclosing, the outer achenes. Receptacle flat, naked, or slightly fimbrillate. Rays truncate and 5 -toothed at the apex. Anthers sagittate
at the base. Style-branches slender, obtushish. Achenes 5-angled or 5-ribbed, truncate, not beaked. Pappus of 2 or 3 series of short blunt scales. [From the Arabic name.] About 8 species, natives of the Old World.

1. Cichorium Íntybus L. Chicory. Wild Succory. Blue Sailors. Bunk. (I. F. f. 35 I3.) Perennial from a long deep tap-root; stems slightly hispid, stiff, much branched, 3-9 dm. high. Basal leaves spreading on the ground, runcinate-pinnatifid, spatulate in outline, $7-15 \mathrm{~cm}$. long, narrowed into long petioles; upper leaves much smaller, lanceolate or oblong, lobed or entire, clasping and auricled at the base; heads numerous, $25-37 \mathrm{~mm}$. broad, $\mathbf{I}-4$ together in sessile clusters on the nearly naked or bracted branches; inner bracts of the involucre about 8. Roadsides, fields and waste places, N. S. to Minn., N. Car., Neb. and Kans. The ground-up root is used as a substitute or adulterant for coffee. July-Oct.

Cichorium Intybus divaricàtum DC. Some or all the heads on stout spreading peduncles $2-10 \mathrm{~cm}$. long. Frequent with the type.

## 2. LÁPSANA L.

Annual erect branching herbs, with alternate dentate or pinnatifid leaves, and small pånicled slender-peduncled heads of yellow flowers. Involucre nearly cylindric, its principal bracts in I series, nearly equal, with a few exterior small ones at the base. Receptacle flat, naked. Rays truncate and 5-toothed at the apex. Anthers sagittate at the base. Style-branches slender. Achenes obovate-oblong, 20-30-nerved, somewhat flattened, narrowed below, rounded at the summit. Pappus none. [Greek, lampsana, the name of a crucifer.] About 9 species, natives of the Old World.

1. Lapsana commùnis L. Nipplewort. Succory Dock-cress. (I. F.f. 3514.) Stem paniculately branched, glabrous above, more or less hispid-pubescent below, 3-10 dm. high. Lower leaves ovate, repand-dentate, obtuse, thin, pubescent, or glabrate, petioled, $5-10 \mathrm{~cm}$. long, often with $2-6$ lobes on the petiole, the uppermost oblong or lanceolate, sessile, acute, much smaller, mostly entire; heads very numerous, $6-12 \mathrm{~mm}$. broad; involucre oblong-cylindric, 4-6 mm . high, of about 8 linear glaucous principal bracts and several very small outer ones. Along roadsides and in waste places, Quebec and Ont. to N. J. and Penn. Also on the Pacific Coast. Nat. from Europe. June-Sept.

## 3. SERÍNIA Raf.

Low glaucescent branching annual herbs, with alternate clasping entire or lobed leaves, or those of the stem sometimes appearing as if opposite, and few small long-peduncled heads of yellow flowers. Involucre broadly campanulate, its bracts about 8 , equal, membranous, becoming concave after flowering. Receptacle flat, naked. Rays truncate and 5 -toothed at the apex. Anthers sagittate at the base. Style-branches slender. Achenes obovoid, 8-Io-ribbed, contracted at the base, rounded at the summit. Pappus none, or a mere vestige. [Greek, small chicory.] Three known species of the southern U. S.
I. Serinia oppositifolia (Raf.) Kuntze. Serinia. (I. F. f. 3515.) Glabrous throughout, or slightly glandular-pubescent along the ends of the peduncles, branched from the base, $\mathbf{I O}-\mathbf{2 5} \mathrm{cm}$. high. Basal and lower leaves petioled, oblonglanceolate or spatulate in outline, acute or obtuse, entire, lobed or pimatifid. 7-12 cm . long, 4-12 mm. wide; upper leaves mainly sessile, clasping, alternate, or appearing as if opposite, usually entire, smaller; peduncles very slender, sometimes I dm. long; heads 3-4 mm. broad; bracts of the involucre acute or acuminate, about the length of the rays. In fields, Kans. to Tex., N. Car. and Fla. March-May.
4. ADOPÒGON. Neck.

Herbs, with scapose or leafy stems, hasal or alternate leaves, and small or middle-sized heads of yellow or orange flowers, solitary at the end of the scape or its branches. Involucre campanulate, its herbaceous bracts in I or 2 series, with no exterior shorter ones. Receptacle flat, naked. Riys trumeate and 5 -tenothed at the apex. Anthers sagittate at the base. Style-branches slender, ohtusish. Achenes turbinate or oblong, 15-20-ribbed. truncate. Pappus in 1 or 2 series, the
outer of thin broad rounded scales, the inner of slender naked bristles, or these sometimes wanting in the southwestern $A$. occidentale. [Greek, a pleasing beard.] Five known species, natives of N. Am.
Stem i-leaved and branched above, bearing 2-6 heads.

1. A. Virginicum.

Scape naked, monocephalous.
Head about 25 mm . broad; pappus-bristles 12-20; perennial. 2. A. Dandelion.
Head 6-14 mm. broad; pappus-bristles 5-7; annuals.
Bracts of the involucre 5-8, remaining erect, firm, keeled. 3. A. occidentale. Bracts of the involucre 8-18, at length reflexed, thin.
4. A. Carolinianum.

1. Adopogon Virgínicum (L.) Kuntze. Cynthia. Virginia Goatsbeard. (I. F. f. 35 16.) Perennial, glabrous and glaucous ; stem 3-6 dm. high, x-leaved and branched above. Basal leaves tufted, runcinate, sinuate, denticulate, or entire, $5-17 \mathrm{~cm}$. long, narrowed into margined petioles; heads about 4 cm . broad; involucre of 9-15 lanceolate nerveless bracts 6-8 mm. long; achenes nearly oblong; pappus of IO-15 oblong scales and an equal or greater number of capillary bristles; flowers orange to reddish orange. In moist woods and meadows, Mass. to southern Ont. and Manitoba, Ga., Ky., Mo. and Kans. May-Oct.
2. Adopogon Dandèlion (L.) Kuntze. Dwarf Dandelion or Goatsbeard. (I. F. f. 35 17.) Perennial, acaulescent, glabrous and somewhat glaucous; scape ${ }^{15}-45 \mathrm{~cm}$. high, slender. Stolons filiform, bearing globose tubers; leaves all basal, tufted, linear-lanceolate to spatulate, entire, denticulate, sinuate, or pinnatifid, narrowed at the base, $7-15 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide; head about 25 mm . broad; involucre about $\mathbf{I} \mathrm{cm}$. high; pappus similar to that of the preceding species. In moist soil, Md. to Fla., west to Kans. and Tex. April-June.
3. Adopogon occidentàle (Nutt.) Kuntze. Western Dwarf Dandelion. (I. F. f. 35 I8. ) Annual, acaulescent; scapes tufted, $5-20 \mathrm{~cm}$. high, usually glandular, at least above, bearing a single head $10-20 \mathrm{~mm}$. broad. Leaves basal, lanceolate to obovate, entire to pinnatifid, mostly shorter than the scapes; involucre $4-6 \mathrm{~mm}$. high, its bracts 5-8, lanceolate, becoming ovate-lanceolate to ovate, firm and keeled at maturity, remaining erect; pappus of 5 obovate scales and usually 5 alternating bristles. Prairies, southern Mo. to Tex.
4. Adopogon Caroliniànum (Walt.) Britton. Carolinia Dwárf Dandelion. Krigia. (I. F. f. 35 19.) Annual, acaulescent; scapes usually several from the same root, very slender, glabrous or hispidulous, monocephalous, $3-40 \mathrm{~cm}$. high. Leaves commonly all basal, tufted, spatulate, lanceolate or linear, pinnatifid, sinuate, lobed, dentate or rarely entire, $3-15 \mathrm{~cm}$. long, narrowed into margined petioles; head 6-14 mm. broad; involucre of 9-18 linear-lanceolate bracts; pappus usually of 5 round short scales and 5 -10 long capillary bristles. In dry, sandy soil, Me. to Ont., Minn., Fla. and Tex. April-Aug.

## 5. ARNÓSERIS Gaertn.

A low annual scapose herb, glabrous, or nearly so, with tufted basal dentate or nearly entire leaves. Scapes several or numerous, simple or branched, upwardly thickened below the solitary heads of yellow flowers. Involucre campanulate, its bracts in I series, narrow, equal, thickened and keeled on the back after flowering, rarely with a few outer minute ones. Receptacle flat, pitted, not chaffy. Anthers sagittate. Style-branches obtuse. Achenes oval, 8-10-ribbed, narrowed below, truncate, or with a denticulate margin. Pappus none. [Greek, lamb-succory.] A monotypic genus of western Europe.
I. Arnoseris mínima (L.) Dumort. Lamb Succory. (I. F. f. 3520.) Scapes slender, 7-30 cm. high, leafless, simple, or with I-4 branches mostly above the middle, gradually thickened and hollow upward. Leaves oblanceolate, obovate, or oblong, $3-7 \mathrm{~cm}$. long, $6-20 \mathrm{~mm}$. wide. usually coarsely and sharply toothed, narrowed into margined petioles; heads 16 mm . broad, or less; bracts of the involucre linear-lanceolate, acuminate, strongly keeled after flowering, $4-8 \mathrm{~mm}$. long, curving over the achenes. Mount Desert Island, Me. Fugitive from Europe. Summer.

## 6. HYPOCHAERIS L.

Mostly perennial herbs, with scapose, often branched stems and mostly basal tufted leaves, pinnatifid to entire, those of the scapes few, scale-like, very small, or none. Heads mostly large, long-peduncled. Flowers yellow. Involucre oblong-
cylindric to campanulate, its bracts herbaceous, imbricated in several series, appressed, the outer smaller. Receptacle flat, chaffy. Anthers sagittate. Stylebranches slender, obtusish. Achenes oblong to linear, 1o-ribbed, somewhat narrowed below, contracted above into a long or short beak, or the outer truncate. Pappus of I row of plumose bristles, sometimes with some shorter simple ones. [Greek, for pigs, which are fond of its roots.] About 50 species, natives of Europe, Asia, and S. Am.

1. Hypochaeris radicàta L. Long-rooted Cat's-ear. Gosmore. (I. F. f. 352I.) Perennial; stems several together, glabrous, slender, 3-6 dm.high, bracted, or rarely simple, bearing a few scales. Leaves spreading on the ground, oblanceolate to obovate in outline, pinnatifid-lobed to dentate, $5-15 \mathrm{~cm}$. long, hirsute on both sides; involucre oblong-cylindric, about 25 mm . high, its bracts glabrous, or sparingly pubescent; heads 25 mm . broad or more; achenes rough, all with very slender beaks longer than the body; flowers longer than the involucre. In waste places, L. I. to N. J. Also in Cal. and Wash. Adventive or nat. from Europe. Native also of Asia. May-Oct.

Hypochaeris glabra L., the smooth Cat's-ear, a smaller species, with nearly or quite glabrous leaves, flowers scarcely longer than the involucre, and the outer achenes truncate, has been found as a waif in Me., and is nat. or adventive on the Pacific Coast.

## 7. LEÓNTODON L.

Perennial scapose herbs, with tufted basal mostly pinnatifid leaves, branched and scaly, or simple and naked scapes, and large heads of yellow flowers, solitary at the end of the scape or of its branches. Involucre ovoid or oblong, its principal bracts in I or 2 series, nearly equal, with several series of short outer ones. Receptacle flat, fimbrillate, villous, or somewhat honeycombed. Rays truncate and 5 -toothed at the apex. Anthers sagittate at the base. Style-branches slender. Achenes oblong or linear, finely striate, contracted or beaked at the summit. Pappus of 1 or 2 series of plumose persistent brownish bristles, somewhat broadened at the base, or the outer scale-like and simple. [Greek, lion's tooth.] About 45 species, natives of the Old World.
Plant nearly glabrous; scape commonly branched; pappus-bristles all plumose.

1. L. autumnale.

Plant somewhat hirsute; scape simple; outer pappus of outer achenes simple.
2. L. nudicaule.
i. Leontodon autumnàle L. Fall Dandelion. Autumnal Hawkbit. Lion's-тоотн. (I. F. f. 3522.) Scape slender, usually branched and scaly, 1.5-6 dm. high. Leaves narrowly oblong to linear-lanceolate, pinnatifid into narrow lobes, or some of them coarsely dentate, $7-20 \mathrm{~cm}$. long, $6-25 \mathrm{~mm}$. wide, acuminate at the apex, short-petioled; heads several, rarely solitary, about $25-30 \mathrm{~mm}$. broad: involucre oblong, glabrous or slightly pubescent. In fields and along roadsides, Newf. and Ont. to N. J., Penn. and Ohio. Nat. from Europe. Native also of Asia. June-Nov.
2. Leontodon nudicaùle (L.) Porter. Rough or Hairy Hawkbit. (I. F. f. 3523.) Scape simple, slender, $\mathbf{I}-3 \mathrm{dm}$. high, minutely scaly, or naked. Leaves linear-oblong to narrowly spatulate, acute or ohtuse, not acuminate, nearly entire. coarsely sinuate-dentate or sometimes pinnatifid, $5-\mathbf{1 2} \mathrm{cm}$. long, $6-16 \mathrm{~mm}$. wide, narrowed into petioles; head solitary at the end of the scape, $1-2 \mathrm{~cm}$. broad; involucre canescent or pubescent; outer achenes with an outer pappus of simple narrow scales and an inner one of plumose bristles. In ballast and waste places about the eastern seaports. Also at Seidersville, Penn., and on Vancouver Island. Adventive from Europe. June-Oct.

## 8. PÌCRIS L.

Erect hispid, mostly branching, leafy herbs, with alternate leaves (in our species), and rather large, usually corymbose or paniculate heads of yellow flowers. Involucre campanulate or cup-shaped, its principal bracts in one series, nearly equal, with $2-3$ series of small or larse exterior spreading ones. Receptacle flat. short-fimbrillate. Rays truncate and 5 -toothed at the apex. Anthers sagittate at the base. Style-branches slender. Achenes linear or oblong, somewhat incurved, terete or angled, 5-10-ribbed and transversely wrinkled, narrowed at the base and
summit, or beaked in some species. Pappus of I or 2 series of slender plumose bristles. [Greek, bitter.] About 35 species, natives of the Old World, one perhaps indigenous in Alaska.
Outer involucral bracts linear; achenes not beaked.

1. P. hieracioides.

Outer involucral bracts ovate, foliaceous; achenes short-beaked.
2. P.echioides.
I. Picris hieracioìdes L. Hawkweed Picris. (I. F. f. 3524.) Biennial, more or less hispid, much branched, 3-9 dm. high. Leaves lanceolate or oblonglanceolate, dentate, or nearly entire, the basal narrowed into petioles, acute, often 15 cm . long, those of the stem mostly sessile and smaller; heads numerous, $\mathbf{1 - 2 . 5} \mathrm{cm}$. broad; involucre $8-12 \mathrm{~mm}$. high, its outer bracts linear, subulate, spreading, the inner linear-lanceolate, acuminate; pappus copious, nearly white. In waste places, Ill., Penn., N. J., and in ballast about the seaports. Adventive from Europe. Nat. also of Asia. Very bitter. June-Sept.
2. Picris echioides L. Bristly Ox-tongue. Bugloss and Bugloss PicRIS. (I. F. f. 3525.) Annual or biennial, branched, hispid; stem about 7 dm . high. Basal and lower leaves spatulate or oblong, obtuse, repand-dentate, $5-\mathbf{1 5} \mathrm{cm}$. long, narrowed into petioles; upper leaves sessile and clasping, oblong or lanceolate, smaller, the uppermost mainly acute and entire; heads numerous, short-peduncled, about 12 mm . broad; outer bracts of the involucre 4 or 5, foliaceous, ovate, acute, hispid-ciliate, the inner ones lanceolate, membranous. In waste places, N. S. and Ont., and in ballast about the seaports. Fugitive from Europe. July-Sept.

## 9. PTILÒRIA Raf.

Annual or perennial, mostly glabrous, often glaucous herbs, with erect, simple or branched, usually rigid stems, alternate or basal, entire dentate or runcinatepinnatifid leaves, those of the stem and branches often reduced to subulate scales, and small erect heads of pink flowers, paniculate, or solitary at the ends of the branches, opening in the morning. Involucre cylindric or oblong, its principal bracts few, equal, scarious-margined, slightly united at the base, with numerous short exterior ones and sometimes a few of intermediate length. Receptacle flat, naked. Anthers sagittate at the base. Style-branches slender. Achenes oblong or linear, terete or columnar, 5 -ribbed, truncate or beaked at the summit, the ribs smooth or rugose. Pappus of I series of rather rigid plumose bristles. [Greek, referring to the feathery pappus.] About 16 species, natives of western and central N. Am.
Pappus brownish, plumose except at the base. Pappus white, plumose to the base.
I. Ptiloria paucifiòra (Torr.) Raf. Brown-plumed Ptiloria. (I. F. f. 3526.) Perennial; stem rather stout, striate, rigid, divergently branched, 3-6 dm. high. Basal and lower leaves runcinate-pinnatifid, $3-6 \mathrm{~cm}$. long, $6-\mathbf{5 2} \mathrm{mm}$. wide, the upper all short and narrowly linear or reduced to scales; heads somewhat racemose-paniculate along the branches, usually about 5 -flowered; involucre 8 -10 mm. high; rays $2-4 \mathrm{~mm}$. long: pappus brownish, plumose to near the base. Plains, Neb. (?), Kans. and Wyo. to Tex. and Cal. Summer.
2. Ptiloria ramòsa Rydb. White-plumed Ptiloria. (I. F. f. 3527.) Similar to the preceding species, but commonly lower, bushy-branched. Basal leaves runcinate-pinnatifid, those of the stem linear, entire, or sometimes runcinatedentate, the uppermost reduced to small scales; heads numerous, usually solitary at the ends of the branchlets; pappus bright white, very plumose to the base. Plains and dry, rocky soil, western Neb. to Mont. and Colo. May-Aug. It has been confused with P. tenuifolia (Torr.) Raf.

## 10. TRAGOPOGGON L.

Biennial or perennial, erect, usually branched, somewhat succulent herbs, with slender fleshy tap-roots, alternate entire linear-lanceolate long-acuminate leaves, clasping at the base, and long-peduncled large heads of yellow or purple flowers, opening in the early morning, usually closed by noon. Involucre cylindric or narrowly campanulate, its bracts in I series, nearly equal, acuminate, united at the base. Rays truncate and 5-toothed at the apex, Anthers sagittate at the base.

Style-branches slender. Achenes linear, terete, or 5-angled, 5-10-ribbed, terminated by slender beaks, or the outermost beakless. Pappus-bristles in $x$ series, plumose, connate at the base, the plume-branches interwebbed. [Greek, goatsbeard.] About 35 species, natives of the Old World.
Flowers yellow; involucral bracts equalling or shorter than the rays.

1. T. pratensis. Flowers purple; involucral bracts much longer than the rays.
2. T. porrifolius.
3. Tragopogon praténsis L. Yellow Goat's-beard. Meadow Salsify. (I. F. f. 3528.) Stem branched, 4-9 dm. high. Leaves keeled, tapering from the broad, more or less clasping base to a very long acuminate tip, the lower sometimes 25 cm . long and 25 mm . wide; peduncles thickened at the top; heads $3-6 \mathrm{~cm}$. broad; bracts of the involucre about 8, lanceolate, acuminate, shorter than or equalling (rarely exceeding) the yellow rays; marginal achenes striate, smonth or roughened. In fields and waste places, N. B. to N. J., Ont., Ohio and Manitoba. Nat. from Europe. June-Oct.
4. Tragopogon porrifòlius L. Oyster Plant. Salsify. Purple Goat'sbeard. (1. F. f. 3529 .) Taller, sometimes 1.5 m . high. Peduncles very much thickened and hollow for $3-7 \mathrm{~cm}$. below the heads; heads $5-10 \mathrm{~cm}$. broad, very showy; bracts of the involucre linear-lanceolate, acuminate, usually much longer than the purple rays; achenes sometimes 5 cm . long, the outer ones covered with scale-like tubercles, especially on the ribs below. In fields and waste places, Ont. to N. J., N. Car., Minn. and Colo., mostly escaped from gardens, where it is common. Native of Europe. June-Oct.

## II. MALÁCOTHRIX DC.

Annual or perennial, branching or scapose herbs, with alternate or basal, mostly pinnatifid leaves, and long-peduncled panicled or solitary heads of yellow or rarely white flowers. Involucre campanulate, its principal bracts in 1 or 2 series, equal or nearly so, with several series of shorter exterior ones. Receptacle flat, naked or bristly. Rays truncate and 5 -toothed at the apex. Anthers sagittate at the base. Style-branches slender. Achenes oblong or linear, glabrous, 10-15-ribbed, 4 or 5 of the ribs usually more prominent than the others, truncate, or margined and 4 -5-toothed at the summit. Pappus-bristles in 2 series, the inner naked or minutely serrulate, slender, coherent at the base and deciduous in a ring, the outer few ( $1-8$ ), more persistent, or all deciduous in our species. [Greek, soft-hair, in allusion to the soft pappus.] About 15 species, natives of the western and southwestern U. S. and lower Cal.
I. Malacothrix sonchoides (Nutt.) T. \& G. Malacothrix. (I. F. f. 3530.) Annual, glabrous throughout, or slightly glandular; stem branched. ${ }^{1} 5-30 \mathrm{~cm}$. high. Leaves somewhat fleshy, oblong or linear-oblong in outline, pinnatifid and the lobes dentate with mucronate-pointed teeth, the basal ones $4-7 \mathrm{~cm}$. long, narrowed into short broad petioles, those of the stem smaller, sessile; heads several or numerous, $\mathbf{1 6} \mathbf{- 2 5} \mathrm{mm}$. broad; principal bracts of the involucre linear. acute, scarious-margined, the outer short, oblong; achenes linear-oblong, margined at the summit by a 15 -denticulate white border; pappus-bristles all deciduous. On dry plains, western Neb. and Kans. to Cal. and N. Mex. May-Aug.

## 12. CHONDRÍLLA L.

Perennial herbs, with stiff divaricately branched stems, the basal leaves large and mostly pinnatifid, those of the stem small, narrow, alte rnate, and few middle sized heads of yellow flowers mostly solitary at the ends of the branches. Involucre cylindric, several-flowered, its inner bracts in $\mathbf{I}$ or 2 series, nearly equal, with several series of small or minute outer ones. Receptacle flat, naked. Rays truncate and 5 -toothed at the summit. Anthers sagittate at the base. Style-branches slender. Achenes oblong or linear, 4-5-angled, many-ribbed, more or less spiny near the summit, abruptly contracted into a beak. Pappus of copious soft white simple bristles. [Greek, lump, from the gummy matter borne on the stems of some species.] About 18 species, of the Old World.

1. Chondrilla júncea L. Gum Succorv. (l. F. f. 353I.) Stem rush-like. hirsute at the base, glabrous above, much branched. $3-0$ dm. high. Basal leaves runcinate-pinnatifid, those of the stem linear or linear-lanceolate, acute, dentate or
entire, sessile, $\mathbf{I}-4 \mathrm{~cm}$. long, $\mathrm{I}-3 \mathrm{~mm}$. wide; heads terminal and lateral on the branches, short-peduncled or sessile, $8-12 \mathrm{~mm}$. broad; involucre glabrous or nearly so, about 8 mm . high, its inner bracts narrowly linear; achenes slightly shorter than the filiform beak. In dry fields and waste places, Del. to Md. and Va. Nat. from Europe. July-Aug.

## 13. TARÁXACUM Hall.

Perennial acaulescent herbs, with basal tufted pinnatifid or sinuate-dentate leaves, and large heads of yellow flowers, solitary, or very rarely 2 or 3 together at the ends of naked hollow scapes. Involucre obloig or campanulate, its inner bracts in I series, nearly equal, slightly united at the base, the outer of several series of shorter somewhat spreading ones, often reflexed at maturity. Receptacle flat, naked. Rays truncate and 5 -toothed at the summit. Anthers sagittate at the base. Style-branches slender, obtusish. Achenes oblong or linear-fusiform, 4-5angled. 5-10-nerved, roughened or spinulose, at least above, tapering into a very slender beak. Pappus of numerous filiform unequal simple persistent bristles. [Name of some wild succory, probably of Arabic or Persian origin.] About 20 species, natives of the northern hemisphere and southern S. Am.
Outer involucral bracts reflexed; achenes greenish brown, the beak 2-3 times their length.

1. T. Taraxacum.

Outer involucral bracts spreading or ascending. Achenes greenish, the beak $2-3$ times their length. Achenes red, the beak not more than twice their length.
2. T. latilobum.
3. T. erythrospermum.
I. Taraxacum Taráxacum (L.) Karst. Dandelion. Blowball. (I. F. f. 3532.) Root thick, deep, often $2-3 \mathrm{dm}$. long, bitter. Leaves rblong to spatulate in outline, usually pubescent. at least when young, acute or obtuse, pinnatifid or sinuate-lobed. rather succulent. $7-25 \mathrm{~cm}$. long, $\mathrm{I}-6 \mathrm{~cm}$. wide, narrowed into petioles; scape erect, $5-45 \mathrm{~cm}$. high; head $3-5 \mathrm{~cm}$. broad; flowers $150-200$; inner bracts of the involucre linear or linear-lanceolate, the outer similar, shorter, not glaucous, reflexed, all acute; achenes greenish-brown, fusiform. spinulose above. In fields and waste places. Perhaps indigenous northward, southward naturalize $\dot{\bar{a}}$ as a weed from Europe. Also in Asia and distributed as a weed in all civilized parts of the world. Jan-Dec.
2. Taraxacum latilobum DC. Mountain Dandelion. Similar to the preceding but scape lower. $5-15 \mathrm{~cm}$. high. Leaves sinuately lobed with broadly triangular lobes. but less deeply so than in T. Taraxacum and rarely as far as half way to the midrib, or often merely dentate or subentire; heads smaller, about 3 cm . wide; bracts fewer, the outer broadly ovate, appressed or merely spreading. In moist places in subalpine or subarctic regions. Lab, to Br . Col., south in the mountains to Colo. and Cal. (T. Taraxacum alpinum Porter; not T. alpinum Koch of Europe.)
3. Taraxacum erythrospérmum Andrz. Red-seeded Dandelion. (I. F. f. 3533.) Similar to the two preceding species, the leaves glabrous, very deeply runcinate-pinnatifid or pinnately divided into narrower triangular-lanceolate usually long-pointed segments; heads rarely more than 25 mm . broad, $70-90$ flowered; bracts of the involucre glaucous. the outer lanceolate, spreading or ascending, the inner linear, longer, each usually with an appendage just below the tip; achenes narrower, bright red, or red-brown. spinulose above: pappus dirty white. In fields and woods, Mie. to Vt., southern N. Y. and Penn. Nat. from Europe? April-June.

## 14. SÓNCHUS L.

Annual or perennial succulent herbs, with alternate, mostly auriculate-clasping, entire dentate lobed or pinnatifid. prickly-margined leaves, and large or middle-sized, peduncled corymbose or paniculate heads of yellow flowers. Involucre ovoid or campanulate, usually becoming thickened and more or less conic at the base when old. its bracts herbaceous or membranous, imbricated in several series, the outer successively smaller. Receptacle flat. naked. Rays truncate and 5 -tnothed at the apex. Anthers sagittate at the base. Style-branches slender. Achenes oval, oblong, or linear, more or less flattened, ro-20-ribbed, somewhat
narrowed at the base, truncate. Pappus of very copious soft white simple capillary bristles, usually falling away connected, sometimes with I or 2 stouter ones which fall separately. [The Greek name of the Sow-thistle.] About 45 species, of the Old World. Besides the following, another occurs on the Pacific Coast.
Involucre glandular-pubescent ; heads nearly 25 mm . high.

1. $S$. arvensis.
Involucre glabrous; heads $12-16 \mathrm{~mm}$. high.
Auricles of the leaves acute; achenes striate and transversely wrinkled. 2. S. oleraceus.
Auricles rounded; achenes ribbed, not transversely wrinkled. 3. S. asper.
2. Sonchus arvénsis L. Corn Sow-Thistle. Milk Thistle. (I. F. f. 3534.) Perennial by deep roots and creeping rootstocks, glabrous; stem leafy below, paniculately branched and nearly naked above, 6-12 dm. high. Lower and basal leaves runcinate-pinnatifid, spinulose-dentate, narrowed into short petioles, the upper pinnatifid or entire, lanceolate, clasping; heads several or numerous, corymbose-paniculate, $3-5 \mathrm{~cm}$. broad, bright yellow, very showy; bracts as also the peduncles glandular-bristly; achenes oblong, with about io rugose longitudinal ribs. In low grounds along salt meadows and streams, N. J. to Que. and at Great Salt Lake, Utah, and in fields and along roadsides, Newf. to Minn. Nat. from Europe. July-Oct.
3. Sonchus oleràceus L. Annual Sow-Thistle. Hare's Lettuce. (I. F. f. 3535 .) Annual, with fibrous roots; stem leafy below, nearly simple, 3-30 dm. high. Basal and lower leaves petioled, lyrate-pinnatifid, $10-25 \mathrm{~cm}$. long, the terminal segment commonly large and triangular, the margins denticulate with mucronate or scarcely spiny teeth; upper leaves pinnatifid, clasping by an auricled or sagittate base; uppermost leaves often lanceolate and entire; heads several or numerous, pale yellow, $18-30 \mathrm{~mm}$. broad. In fields and waste places, a common weed in most cultivated parts of N. Am. except the extreme north. Also in Cent. and S. Am. Nat. from Europe. May-Nov.
4. Sonchus ásper (L.) All. Spiny or Sharp-fringed Sow-Thistle. (I. F.f. 3536.) Annual, similar to the preceding species; leaves undivided, lobed or sometimes pinnatifid, spinulose-dentate to spinulose-denticulate, the lower and basal ones obovate or spatulate, petioled, the upper oblong or lanceolate, clasping by an auricled base; heads several or numerous, 25 mm . broad or less; flowers pale yellow. In waste places throughout most of our area and in tropical and S. Am. Widely distributed as a weed in nearly all cultivated parts of the earth. Nat. from Europe. May-Nov.

## 15. LACTÙCA L.

Tall leafy herbs, with small panicled heads of yellow, white or blue flowers, and alternate leaves. Involucre cylindric, its bracts imbricated in several series, the outer shorter, or of $\mathbf{1}$ or 2 series of principal nearly equal inner bracts, and several rows of short outer ones. Receptacle flat, naked. Ray's truncate and 5 . toothed at the summit. Anthers sagittate at the base. Style-branches mostly slender. Achenes oval, oblong or linear, flat, 3-5-ribbed on each face, narrowed above or contracted into a narrow beak, which is somewhat expanded at the summit into a small disk bearing the copious soft capillary white or brown pappusbristles. [The ancient Latin name, from lac, milk, referring to the milky juice.] About 95 species, natives of the northern hemisphere.

* Pappus bright white.

1. Leaves spiny-margined and often with spiny or hispid midribs ; flowers yellow.

Heads 6-12-flowered; involucre very narrow, $8-12 \mathrm{~mm}$. high

1. L. Scariola. Heads $\mathbf{1 2}$-20-flowered; involucre broader.

Involucre $16-18 \mathrm{~mm}$. high; achene about as long as its beak. 2. l. I.udericiana.
Involucre $8-12 \mathrm{~mm}$. high; achene longer than its beak.
6. L. sagittifolia.
2. Leaves neither spiny-margined nor with spiny midribs (rarely spinulose in No. 4).
(a) Achenes very thin, flat, contracted into filiform or tapering beaks.

Outer involucral bracts abruptly shorter than the inner; heads $8-1+$ mim. high; flowers yellow to red (blue in No. 5).
Leaves, or some of them, pinnatifid.
Plant glabrous throughout, $1-3 \mathrm{~m}$. high. 3. L. Canadensis.
Leaves, at least their midribs, hirsute.
Beak of the achene as long as its body; flowers yellow. 4. L. hirsufa. Beak of the achene less than half as long as its body: flowers blue.
5. L. Morssit.

Leaves entire or dentate, none of them pinnatifid.
Stem glabrous, or hirsute only toward the base.
Leaves oblong or oblong-lanceolate; achene longer than the beak.
6. L. sagittifolia.

Leaves lanceolate; achene about equalling the beak. Stem hirsute up into the branches of the inflorescence. 3. L. Canadensis. Stem hirsute up into the branch. L. Steelei. Outer bracts gradually shorter; heads $16-20 \mathrm{~mm}$. high; flowers blue. 8. L. pulchella.
(b) Achenes beakless or with short necks, thickish; flowers blue.

Leaves oblong to ovate, acuminate, dentate.
Leaves pinnatifid, the terminal segment commonly triangular.
*'* Pappus brown; flowers blue to white.
9. L. villosa.
10. L. Floridana.
II. L. spicata.
I. Lactuca Scariola L. Prickly Lettuce. (I. F. f. 3537.) Biennial, green and glaucous; stem stiff, leafy, usually paniculately branched, glabrous throughout, or hirsute at the base, $6-20 \mathrm{dm}$. high. Leaves oblong or oblonglanceolate, denticulate or pinnatifid, sessile or auriculate-clasping, the lowest sometimes 25 cm . long and 7 cm . wide, the upper much smaller; heads $4-8 \mathrm{~mm}$. broad, very numerous in an open panicle; involucre cylindric, its outer bracts about onethird the length of the inner; rays yellow; achenes obovate-oblong, about as long as the filiform beak. In fields and waste places, Me. to S. Dak., N. J., Ga., Neb., Colo. and Kans. Nat. from Europe. Aug-Sept.

Lactuca salígna L., the Willow Lettuce of Europe, similar to L. Scariola, but with runcinate-pinnatifid lower leaves, either spinulose on the midvein or unarmed, has been found in Ohio.
2. Lactuca Ludoviciàna (Nutt.) DC. Western Lettuce. (I. F. f. 3538). Biennial, glabrous throughout, leafy up to inflorescence, paniculately branched, $6-15 \mathrm{dm}$. high. Leaves oblong to ovate-oblong, acute or acutish, $5-10 \mathrm{~cm}$. long, auriculate-clasping, spinulose-denticulate to pinnatifid with spinulose segments; heads $6-10 \mathrm{~mm}$. broad, numerous in an open panicle; involucre cylindric or ovoid-cylindric, glabrous, its bracts successively shorter and broader, the lower ones ovate; rays yellow; achenes oval to obovate, flat. Plains and banks, Iowa, Minn. and S. Dak. to Kans. and Tex. July-Sept.

3 Lactuca Canadénsis L. Wild or Tall Lettuce. Wild Opium. (I. F. f. 3539.) Biennial or annual, glabrous throughout, somewhat glaucous; stem leafy up to the inflorescence, I-3 m . high, branching above into a narrow panicle. Stem-leaves sessile or auriculate-clasping, $5-20 \mathrm{~cm}$. long, the uppermost smaller, often lanceolate, acuminate and entire, the basal often 3 dm . long, narrowed into petioles; heads numerous, $4-6 \mathrm{~mm}$. broad ; involucre cylindric; rays yellow; achenes oval. In moist, open places, N. S. to the N. W. Terr. south to Ga., Ala., La. and Ark. June-Nov.

Lactuca Canadénsis montàna Britton. Plant 3-12 dm. high; leaves all lanceolate and entire ; bracts of the involucre purple or purplish. Mountains, Penn. and N. Y.
4. Lactuca hirsùta Muhl. Hairy or Red Wood-Lettuce. (I. F. f. 3540.) Similar to the preceding species, but commonly smaller and less leafy; stem 3-18 dm. high, naked and paniculately branched above, usually hirsute, at least below. Stem-leaves mostly sessile or auriculate-clasping, $7-17 \mathrm{~cm}$. long, the uppermost sometimes lanceolate and entire, the basal petioled; midvein rarely spinulose; heads numerous, $4-6 \mathrm{~mm}$. broad; involucre glabrous, $10-18 \mathrm{~mm}$. high; outer bracts shorter than the inner; rays reddish-yellow or paler; achenes oblongoval, flat, about the length of the beak. In dry soil, Me. to Ont., Minn., Ala. and Tex. July-Sept.
5. Lactuca Mórssii Robinson. Morss Wild Lettuce. Similar to the preceding species; stem strict, leafy, I-3 m. tall, somewhat hirsute at the base. Leaves runcinate-pinnatifid, the lower sparingly hirsute beneath along the midrib and cordate-clasping narrowed base, the upper glabrous; involucre shorter than in L. hirsuta; rays blue; achenes oval-lanceolate, 3 -ribbed on each face, $4-5 \mathrm{~mm}$. long, 3-4 times as long as the filiform beak. Along salt meadows, Me. and eastern Mass. to N. Y.
6. Lactuca sagittifòlia Ell. Arrow-leaved Lettuce. (I. F. f. 3541.) Biennial; stem glabrous throughout, or hirsute below, leafy nearly up to the usually paniculate inflorescence, 6-18 dm. high. Leaves entire or denticulate, the lower rarely pinnatifid, sometimes spinulose on the margins, those of the stem
sessile or sagittate-clasping, $7-15 \mathrm{~cm}$. long, $\mathrm{I}-3 \mathrm{~cm}$. wide, the basal and lower ones petioled; heads commonly very numerous, $4-8 \mathrm{~mm}$. broad; involucre cylindric, 10-14 mm . high, the outer bracts shorter than the inner; rays yellow or reddish. In dry, open soil, N. B. and Ont. to Idaho, Ga. and Kans. July-Sept.
7. Lactuca Steèlei Britton, n. sp. Steele's Wild Lettuce. Stem and branches hirsute. Leaves obovate to oval, the larger 2 dm . long and I dm. wide, sessile, irregularly dentate, not lobed, hispid on the veins beneath, short-acuminate; involucre about 12 mm . high; rays not seen; achenes oval, 3 -ribbed, about 3 mm . long, the filiform beak slightly shorter; pappus bright white. Near Washington, D. C., E. S. Steele, July 10, 1897.
8. Lactuca pulchélla (Yursh) DC. Large-flowered Blue Lettuce. (I. F. f. 3542.) Pereninial, glabrous throughout, somewhat glaucous; stem rather slender, leafy up to the corymbose-paniculate inflorescence, 3-9 dm. high. Leaves linear-lanceolate, lanceolate or oblong, acute, entire, dentate, lobed or pinnatifid, those of the stem sessile or partly clasping, $5-20 \mathrm{~cm}$. long, $4-35 \mathrm{~mm}$. wide, the lowest and basal ones sometimes petioled; heads mostly numerous, $\mathbf{1 2 - 2 0} \mathbf{~ m m}$. broad; involucre well imbricated, $16-20 \mathrm{~mm}$. high ; achenes oblong-lanceolate, flat, twice as long as their tapering beaks. In moist soil, western Ont. to the N. W. Terr. and Br. Col., south to Mich., Kans., N. Mex. and Cal. June-Sept.
9. Lactuca villòsa Jacq. Hairy-veined Blue Lettuce. (I. F. f. 3543.) Annual or biennial; stem glabrous, leafy up to the paniculate inflorescence, $6-18 \mathrm{dm}$. high. Leaves acuminate, acutely dentate or the teeth mucronate-tipped, glabrous above, pubescent with short, stiff hairs on the veins beneath, sessile and slightly clasping at the base, or petioled, $10-15 \mathrm{~cm}$. long, $3-6 \mathrm{~cm}$. wide, the lowest sometimes lobed at the base; heads numerous, $6-10 \mathrm{~mm}$. broad; involucre about 1 cm . high, some or all of the bracts obtuse; achenes thick, oblong, little flattened, narrowed above. In thickets, N. Y. to Ill., south to Fla., Ga. and Ky. July-Sept.
io. Lactuca Floridàna (L.) Gaertn, False or Florida Lettuce. (I. F. f. 3544.) Annual or biennial; stem glabrous, rather stout, leafy up to the large, paniculate inflorescence, I-2 m. high. Leaves sessile or petioled, $\mathrm{I}-3 \mathrm{dm}$. long, glabrous above, pubescent on the veins beneath, the lateral segments lanceolate to oval, acute, all usually dentate, or the leaves irregularly lobed; heads numerous, $6-10 \mathrm{~mm}$. broad; rays blue; involucre about 12 mm . high. In moist, open places, southern .N. Y. and Penn. to Ill., Neb., Fla., La. and Kans. July-Sept.

1I. Lactuca spicàta (Lam.) Hitchc. Tall Blue Lettuce. (I. F. f. 3545.) Annual or biennial; stem usually stout, glabrous, $\mathbf{I}-3.5 \mathrm{~m}$. high, leafy up to the large, rather dense panicle. Leaves deeply pinnatifid or lobed, sharply dentate with mucronate-pointed teeth, sessile, or the lower narrowed into margined petioles, glabrous on both sides, or pubescent on the veins beneath, $12-30 \mathrm{~cm}$. long, $5-15 \mathrm{~cm}$. wide; heads very numerous, about 4 mm . broad; rays blue to nearly white; achenes oblong, compressed, narrowed above into a short neck. In moist soil, Newf. to Manitoba, south to N. Car., Temn., Iowa and S. Dak. July-Oct.

Lactuca spicàta integrifolia (A. Gray) Britton. Leaves oblong, sharply denticulate, undivided, or some of the lower ones pinnatifid. N. Car. to Mich.

## 16. LYGODÉSMIA D. Don.

Glabrous rigid branching herbs, with linear leaves, or the basal and lower ones sometimes broader and pinnatifid, those of the stem very narrow and entire or reduced to linear scales, and middle-sized 3-12-flowered heads of pink or purple flowers, solitary and erect at the ends of the stem and branches, or sometimes racemose. Involucre cylindric, its principal bracts 5-8, linear, scarious-margined. equal, slightly united at the base, with several very short outer ones. Receptacle flat, naked. Rays truncate and 5 -toothed at the apex. Anthers sagittate at the base. Style-branches slender. Achenes linear, smooth or striate. Pappus of copious somewhat unequal simple bristles. [Greek, twig-hundle, from the numerous branches.] About 6 species, natives of western and southern N. A.
Heads solitary at the ends of the branches; leaves linear or subulate. 1. l. juncea. Heads racemose along the branches; leaves elongated-linear. 2. L. vostrata.

1. Lygodesmia júncea (Pursh) D. Don. Rush like lygonesmia. (I. F. f. 3546.) Perennial by a thick woody root; stems stiff, striate, much branched,
$20-45 \mathrm{~cm}$. high, the branches erect. Lower leaves linear-lanceolate, rigid, entire, acute, or acuminate, $\mathbf{I}-\mathbf{2 . 5} \mathrm{cm}$. long, $\mathbf{I}-3 \mathrm{~mm}$. wide, the upper similar but smaller, or reduced to subulate scales; heads $\mathbf{1 2 - 1 6 ~} \mathrm{mm}$. broad, mostly 5 -flowered; involucre 12-16 mm . high; achenes narrowly columnar or slightly tapering, truncate at the summit, about 8 -nerved or ribbed; pappus light brown. Plains, Minn. to Mont., Mo., Kans. and N. Mex. June-Aug.
2. Lygodesmia rostràta A. Gray. Beaked Lygodesmia. (I. F. f. 3547.) Annual, less rigid; stem striate, leafy, paniculately branched, 3-9 dm. high. Leaves elongated-linear, acuminate, entire, 3-nerved, the lower $7-17 \mathrm{~cm}$. long, $2-3 \mathrm{~mm}$. wide, the uppermost very small and subulate; heads numerous, 7-10flowered, about 1 cm . broad; involucre $10-14 \mathrm{~mm}$. high; achenes narrowly fusiform, narrowed or somewhat beaked at the summit, 5 - 8 -ribbed or -striate, 8 -10 mm . long, longer than the whitish pappus. Kans. and Neb. to the N. W. Terr., Colo. and Wyo. Aug.-Sept.

## 17. AGÓSERIS Raf.

Herbs, mostly acaulescent, with tufted usually sessile basal leaves, and solitary heads of yellow or rarely purple flowers at the end of a naked or bracted scape. Involucre campanulate or oblong, its bracts imbricated in several rows, appressed, or with spreading tips, membranous or herbaceous, not thickened after flowering, the outer ones gradually shorter and broader. Receptacle flat, naked or foveolate. Rays truncate and 5 -toothed at the apex. Anthers sagittate at the base. Stylebranches slender. Achenes oblong, obovate, or linear, io-ribbed, not flattened, beaked at the summit. Pappus of copious slender simple white bristles. [Greek, head- or chief-succory.] About 25 species, natives of western and southern N. A. and southern S. A. Besides the following, some 20 others occur in the western parts of the U. S.

$$
\begin{array}{ll}
\text { Head } 3-5 \mathrm{~cm} \text {. broad; achenes 10-12 mm. long. } & \text { 1. A. glauca. } \\
\text { Head } 2.5 \mathrm{~cm} \text {. broad or less; achenes about } 6 \mathrm{~mm} . \text { long. } & \text { 2. A. parvifora. }
\end{array}
$$

1. Agoseris glàuca (Pursh) Greene. Large-flowered Agoseris. (I. F. f. 3548.) Perennial, pale or glaucous, glabrous throughout or a little woolly below. Leaves linear, lanceolate, or oblong, entire, dentate or pinnatifid, $5-25 \mathrm{~cm}$. long, 4-20 mm . wide, acuminate at the apex, narrowed at the base, sometimes into margined petioles; scapes stout, glabrous or slightly pubescent, longer than the leaves, often 4 dm . high; involucre oblong-campanulate, or broader in fruit, commonly quite glabrous, its bracts lanceolate, acuminate; achenes conspicuously beaked; pappus of rather rigid scabrous or denticulate bristles. S. Dak. to the N. W. Terr., south to Kans., Colo. and Utah. May-July.
2. Agoseris parviflòra (Nutt.) Greene. Small-flowered Agoseris. (I. F. f. 3549.) Perennial, glabrous throughout; scape slender, much longer than the leaves, $12-40 \mathrm{~cm}$. high. Leaves narrowly linear, acuminate, entire, $7-20 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide; involucre oblong-ovoid, becoming nearly hemispheric in fruit, $12-16 \mathrm{~mm}$. high, glabrous, its bracts lanceolate, acuminate; achenes conspicuously beaked; pappus of numerous unequal very slender bristles. Plains, western Neb. to Manitoba, Idaho and N. Mex. May-July.

## 18. NOTHOCÁLAIS Greene.

Perennial herbs, with basal tufted narrow undulate or crisped, tomentose-margined leaves, and large heads of yellow flowers solitary at the ends of simple naked scapes. Involucre oblong-campanulate, its bracts in 2-4 series, lanceolate, acute, or acuminate, appressed, nearly equal, the margins hyaline. Receptacle flat, alveolate. Rays truncate and 5 -toothed at the apex. Anthers sagittate at the base. Achenes fusiform, contracted or beaked at the summit, io-ribbed or rostriate. Pappus of $10-30$ white soft unequal narrow scabrous scales, with or without some capillary bristles. [Greek, false Calais.] Three known species, of western and central N. A.
I. Nothocalais cuspidata (Pursh) Greene. False Calais. (I. F. f. 3550 .) Leaves linear, long-acuminate, thick, pubescent or glabrate, I-2 dm. long, 4-10 mm. wide, somewhat conduplicate, their margins conspicuously white-tomentose and crisped, or entire. Scape stout, tomentose, at least above, shorter than or equalling
the leaves; head $3-5 \mathrm{~cm}$. broad; involucre usually quite glabrous, nearly 25 mm . high; achenes slightly contracted at the summit, about 6 mm . long; pappus of $40-50$ unequal scales and bristles. In dry soil, on prairies and rocky hills, Ill. to the N. W. Terr., south to Neb. and Kans. April-June.

## 19. SITÍLIAS Raf.

Perennial herbs (some species annual ?), with alternate or basal leaves, and mostly large, solitary or few heads of yellow flowers, borne on long, usually bracted peduncles. Involucre oblong or campanulate, its principal bracts in I series, nearly equal, slightly united at the base, with several series of smaller outer ones. Rays truncate and 5 -toothed at the summit. Anthers sagittate at the base. Style-branches short, obtusish. Achenes oblong or fusiform, mostly 5 -ribbed, roughened or hirsute, abruptly narrowed into a long filiform beak. Pappus of numerous soft simple brownish somewhat unequal bristles, surrounded at the base by a villous white ring. [Name unexplained.] Six known species, of N. Am, and Mex.

## Stem leafy, usually branched; plant glabrous, or nearly so. r. S. Caroliniana. <br> Scape naked, monocephalous; plant hirsute, or pubescent.

I. Sitilias Caroliniàna (Walt.) Raf. Leafy Stemmed False Dandelion• (I. F. f. 355 I.) Glabrous or nearly so; stem leafy, usually branched, 6-15 dm. high. Basal leaves oblong or oblong-lanceolate, pinnatifid, lobed, coarsely dentate or some of them entire, acute, acuminate, or obtusish, 7-20 cm. long, $1-3 \mathrm{~cm}$. wide, narrowed into margined petioles; stem leaves sessile or partly clasping, the upper usually lanceolate, entire and acuminate; heads 1 or several, $25-35 \mathrm{~mm}$. broad; involucre commonly puberulent or pubescent, its outer bracts setaceous or subulate, spreading, the inner corniculate at the apex. In dry fields, Del. to Fla., Mo., La. and Tex. April-July.
2. Sitilias grandifiòra (Nutt.) Greene. Rough False Dandelion. (I. F. f. 3552.) Hirsute or pubescent. Root tuberous-thickened; leaves all basal, oblong or spatulate in outline, deeply pinnatifid, $7-17 \mathrm{~cm}$. long, $2.5-3.5 \mathrm{~cm}$. wide, narrowed into margined petioles; scape naked or sometimes with a small leaf near its base; head solitary, $3-5 \mathrm{~cm}$. broad; outer bracts of the involucre small, short, subulate, the inner ones obscurely corniculate at the tip. On prairies, Kans. to Tex. April-June.

## 20. CREPIS L.

Perennial or annual herbs, with alternate or basal, mostly toothed or pinnatifid leaves, and small or middle-sized heads, usually paniculate or corymbose, of yellow or orange flowers. Involucre cylindric, campanulate or swollen at the base, its principal bracts in I series, equal, with a number of exterior smaller ones. Receptacle mostly flat, naked or short-fimbrillate. Rays truncate and 5 -toothed at the apex. Anthers sagittate at the base. Style-branches slender. Achenes linearoblong, 10-20-ribbed or nerved, not transversely rugose, narrowed at the base and apex, beakless in our species. Pappus copious, of very slender white bristles. [Greek, sandal; application not explained.] About I8o species, of the northern hemisphere. Besides the following, about Io others occur in western N. Am. Involucre glabrous.

Involucre cylindric; plant pubescent below; introduced.
Involucre campanulate; plant glaucous; native, western. Involucre pubescent, glandular, or canescent.

Foliage not canescent nor scurfy, sometimes hirsute. Stem naked, or with 1 or 2 small leaves; western, native. Stems leafy; introduced annuals or biennials. Stem leaves narrow, revolute-margined, sessile, Stem leaves lanceolate, clasping, not revolute-margined. Involucre $6-8 \mathrm{~mm}$. high; achenes io-striate. Involucre $8-12 \mathrm{~mm}$. high; achenes 13 -striate.

1. C. pulchra.
2. C. glauca.
3. C. runcinata.
4. C. tectorum.
5. C. virens.
6. C. biennis.
7. C. intermedia.
8. C. occidentalis. r. Crepis púlchra L. Small-flowered Hawksbeard. (I. F. f. 3553.)
nnual; stem 6-13 dm. high, leafy and pubescent below, mostly glabrous, naked and paniculately branched above. Stem leaves oblong or oblong-lanceolate, den-
tate, clasping by an auricled base or truncate, pubescent, $7-10 \mathrm{~cm}$. long, acute or obtuse; basal leaves runcinate, narrowed into petioles; heads very numerous, about 6 mm . broad, in a large naked panicle; involucre narrow, cylindric, glabrous, about 1 cm . high, its principal bracts $12-15$, linear, acuminate, the outer ones very short, ovate, appressed; achenes linear, faintly Io-nerved. Along railroad near Culpepper, Va. Nat. or adventive from Europe. May-July.
9. Crepis glàuca (Nutt.) T. \& G. Glaucous Hawksbeard. (I. F. f. 3554.) Perennial; scapose, or rarely with 1 or 2 leaves on the stem, 3-7 dm. high, glabrous and glaucous throughout. Basal leaves spatulate, oblanecolate, or obovate, gradually narrowed into margined petioles, entire, dentate, or pinnatifid, $5^{-1} 5 \mathrm{~cm}$. long, $\mathbf{I}-2 \mathrm{~cm}$. wide; heads not numerous, long-peduncled, $\mathbf{1} 2-25 \mathrm{~mm}$. broad; peduncles glabrous; involucre campanulate, its principal bracts lanceolate, acute, the outer ones very short, ovate, appressed; achenes oblong-cylindric. strongly ro-ribbed. In moist and saline soil, Neb. to the N. W. Terr., Nev. and Utah. July-Aug.
10. Crepis runcinàta (James) T. \& G. Naked-stemmed Hawksbeard. (I. F. f. 3555.) Perennial, similar to the preceding species but not glaucous or scarcely so, often pubescent below; stem leafless or with I or 2 small leaves, 3-9 dm. high. Basal leaves spatulate, obovate, or oblong, obtuse or acute, entire, repand, dentate, or rarely runcinate-pinnatifid, $5-15 \mathrm{~cm}$. long, $2-3 \mathrm{~cm}$. wide; heads several, long-peduncled, nearly 25 mm . broad; involucre campanulate, its principal bracts linear-lanceolate, acute, outer ones short, lanceolate, appressed; achenes linear-oblong, Io-ribbed. In moist soil, Iowa to Manitoba, west to Utah and Mont. June-July.
11. Crepis tectorum L. Narrow-Leaved Hawksbeard. (I. F. f. 3556.) Annual; stem slender, puberulent or pubescent, leafy, branched, 3-6 dm. high. Basal leaves lanceolate, dentate, or runcinate-pinnatifid, $10-15 \mathrm{~cm}$. long; stem leaves sessile, sometimes slightly sagittate at the base, linear, entire, dentate, or lobed; heads numerous, corymbose, $12-20 \mathrm{~mm}$. broad; involucre narrowly campanulate, canescent or pubescent, $6-10 \mathrm{~mm}$. high, its principal bracts lanceolate, acuminate, downy within, the exterior ones linear, spreading; achenes io-ribbed, the ribs minutely scabrous. In waste places and in ballast, N. J. to Conn., Ont., Mich. and Neb. June-July.
12. Crepis virens L. Smooth Hawksbeard. (I. F. f. 3557.) Annual; stem corymbosely branched above, glabrous or somewhat hirsute below, 3-7 dm. high. Basal leaves spatulate, pinnatifid, or dentate, sometimes 2 dm . long and 5 cm . wide, narrowed into petioles; stem leaves lanceolate or oblong, clasping by a sagittate base, flat, the upper mostly very small and usually entire; heads numerous, $10-16 \mathrm{~mm}$. broad, slender-peduncled; involucre oblong, $6-8 \mathrm{~mm}$. high, its principal bracts lanceolate, glabrous within, the outer mostly appressed; achenes Io-ribbed, smooth. In fields and waste places, Conn., N. Y., N. J. and Penn., and in ballast abouit the seaports. Also on the Pacific Coast. Adventive from Europe. Very variable. July-Sept.
13. Crepis biénnis L. Rough Hawksbeard. (I. F. f. 3558.) Biennial, or sometimes annual; stem pubescent or hirsute. leafy, at least below, branched above, 6-9 dm. high. Leaves runcinate-pinnatifid, usually hirsute, $5-15 \mathrm{~cm}$. long, oblong or spatulate, the lower and basal ones narrowed into petioles and sometimes merely dentate; heads several, subcorymbose, $2-4 \mathrm{~cm}$. broad; involucre canescent or pubescent, $8-12 \mathrm{~mm}$. high, its principal bracts linear-lanceolate, downy within, the outer ones linear-oblong or lanceolate, spreading; achenes oblong, I3-striate, glabrous. In waste places, Vt., Penn., and in ballast about the seaports. Nat. or adventive from Europe. June-Aug.
14. Crepis intermèdia A. Gray. Small-flowered Gray Hawksbeard. (I. F. f. 3559.) Perennial, cinereous puberulent or scurfy; stem rather slender, I-3-leaved, 3-6 dm. high, naked and branched above. Basal leaves lanceolate or oblong-lanceolate, laciniate-pinnatifid, long-acuminate at the apex, narrowed at the base, $10-15 \mathrm{~cm}$. long; stem leaves lanceolate, sessile, less divided; heads several, $12-18 \mathrm{~mm}$. broad; involucre oblong-campanulate, its principal bracts $5-8$, lanceolate or linear-oblong, canescent, acutish. the outer ones few and short; achenes oblong, strongly ro-ribbed. In dry soil, western Neb. and Colo. to Cal. and Br. Col. May-Sept.
15. Crepis occidentalis Nutt. Large-flowered Gray Hawksbeard. (I. F. f. 3560 .) Perennial, scurfy and canescent, sometimes also hirsute; stem rather stout, leafy, branched, $15-45$ high. Leaves oblong-lanceolate or oblong in oulline, laciniate-pinnatifid, acute or acuminate, the lower and basal ones $15-25 \mathrm{~cm}$. long, narrowed into petioles, the upper sessile and slightly clasping; heads few or several, corymbose, stout-peduncled, about 25 mm . broad; involucre oblong-campanulate, canescent, its principal bracts 9-24, linear, acute; achenes oblong, sharply $10-r i b b e d$, glabrous. Plains, western Neb. (according to Gray) and Colo. to Cal., north to the N. W. Terr. and Br. Col. May-July.

## 21. HIERACIUM L.

Perennial hispid scabrous glandular or glabrous herbs, with alternate or basal leaves, and small middle sized or large, solitary corymbose or paniculate heads of yellow orange or red flowers. Involucre cylindric, campanulate, or nearly hemispheric, its principal bracts in $\mathbf{I}-3$ series, the outer either regularly and gradually smaller or abruptly much smaller, none of them much thickened at the base after flowering. Receptacle flat, naked or short-fimbrillate. Rays truncate and 5 -toothed at the apex. Anthers sagittate at the base. Style-branches slender. Achenes oblong, columnar, or fusiform, not beaked, 10-15-ribbed, terete or 4-5-angled. Pappus copious, or I-2 rows of simple rather stiff persistent brown or brownish bristles. [Greek, hawk.] Not fewer than 300 species, natives of the north temperate zone and the Andes of S. Am. Besides the following, some 15 others occur in western N. Am.

* Flowering stem leafless, or with $1-5$ leaves; achenes columnar or oblong, truncate.
(a) Stem scapose, with a single head only; introduced; principal bracts in 1 or 2 series.

1. H. Pilosella.
(b) Heads corymbose or paniculate ; principal bracts in $1-3$ series.

Leaves coarsely dentate; introduced species.
Leaves cordate or subcordate. . 2. H. murorum.
Leaves narrowed at both ends. 3. H. vulgatum.
Leaves denticulate or entire.
Leaves mostly entire, spatulate to oblong; heads corymbose; introduced species; principal bracts of the involucre in $2-3$ series.

Heads $16-25 \mathrm{~mm}$. broad; flowers red or orange. 4. H. aurantiacum.
Heads $10-18 \mathrm{~mm}$. broad; flowers yellow.
Glaucous, slightly hispid. 5. H. praealtum.
Densely hirsute.
6. H. pratense.

Leaves, at least some of them, denticulate, mostly obovate or oval; heads corymbosepaniculate; natives; principal bracts in 1 series.

Principal bracts of the involucre glabrous, or nearly so.
Stem glabrous, or nearly so; leaves usually purple-veined.

$$
\begin{array}{cl}
\text { S. H. venosum. } \\
\text { Stem pilose below ; leaves green. } & \text { 8. H. Marianum. } \\
\text { Involucre and peduncles densely hirsute and glandular. } & \text { 9. H. Greeniz. }
\end{array}
$$ * * Flowering stem abundantly leafy, at least below.

(a) Principal bracts of the involucre in 2-4 series; heads corymbose.

Leaves sessile, not clasping; involucre glabrous.
Leaves, at least the upper, clasping; involucre pubescent.
(b) Principal bracts in I series; heads small, paniculate or racemose.

1. Achenes columnar at maturity, truncate.

Plant nearly or quite glabrous except towards the base; heads $15-20$-flowered.
Plants scabrous or glandular ; heads $15-50$-flowered.
Peduncles stout, spreading.
Peduncles slender, ascending.
No tuft of basal leaves at flowering time.
Basal leaves present at flowering time.
10. H. umbellatum.
i1. H. Canadense.

Io. H. umbellatum.
ir. H. Canadense.
2. Achenes spindle-shaped, or with a tapering summit at maturity

Leaves and lower part of the stem pilose.
Leaves and stem densely clothed with very long brown hairs.
15. H. Gronoziì.
16. H. Lonsitilum.
I. Hieracium Pilosélla L. Mouse-ear Hawkweed. (I. F. f. 3561.) Stoloniferous, pilose-pubescent throughout; stolons leafy, rooting, slender, $i-30 \mathrm{~cm}$. long. Scape slender, erect, $10-25 \mathrm{~cm}$. high, leafless, with a single head; leaves oblong or spatulate, entire, obtuse or acutish at the apex, narrowed into petioles,
often white-toment se beneath, $4-7 \mathrm{~cm}$. long, $8-16 \mathrm{~mm}$. wide; head 25 mm . broad or more; flowers yellow; bracts linear, acuminate, pubescent, usually with 1 or 2 exterior ones. Dooryards and fields, Ont., N. Y., Penn. and Mich. Adventive from Europe. May-Sept.

Hieracium Pilosélla Peleteriànum Mer. Stolons shorter, thick; plant silky-pubescent. Fields and roadsides, Prince Edward Island. Nat. from Europe.
2. Hieracium muròrum L. Wall Hawkweed. (I. F. f. 3562.) Stem pubescent or glabrate, simple, or with I or 2 branches, 3-7 dm. high. Basal leaves thin, ovate or oblong, obtuse or acute, cordate or truncate at the base, or abruptly narrowed into petioles, coarsely dentate or laciniate, at least near the base, $5-10 \mathrm{~cm}$. long, $3-5 \mathrm{~cm}$. wide, the petioles villous; stem leaves I or 2 (sometimes none), shortpetioled or sessile; heads about 25 mm . broad; peduncles ascending, usually glandular; involucre 8 -10 mm. high, its bracts linear-lanceolate, acute, glandularpubescent; pappus nearly white. Woodlands near Brooklyn, N. Y.; about Quebec. Adventive or fugitive from Europe. June-Aug.
3. Hieracium vulgàtum Fries. Hawkweed. (I. F. f. 3563.) Similar to the preceding species, sometimes taller and slightly glaucous; stem 2-5-leaved, pubescent or glabrate. Basal leaves oblong or lanceolate, coarsely dentate or denticulate, petioled, $5-12 \mathrm{~cm}$. long, $\mathbf{1}-3 \mathrm{~mm}$. wide, stem leaves similar, short-petioled or sessile; petioles more or less pubescent; peduncles mostly glandular, straight; bracts linear, acuminate, mostly glandular. Lab. and Newf. to Quebec and in southern N. Y. and N. J. Probably introduced. Also in Greenland, northern Europe and Asia. July-Sept.
4. Hieracium aurantiacum L. Orange or Tawny Hawkweed. Golden Mouse-Ear Hawkweed. (I. F. f. 3564 .) Stoloniferous, or stolons wanting; stem leafless or rarely with 1 or 2 small sessile leaves, hirsute, slender, $1.5-5 \mathrm{dm}$. high. Basal leaves hirsute, tufted, spatulate or oblong, obtuse, narrowed at the base, entire, or sometimes slightly denticulate, $5-12 \mathrm{~cm}$. long, $5^{-2} \mathrm{~cm}$. wide; heads $14-25 \mathrm{~mm}$. broad; peduncles glandular-pubescent; involucre $8-10 \mathrm{~mm}$. high, its bracts linear-lanceolate, acuminate, hirsute and sometimes glandular. In fields, woods and along roadsides, N. B. and Ont. to N. Y., N. J. and Penn. Nat. from Europe. June-Sept.
5. Hieracium praeáltum Vill. King-devil. (I. F. f. 3565.) Stoloniferous or stolons wanting; stem glabrous, or somewhat hispid, glaucous, slender, 4-9 dm. high, bearing I-3 leaves near the base. Basal leaves tufted, narrowly oblong, lanceolate, or spatulate, entire, obtuse or acute at the apex, narrowed below into margined petioles, hirsute with stiff hairs, $5-10 \mathrm{~cm}$. long, $6-14 \mathrm{~mm}$. wide; heads $8-12 \mathrm{~mm}$. broad; peduncles mostly short, pilose and glandular; involucre about 6 mm . high, its bracts linear, acute or acuminate, pilose and somewhat glandular. In fields, meadows and along roadsides, Me. and Ont. to N. Y. Nat. from Eurcpe. June-Sept.
6. Hieracium praténse Tausch. Field Hawkweed. (I. F. f. 3566.) Stoloniferous, hirsute or pilose with long hairs, those of the stem blackish. Stem scapose. simple, 3-6 dm. high, bearing I or 2 leaves below the middle; basal leaves numerous, tufted, light green, oblanceolate to oblong, obtuse, $5-12 \mathrm{~cm}$. long, $\mathbf{1 - 2}$ cm . wide, narrowed into margined petioles, or to a sessile base, entire, or with few distant minute glandular teeth; heads 2 cm . wide, or less; peduncles glandular and often tomentose; bracts of the involucre linear-lanceolate, acuminate, glandular and pilose. Dongan Hills, Staten Island, N. Y. Nat. or adventive from Europe.
7. Hieracium venòsum L. Rattlesnake-weed. Poor Robin's Plantain. (I. F. f. 3567.) Stems solitary or several from the same root, slender, glabrous, or with a few hispid hairs, leafless or with I-3 leaves, 3-9 dm. high. Basal leaves tufted, spreading on the ground, obovate, oval or oblong-spatulate, mostly obtuse, narrowed at the base, sessile or petioled, $3-10 \mathrm{~cm}$. long, $\mathrm{I}-3 \mathrm{~cm}$. wide, usually purple-veined, more or less hirsute, sorne or all of them glandulardenticulate; heads $10-16 \mathrm{~mm}$. broad, i5-40-flowered, slender-peduncled; peduncles glabrous, or slightly glandular; involucre about 6 mm . high. Dry woods and thickets, Me. to Ont. and Manitoba south to Ga., Ky. and Neb. May-Oct.
8. Hieracium Mariànum Willd. Maryland Hawkweed. (I. F. f. 3568.) Stems usually solitary, slender, 3-9 dm. high, bearing 2-7 leaves. Basal leaves
obovate or oblong, ascending or erect, obtuse, narrowed at the base, sessile or petioled, villous or hirsute, glandular-denticulate, $5-20 \mathrm{~cm}$. long, $3-5 \mathrm{~cm}$. wide, those of the stem similar, smaller; heads $12-20 \mathrm{~mm}$. broad, $15-40$-flowered, slenderpeduncled; peduncles more or less glandular and sometimes canescent ; involucre about 8 mm . high, bracts linear-lanceolate, acute, or acuminate, glabrous or nearly so, with a few short outer ones. In dry woods and thickets, R. I. to southern N. Y., Penn., Ky., Ala. and Fla. May-July.
9. Hieracium Greènii Porter and Britton. Green’s Hawkweed. (I. F. f. 3569.) Stem glabrous up to the branches, rather slender, leafless or rarely with I or 2 leaves, 4-7 dm. high. Basal leaves tufted, ascending, spatulate, oblong, or obovate, obtuse, narrowed at the base, mostly petioled, glandular-denticulate or entire, villous-pubescent or somewhat hispid, $10-17 \mathrm{~cm}$. long, $1-5 \mathrm{~cm}$. wide; heads $30-40$-flowered, slender-peduncled, $16-20 \mathrm{~mm}$. broad; involucre 10 mm . high, bracts linear, acute, densely pilose-glandular. In dry soil, mountains of Penn. to Va. and W. Va. May-June.
10. Hieracium umbellàtum L. Narrow-leaved Hawkweed. (I. F. f. 3570.) Stem rather slender, glabrous or puberulent, 3-7 dm. high. Leaves lanceolate or linear-lanceolate or the lowest spatulate, entire, denticulate or sometimes laciniate-dentate, acute or acuminate, narrowed to a sessile base, $3-7 \mathrm{~cm}$. long, 4-12 mm. wide, glabrous above, mostly somewhat pubescent beneath, the margins commonly ciliolate; heads about 25 mm . broad; peduncles rather stout, canescent; involucre $10-14 \mathrm{~mm}$. high, the outer bracts spreading. Lower St. Lawrence River to Ont., Minn., Neb., Br. Col. and Ore. Also in northern Europe and Asia. June-Aug.
II. Hieracium Canadénse Michx. Canada Hawkweed. (I. F. f. 357 r.) Stem erect, firm, glabrate or pubescent, 3-15 dm. high. Leaves numerous, oblonglanceolate, ovate-oblong, or lanceolate, acute or acuminate at the apex, rounded, sessile, and, at least the upper ones, clasping at the base, $3-7 \mathrm{~cm}$. long, $6-25 \mathrm{~mm}$. wide, serrate or incised, the margins sometimes ciliolate, glabrous or pubescent beneath, the lowest somewhat spatulate and petioled; heads about 25 mm . broad; involucre about 12 mm . high, outer bracts spreading. In dry woods and thickets, N. S. to Ont. and the N. W. Terr., south to N. J. and Mich. July-Sept.
12. Hieracium paniculatum L. Panicled Hawkweed. (I. F. f. 3572.) Glabrous throughout, or somewhat pilose-pubescent below, stem paniculately branched above, leafy, slender, 3-9 dm. high. Leaves thin, lanceolate or oblonglanceolate, acute or acuminate at the apex, narrowed to a sessile base, or the lowest into petioles, denticulate or dentate, $5-15 \mathrm{~cm}$. long, $6-25 \mathrm{~mm}$. wide; heads 10-14 mm . broad; peduncles filiform, often drooping, glabrous or sometimes glandular; involucre about 6 mm . high, glabrous or nearly so, bracts linear, acute, with a few very small outer ones at the base. In dry woods, Me., Quebec and Ont. to Ga., Ala. and Ky. July-Sept.
13. Hieracium scàbrum Michx. Rough Hawkweed. (I. F. f. 3573.) Stem stout, leafy, densely hirsute or hispid below and glandular-pubescent above, strict, 3-12 dm. high. Leaves hirsute, obovate, oblong, or broadly spatulate, $5-10 \mathrm{~cm}$. long, $2-4 \mathrm{~cm}$. wide, obtuse at the apex, narrowed to the sessile base or the lowest into margined petioles, denticulate; heads $\mathbf{1 2 - 1 6 ~ m m . ~ b r o a d ; ~ p e d u n - ~}$ cles stout, densely glandular; involucre $8-10 \mathrm{~mm}$. high. glandular; bracts linear, acute, with a few very small outer ones. In dry woods and clearings, N. S. to Minn., Ga., Neb. and Kans. July-Sept.
14. Hieracium Alleghaniénse Britton n. sp. Alleghany Hawkween. Stem rough-hairy below, glabrous or nearly so above, about 6.5 dm . tall. I.ower and middle stem-leaves oblanceolate, $\mathbf{1}-\mathbf{1 . 5 ~ d m}$. long, 3 cm . wide or more, obtuse. cuspidate, tapering into narrowly margined pubescent petioles, thin, pale and pubescent along the midvein beneath, green above, with a few very distant minute glandular teeth; upper leaves oblong to oblong-lanceolate, acute, narrowed to a sessile base; inflorescense paniculate, its branches filiform, glandular; heads rather numerous: involucre about 7 mm . high, its bracts linear-lanceolate, sparingly glandular, a little shorter than the brown pappus; young achenes truncate. Aurora. Alleghany Mountains of W. Va., E. S. Steele, Aug. 29, I898.
15. Hieracium Gronòvii L. Gronovius' Hawkweed. Hairy Hawkweed. (I. F. f. 3574.) Stem stiff, mostly slender, leafy and villous or hirsute, sometimes
nearly leafless, 3-9 cm. high. Leaves villous or hirsute, the basal and lower ones obovate or spatulate, denticulate, or entire, obtuse, $5^{-15} \mathrm{~cm}$. long, usually narrowed into petioles; stem leaves mostly sessile, oblong or oval, obtuse or acute, the upper gradually smaller; heads $10-18 \mathrm{~mm}$. broad; peduncles glandular and canescent, slender; involucre about 8 mm . high, somewhat canescent, bracts linear-lanceolate, acute, with several very small outer ones. In dry soil, Mass. to Ont., Ill., Fla. and Tex. July-Sept.
16. Hieracium longípilum Torr. Long-bearded Hawkweed. (I. F. f. 3575.) Stem, at least its lower portion, and leaves densely covered with long brown rather rigid bristly hairs $1-2.5 \mathrm{~cm}$. long, arising from papillæ. Stem very leafy below, stiff, simple, $6-10 \mathrm{dm}$. higin; basal and lower leaves spatulate or oblong, obtuse, mostly entire, $8-16 \mathrm{~cm}$. long, narrowed into margined petioles, the upper lanceolate or spatulate, mostly sessile; heads $16-20 \mathrm{~mm}$. broad; peduncles tomentose and glandular; involucre $8-10 \mathrm{~mm}$. high, bracts linear-lanceolate, acuminate, with several short subulate outer ones. Prairies and dry woods, Ont. to Minn., Ill., Kans. and Tex. July-Sept.

## 22. NÀBALUS Cass.

Perennial, herbs with alternate, mostly petioled, dentate lobed or pinnatifid leaves, or the upper auriculate and clasping, and numerous small heads of ligulate white yellowish or purplish flowers in open or spike-like terminal panicles, or also in axillary clusters, usually drooping. Involucre cylindric, usually narrow, its principal bracts in I or 2 series, nearly equal, with a few smaller exterior ones at the base. Receptacle flat, naked. Rays truncate and 5 -toothed at the summit. Style-branches slender. Achenes oblong or narrowly columnar, truncate, terete or $4-5$-angled, mostly 10 -ribbed. Pappus of copious rather rigid simple white to red-dish-brown bristles. [Modern Latin, from an Indian name for Rattlesnake-root.] About 20 species, natives of America and Asia. Besides the following, another occurs in northwestern Am.

## * Bracts of the involucre glabrous, or with a few scattered hairs.

Heads 5-7 flowered; involucre very narrow, light green, 2 mm . thick; pappus light straw-color.

1. N. altissimus.

Heads 8-16 flowered; involucre broader, green, purple or glaucous, $3^{-6} \mathrm{~mm}$. thick.
Leaves, or some of them, lobed, divided, or pinnatifid; involucre about 3 mm . thick. Pappus deep cinnamon-brown.
2. N. albus.

Pappus straw-color or light brown.
Inflorescence paniculate.
Involucral bracts with some stiff hairs, obviously shorter than the pappus; panicle-branches divergent. 3. N. serpentarius.
Involucral bracts glabrous, equalling the pappus; panicle-branches ascending, or erect.
4. N. trifoliolatus.

Inflorescence thyrsoid or glomerate.
Leaves palmately lobed or divided; northern.
5. N. nanus.

Leaves pinnately lobed or pinnatifid; southern. 6. N. virgatus. Leaves irregularly dentate or denticulate, oblong; plant tall. 3. N. serpentarius. Leaves entire or denticulate ; plant low, alpine ; involucre $5-6 \mathrm{~mm}$. thick.
7. N. Boottii.
** Bracts of the involucre hirsute-pubescent.
Inflorescence narrowly thyrsoid; heads 8-16-flowered.
Leaves and stem rough-puberulent or scabrous.
Leaves and stem glabrous, glaucous.
Inflorescence corymbose-paniculate; heads 20-25-flowered.
8. N. asper.
9. N. racemosus.
r. Nabalus altíssimus (L.) Hook. Tall White Lettuce. (I. F. f. 3576.) Glabrous, or sparingly hispidulous, not glaucous; stem slender, $\mathbf{I}-2 \mathrm{~m}$. high, green, or sometimes purplish. Leaves thin, hastate, cordate, ovate, or the uppermost lanceolate, entire, denticulate, dentate or palmately lobed or divided, most of them long-petioled, the larger sometimes 15 cm . long; heads very numerous, in a narrow panicle, and often in axillary clusters, $5-7$-flowered, pendulous, about 4 mm . broad; inflorescence often narrow; involucre narrowly cylindric, $10-18 \mathrm{~mm}$. long, about 2 mm . thick, green, glabrous, its principal bracts about 5; flowers greenish or yellowish white. In woods and thickets, Newf. to Manitoba, south to Ga. and Tenn. July-Oct.
2. Nabalus álbus (L.) Hook. Rattlesnake-root. White Lettuce. (I. F. f. 3577.) Glabrous and glaucous; stem commonly purple, 6-15 dm. high. Leaves hastate, ovate, cordate, denticulate, dentate, lobed, or palmately divided, or the upper lanceolate, entire; heads numerous, pendulous, about 6 mm . broad, paniculate, or thyrsoid, and often in axillary clusters; involucre glabrous, or with a few scattered hairs, glaucous, $\mathbf{1 0} \mathbf{O} \mathbf{1 4} \mathrm{mm}$. high, its principal bracts about 8 , purplish; flowers greenish or yellowish white, fragrant. In woods, Me. and Ont. to Manitoba, south to Ga. and Ky. Aug.-Sept.
3. Nabalus serpentàrius (Pursh) Hook. Lion's-foot. Gall-of-the-Earth. (I. F. f. 3578.) Glabrous or sparingly pubescent, green; stem stout or slender, not glaucous, 3-12 dm. high. Leaves rather firm, similar to those of the preceding species, equaily variable in outline, often pinnatifid or pinnately lobed, or palmately divided; inflorescence paniculate, the branches divaricate, upcurved; heads numerous, about 6 mm . broad, pendulous; involucre more or less bristlyhispid, rarely glabrous, $10-14 \mathrm{~mm}$. long, its principal bracts about 8 , shorter than the pappus; flowers whitish or cream-color, rarely yellow. In fields and thickets, Ont. to southern N. Y., Fla., Ala. and Ky. July-Oct.

Nabalus serpentàrius integrifolius (Cass.) Britton. Leaves oblong to oval, irregularly dentate, denticulate or entire. L. I. to N. Car.
4. Nabalus trifoliolàtus Cass. Tall Rattlesnake-root. (I. F. f. 3579.) Glabrous throughout; stem usually stout, IO-27 dm. high. Leaves thinnish, the lower long-petioled, usually 3-divided with the divisions stalked or sessile, the upper short petioled or sessile, all commonly lobed or dentate, but the upper sometimes lanceolate, acuminate and entire; panicle-branches ascending, or nearly erect; heads few in the clusters, drooping: involucre glabrous, 12 mm . long, its principal bracts 6-8, equalling the pappus; flowers whitish or pale yellow. In woods and thickets, Me. to Vt., Penn., Tenn. and Mo. Aug.-Oct.
5. Nabalus nànus (Bigel.) DC. Low Rattlesnake-root, or Lion's-foot. (I. F. f. 358 o .) Glabrous throughout; stem simple, erect, '1-4 dm. high. Basal and lower leaves slender-petioled, 3 -divided, or sometimes broadly hastate, the divisions variously lobed, toothed, or entire; upper leaves much smaller, entire, toothed, or lobed, sessile, or short-petioled; inflorescence rarely with I or 2 short ascending branches; involucre dark purple-brown or nearly black, glabrous, $8-12 \mathrm{~mm}$. long, its inner bracts 6-8, slightly ciliate at the apex, about as long as the pappus. Alpine summits of the Adirondacks and the mountains of N. Eng.; N. S. to Lab. and Newf. Aug.-Sept.
6. Nabalus virgàtus (Michx.) DC. Slender Rattlesnake-root. De Witt's Snakeroot. (I. F.f. 3581.) Glabrous, somewhat glaucous; stem strict, mostly simple, 6-12 dm. high. Leaves lanceolate or oblong-lanceolate, the basal and lower ones sinuate-pinnatifid or pinnately parted, petioled, often 25 cm . long, the lobes entire or dentate, distant; upper leaves all sessile, pinnately lobed, or the uppermost entire, very small and bract-like; heads very numerous, pendulous, about 4 mm . broad, in a narrow, simple or branched, terminal thyrsus, often unilateral; involucre 10 mm . long, its prineipal bracts about 8 ; flowers white or pinkish. In moist sandy soil, N. J. to Fla., near the coast. Sept-Oct.
7. Nabalus Boòttii DC. Boott's Rattlesnake-Root. (I. F. f. 35 S2.) Glabrous below, commonly pubescent above; stem simple, $1-3.5 \mathrm{dm}$. high. Leaves thickish, the basal and lower ones ovate, hastate, or deltoid, petioled. mostly obtuse, entire, or denticulate, $3-5 \mathrm{~cm}$. long, the upper ovate or oblong. usually entire, short-petioled or sessile, much smaller; heads erect, spreading, or some of them pendulous, racemose or somewhat thyrsoid. S-10 mm. broad; involucre campanulate-oblong, $8-14 \mathrm{~mm}$. long, dark purplish green, its principal bracts 8-ro, obtuse or obtusish; flowers whitish, odorous. Alpine summits of the mountains of northern N. Eng. and N. Y. July-Aug.
8. Nabalus ásper (Michx.) T. \& G. Rough White-lettuce. (I. F. f. $35 S_{3}$.) Stem virgate, 6-12 dm. high. Leaves firm, oval, oblong, or oblanceolate, those of the stem all closely sessile, acute or acutish, dentate. denticulate, or the uppermost entire, the lower sometimes clasping, $5-7 \mathrm{~cm}$. long, $1-2.5 \mathrm{~cm}$. wide, the hasal tapering into winged petioles, commonly obtuse; heads mumerous, crect, spreading, or slightly drooping, 6-S mm. broad, 12-16-flowered. in a long narrow thyrsus;
involucre oblong, 4-5 mm. thick, IO-14 mm. high, very hirsute, its principal bracts 8 -10; flowers light yellow; pappus straw-color. On dry prairies, Ohio to Minn. and Neb., south to Ky., La. and Kans. Aug.-Sept.
9. Nabalus racemòsus (Michx.) DC. Glaucuus White-lettuce. (I. F.f. 3584.) Stem virgate, striate, 3-18 dm. high. Leaves thickish, glabrous and glaucous, the lower and basal ones oval, oblong, oblanceolate, or obovate, dentate or denticulate, $\mathbf{I}-2 \mathrm{~cm}$. long, mostly obtuse, tapering into long margined petioles; upper leaves sessile, smalier and partly clasping, lanceolate to ovate-lanceolate, denticulate or entire, mostly acute; heads numerous, erect, spreading, or slightly drooping, $12-16$-flowered, $4-6 \mathrm{~mm}$. broad; involucre oblong-cylindric, hirsute, 10-12 mm . long, $3-5 \mathrm{~mm}$. thick, longer than the hirsute peduncle, its principal bracts $8-10$, with several small outer ones; flowers purplish. In moist open places, N. B. and Anticosti to the N. W. Terr., south to southern N. Y., N. J., Mo. and Colo. Aug.-Sept.

Nabalus racemòsus pinnatífidus (A. Gray) Britton. Leaves pinnatifid or pinnately lobed. Hackensack marshes, N. J.; near Mt. Vernon, N. Y.

Prenanthes Mainénsis A. Gray, from northern Me., is probably a hybrid between $N$. racemosus and N. trifoliolatus.
io. Nabalus crepidíneus (Michx.) DC. Corymbed Rattlesnake-Root. (I. F. f. 3585 .) Stem glabrous or nearly so below, sometimes puberulent above, stout, I. 5-2.7 m. high. Leaves thin, the basal and lower ones hastate, ovate, oblong, or deltoid, sharply dentate, lobed, or incised, sometimes 25 cm . long, usually with broadly winged petioles; the upper much smaller, sessile or short-petioled, narrowed at the base, not clasping, ovate, deltoid, or lanceolate, acute; heads numerous, pendulous, short-peduncled, $8-12 \mathrm{~mm}$. broad; involucre oblong or oblongcampanulate, hirsute, $10-15 \mathrm{~mm}$. long, about 6 mm . thick, dark green or purplish, its principal bracts $\mathbf{1 2 - 1 5}$; flowers cream-color; pappus brown. In fields and thickets, western Penn. and N. Y. to Ky., Minn. and Kans. Aug.-Oct.

## Family 4. AMBROSIÀCEAE Reichenb. <br> Ragweed Family.

Herbs, monœcious, or sometimes diœcious, many of them weeds. rarely shrubby, with alternate leaves, or the lower opposite, and small heads of greenish or white flowers subtended by an involucre of few, separate or united bracts, the pistillate heads sometimes larger and nut-like or bur-like. Staminate and pistillate flowers in the same, or in separate heads. Receptacle chaffy. Pistillate flowers with no corolla, or this reduced to a short tube or ring; calyx adnate to the i-celled ovary, its limb none, or a mere border; style 2-cleft. Staminate flowers with a funnelform tubular or obconic $4-5$-lobed corolla; stamens mostly 5 , separate, or their anthers merely connivent, not truly syngenesious, with short inflexed appendages ; ovary rudimentary; summit of the style often hairy or penicillate. Eight genera and about 55 species, mostiy natives of America.
Staminate and pistillate flowers in the same heads; involucre of a few rounded bracts. 1. Iva.

Staminate and pistillate flowers in separate heads, the staminate mostly uppermost; involucre of the pistillate heads bur-like or nut-like.

Involucral bracts of the staminate heads united.
Involucre of the pistillate heads with several tubercles or prickles in a single series. 2. Ambrosia.
Involucre of the pistillate heads with numerous prickles in several series.
3. Gaertneria. Involucral bracts of the staminate heads separate; involucre of pistillate heads an oblong bur.
4. Xanthium.
I. ÌVA $L$.

Puberulent or scabrous herbs, with thick opposite leaves, or the upper alternate, and small nodding, axillary and solitary, spicate racemose or paniculate heads of greenish flowers. Involucre hemispheric or cup-shaped, its bracts few, rounded.

Receptacle chaffy, the linear or spatulate chaff enveloping the flowers. Marginal flowers I-6, pistillate, fertile, their corollas short, tubular or none. Disk-flowers perfect, sterile, their corollas funnelform, 5 -lobed, their styles undivided, dilated at the apex. Anthers entire at the base, yellow, scarcely coherent with each other, tipped with mucronate appendages. Achenes compressed, obovoid, glabrous. Pappus none. [Named atter Ajuga Iva, from its similar smell.] About 12 species, natives of America. Besides the following, 6 others occur in the southern and western U. S.
Heads spicate or racemose, solitary-axillary, each subtended by a linear or oblong leaf. Heads solitary, pedicelled.

Bracts of the involucre 4-5; heads $3-5 \mathrm{~mm}$. high.
Leaves serrate, oval or oblong; eastern.
Leaves entire or nearly so, obovate or oblong; western.

1. I. frutescens.
2. I. axillaris.

Bracts of the involucre 6-9; heads 6-8 mm. high ; southeastern.

Heads spicate; leaves dentate.
Heads spicate-paniculate, not suibtended by leaves.
3. I. imbricata.
4. I. ciliata.
5. I. xanthiifolia.
I. Iva frutéscens L. Marsh Elder. High-water Shrub. (I. F. f. 3586.) Perennial, shrubby or herbaceous, somewhat fleshy; stem minutely pubescent, or sometimes glabrous below, 9-35 dm. high. Leaves oval, oblong, or oblong-lanceolate, all the lower ones opposite, short-petioled, 3 -nerved, acute or obtusish, serrate, narrowed at the base, the lower $10-15 \mathrm{~cm}$. long, $3-5 \mathrm{~cm}$. wide, the upper smaller and narrower, passing gradually into those of the racemose inflorescence, which are much longer than the short-pedicelled heads; involucre depressed-hemispheric, its bracts orbicular-obovate, separate; fertile flowers about 5, their corollas tubular. Along salt marshes and on muddy seashores, N. H. to Fla. and Tex. July-Sept.
2. Iva axillàris Pursh. Small-flowered Marsh Elder. (I. F. f. 3587.) Perennial by woody roots; stems herbaceous, ascending, glabrous or sparingly pubescent, simple or branched, 3-6 dm. high. Leaves sessile, entire or very nearly so; obtuse, faintly 3 nerved, obovate, oblong, or linear-oblong, $1-4 \mathrm{~cm}$. long, thick, somewhat fleshy, glabrous or pubescent, the lower opposite, the upper alternate and smaller, passing gradually into those of the inflorescence; heads mostly solitary $i_{1}$ the axils of the leaves, 4-6 mm. broad, short-peduncled; involucre hemispheric, about 3 mm . high, its bracts about 5, connate at the base; pistillate flowers 4 or 5 , their corollas tubular. In saline or alkaline soil, N. W. Terr. to S. Dak., Neb., N. Mex., Br. Col. and Cal. May-Sept.
3. Iva imbricàta Walt. Seacoast Marsh Elder. (I. F. f. 3588.) Perennial by woody roots, glabrous or nearly so throughout, fleshy; stem $3^{-6 ~ d m}$. high. simple, or sparingly branched. Leaves all but the lowest alternate, sessile, oblongspatulate, or lanceolate, obtusish, mucronulate, entire, or rarely serrate, obscurely 3 -nerved, the larger $3-5 \mathrm{~cm}$. long, 6-10 mm . wide; heads short peduncled or nearlysessile, the upper ones longer than their subtending leaves; involucre broadly campanulate, its bracts 6-9, not united, somewhat imbricated in 2 series; fertile flowers 2-4, their corollas tubular, the staminate ones much more numerous. On sandy seashores, Va. and N. Car. to Fla. and La. July-Oct.
4. Iva ciliàta Willd. Rough Marsh Elder. (I. F. f. 3589.) Annual. hispid-pubescent; stem simple, or branched, 6-20 dm. high. Leaves nearly all opposite, ovate, petioled, scarcely fleshy, puberulent beneath, acuminate at the apex, abruptly or gradually narrowed at the base, coarsely and irresularly dentate. 3 nerved, the lower $10-12 \mathrm{~cm}$. long; upper leaves linear-lanceolate, hispid. squarrose, much longer than the heads; heads about 2 mm . broad; bracts of the involucre 3-5, distinct or united below; hispid; fertile flowers 3-5, their corollas slender; staminate flowers 10-15. In moist soil. Ill. to Neb, Lat, and N. Mex. Aug.-Oct.
5. Iva xanthiifòlia (Fresen.) Nutt. Burweed Marsh Elider. (I. F. f. 3590.) Annual; stem much branched, pubescent or puberulent alove, glabrous below, 1-2 m. high. Leaves nearly all opposite, broadly ovate, long-petioled. acuminate at the apex, abruptly or gradually contracted at the hase. coarsely and irregularly dentate, pale and canescent or puberulent beneath. roughish above. 3ribbed; inflorescence spicate-paniculate, terminal and axillary, ample, naked; heads sessile or minutely peduncled, less than 2 mm . broad; bracts of the involucre in 2
series of 5 , the outer ovate, the inner obovate or truncate, concave, subtending the usually 5 achenes; corollas of the fertile flowers rudimentary or none; staminate flowers 10-15, their corollas obconic. In moist soil, or waste places, Ont. to N. W. Terr., south to Wis., Neb., N. Mex. and Utah. July-Sept.

## 2. AMBRÒSIA L.

Monœcious (rarely diœcious) branching herbs, with alternate or opposite, mostly lobed or divided leaves, and small heads of green flowers, the staminate spicate or racemose, the pistillate solitary or clustered in the upper axils. Involucre of the pistillate heads globose, ovoid or top-shaped, closed, I-flowered, usually armed with 4-8 tubercles or spines; corolla none; stamens none; style-branches filiform; achenes ovoid or obovoid; pappus none. Involucre of the staminate heads mostly hemispheric or saucer-shaped, 5-12-lobed, open, many-flowered; receptacle nearly flat, naked, or with filiform chaff; corolla funnelform, 5 -toothed; anthers scarcely coherent, mucronate-tipped; style undivided, penicillate at the summit. [The ancient classical name.] About I2 species, mostly natives of America. Besides the following, some 5 others occur in the southern and western U. S.
Sterile heads sessile; a lanceolate hispid lobe on inner border of involucre.

1. A. bidentata.

Sterile heads short-pedicelled; involucre depressed-hemispheric.
Leaves opposite, palmately 3 - 5 -lobed, or undivided; receptacle naked.
Leaves opposite and alternate, $\mathbf{x - 2}$-pinnatifid; receptacle chaffy.
Annual; leaves thin; fruiting involucre spiny. 3. A. artemisiafolia. Perennial; leaves thick ; fruiting involucre naked or tubercled.
4. A. psilostachya.
I. Ambrosia bidentàta Michx. Lance-Leaved Ragweed. (I. F. f. 3591.) Annual, hirsute, usually much branched, very leafy, 3-9 dm. high. Leaves lanceolate, mainly alternate, sessile and somewhat cordate-clasping at the base, acuminate at the apex, i-nerved, $3-7 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide, usually with I or 2 sharp lobes at the base and a few minute sharp teeth above, or the upper ones quite entire; spikes of staminate heads dense, their receptacles chaffy; fertile heads solitary, or clustered, oblong, 4-angled, 6-8 mm. long, bearing 4 sharp spines. Prairies, Ill. to Kans., La. and Tex. July-Sept.
2. Ambrosia trífida L. Horse-cane. Bitter-weed. Great Ragweed. (I. F. f. 3592.) Annual, scabrous or hispid, or nearly glabrous, branched, I-5 m. high. Leaves all opposite, petioled, 3 -nerved, deeply $3-5$-lobed, the lobes lanceolate or ovate, sharply serrate, acute or acuminate; the upper sometimes ovate and undivided; racemes of sterile heads $7-25 \mathrm{~cm}$. long, their involucres saucer-shaped, 3 -ribbed on the outer side; fertile heads usually clustered in the axils of the upper bract-like leaves, turbinate to obovoid, $5-7$-ribbed, conic-beaked, $6-8 \mathrm{~mm}$. long, each rib bearing a tubercle near the summit. In moist soil, Quebec to Fla., the N. W. Terr., Neb., Colo. and Ark. July-Oct.

Ambrosia trífida integrifòlia (Muhl.) T. \& G. Leaves ovate or oblong-lanceolate, not lobed; plant usually lower. Frequent with the type.
3. Ambrosia artemisiæfòlia L. Ragweed. Roman Wormwood. Hogweed. Wild Tansy. (I. F. f. 3593.) Annual, pubescent, puberulent or hirsute, paniculately branched, $3-18 \mathrm{dm}$. high. Leaves thin, $1-2$-pinnatifid, petioled, $5-10 \mathrm{~cm}$. long, the upper alternate, the lower mostly opposite, pale or canescent beneath, the lobes oblong or lanceolate, obtuse or acute; racemes of sterile heads very numerous, $2-15 \mathrm{~cm}$. long, the involucres hemispheric, crenate; fertile heads obovoid or subglobose, mostly clustered, 3-4 mm. long, short-beaked, 4-6-spined near the summit, sparingly pubescent. In dry soil, often a pernicious weed in cultivated fields, N. S. to Fla., west to Br. Col. and Mex. Also in the W. Ind. and S. Am., and introduced into Europe as a weed. July-Oct.
4. Ambrosia psilostàchya DC. Western Ragweed. (I. F. f. 3594.) Similar to the preceding species, but perennial by running roots, the leaves thick, the pubescence strigose or hispid. Stems usually much branched, 6-12 dm. high, rather stout; leaves $\mathbf{1 - 2}$ pinnatifid, $5 \mathbf{- 1 2} \mathrm{~cm}$. long, the lobes acutish; racemes of sterile heads several or numerous, $5^{-15} \mathrm{~cm}$. long, the involucres campanulate, the
receptacles chaffy; fertile heads mostly solitary, ovoid or obovoid, reticulated, short-pointed, unarmed, or with about 4 short tubercles, pubescent, $3-4 \mathrm{~mm}$. long. In moist open soil, Ill. to the N. W. Terr., Tex., Mex. and Cal. July-Oct.

## 4. GAERTNERIA Med.

Hispid or tomentose branching herbs, with the aspect of Ambrosias, sometimes woody at the base, with mostly alternate lobed or divided leaves, and small monœcious greenish heads of discoid flowers, the staminate in terminal spikes or racemes, the pistillate solitary or clustered in the upper axils. Involucre of the pistillate heads ovoid or globose, closed, r-4-celled, 1-4-beaked, armed with several rows of spines and forming a bur in fruit; corolla none or rudimentary; style deeply bifid, its branches exserted; stamens none; achenes obovoid, thick, solitary in the cells; pappus none. Staminate heads sessile, or short-peduncled, their involucres broadly hemispheric, open, 5-12-lobed; receptacle chaffy; corolla regular, the tube short, the limb 5-lobed; style undivided; anthers scarcely coherent; mucronate-tipped. [In honor of Joseph Gaertner, 1732-1791, German botanist.] About I5 species, natives of America. In addition to the following, some 8 others occur in the western and southwestern United States.
Plant hirsute; annual; spines of the fruiting involucre long, flat. I. G. acanthicarpa. Leaves densely white-tomentose beneath; spines short, conic; perennials.

Leaves bipinnatifid.
Leaves pinnately divided, the terminal segment large.
2. G. discolor.
I. Gaertneria acanthicàrpa (Hook.) Britton.
3. G. tomentosa.

Hooker's Gaertneria. (I. F. .f. 3595.) Annual, erect or diffuse, paniculately branched, 3-6 dm. high: stem hirsute or hispid. Lower and basal leaves slender-petioled, bipinnatifid, 5-Io cm . long, the upper short-petioled or sessile, once pinnatifid, or merely lobed; racemes of sterile heads usually numerous, $3-7 \mathrm{~cm}$. long; fruiting involucres clustered in the axils, $6-8 \mathrm{~mm}$. long, commonly I -flowered, armed with numerous long flat straight spines. N. W. Terr. to Kans., Tex., Br. Col. and Cal. July-Sept.
2. Gaertneria discolor (Nutt.) Kuntze. White-Leaved Gaertneria. (I. F. f. 3596.) Erect or ascending from perennial rootstocks, branched, about 3 dm . high. Leaves nearly all bipinnatifid, petioled, densely white-tomentose beneath, green and pubescent or glabrate above, $5-12 \mathrm{~cm}$. long; sterile racemes narrow, commonly solitary, $3-5 \mathrm{~cm}$. long; fruiting involucres clustered in the axils, finely canescent, about 4 mm . long, mostly 2 -flowered, armed with short, sharp, conic spines. In dry soil, S. Dak. to Wyo., Colo. and N. Mex. Aug.-Sept.
3. Gaertneria tomentòsa (A. Gray) Kuntze. Woolly Gaertneria. (I. F. f. 3597.) Erect from a deep perennial root, usually branched at the base, 3-9 dm. high. Leaves pinnately lobed or divided, finely and densely tomentose on both sides, or ashy above, the terminal segment lanceolate or oblong-lanceolate, acuminate, serrulate or entire, very much larger than the 2-6 rather distant narrow lateral ones; sterile racemes solitary, $5-10 \mathrm{~cm}$. long; fruiting involucres solitary, or 2-3 together in the upper axils, ovoid, finely canescent or glabrate, 2 -flowered, about 6 mm . long, armed with subulate-conic, very acute, sometimes curved spines. On rich prairies and along rivers, western Neb., Kans. and Colo. Aug.-Sept.

## 4. XÁNTHIUML.

Monœecious annual branching coarse rough or spiny herbs, with alternate lobed or dentate leaves, and rather small heads of greenish discoid flowers, the staminate ones capitate-clustered at the ends of the branches, the pistillate axillary. Staminate heads with a short involucre of i to 3 series of distinct bracts; receptacle cylindric, chaffy; corollas tubular, 5 -toothed; anthers not coherent, mucronate at the apex; filaments monadelphous; style slender, undivided. Pistillate heads of an ovoid or oblong, closed involucre, covered with hooked spines, I-z-heaked, 2-celled, each cavity containing one ohovoid or ohbong achene; corolla none; pappus none; style 2-cleft, its branches exserted. [Greck, vellow, from its yielding a yellow hair-dye.] About 15 species, of wide geographic distribution.
Leaves lanceolate, not cordate; axils bearing 3 -divided spines. I. I. spinesum.
Leaves orbicular or broadly ovate, cordate, or truncate ; axils not spiny.
Bur $12-20 \mathrm{~mm}$. long, usually nearly glabrous; beaks straight or nearly so.

Bur $5-30 \mathrm{~mm}$. long ; beaks hooked or incurved.
Body of the bur oblong, twice as long as thick or more.
Bur and its spines merely puberulent and glandular or with a few hispid hairs. Prickles very dense, slender ; leaves thin, sharply toothed.
3. X. Pennsylvanicum.

Prickles scattered, stout ; leaves firm, bluntly toothed.
4. X. Canadense.

Bur or its prickles very hispid.
Prickles as long as the diameter of the bur or longer.
5. X. speciosum.

Prickles not longer than the diameter of the bur. Prickles slender, loosely hispid to about the middle.
6. $X$. commипе.

Prickles stout, very densely long-hispid nearly to the stronglyhooked tip.
7. X. Macounii.

Body of the bur oval to ovoid, not twice as long as thick.
Prickles of the bur dense ; pubescence of the bur and its prickles brown.
8. X. echinatum.

Prickles of the bur.scattered; pubescence of the bur and its prickles yellow.
9. X. glanduliferum.

1. Xanthium spinòsum L. Spiny or Thorny Clotbur or Burweed. (I. F. f. 3598.) Stem pubescent or puberulent, much branched, 3-6 dm. high. Leaves lanceolate or ovate-lanceolate, acute or acuminate, lobed, or the upper entire, narrowed at the base, short-petioled, white canescent beneath and on the whitish veins of the upper surface, $5-12 \mathrm{~cm}$. long; ripe fertile involucre (bur) oblong-cylindric, 812 mm . long, about 4 mm . in diameter, pubescent, armed with short subulate rather inconspicuous beaks, and numerous glabrous prickles about 2 mm . long. In waste grounds, Ont. to Fla., west to W. Va., Mo. and Tex. Widely distributed as a weed. Nat. from Europe or Asia. Aug.-Nov.
2. Xanthium glabràtum (DC.) Britton. Smoothish Cocklebur or Burweed. (I. F. f. 3599.) Rough, 3-10 dm. high. Leaves slender-petioled, broadly ovate to orbicular, 3 ribbed and cordate or cordate-reniform at the base, the lower often 25 cm . wide, the margins dentate, or more or less $3-5$-lobed, both surfaces roughish and green; bur oblong, glabrous or nearly $\mathrm{s}, \mathbf{1 2 - 1 8} \mathrm{cm}$. long, about 6 mm . in diameter, its 2 sharp subulate 2 -toothed beaks straight or nearly so, equalling or slightly longer than the numerous, nearly glabrous or pubescent prickles. In waste places, N. Eng. and N. Y. to Neb., south to Fla. and Mex. [X. macrocarpon, var. glabratum DC.; X. pungens Wallr.; has generally been referred to the Old World X. strumarium L., which has smaller, puberulent burs, with stouter shorter beaks.] Aug.-Oct.
3. Xanthium Pennsylvànicum Walir. Pennsylvania Clotbur. Stem comparatively slender, smooth below, roughish above, $2-6 \mathrm{dm}$. high. Leaves thin, long-petioled, sharply toothed and some of them 3-5-lobed, smoothish, or the upper surface scabrate, glandular; burs clustered in the axils, $15-18 \mathrm{~mm}$. long, about one-third as thick, puberulent and resinous-glandular, and commonly with a few longer hairs; prickles very numerous, subulate, hooked, the longer ones nearly as long as the diameter of the bur; beaks slender, but stouter than the prickles, incurved and hooked. D. C. to Penn., Ont. and Minn.
4. Xanthium Canadénse Mill. American Cocklebur. Hedgehog Burweed. (I. F. f. 3600.) Similar to the preceding species. Leaves roughish and thicker, bluntly toothed and lobed; bur puberulent and glandular, oblong, 15-20 mm . long, $5-8 \mathrm{~mm}$. in diameter, the two stout beaks hooked or incurved at the apex, longer than or equalling the scattered rather slender hooked prickles. Northern N. Y. to Mass. Aug.-Oct.
5. Xanthium speciòsum Kearney. Great Clotbur. Very stout, i-I. 5 m . high. Stem sharply angled above; lower petioles $10-15 \mathrm{~cm}$. long; leaf-blades broadly triangular-ovate, the larger $15-22 \mathrm{~cm}$. wide, 3-5-lobed, dentate, scabrous on both surfaces; burs commonly clustered, oblong to ovoid-oblong, 2.5 cm . long or more, the stout beaks $10-12 \mathrm{~mm}$. long, somewhat incurved, strongly hooked at the apex. equalling or a little longer than the dense subulate uncinate prickles, which are hispid to above the middle. Tenn. and Mo. to N. Dak., Kans. and Tex.
6. Xanthium commùne Britton, n. sp. Common Clotbur. Stem rather slender, 3-6 dm. high, roughish. Leaves broadly ovate, more or less lobed, sca-
brous, especially above; burs commonly solitary in the axils, oblong, $1.5-2.5 \mathrm{~cm}$. long, half as thick, or less, the subulate-conic beaks slightly incurved, hooked at the apex, about as long as the subulate uncinate prickles, which are hispid to about the middle with brown hairs. Quebec to N. Y., Kans., Mo. and Ariz. Type collected by N. L. Britton at Westport, N. Y.
7. Xanthium Macoùnii Britton, n. sp. Macoun's Clotbur. Stem purplish or purple-blotched, about 2.5 dm . high. Leaves slender petioled, triangularovate, acute, irregularly dentate, firm, scabrous on both surfaces; burs mostly 2 in each axil, oblong, the body about 2 cm . long and 8 mm . thick, the stout prickles very densely hispid, excepting their strongly incurved, glabrous lips, shorter than the stouter, hispid incurved beaks, and than the diameter of the bur. Goose Island, Lake Winnipeg, Manitoba, J. M. Macoun, Aug. 16, 1884. Specimen in the herbarium of the Geological and Natural History Survey of Canada.
8. Xanthium echinàtum Murr. Beach Clotbur. Stem rough, purplish or purple-blotched, 3-6 dm. high. Leaves firm, scabrous, with scattered short papillose hairs, obtusely toothed and lobed, somewhat resinous-glandular beneath; burs commonly clustered in the axils, ovoid to oval, $15-20 \mathrm{~mm}$. long, $8-12 \mathrm{~mm}$. thick, glandular; prickles very dense, densely hispid from the base to the middle or beyond, subulate, hooked, the longer about 5 mm . long, and about equalling the stout hispid beaks. Sea, lake and river beaches, N. C. to Mass., Vt., northern N. Y. and Minn. ( $X$. maculatum Raf.; X. oviforme Wallr., ex descr.)
9. Xanthium glandulíferum Greene. Glandular Clotbur. Similar to X. echinatum. Leaves very thick and scabrous with short stout papillæ; burs oval, $10-15 \mathrm{~mm}$. long, 6-9 mm. thick, yellow, the prickles scattered, bristly-hispid nearly to the hooked apex, scarcely as long as the conic-subulate short-bristly beaks. Neb. to N. Dak. and Assiniboia.

## Family 5. COMPÓSITAE Adans.

## Thistle Family.

Herbs, rarely shrubs (some tropical forms trees), with watery or resinous (rarely milky) sap, and opposite alternate or basal exstipulate leaves. Flowers perfect, pistillate, or neutral, or sometimes monœcious or diœcious, borne on a common receptacle, forming heads, subtended by an involucre of few to many bracts arranged in one or more series. Receptacle naked, or with chaffy scales subtending the flowers, smooth, or variously pitted or honeycombed. Calyx-tube completely adnate to the ovary, the limb (pappus) of bristles, awns, teeth, scales, or crownlike, or cup-like, or wanting. Coralla tubular, usually 5 -lobed or 5 -cleft, the lobes valvate, or that of the marginal flowers of the head expanded into a ligule (ray); when the ray-flowers are absent the head is said to be discoid; when present, radiate; the tubular flowers form the disk. Stamens usually 5, borne on the corolla and alternate with its lobes, their anthers united into a tube (syngenesious), often appendaged at the apex, sometimes sagittate or tailed at the base; pollen-grains globose, often rough or prickly. Ovary I-celled; ovule I, anatropous; style of fertile flowers 2 -cleft; stigmas marginal; style of sterile flowers commonly undivided. Fruit an achene. Seed erect; endosperm none; embryo straight; hypocotyl inferior. About 760 genera and not less than 10,000 species, of wide geographic distribution. In K゙ulnia, the anthers are distinct, or nearly so.

[^47]*** Anthers not tailed at the base; stigmatic lines of the style-branches in the perfect flowers extending to the summit; flowers tubular only, or tubular and radiate, often yellow.

1. Receptacle naked (see also Nos. 79, 80, 81 and 82 of Tribe 7.)
a. Bracts of the involucre usually well imbricated.

Style-branches of the perfect flowers flattened, with terminal appendages.
Tribe 3. Astereae.
Style-branches truncate, or with hairy tips.
Tribe 6. Helenieae.
b. Bracts little imbricated, or not at all; pappus of soft bristles.

Tribe 8. Senecioneae. 2. Receptacle chaffy (except in Nos. 79, 80, 8I and 82).

Bracts of the involucre herbaceous or foliaceous; not scarious. Tribe 5. Heliantheae.
Bracts of the involucre dry, scarious.
Tribe 7. Anthemideae.
*** * Anthers long-tailed at the base, with elongated appendages at the tip; heads large; rays none. (In Centaurea often with enlarged marginal flowers; bracts imbricated. Tribe 9. Cynareae.

## Tribe i. Vernonieae.

Pappus double, the inner of rough capillary bristles, the outer of scales, or short bristles;
heads not glomerate. 1. Vernonia.
Pappus a single series of bristles; heads glomerate, subtended by sessile bracts.
2. Elephantopus.

## Tribe 2. Eupatorieae.

* Achenes 3-5-angled, not ribbed.

Pappus of 5 broad obtuse scales; aquatic herb with linear whorled leaves.
3. Sclerolepis.

Pappus of numerous capillary bristles.
Involucre of more than 4 bracts; erect herbs. 4. Eupatorium.
Involucre of 4 bracts; twining herbaceous vines.
5. Willugbaeya.

* Achenes 8-ro-ribbed, or 8-ro-striate.
I. Bracts of the involucre in several series, the outer successively shorter.

Bracts of the involucre strongly striate-nerved; heads panicled or corymbed in our species.

Pappus-bristles rough or serrate; involucral bracts numerous.
Pappus-bristles plumose; involucral bracts few.
6. Coleosanthus.
7. Kuhnia.

Bracts of the involucre faintly striate, if at all; heads spiked or racemed.
8. Lacinaria.
2. Bracts of the involucre in only 2 or 3 series; all nearly equal.
9. Trilisa.

## Tribe 3. Astereae.

## A. Ray-flowers yellow (white in one species of Solidago), or wanting; plants not dioecious.

* Pappus of scales, or awns, or wanting, never of numerous capillary bristles.

Heads small, nor over 4 mm . high ; leaves narrowly linear, entire. Perennial herbs, or shrubs; all the flowers fertile.
Annual herb; disk-flowers sterile.
ro. Gutierrezia:
II. Amphiachyvis.

Heads large, showy; leaves oblong to lanceolate, spinulose-dentate.
12. Grindelia.

* P Pappus of either the radiate or tubular flowers, or both, of numerous capillary bristles, with or without an outer series of shorter ones, or of scales.
$\dagger$ Pappus, at least of the disk-flowers, double, an inner series of capillary bristles, and an outer one of scales or short bristles; heads large.
Achenes of the ray-flowers thick, the pappus obsolete, or of a few caducous bristles; achenes of the disk-flowers flat.
Achenes of both ray-flowers and disk-flowers flattened.

13. Heterotheca.
++ Pappus wholly of capillary bristles.
14. Heads wholly of disk-flowers (in our species) : ravs none; leaves narrowly linear.
a. Perennial herbs; style-tips not exserted; eastern. 15. Chondrophora.
b. Shrubs; style-tips mostly exserted; western.

Involucral bracts gradually narrowed to the tip, keeled, chartaceous.
16. Chrysothamnus.
17. Oonopsis.
2. Heads with both ray-flowers and disk-flowers (in our species).
a. None of the leaves cordate; pappus mostly as long as the achene, or longer.

Leaves bristly-serrate or pinnatifid.
Achenes glabrous; pappus-bristles deciduous.
Achenes white-tomentose ; pappus-bristles persistent.
18. Prionopsis.
19. Sideranthus,

Leaves entire, or toothed, not bristly-serrate.
Leaves narrow, coriaceous, evergreen, entire; low western undershrubs.
20. Stenotus.

Annual or perennial herbs; leaves not evergreen.
Pappus-bristles unequal; heads loosely panicled; annual.
21. Isopappus.

Pappus-bristles equal; heads variously clustered; perennial herbs.
Receptacle alveolate; rays mostly not more numerous than the disk-flowers.
22. Solidago.

Receptacle fimbrillate; rays more numerous than the disk-flowers; heads corymbose-paniculate.
23. Euthamia.
b. Lower and basal leaves cordate; pappus-bristles shorter than the achene.
24. Brachychaeta.

## B. Ray-flowers present, not yellow in any of our species.

* Pappus a mere crown, or of a few awns or bristles, or wanting, never of numerous capillary bristles
I. Receptacle conic.

Outer bracts of the involucre shorter than the inner; achenes prismatic.
25. Aphanostephus.

Bracts of the invelucre all about equal ; achenes flattened. 26. Bellis.
2. Receptacle flat, or somewhat convex.

Achenes of the disk-flowers compressed, of the ray-flowers 3 -angled; perennial herbs with large heads.
Achenes fusiform, terete; annual herbs with small heads.
27. Tounsendia.
28. Chaetopappa. Achenes obovate, flattened, with thickened or winged margins; perennials.
29. Boltonia.
** Pappus of numerous capillary bristles.
I. Pappus a single series of capillary bristles; sometimes with an outer series of shorter ones.
a. Bracts of the involucre in 2 to many series.

Bracts mostly in 2-5 series; teeth or lobes of the leaves not bristle-tipped.
Involucre narrow, its bracts firm; rays few, white. 30. Sericocarpus:
Involucre turbinate to hemispheric, bracts mostly thin; rays usually numerous, white to purple.

Disk-flowers turning red, purple, or brown. 31. Aster.
Disk-flowers permanently white; leaves subulate to spatulate, crowded, rigid.
32. Leucelene.

Involucre turbinate; rays not exceeding the mature pappus, or none.
33. Brachyactis.

Bracts in many series; teeth or lobes of the leaves bristle-tipped in our species.
34. Machaeranthera.
b. Bracts of the involucre in only 1 or 2 series, very narrow; heads mostly long-peduncled.
Rays longer than the diameter of the disk.
35. Erigeron.

Rays not longer than the diameter of the disk; heads very small, panicled. 36. Leptilon.
2. Pappus distinctly double, the inner bristles long, the outer shorter. Leaves lanceolate, ovate, or obovate; rays white.
37. Doellingeria.

Leaves narrowly linear; rays violet.

## C. Ray-flowers none; diæcious shrubs; pappus capillary-

38. Ianactis.
39. Baccharis.

## Tribe 4. Inuleae.

* Heads small, rays none; flowers white or whitish.
I. Receptacle chaffy.

Receptacle convex; pappus none.
40. Filago.

Receptacle subulate; pappus of the inner flowers of rough capillary bristles.
41. Gifola.
2. Receptacle naked.
a. Pappus, at least that of pistillate flowers, of capillary bristles.

Bracts of the involucre notscarious; plants pubescent or glabrous, not woolls.
42. Pluchea.

Bracts of the involucre scarious, mostly white or pink; plants woolly.
Plants diœcious, or polygamo-diœcious.
Pappus-bristles of staminate flowers thickened above. 4.3. Antennaria.
Pappus-bristles not thickened; stem leafy, 44. Anaphalis,

Plants not diœcious; flowers all fertile.
45. Gnaphalium.
b. Pappus none; leaves broad, alternate, woolly beneath.
46. Adenocaulon.

* Heads large; ray-flowers yellow. 47. Inula.

## Tribe 5. Heliantheae.

## A. Disk-flowers perfect, but sterile.

Achenes thick, short, not flattened; pappus none.
Achenes merely subtended by the inner involucral bracts.
Achenes embraced and enclosed by the inner involucral bracts.
48. Polymnia.
49. Melampodium.

Achenes flattened.
Ray-flowers in 2 or 3 series; achenes falling away free. 50. Silphium.
Ray-flowers in I series; achenes adnate to 2 or 3 scales of the receptacle, falling away with them.

Rays large, yellow.
Leaves opposite and basal.
51. Chrysogonum.

Leaves alternate.
Pappus none, or of 2 caducous awns.
Pappus a persistent irregularly-cleft crown.
Rays small, the heads appearing discoid.
52. Berlandiera.
53. Engelmannia.
54. Parthenium.

## B. Disk-flowers fertile.

* Ray-flowers persistent upon the achenes.

Achenes compressed, or 3 -angled; leaves entire.
Achenes short, thick; leaves toothed.
55. Crassina.
56. Heliopsis.

*     * Ray-flowers deciduous, or none.
$\dagger$ Pappus a cup, or crown, or of a few teeth, awns, or bristles.

1. Achenes, at least those of disk-flowers, not compressed (except in Ratibida and Verbesina); scales of the receptacle mostly concave, or clasping.
Scales of the receptacle small, awn-like or bristle-like; rays white, short.
2. Eclipta.

Scales of the receptacle broad, larger.
Involucre of 4 large somewhat united bracts.
58. Tetragonotheca.

Involucre of several or numerous separate bracts.
Receptacle conic, or columnar.
Ray-flowers fertile, or wanting; leaves opposite. 59. Spilanthes.
Ray-flowers sterile, or neutral; leaves mostly alternate.
Rays yellow.
Achenes 4 -angled. 60. Rudbeckia.
Achenes compressed, winged. 6I. Ratibida.
Rays rose-purple.
62. Brauneria.

Receptacle flat, or convex (low-conic in species of Nos. 64 and 65).
Low, fleshy seacoast shrubs.
63. Borrichia.

Tall herbs, not fleshy.
Achenes not much flattened, not winged, nor margined.
64. Helianthus.

Achenes of disk-flowers flattened and margined, or winged.
65. Verbesina.
2. Achenes very flat; scales of the receptacle flat, or but slightly concave.
a. Bracts of the involucre all separate.

Pappus of 2 short teeth or awns, or a mere border, or none.
66. Coreopsis.

Pappus of 2-6 awns or teeth, upwardly or downwardly barbed or hispid.
67. Bidens.
b. Inner bracts of the involucre united to about the middie.
68. Thelesperma.

$$
++ \text { Pappus of numerous scales. }
$$

Leaves opposite, toothed; ray-flowers fertile; rays small.
Leaves alternate, entire.
Rays large, neutral ; receptacle deeply honeycombed.
Rays none; scales of the receptacle narrow, rigid.
69. Galinsoga.
70. Actinospermum
71. Marshallia.

## Tribe 6. Helenieae.

## A. Ray-flowers persistent on the achenes, falling away with them, papery.

72. Psilostrophe.

## B. Ray-flowers deciduous, or wanting.

* Plants not dotted with oil-glands.
a. Pappus none.

73. Flaveria.
b. Pappus present (in all our species), of separate scales or bristles.
74. Bracts of the involucre petal-like, colored, their margins and apices scarious. Leaves, at least the lower, pinnately parted, or pinnatifid; rays none; corolla-lobes of disk-flowers ovate. 74. Hymenopappus. Leaves entire; rays present, or none; corolla-lobes of disk-flowers lineąr.
75. Polypteris.
76. Bracts of the involucre herbaceous, not scarious-tipped, nor petal-like, appressed, or spreading.

## Receptacle naked.

Bracts of the involucre appressed.
Achenes 4 -angled, linear or oblong.
Achenes 5-10-ribbed or 5-10-angled, top-shaped.
Outer involucral bracts separate.
Outer involucral bracts connate at base.
Bracts of the involucre spreading, or reflexed at maturity. Receptacle with bristle-like chaff.
76. Picradeniopsis.
77. Tetraneuris.
78. Picradenia.
79. Helenium.
80. Galliardia.
** Plants dotted with oil-glands, especially the leaves and involucre.
Involucral bracts more or less united; style-branches of the disk-flowers elongated.
Involucral bracts united at the base.
81. Boebera.

Involucral bracts united high up into a cup. 82. Thymophylla.
Involucral bracts separate; style-branches of the disk-flowers very short.
83. Pectis.

## Tribe 7. Anthemideae. <br> * Receptacle chaffy.

Achenes flattened; involucre obovoid to campanulate; heads small.
Achenes terete; involucre hemispheric; heads large. 85. Anthemis.
84. Achillea.

*     * Receptacle not chaffy, naked, or sometimes hairy.

1. Ray-flowers usually present, sometimes wanting; rays large.

Receptacle flat to hemispheric; bracts of the involucre in several series.
86. Chrysanthemum.

Receptacle conic to ovoid; bracts in few series; rays white or none.
2. Ray-flowers none; heads small.

Heads corymbed; pappus a short crown; flowers yellow.
87. Matricaria.
88. Tanacetum.
89. Artemisia.

## Tribe 8. Senecioneae.

Leaves all basal; heads on scapes.
Head solitary; flowers yellow.
Heads corymbed; flowers white or purple.
Leaves opposite; rays yellow.
Leaves alternate.
90. Tussilago.

Heads racemose, spicate or panicled; pappus none.
91. Petasites.
92. Arnica.

Flowers white, whitish or pinkish; rays none.
Marginal flowers pistillate; disk-flowers perfect.
Flowers all perfect.
93. Frechtites.

Involucre of about 5 bracts; sap milky.
Involucre of about 12 bracts and several smaller outer 94. Mesadenia.
Flowers yellow; ray-flowers mostly present.
95. Sinosma.
96. Senecio.

## Tribe 9. Cynareae.

* Achenes inserted on the receptacle by their bases, not oblique.

Receptacle densely bristly.
Filaments separate.
Involucral bracts hooked at the tip; leaves not bristly.
Involucral bracts not hooked; leaves bristly.
Filaments united below. 99. Mariana. Receptacle fleshy, not bristly.
100. Unopordon.
** Achenes obliquely inserted on the receptacle.
Heads not subtended by bristly leaves; involucral bracts often bristly.
101. Centaurea.
Heads sessile, subtended by bristly leaves. 102. Cnicus.

## I. VERNÒNIA Schreb.

Erect branching perennial herbs, or some tropical species shrubby, with alter. nate (very rarely opposite), in our species sessile leaves, and discoid cymose-paniculate heads of purple, pink, or white tubular flowers. Involucre hemispheric, campanulate or oblong-cylindric, its bracts imbricated in several or many series. Receptacle flat, naked. Corolla regular, 5 -cleft. Anthers sagittate at the base, not caudate. Style-branches subulate, hispidulous their whole length. Achenes 8 -ro-ribbed, truncate. Pappus of our species in 2 series, the inner of numerous roughened capillary bristles, the outer of much shorter small scales or stout bristles. [Named after William Vernon, English botanist.] About 475 species, of wide distribution in warm-temperate regions, most abundant in S. Am. Besides the following, 2 or 3 others occur in the southern and southwestern U. S.
Bracts of the hemispheric involucre, or some of them, with subulate or filiform tips.
Involucre $6-10 \mathrm{~mm}$. broad, its bracts shorter than the head. I. V. Noveboracensis.
Involucre $18-25 \mathrm{~mm}$. broad, its bracts as long as the head. 2. $V$. crinita.
Bracts of the involucre merely acute, obtuse or truncate.
Leaves lanceolate to oval, pinnately veined.
Bracts of the involucre with squarrose tips. 3. V. Baldwinii.
Bracts of the involucre appressed or their tips slightly spreading.
Leaves glabrous or very nearly so on both surfaces.
Leaves thin, pale beneath, the lower oval, coarsely serrate.
4. V. glauca.

Leaves thin, green beneath, lanceolate, finely serrate.
5. V. gigantea. Leaves thick, narrowly lanceolate, sharply serrate.
6. V. fasciculata.

Leaves densely pubescent beneath, lanceolate.
Involucre $8-12 \mathrm{~mm}$. high; plant tomentose. Involucre $6-7 \mathrm{~mm}$. high; plant pubescent.
7. V. Drummondii.
8. V. interior.
9. V. marginata.

Leaves narrowly linear, I-nerved, 4-6 mm . wide, dentate.
I. Vernonia Noveboracénsis (L.) Willd. New York Iron-weed. Flat Top. (I. F. f. 360I.) Roughish-pubescent or glabrate, 9-27 dm. high. Leaves lanceolate or narrowly oblong, serrulate, $7-25 \mathrm{~cm}$. long, $10-25 \mathrm{~mm}$. wide, acuminate or acute at the apex; heads peduncled; involucre $20-30$-flowered; bracts brownish-purple, ovate or ovate-lanceolate, tipped with subulate spreading awns usually of twice or three times their own length, or some of the lower linear-subulate, the upper sometimes merely acute; flowers deep purple, rarely white; achenes hispidulous on the ribs. In moist soil, Mass. to Minn., Ga. and Kans. July-Sept.

Vernonia Noveboracénsis tomentòsa (Walt.) Britton. Leaves densely puberulent beneath, broader; involucre purple, some scales sometimes merely acute. In dry soil, Va. to N. Car.
2. Vernonia crinita Raf. Great Iron-weed. (I. F. f. 3602:) Stout, glabrate or finely rough-pubescent, 25-35 dm. high. Leaves narrowly lanceolate, finely denticulate, acuminate. Io-30 cm . long, $6-25 \mathrm{~mm}$. wide; heads stoutpeduncled, the peduncles thickened above; involucre 50-70-flowered; bracts green. or the upper reddish, very squarrose, all filiform-subulate from a broader base and equalling the head, the inner ones somewhat wider below; achenes hispidulous on the ribs. On prairies and along streams, Mo. and Kans. to Tex. Aug.-Oct.
3. Vernonia Baldwnii Torr. Baldwin's Iron-weed. (I. F. f. 3603 .) Stout, 6-16 dm. high, finely and densely tomentose-pubescent. Leaves lanceolate or oblong-lanceolate, acuminate or acute at the apex, sharply serrate, $10-20 \mathrm{~cm}$. long, $1-2.5 \mathrm{~cm}$. wide, scabrate above, densely tomentulose beneath; heads stoutpeduncled, I5-30-flowered; involucre hemispheric, $6-8 \mathrm{~mm}$ broad; bracts ovate, the acute tips recurved or spreading. In dry soil, Mo. and Neb. to Tex. JulySept.
4. Vernonia glàuca (L.) Britton. Broad-leaved Iron-weed. (I. F. f. 3604.) Slender, glabrous or finely puberulent, 6-15 dm. high. Leaves thin, the lower broadly oval or slightly obovate, sharply serrate, acute or acuminate, $10-17$ cm . long, $3-6 \mathrm{~cm}$. wide, the upper narrower and more finely toothed; inflorescence loosely branched; heads $10-20$-flowered; involucre campanulate, $4-7 \mathrm{~mm}$. broad; bracts ovate, acute, or mucronate, or the upper ones obtuse; achenes minutely hispidulous. In woods, Penn. and Md. to Ohio, south to Fla. and La. Aug.-Sept.
5. Vernonia maxima Small. Tall Iron-weed. (I. F. f. 3605.) Glabrous or nearly so, $1.5-3 \mathrm{~m}$. high. Leaves thin, lanceolate, sometimes broadly so, usually long-acuminate, finely serrate, $\mathbf{I}-3 \mathrm{dm}$. long, $\mathbf{I}-4 \mathrm{~cm}$. wide, usually glabrous on both surfaces; inflorescence at length loosely branched and open; involucre campanulate, rounded at the base, $4-5 \mathrm{~mm}$. broad, $15-30$-flowered; bracts obtuse or mucronate, more or less ciliate; achenes slightly hispidulous; pappus purple. In moist soil, Penn. to Ala., Mo., Ky. and La. July-Sept. [V. gigantea (Walt.) Britton, in part.]

Vernonia maxima pubéscens E. L. Morris. Mostly over 3 m . tall, pubescent, especially on the lower surfaces of the leaves, the peduncles bracted below the heads. W. Va.
6. Vernonia fasciculàta Michx. Western Iron-weed. (I. F. f. 3606.) Glabrous, or puberulent above, 6-12 dm. high. Leaves firm, lanceolate or linearlanceolate, long-acuminate, $7-15 \mathrm{~cm}$. long, $4-30 \mathrm{~mm}$. wide, glabrous or nearly so on both surfaces; inflorescence usually compact; heads short-peduncled, or some of them sessile; involucre campanulate, 4-6 mm . broad, 20-30-flowered; bracts ovate or oval, acute, ciliate, or sometimes pubescent; achenes glabrous, or a little pubescent. In moist soil or on prairies, Ohio to Minn. and N. Dak., south to Ky. and Tex. July-Sept.
7. Vernonia Drummóndii Shuttlw. Drummond's Iron-weed. (I. F. f. 3607.) Stout, densely tomentose, 9-2I dm. high. Leaves lanceolate to narrowly oblong, acuminate, finely serrate, $7-\mathbf{1} 5 \mathrm{~cm}$. long, $\mathbf{I}-4 \mathrm{~cm}$. wide, scabrous above, densely pubescent beneath; heads short-peduncled; involucre hemispheric or shortcylindric, 15-50 flowered; bracts purplish, ovate, acute, or mucronate, more or less floccose-pubescent or ciliate; achenes glabrous. Prairies, Ill. and Ky. to Mo., Ala. and Tex. Autumn.
8. Vernonia intérior Small. Inland Iron-weed. Stem I-2 m. tall, leafy. Leaves lanceolate to elliptic-lanceolate, $6-20 \mathrm{~cm}$. long, acuminate, finely and sharply serrate; involucre $4^{-7} \mathrm{~mm}$. high, its bracts pubescent, acute or acuminate, the tips erect or slightly spreading; achenes pubescent; pappus purple. Prairies and plains, Mo. to Kans. and Tex. Autumn.
9. Vernonia marginàta (Torr.) Britton. James' Iron-weed. (I. F. f. 3608 .) Glabrous or very nearly so, 3-9 dm. high. Leaves minutely denticulate, r-nerved, firm, punctate, $5-\mathbf{1 2} \mathrm{cm}$. long, 3-9 mm . wide, acuminate; inflorescence rather loose; involucre campanulate or turbinate, $15-30$-flowered, $8-12 \mathrm{~mm}$. broad: bracts ovate to ovate-lanceolate, acute, to short-acuminate, purplish, somewhat pubescent, appressed; achenes nearly glabrous, or somewhat pubescent. Prairies, Neb. to Tex. and N. Mex. Autumn.

## 2. ELEPHÁNTOPUS L.

Perennial rigid pubescent herbs, with alternate or basal, simple pinnately-veined leaves, and in our species glomerate bracted heads of blue or purple flowers in branching corymbs. Heads discoid, $2-5$ flowered. Involucre compressed, oblong, its chaffy bracts imbricated in about 2 series, the 4 outer bracts shorter. Bracts of the glomerules large, foliaceous. Receptacle small, naked. Corolla nearly regular, 5 -lobed, but a little deeper cleft on the inner side. Achenes ro-ribbed, truncate. Pappus of rigid persistent awn-like scales or bristles in I or 2 rows. [Greek, ivory, or Elephant's-foot.] About 14 species, natives of tropical or warm regions. Besides the following another occurs in the southern U. S.
Stem and branches usually leafy.

1. E. Carolinianus.

Stem scapiform, naked, or with $x$ or 2 leaves.
Leaves oblong or oblanceolate, $1.8-5 \mathrm{~cm}$. wide; heads 8 mm . long.
2. E. nudatus.

Leaves ovate, oval, or obovate, $5-10 \mathrm{~cm}$. wide ; heads 12 mm . long.
3. E. tomentosus.
r. Elephantopus Caroliniànus Willd. Carolina Elephant's-foot. (I. F. f. 3609.) Erect, hirsute-pubescent, or glabrate above, branched above, 3-9 dm. high. Leaves oval, ovate, or obovate, thin, the lower rather abruptly narrowed into margined petioles, obtuse, crenate-dentate, $7-20 \mathrm{~cm}$. long, $5-10 \mathrm{~cm}$. wide, the upper smaller, narrower and sessile; glomerules, including the bracts, nearly 25 mm . broad; scales of the pappus lanceolate-subulate, gradually narrowed into a long slender awn. In dry woods, southern N. J. and Penn. to Fla., Kans. and Tex. Aug.-Sept.
2. Elephantopus nudàtus A. Gray. Smoothish Elephant's-foot. (I. F. f. 3610.) Erect, rather stout, appressed-pubescent, or glabrate, 3-6 dm. high. Leaves obtuse at the apex, gradually narrowed at the base, crenate or repand, $5-25 \mathrm{~cm}$. long, the basal ones usually much larger than those of the stem and branches, or these usually few and bract-like; glomerules $12-18 \mathrm{~mm}$. broad; scales of the pappus ovate-triangular, abruptly narrowed into the awn. In sandy woods, Del. to Fla., west to Ark. and La. Aug.-Sept.
3. Elephantopus tomentòsus L. Woolly Elephant's-foot. Tobaccoweed. (I. F. f. 36 II.) Erect, villous-pubescent, or sometimes glabrate, 3-6 dm. high, the stem branching above, leafless or with I or 2 leaves Basal leaves narrowed at the base, usually silky-pubescent beneath, crenate-dentate, $10-22 \mathrm{~cm}$. long; glomerules $2.5-4 \mathrm{~cm}$. broad; scales of the pappus triangular-subulate, gradually narrowed into the awn. In moist soil, Va. to Fla., west to Ky., Ark. and La. Aug.-Sept.

## 3. SCLERÒLEPIS Cass.

Slender aquatic herbs, with linear entire verticillate leaves, and solitary (rarely $2-4$ ) discoid peduncled terminal heads of small purplish flowers. Involucre broadly campanulate or hemispheric. Bracts imbricated in about 2 series. Receptacle conic, naked. Corolla regular, its tube short, its limb campanulate, 5 -lobed. Anthers obtuse at the base. Style-branches slender, obtuse. Pappus of 5 broad cartilaginous obtuse scales. Achenes 5-angled. [Greek, hard scale, referring to the pappus.] A monotypic genus.
I. Sclerolepis uniflòra (Walt.) Porter. Sclerolepis. (I. F. f. 3612.) Perennial; stem simple, decumbent at the base, erect or ascending, glabrous or slightly pubescent, 3-6 dm. long, leafy. Leaves sessile, verticillate in 4's-6's, linear, I-nerved, $8-25 \mathrm{~mm}$. long, $\mathbf{I - 2} \mathrm{mm}$. wide, or the submerged ones filiform; head about I cm . broad; bracts of the involucre linear-oblong, acutish, usually puberulent. In shallow ponds and streams, pine barrens of N. J. to Fla. July-Sept.

## 4. EUPATORIUM L.

Erect, perennial herbs, with opposite or verticillate, or sometimes alternate, often punctate leaves, and in our species cymose-paniculate discoid heads of white, blue or purple flowers. Involucre oblong, ovoid, campanulate, or hemispheric, the bracts imbricated in 2 -several series. Receptacle naked. Corolla regular, its tube slender, its limb 5 -lobed or 5 -toothed. Anthers obtuse and entire at the base, appendiculate at the apex. Style-branches elongated, flattened, or thickened above, stigmatic at the base. Achenes 5 -angled, truncate. Pappus of numerous capillary usually scabrous bristles arranged in I row. [Named for Mithridates Eupator, i.e., of a noble father.] About 475 species, mostly of warm or tropical regions. Besides the following, some 35 others occur in southern and western N. A.

[^48]Leaves rugose, pubescent; inflorescence depressed.

Leaves ovate, acute.
Leaves lanceolate, long-acuminate.
Leaves nearly glabrous; inflorescence pyramidal.
Leaves sharply serrate.
Leaves crenate, the teeth apiculate.
2. E. maculatum.
3. E. Rydbergi.
4. E. purpureum.
5. E. trifoliatum.
*** Leaves opposite (rarely in 3 's), or the uppermost alternate.

+ Involucral bracts imbricated in 2 or more series, the outer shorter.
I. Leaves, at least the lower, slender-petioled. 6. $E$. serotinum.

2. Leaves all sessile, short-petioled or connate-perfoliate.
a. Leaves not clasping nor connate-perfoliate.
\& Leaves narrowed at the base.

Bracts of the involucre acute or cuspidate.
Leaves linear-lanceolate, sparingly toothed, $4-12 \mathrm{~mm}$. wide. 7. E. leucolepis.
Leaves oblong or lanceolate, coarsely toothed, $\mathrm{x}-4 \mathrm{~cm}$. wide. 8. E. album.
Bracts of the involucre obtuse. Leaves linear, crowded, usually entire, obtuse.

Leaves lanceolate, oval or oblong, usually serrate.
Leaves linear-lanceolate, acute, dentate.
Leaves oblong to oval, sharply serrate, obtusish or acute.
Leaves lanceolate, sparingly dentate, long-acuminate. § § Leaves rounded, obtuse or truncate at the base.

1o. E.Torreyanum.
11. E. semiserratum. 12. E. altissimum. 13. E. sessilifolium.

Plant glabrous; leaves lanceolate, long-acuminate.
9. E. hyssopifolium.
Leaves linear-lanceolate, acute, dentate.
Leaves oblong to oval, sharply serrate, obtusish or acute. II. E. Torreyanum.
Leaves lanceolate, sparingly dentate, long-acuminate. I2. E. Eattissimutum.
\& \& Leaves rounded, obtuse or truncate at the base.
Plant glabrous; leaves lanceolate, long-acuminate.
Plants pubescent, leaves ovate or oblong, acute or obtuse.

Leaves ovate-oblong, to lanceolate, mostly rounded at the base, usually obtuse.
14. $E$. verbenaefolium.

Leaves broadly ovate, crenate-dentate, mostly truncate at the base, obtusish.
15. E. rotundifolium.

Leaves ovate, dentate, acute. 16. E. pubescens. b. Leaves clasping or connate-perfoliate at the base.

Leaves connate-perfoliate; involucral bracts acute. 17. E. perfoliatum.
Leaves merely clasping; involucral bracts obtuse. 18. E. resinosum. $\dagger \dagger$ Involucral bracts in 1 or 2 series, all equal or nearly so. Receptacle flat; flowers white.

Leaves thin, $5-12 \mathrm{~cm}$. long, sharply dentate, acuminate. 19. E. ageratoides. Leaves thickish, $2 \sim 5 \mathrm{~cm}$. long, blunt-toothed, acute or obtusish.

Receptacle conic ; flowers blue or violet.
20. E. aromaticum.
I. Eupatorium capillifòlium (Lam.) Small. Dog-fennel. Hog-weed. (I. F. f. $3^{613}$.) Erect, paniculately much branched, with the aspect of an Artemisia, the stem finely pubescent, $1-3 \mathrm{~m}$. high. Leaves crowded, glabrous or nearly so, alternate, the lower petioled, the upper sessile; heads very numerous, about 3 mm . high, short-peduncled, racemose-paniculate, $3-6$-flowered; bracts of the involucre in about 2 series, linear, cuspidate, narrowly scarious-margined, glabrous; flowers greenish white. In fields, Va. to Fla. Also in the W. Ind. Sept.
2. Eupatorium maculàtum L. Spotted Joe-pye Weed. (I. F. f. 36i4.) Scabrous or pubescent, $6-18 \mathrm{dm}$. high. Stem usually striate, often rough and spotted with purple; leaves thick, ovate or ovate-lanceolate, coarsely dentate, verticillate in 3's-5's, or the upper ones opposite; peduncles and outer scales of the involucre pubescent; flowers pink or purple. In moist soil, N. Y. to Ky., Minn., Br. Col., Kans. and N. Mex. Aug.-Sept.

Eupatorium maculàtum amoènum (Pursh) Britton. Leaves opposite, or in 3's or 4's, ovate or oblong ; heads smaller, fewer ; plant low. In dryer places, Va. to N. Y. and Me.
3. Eupatorium Rýdbergi Britton, n. sp. Rydberg's Joe-pye Weed. Stem tall, pubescent, often densely so, at least above. Leaves verticillate in 3 's 5 's, rather slender-petioled, lanceolate, serrate, acuminate at the apex, narrowed at the base, scabrous above, finely densely pubescent and reticulate-veined beneath, I-I. 5 dm. long, $2-3.5 \mathrm{~cm}$. wide; inflorescence depressed or subpyramidal; outer bracts of the cylindric involucre pubescent; flowers pink or purple. In moist soil. Iowa to Neb. and Colo. Type Rydberg, No. 1682, from South Fork of Dismal River, Neb. July-Sept.
4. Eupatorium purpùreum L. Joe-pye or Trumpet-ween. (I. F. f. 3615 .) Glabrous or sparingly pubescent, $\mathbf{r}-3 \mathrm{~cm}$. high. Stem green or purple, usually smooth; leaves thin, verticillate in 3 's-6's, ovate, oval, or ovate-lanceolate, petioled, acuminate, serrate, sometimes incised, $1-3 \mathrm{dm}$. long, $3-7 \mathrm{~cm}$. wide; heads numerous; involucre cylindric, its bracts pink, oblong, obtuse, imbricated in 4 or 5 series, the outer shorter: flowers pink or purple, occasionally white. In moist soil, N. B. to Man., Fla. and Tex. Aug.-Sept.

Eupatorium purpùreum falcatum (Michx.) Britton. Leaves narrower, linear-lanceolate, or linear-oblong, $12-30 \mathrm{~mm}$. wide. With the type.
5. Eupatorium trifoliàtum L. Crenate-leaten Jof-pye Weed. Stem tall, stout, often purple, glabrous, or very nearly so. Leaves rather firm, lancoolate to oblong-lanceolate, verticillate, acute or acuminate at the apex, 1.5-2 dm. long, smooth and glabrous on both sides or very nearly so, crenate ; inflorescence ample,
its branches puberulent; bracts of the cylindric involucre all obtuse, the outer short, puberulent. In moist soil, N. Y. and N. J. to eastern Tenn. and Wis. July-Sept.
6. Eupatorium serótinum Michx. Late-flowering Thoroughwort. (I. F. f. 3616.) Much-branched, finely and densely pubescent, or glabrate below, 12-25 dm. high. Leaves lanceolate or ovate-lanceolate, acuminate, sharply serrate, $7-15 \mathrm{~cm}$. long, $1-5 \mathrm{~cm}$. wide, 5 -nerved at the base, the lower opposite, the upper alternate; heads very numerous, the inflorescence broadly cymose; heads 7-15-flowered, 4-6 mm. high; involucre campanulate, its bracts pubescent, linearoblong, obtuse or truncate; flowers white. In moist soil, Md. to Fla., Iowa, Kans. and Tex. Sept.-Nov.
7. Eupatorium leucólepis T. \& G. White-bracted Thoroughwort. Justice-weed. (I. F. f. 36I7.) Slender, puberulent, branched above, 3-6 dm. high. Leaves linear, oblong or oblong-lanceolate, glaucous green, rough, thick, blunt-pointed, sparingly serrate, or the upper entire, $3-7 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide, obscurely 3 -nerved; inflorescence cymose-paniculate; heads $6-8 \mathrm{~mm}$. high, about 5 -flowered; bracts of the narrow involucre white, lanceolate, densely canescent, the outer shorter; flowers white. In moist places, pine barrens of N. J. to Fla., Ga. and La. Aug.-Sept.
8. Eupatorium álbum L. White Thoroughwort. (I. F. f. 36I8.) Pubescent with spreading hairs, branched above, 3-9 dm. high. Leaves obtuse, obtusish or the upper acute at the apex, $3-10 \mathrm{~cm}$. long, $\mathrm{I}-2.5 \mathrm{~cm}$. wide, rather thick, minutely scabrous above, more or less pubescent beneath; inflorescence cy-mose-paniculate; heads numerous, 8 -10 mm. long, $5-7$-flowered; involucre narrow, its bracts bright white, linear, cuspidate, the outer short and usually pubescent, the inner much longer, glabrous and shining; flowers white. In sandy soil, L. I. to Fla., west to La. Aug.-Sept.

Eupatorium àlbum subvenòsum A. Gray. Leaves $2-5 \mathrm{~cm}$. long, acute, less coarsely serrate, prominently 3 -nerved at the base; bracts of the involucre greenish. Eastern L. I. and N. J.
9. Eupatorium hyssopifòlium L. Hyssop-Leaved Thoroughwort. Jus-TICE-WEED. (I. F. f. 3619.) Roughish-puberulent, densely corymbosely branched above, bushy, $3-6 \mathrm{dm}$. high. Leaves opposite, and fascicled in the axils, $\mathbf{I}-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, firm, narrowed at the base, margins usually revolute; inflorescence densely cymose-paniculate; heads 6-8 mm. long, about 5 -flowered; involucre campanulate, its bracts linear or linear-oblong, sometimes apiculate, puberulent; flowers white. In dry fields, Mass. to Fla. and Tex. Aug.-Sept. A plant from the coast of Maryland with very narrow leaves, closely approaches Eupatorium lecheaefolium Greene, from Florida.
10. Eupatorium Torreyànum Short. Torrey's Thoroughwort. (I. F. f. 3620.) Rootstock tuberous-thickened; stem usually densely puberulent, mostly branched above, 4-9 dm. high. Leaves commonly with short leafy branches in their axils, often drooping, acute, $2-7 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide, usually distinctly 3 -nerved, the upper and those of the branches much smaller, linear, entire; heads about 6 mm . high, generally 5 -flowered; bracts of the campanulate involucre linearoblong, pubescent, or puberulent; flowers white. In dry soil, Penn. to N. Car., Ky., Fla. and Tex. July-Sept.
ir. Eupatorium semiserràtum DC. Small-flowered Thoroughwort. (I. F. f. 3621.) Pubescent or puberulent, loosely branched above, 6-9 dm. high. Leaves rather thin, short-petioled, narrowed at the base, $5-10 \mathrm{~cm}$. long, $10-25 \mathrm{~mm}$. wide, 3 -nerved, usually with short branches in their axils; heads $4-6 \mathrm{~mm}$. high, about 5 -flowered; involucre campanulate, its bracts linear-oblong, canescent; flowers white. In dry soil, Va. to Fla., Tex. and Ark. Aug.-Sept.
12. Eupatorium altíssimum L. Tali. Thoroughwort. (I. F. f. 3622.) Densely and finely pubescent, corymbosely much-branched above, 12-25 dm. high. Leaves tapering below into a short petiole, roughish, rather thick, some of them entire, strongly 3 -ribbed, $5-12 \mathrm{~cm}$. long, $10-25 \mathrm{~mm}$. wide; heads about 5 -flowered, $6-8 \mathrm{~mm}$. high; involucre campanulate, its bracts oblong, densely pubescent; fliwers white. In dry open. places, Penn. to N. Car., Ala., S. Dak., Neb. and Tex. Sept.-Oct.

I3. Eupatorium sessilifòlium L. Upland or Bastard Boneset. (I. F. f. 3623) Glabrous throughout, or pubescent above, branched near the summit,

6-18 dm. high. Leaves closely sessile, thin, sharply serrate, $7-15 \mathrm{~cm}$. long, I- 3 mm . wide; heads $8-10 \mathrm{~mm}$. high, about 5 -flowered; involucre campanulate, its bracts linear-oblong, the inner obtuse, the outer acutish; flowers white. In dry woods, Mass. to Penn., Ill. and Ala. Aug.-Oct.

Eupatorium sessilifolium Brittoniànum Porter. Leaves ovate or oblong-ovate, sparingly and finely serrate, firm, rounded at the base, acute, the upper $2-5 \mathrm{~cm}$. long, $12-18 \mathrm{~mm}$. wide, pinnately veined, dark green; cymes dense, their branches puberulent. Budd's Lake, N. J.
14. Eupatorium verbenaefòlium Michx. Rough or Vervain Thoroughwort. (I. F. f. 3624.) Rough-pubescent, slender, 9-25 dm. high, branched at the summit. Leaves obtuse or blunt-pointed, rounded at the base, more or less crenate-dentate, $5-10 \mathrm{~cm}$. long, $\mathbf{I}-2.5 \mathrm{~cm}$. wide, the upper pairs distant and small; heads 5 -flowered, about 6 mm . high; involucre campanulate, its bracts linearlanceolate, acute, densely pubescent; flowers white. In moist soil, Mass. to Penn., south to Fla. and La. July-Sept.

Eupatorium verbenaefolium Saùndersii Porter. Leaves of the stem lanceolate or lance-ovate, acuminate, not rounded at the base, strongly incised-dentate, with the teeth mostly acute ; those of the inflorescence smaller and entire. Collected in a sphagnumbog near Willow Grove, Montgomery Co., Penn., by Mr. C. F. Saunders, for whom it is named, and later in Tinicum, Delaware Co., by Mr. B. H. Smith.
15. Eupatorium rotundifòlium L. Round-leaved Thoroughwort. Wild Hoarhound. (I. F. f. 3625.) Rough-pubescent, branched at the summit, 3-6 dm. high. Leaves broadly ovate, often as wide as long, acutish or obtuse, truncate to subcordate at the base, coarsely dentate-crenate, $2-5 \mathrm{~cm}$. long, ascending; heads about 5 -flowered, $4-6 \mathrm{~cm}$. high; involucre campanulate, its bracts linear-oblong, acute, densely pubescent; flowers white. In dry soil, southern N. Y. to Fla., Ky. and Tex. July-Sept.
16. Eupatorium pubéscens Muhl. Hairy Thoroughwort. (I. F. f. 3626.) Puberulent or pubescent, branched above, usually taller than the preceding species. Leaves often wice as long as wide, rounded or truncate at the base, coarsely dentate with anate or acutish teeth, or the lower incised-dentate; heads $5-8$-flowered, 4-6 mm. high; involucre campanulate, its linear-oblong bracts in 2 or 3 series, the outer shorter; flowers white. In dry soil, N. H. and Mass. to Penn., W. Va. and Fla, July-Sept.

I7. Eupatorium perfoliàtum L. Common Thoroughwort. Boneset. Indian Sage. (I. F.f. 3627 .) Pubescent, stout, branched above, $6-15 \mathrm{dm}$. high. Leaves opposite, or rarely in 3's, divaricate, lanceolate, long-acuminate with a slender apex, finely crenate-serrate, rugose and pubescent beneath, $\mathbf{r}-2 \mathrm{dm}$. long, $2-4 \mathrm{~cm}$. wide; heads crowded, IO-16-flowered, $4^{-6} \mathrm{~mm}$. high; involucre campanulate, its bracts lanceolate, pubescent; flowers white, rarely blue. In wet places, N. B. to Man., Fla., Neb. and Tex. July-Sept.

Eupatorium perfoliàtum truncatum (Muhl.) A. Gray. Leaves separated and truncate, or somewhat rounded at the base. Occasional with the type.

Eupatorium perfoliatum cuneatum (Engelm.) A. Gray. With leaves smaller, narrowed and separated at the base, occurring in Ark. and Mo., is regarded by collectors as a hybrid with $E$. serotinum.
18. Eupatorium resinòsum Torr. Rfsin Boneset. (I. F. f. 362S.) Slender, resinous-pubescent, 6-9 dm. high, branched at the summit, the inflorescence comparatively small, $7-10 \mathrm{~cm}$. broad. Leaves closely sessile, clasping, or slightly connate-perfoliate at the base, linear-lanceolate, long-acuminate, sharply serrate, $7-15 \mathrm{~cm}$. long, 6-12 mm. wide, roughish above, canescent beneath; heads $10-15-$ flowered; involucre campanulate, about 4 mm . high. its bracts oblong; flowers white. In wet places, pine-barrens of N. J. Aug.-Sept.
19. Eupatorium ageratoides L. f. White Snake-root. White Sanicle. (I. F. f. 3629.) Glabrous or nearly so, much branched, 3-12 dm. high. Leaves opposite, thin, rounded, truncate or cordate at the base or abruptly narrowed into the slender petiole, coarsely dentate or crenate, $2-7 \mathrm{~cm}$. wide, 3 -nerved and reiny; inflorescence rather loose, ample; heads ro-30-flowered; involucre narrowly campanulate, about 4 mm . high; its bracts linear, acute or acuminate. In rich woods, N. B. to Ga., Ont., S. Dak., Neb., the Ind. Terr. and La. July-Nov.

20 Eupatorium aromàticum L. Smaller White Snake-root. (I. F. f. 3630.) Puberulent or glabrate, slender, branched at the summit, 3-7 dm. high. Leaves opposite, petioled, firm, obtuse or acutish at the apex, rounded, cordate or sometimes narrowed at the base, crenate-dentate, $4-7 \mathrm{~cm}$. long, $18-35 \mathrm{~mm}$. wide, 3 -nerved and veiny; petioles $4-16 \mathrm{~mm}$. long; inflorescence usually compact; heads Io- 25 -flowered; involucre campanulate, $3-4 \mathrm{~mm}$. high, its bracts linear, generally obtuse; flowers white. In dry soil, Mass. to Fla. Aug.-Oct.
21. Eupatorium coelestinum L. Mist-flower. (I. F. f. 363I). Pubescent or puberulent, branched, 3-9 dm. high. Leaves opposite, petioled, ovate, obtuse or acute at the apex, truncate at the base, or abruptly contracted into the petiole, crenate-dentate, $4-7 \mathrm{~cm}$. long, $18-35 \mathrm{~mm}$. wide; heads $4-6 \mathrm{~mm}$. high; involucre broadly campanulate, its bracts linear-lanceolate, acuminate; flowers blue or violet. In moist soil, N. J. to Fla., Ill., Kans., Ark. and Tex. Also in Cuba. Aug.-Oct.

## 5. WILLUGBAEYA Neck.

Herbaceous twining vines, or some tropical species shrubs, with opposite, petioled leaves, and discoid, mostly cymose-paniculate heads of white or pink flowers. Heads 4 -flowered. Involucre oblong, of 4 slightly unequal narrow bracts. Receptacle small, naked. Corolla regular, its tube slender, the limb campanulate, 5 -cleft. Anthers entire and obtuse at the base. Style-branches elongated, acutish. Achenes truncate, 5 -angled. Pappus of numerous capillary roughish bristles in I or 2 series. [Probably named in honor of Francis Willoughby, 1635-1672, Eng. lish naturalist, but the name spelled by Necker as above.] About 150 species, of Am. Besides the following another occurs in the southern U. S.
I. Willugbaeya scándens (L.) Kuntze. Climbing Hempueed or Boneset. (I. F. f. 3632.) Glabrous or nearly so, $1.5-4.5 \mathrm{~m}$. long. Leaves ovate or hastate, deeply cordate, acuminate, repand or obtusely dentate, $5-10 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide; petioles slender, shorter than the blades; heads in compound clusters borne at the ends of the branches; involucre about 6 cm . long. its bracts lanceolate, acuminate or apiculate; flowers white or pink; achenes resinous. In swamps and moist soil, N. H. and Mass. to western Ont. and Ind., Fla. and Tex. Also in the W. Ind. and S. Am. July-Sept.

## 6. COLEOSANTHUS Cass.

Herbs or shrubs, with discoid heads of white, yellowish or pink flowers, in panicles or cymes, or rarely solitary. Involucre campanulate or oblong, its bracts striate, imbricated in several series, the exterior ones successively smaller. Receptacle naked. Corolla regular, 5 -lobed. Anthers obtuse at the base. Stylebranches long, obtuse. Achenes Io-striate or Io-ribbed. Pappus a single row of numerous rough or serrate bristles. [Greek, sheath-flower.] About 60 species. Besides the following some 40 others occur in the southern and western U. S.
I. Coleosanthus grandiflòrus (Hook.) Kuntze. Large-flowered Thoroughwort. (I. F. f. 3633.) Erect, glabrous or puberulent, much branched, 6-9 dm. high. Leaves slender-petioled, deltoid-ovate, cordate at the base, acuminate at the apex, coarsely crenate-dentate, $5-10 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide; heads short-peduncled, $\mathbf{1 2 - 1 4} \mathrm{mm}$. long; peduncles pubescent; involucre campanulate, 30-45-flowered, the outer bracts ovate, pubescent, usually abruptly acuminate or subulate-tipped, the inner linear, glabrous, striate. Mont. to Mo., Kans., N. Mex. to Ore. and Ariz. Aug.-Sept.

## 7. KÙ̀HNIA L.

Perennial herbs, with alternate punctate resinous-dotted leaves, and discoid heads of white or purplish flowers in terminal cymose corymbs. Involucre turbi-nate-campanulate, its bracts striate, imbricated in several series, the outer shorter. Corolla regular, the tube slender, the limb 5-lobed. Anthers obtuse and entire at the base, nearly or quite separate. Style-branches slender, obtusish. Achenes Io striate. Pappus a single row of numerous very plumose bristles. [Named for Dr. Adam Kuhn, of Philadelphia, a pupil of Linnæus.] About 8 species, of N. Am, and Mex.

Puberulent; leaves sparingly dentate, or entire; heads loosely clustered, $8-10 \mathrm{~mm}$. high. I. $K$. eupatorioides. Pubescent or tomentulose; leaves sharply serrate; heads densely clustered, $12-16 \mathrm{~mm}$. high.

1. Kuhnia eupatorioides L. False Boneset. (I. F. f. 3634.) Erect, puberulent and resinous, 3-9 dm. high, branched above. Leaves lanceolate or linear-lanceolate, acute or obtusish at the apex, narrowed at the base, the upper sessile, the lower usually short-petioled; heads several or numerous, peduncled, $8-10 \mathrm{~mm}$. high; outer bracts of the involucre lanceolate or ovate-lanceolate, acuminate, the inner much longer, linear, cuspidate; pappus tawny, or sometimes nearly white. In dry soil, N. J. to Ga., Ohio, W. Va. and Tex. Aug.-Sept.
2. Kuhnia glutinòsa Ell. Prairie False Boneset. (I. F. f. 3635.) Stouter and often taller than the preceding species, corymbosely or paniculately branched, somewhat viscid. Leaves all sessile, lanceolate to ovate-lanceolate, usually sharply serrate with distinct teeth, veiny, $3-7 \mathrm{~cm}$. long, $6-20 \mathrm{~mm}$. wide; or those of the branches linear-lanceolate and entire; heads numerous, $12-16 \mathrm{~mm}$. high, their peduncles mostly short; inner bracts of the involucre lanceolate, acuminate; pappus tawny or brown. In dry soil, Ill. to S. Dak., Ala. and Tex. Aug.-Oct.

## 8. LACINÀRIA Hill.

Erect perennial herbs, usually from a globular tuber, simple or little branched, with alternate entire narrow I-5-nerved leaves, and spicate or racemose discoid heads of rose purple or white flowers. Involucre oblong, ovoid or subhemispheric, its bracts imbricated in several series, the outer shorter. Receptacle flat, or slightly convex, naked. Corolla regular, its tube slender, its limb 5-lobed or 5-cleft. Anthers obtuse at the base. Style branches elongated, obtuse or flattened at the apex. Achenes io-ribbed, slender, tapering to the base. Pappus of 1 or 2 series of slender barbellate or plumose bristles. [Latin, fringed, from the appearance of the heads.] About 25 species of eastern and central N. Am.

## * Bracts of the involucre acute, acuminate or mucronate.

Involucre cylindric, or turbinate, $15-60$-flowered, its base rounded.

Bracts with lanceolate spreading rigid tips.
Bracts mucronate, closely appressed.
Involucre oblong, or narrowly campanulate, 3-6-flowered.
Inner bracts with prolonged petaloid tips.
Bracts all acute, mucronate or acuminate.
Bracts appressed; pappus-bristles very plumose.
Leaves 2-4 mm. wide: spike usually leafy below.
Leaves less than 2 mm . wide; spike mostly naked.
Tips of the bracts spreading; pappus-bristles barbellate.

1. L. squarrosa.
2. L. cylindracea.
3. L. elegans.
4. L. punctata.
5. L. acidota.
6. L. picnostachya.
** Bracts of the involucre rounded, obtuse, or acutish in No. II.
Bracts of the involucre very obtuse.
Involucre hemispheric, $10-25 \mathrm{~mm}$. broad, $15-45$-flowered; heads peduncled.
Involucre oblong, $4^{-8} \mathrm{~mm}$. broad, $5^{-15}$-flowered.
Involucre rounded at base; bracts usually not punctate; heads mostly sessile.
Spike elongated, not very dense, often 3 dm . long. 8. L. spicata.
Spike short, exceedingly dense.
7. L. Kansana.

Involucre narrowed at base; bracts usually very punctate; heads peduncled.
10. L. graminifolia.

Bracts of the involucre acutish, punctate; involucre oblong-campanulate.
11. L. Smalliti.
x. Lacinaria squarròsa (L.) Hill. Scaly Bhazing: Stak. (I. F. f. 30;6.) Usually stout, 2-6 dm. high, pubescent or glabrous. Leaves narrowly linear, rigid, sparingly punctate, $7-15 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide; heads sessile or shortpeduncled, usually few, or sometimes solitary, $2-+\mathrm{cm}$. long. $\$-15 \mathrm{~mm}$. thick; bracts of the involucre imbricated in 5-7 series, lanceolate, rigid, acuminate, slabrous or pubescent; flowers bright purple; pappus very plumose. In dry soil, western Ont. to Ky.. Fla., S. Dak., Neb. and Tex. June-Sept.

Lacinaria squarròsa intermèdia (Lindl.) Porter. Heads narrower; tips of the bracts less spreading. With the type,
2. Lacinaria cylindràcea (Michx.) Kuntze. Cylindric Blazing Stan. (I. F. f. 3637.) Glabrous or nearly so, stout, 3-5 dm. high, sometimes branched above. Leaves narrowly linear, rigid, scarcely punctate, $7-17 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide; heads several or numerous, peduncled, or the lower sessile, turbinate-cylindric, $\mathbf{I}-2.5 \mathrm{~cm}$. high, $8-\mathbf{1 2} \mathrm{mm}$. thick; bracts of the involucre imbricated in 5 or 6 series, broadly oval, abruptly acuminate at the apex; flowers purple; pappus very plumose. In dry soil, western Ont. to Minn. south to Ill. and Mo. July-Sept.
3. Lacinaria élegans (Walt.) Kuntze. Handsome Blazing Star. (I. F. f. 3638.) Densely and finely pubescent, rarely glabrate, 6-9 dm. high. Leaves linear, very punctate, $3-12 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, the upper much smaller than the lower and soon reflexed; heads $4-5$-flowered, $12-14 \mathrm{~mm}$. high, narrowly campanulate, very numerous in a dense spike or raceme; bracts of the involucre in 2 or 3 series, the inner ones linear, with rose-colored petaloid or sometimes white tips; pappus very plumose; flowers purple. In dry soil, Va. to Fla., Ala. and Tex. Aug.-Oct.
4. Lacinaria punctàta (Hook.) Kuntze. Dotted Button-Snakeroot. (I. F. f. $3^{639}$.) Glabrous, or sparingly pubescent, 1.5-7.5 dm. high; rootstock stout, branching, or globose. Leaves linear, rigid, very punctate, $5^{-15} \mathrm{~cm}$. long, about 2 mm . wide, or the lower 4 mm ., the upper gradually shorter, all erect or ascending; heads 3 - 6 -flowered, $12-16 \mathrm{~mm}$. long, sessile, crowded into a dense spike; spike commonly leafy below; involucral bracts oblong, cuspidate or acuminate, often ciliate on the margins, imbricated in 4 or 5 series; flowers purple. In dry soil, Minn. and Manitoba to Mont., Mo., Tex., N. Mex. and Sonora. Aug.-Oct.
5. Lacinaria acidòta (Engelm. \& Gray) Kuntze. Slender Button-snakeROOT. (I.F.f. 3640.) Similar to the preceding species, but usually glabrous throughout. Stem 6 dm . high, or less, slender. Leaves narrowly linear, $.5-\mathrm{Imm}$. wide, or the lower wider, slightly punctate, $2-10 \mathrm{~cm}$. long, the upper gradually shorter; spike slender, naked, or sparingly leafy at the base; heads 3 -flowered, $\mathbf{1 2 - 1 8} \mathbf{~ m m}$. long; involucre narrowly oblong-campanulate, its bracts oblong to ovate-lanceolate, more or less punctate, abruptly or gradually acuminate, glabrous or sparingly ciliate; flowers purple. Prairies, Kans. and Mo. to Tex. Aug.-Oct.
6. Lacinaria pycnostàchya (Michx.) Kuntze. Prairie or Hairy ButtonSNAKEROOT. (I. F. f. 364I.) Hirsute-pubescent above, usually glabrous below, $6-15 \mathrm{dm}$. high, very leafy. Lower leaves linear-lanceolate, narrowed below the middle into a slender margined petiole, acumirate at the apex, often 3 dm . long and I mm . wide, the upper much smaller, linear-subulate, rigid, punctate; heads $8-12$ mm . long, 3-6-flowered; involucre oblong or cylindric, its bracts oblong, pubescent and ciliate, with acute, slightly spreading, colored tips; flowers purple. On prairies, 1ll. and Minn. to Neb., Ky., La., and Tex. Aug.-Sept.
7. Lacinaria scariòsa (L.) Hill. Large Button-snakeroot. (I. F. f. 3642 .) Finely pubescent, at least above, 3-18 dm. high. Lower leaves oblanceolate, spatulate or oblong-lanceolate, narrowed into a margined petiole, often 3 dm . long and 4 cm . wide; upper leaves linear or linear-lanceolate, much smaller, all densely punctate; heads hemispheric, on stout peduncles $4-50 \mathrm{~mm}$. long, or sometimes sessile; bracts of the involucre imbricated in 5 or 6 series, spatulate-linear, oblanceolate or obovate, their tips dry and scarious, often colored; flowers bluish purple; pappus barbellate. In dry soil, Me. to Fla., Ont., Manitoba, Neb. and Tex. AugSept.

Lacinaria scariòsa squarrulòsa (Michx.) Small. Heads smaller, $10-14 \mathrm{~mm}$. broad, turbinate-hemispheric. Dry woods, Va. to Fla. and Tex. Perhaps a distinct species.
8. Lacinaria spicàta (L.) Kuntze. Dense Button-snakeroot. Gay Feather. Devil's Bit. (I. F. f. 3643.) Glabrous or nearly so, 6-18 dm. high. Lower leaves linear-lanceolate or linear-oblong, usually blunt-pointed, sometimes 3 dm . long and 1 cm . wide, the upper linear or even subulate, somewhat or obscurely punctate: spike generally dense, I-4 dm. long; bracts appressed, oblong, obtuse and scarious-margined at the apex, imbricated in 4-6 series; flowers blue-purple, occasionally white. In moist soil, Mass. to Fla., Ont., S. Dak., Ky., La. and Ark. Aug.-Oct.

Lacinaria spicàta pùmila (Lodd.) Porter. Low, stout, 3-6 dm. high, Lower leaves broader and shorter, obtuse; spike shorter; heads larger,
9. Lacinaria Kansàna Britton, n. sp. Kansas Button-snakeroo't. Very leafy, glabrous, about 6 dm . high. Base of the stem clothed with the fibrous remnants of old leaves, as in L. spicata; leaves similar to those of that species, linear, blunt-tipped; heads confluent into a very dense spike $5-7 \mathrm{~cm}$. long, about 2.5 cm . thick, with numerous undeveloped ones in the axils of linear-subulate bracts below; bracts of the oblong involucre oblong to oblong-spatulate, purple, rounded or obtuse; pappus plumose. Dodge City, Kansas, on river bottoms, B. B. Smyth, No. 163, I890.
10. Lacinaria graminifòlia (Walt.) Kuntze. Loose-flowered ButtonSNAKEROOT. (I. F. f. 3644.) Glabrous, or sparingly pubescent, 3-9 dm. high. Leaves similar to those of the two preceding species, but more conspicuously punctate, usually somewhat ciliate near the base and acute or acutish at the apex; bracts distinctly punctate, appressed, rounded and scarcely margined at the apex, thick; flowers purple; pappus barbellate ; achenes hairy. In dry soil, Va. to Fla. and Ga. Aug.-Sept.

Lacinaria graminifòlia pilòsa (Ait.) Britton. Leaves usually prominently ciliate; heads larger, spicate, racemose, or even paniculate; bracts of the involucre linear-oblong or spatulate, narrowly scarious-margined. In sandy soil, N. J. to Fla. and Ala.
II. Lacinaria Smallii Britton, n. sp. Small's Button-snakeroot. Similar to L. graminifolia. Stem very slender, 3-5 dm. high. Leaves scattered, linear, 4-10 mm . wide, acute, pubescent on the midvein beneath, very punctate; heads scattered, sessile in the axils of the upper small leaves, the uppermost leaves not larger than the involucral bracts; involucre oblong-campanulate, about 8 -flowered, about I cm. high, its innermost bracts linear, acute or acutish, the outermost obtusish, all punctate; flowers purple; pappus short-plumose. Iron Mountain, Smyth Co., Va., at 2900 ft., J. K. Small, Aug. 8, 1892.

## 9. TRÍLISA Cass.

Erect perennial herbs, with fibrous roots and alternate simple leaves; those of the stem sessile or clasping, the basal ones narrowed into petioles. Heads small, discoid, of 5-10 purple or white flowers, in terminal thyrsoid or corymbose panicles Involucre campanulate, its bracts imbricated in 2 or 3 series, the outer scarcely shorter than the inner. Receptacle flat, naked. Corolla regular, its limb 5-lobed. Anthers obtuse and entire át the base. Achenes nearly terete, Io-ribbed. Stylebranches slender, obtuse. Pappus of $\mathbf{I}$ or 2 series of elongated, barbed bristles. [Anagram of Liatris.] Two known species.

Stem glabrous; heads corymbose-paniculate.
Stem viscid-pubescent ; heads thyrsoid-paniculate.

1. T. odoratissima.
2. T. paniculata.

## r. Trilisa odoratíssima (Walt.) Cass. Vanilla-leaf. Vanilla-plant.

 (I. F. f. 3645.) Rather stout, glabrous, 6-9 dm. high. Leaves thick, entire, or sometimes dentate, the lower oblanceolate, oblong or spatulate, obtuse, $10-25 \mathrm{~cm}$. long, $2.5-3.5 \mathrm{~cm}$. wide, those of the stem gradually smaller, oblong, ovate, or oval. the uppermost bract-like; heads corymbose-paniculate, about 6 mm . high; bracts of the involucre oblong, obtusish; achenes glandular-pubescent. In pine-barrens, Va. to Fla. and La. Aug.-Sept.2. Trilisa paniculàta (Walt.) Cass. Hairy Trilisa. (I. F. f. 36q6.) Stem viscid-pubescent, 3-9 dm. high. Leaves entire, the basal ones lanceolate or narrowly oblong, acute, or obtusish, $7-25 \mathrm{~cm}$. long, $\mathbf{I}-3.5 \mathrm{~cm}$. wide, those of the stem much smaller, lanceolate, or oblong-lanceolate; heads thyrsoid-paniculate, about 6 mm . high; bracts of the involucre oblong, obtusish; achenes finely pubescent. In pine-barrens, Va. to Fla. and Ga. Sept.-Oct.

## io. GUTIERREZZIA Lag.

Erect branching, usually glabrous and often glutinous herbs, or shrubs, with linear entire alternate leaves, and small heads of both tubular and radiate yellow flowers, corymbosely paniculate in our species. Radiate flowers few, pistillate. Disk-flowers regular, mostly perfect, or some of them only staminate, the corollalimb 5 -lobed. Involucre ovoid or narrowly campanulate. its bracts coriacoous, imbricated in few series, Receptacle flat, convex, or conic, commonly foveolate.

Anthers obtuse and entire at the base. Style-branches narrow, flattened, their appendages slender. Achenes terete, ribbed, or 5 -angled. Pappus of several scales, those of the ray-flowers shorter than or equalling those of the disk. [Named from Gutierrez, a noble Spanish family.] About 20 species of western N. Am., Mex. and western S. Am. Besides the following some io others occur in the southwestern U. S.
I. Gutierrezia Saròthrae (Pursh) Britt. and Rusby. Gutierrezia. (I. F. f. 3647.) Glabrous or minutely pubescent, bushy, I-6 dm. high, the branches rigid, ascending. Leaves linear, $\mathbf{I}-3.5 \mathrm{~cm}$. long, $\mathbf{I}-2 \mathrm{~mm}$. wide, acute; heads oblong, $3-4 \mathrm{~mm}$. high, few-flowered, usually in clusters of $2-5$ at the ends of the numerous branches; rays $1-6$, scarcely 2 mm . long; scales of the pappus linear-oblong, subulate or acuminate; achenes pubescent. In dry or rocky soil, Minn. and Manitoba to western Neb., Tex. and Sonora, west to Nev., Ariz. and Cal. Aug.-Sept.

## ir. AMPHIÁCHYRIS DC.

Erect, much branched, glabrous herbs, with small alternate entire leaves, and very numerous small heads of both tubular and radiate yellow flowers, solitary or clustered at the ends of the branches. Involucre ovoid or hemispheric, its bracts coriaceous, imbricated in few series. Receptacle naked. Ray-flowers pistillate. Disk-flowers perfect, but sterile, or staminate. Pappus of the ray-flowers obsolete or coroniform, that of the disk-flowers of 5-20 subulate scales or bristles somewhat united at the base. Achenes pubescent. [Greek, chaff-around.] Two known species, natives of the south-central U. S.
I. Amphiachyris dracunculoides (DC.) Nutt. Amphiachyris. (I. F. f. 3648.) Annual, slender, much branched, $15-45 \mathrm{~cm}$. high, the branches ascending. Leaves linear, $12-35 \mathrm{~mm}$. long, $2-4 \mathrm{~mm}$. wide, acutish, the uppermost almost filiform; heads solitary at the ends of short branches, 10-30-flowered, about 4 mm . high; involucre hemispheric, its bracts oval, obtuse; rays $5-10$, about as long as the involucre; disk-flowers mostly staminate, their ovaries abortive, their pappus of $5^{-8}$ subulate aristate scales, united into a short cup at the base. In dry soil, Mo. and Kans. to Tex. ; adventive at Easton, Penn. Sept.-Oct.

## 12. GRINDELIA Willd.

Perennial or biennial herbs, sometimes woody at thę base, with alternate sessile or clasping leaves, usually spinulose-dentate, and rather large heads of both discoid and radiate yellow flowers, solitary at the ends of the branches (rays rarely wanting). Involucre hemispheric or depressed, its bracts imbricated in several or many series, usually subulate-tipped. Receptacle flat or convex, naked, foveolate. Rayflowers fertile. Disk-flowers perfect, or sometimes only staminate. Anthers obtuse and entire at the base. Style-branches narrow, flattened, their appendages linear or lanceolate. Achenes short, thick, sometimes compressed, glabrous, 4-5-ribbed. Pappus of 2-8 soon deciduous awns or bristles. [Named for Prof. H. Grindel, of Riga, $1776-1836$.] About 25 species, natives of western N. Am., Peru and Chili. Besides the following, some 15 others occur in western N. Am.
Leaves spatulate to oblong, obtuse or obtusish; achenes truncate. r. G. squarrosa.
Leaves linear or linear-oblong, acute; achenes 2-toothed.
2. G. lanceolata.
I. Grindelia squarròsa (Pursh) Dunal. Broad-leaved Gum-plant. (I. F. f. 3649.) Glabrous, erect or ascending, 2-6 dm. high. Leapes oblong or oblong-spatulate, obtuse, more or less clasping at the base, sharply dentate, sometimes laciniate, $\mathbf{I}-3.5 \mathrm{~cm}$. long, $6-\mathbf{I} 2 \mathrm{~mm}$. wide; heads very glutinous; bracts of the involucre linear-lanceolate, subulate-tipped, strongly squarrose; achenes truncate, those of the outer flowers usually thicker than those of the inner; pappus of 2 or 3 awns. In dry soil, Ill. and Minn. to Manitoba, south to Mo., Tex., Nev. and Mex. Adventive in southern N. J. June-Sept.

Grindelia squarròsa nùda (Wood) A. Gray. Rays wanting. Mo. and westward with the type.
3. Grindelia lanceolàta Nutt. Narrow-leaved Gum-plant. (I. F. f. 3650.) Slender, erect, glabrous, about 6 dm . high. Leaves lanceolate or linear, acute at the apex, sessile or clasping at the base, spinulose-dentate, laciniate, or
the upper entire, $2-5 \mathrm{~cm}$. long, 4-10 mm. wide; bracts of the involucre linearsubulate, the inner erect, the outer spreading; pappus of I or 2 awns. In dry soil, Tenn. to Kans., La. and Tex. July-Sept.

## 13. HETEROTHECA Cass.

Erect, hirsute or pubescent herbs, with alternate, mostly dentate leaves, and rather large heads of both discoid and radiate yellow flowers, generally solitary at the ends of the branches. Involucre hemispheric or broadly campanulate, its bracts imbricated in several series, the outer shorter. Receptacle flat, alveolate. Ray-flowers pistillate. Disk-flowers perfect, or some of them only staminate. Style-branches flat, their appendages lanceolate or triangular. Achenes pubescent, obtuse, those of the ray-flowers thick, those of the disk-flowers flattened. Pappus of the ray-flowers obsolete or of a few caducous bristles, that of the disk-flowers of an inner row of numerous capillary rough bristles, and an outer row of shorter stouter bristles or scales. [Greek, different-case, from the dissimilar achenes.] Five or 6 species of the southern U. S. and Mex.

1. Heterotheca subaxillàris (Lam.) Britt. \& Rusby. Heterotheca. (I. F. f. 365 I.) Biennial or sometimes annual, 3-9 dm. high. Basal and lower leaves petioled, ovate or oblong, $5-7 \mathrm{~cm}$. long, the upper ones oblong, sessile or clasping, smaller, all acutish or obtuse, dentate; heads rather numerous, 12-18 mm . broad; involucre nearly hemispheric, $6-10 \mathrm{~mm}$. high, its bracts linear, or slightly dilated above, the inner with scarious margins; rays 10-25; inner bristles of the pappus of the disk-flowers about 4 mm . long. In dry soil, Del. to Fla., La., Kans., Ariz. and Mex. July-Sept.

## 14. CHRYSÓPSIS Nutt.

Perennial herbs, with alternate sessile entire leaves, or the basal ones dentate, and large many-flowered heads of both tubular and radiate yeilow flowers (rays wanting in some western species), loosely corymbose, or solitary at the ends of the branches. Involucre campanulate to hemispheric, its bracts narrow, imbricated in several series, the outer shorter. Receptacle usually flat, foveolate. Ray-flowers pistillate. Disk-flowers mostly all perfect. Pappus double in both the disk-and ray-flowers, the inner of numerous rough capillary bristles, the outer of smaller or minute scales or bristles. Achenes flattened, oblong-linear or obovate. Stylebranches narrow, somewhat flattened, their appendages linear or subulate. [Greek, of golden aspect.] About 20 species, of N. Am. and Mex. Besides the following, about 8 others occur in the southern and western U.S.

Leaves elongated-linear, parallel-veined; achenes linear: involucre campanulate
Plant 3-9 dm. high, silvery-pubescent; leaves grass-like, $7-30 \mathrm{~cm}$. long.

1. C. graminifolia.

Plant $1-2.5 \mathrm{dm}$. high, woolly-pubescent; leaves rigid, 2-10 cm . long.
2. C. falcata.

Leaves oblong, lanceolate, or linear, pinnately veined; achenes obovate, or oral ; involucre hemispheric.

Plant densely woolly-pubescent. 3. C. pilosa.
Plants hirsute, or villous-pubescent.
Heads numerous, corymbose-paniculate; eastern species. 4. C. Mariana.
Heads fewer, corymbose, or terminating the branches; western species. Villous-pubescent; leaves oblanceolate, oblong, or lanceolate.

Leaves acute.
Leaves obtuse.
Hirsute-pubescent.
Leaves linear, acutish, short. 7. C. stenephyl/a.
Leaves spatulate, obtuse.
Pilose-pubescent: leaves oblong-lanceolate,
5. C. camporum.
6. C. zillosa.
8. C. hispidid.
9. C. Nuittallii.

1. Chrysopsis graminifòlia (Michx.) Nutt. GR ISs-t.enten (Gothf: Astar. (I. F. f. 3652.) Slender, corrmbosely branched above 1 eaves 3 - 5 -nerved, shin ing, the basal ones $7-30 \mathrm{~cm}$. long, +10 mm . Wite, the upper much smaller, amd the uppermost subulate and erect: heads several or numerous, about cm . broal. solitary at the ends of the branches; involuce campanulate; its bracts gharate; achenes linear-fusiform. In dry soil, Del. to Fla., (Ohio and Tex. Aug--(Oct.
2. Chrysopsis falcàta (Pursh) Ell. Sickle-Leayed Golden Aster. (I.F. f. 3653.) Corymbosely branched above, rather stiff, leafy to the top. Leaves linear, rigid, spreading, sometimes slightly curved, $2-6 \mathrm{~mm}$. wide, obscurely parallel-nerved; heads rather few, 6-10 mm . broad, terminating the branches; involucre campanulate, its bracts slightly pubescent; achenes linear. In sandy soil, eastern Mass. to N. J. July-Aug.
3. Chrysopsis pilosa (Walt.) Britton. Cotrony Golden Aster. (I. F. f. 3654.) Stout, 3-6 dm. high, branched above. Leaves spatulate or oblong, obtuse, the lower and basal ones $2-7 \mathrm{~cm}$. long, 6-10 mm. wide, the uppermost much smaller; heads usually about 2 cm . broad, terminating the branches, bright yellow: involucre hemispheric, its bracts densely pubescent when young. becoming glabrate; achenes obovate. In pine-barrens, Va. to Fla. and Ala. Autumn.
4. Chrysopsis Mariàna (L.) Nutt. Maryland Goldes Aster. (I. F. f. 3655.) Stout, 3-7 dm. high, loosely villous-pubescent with silky hairs when your.g. at length nearly glabrous. Upper leaves oblong or lanceolate, acutish or obtuse, sessile, $2-5 \mathrm{~cm}$. long, the lower oblanceolate or spatulate and narrowed into a petiole, generally obtuse, $5-10 \mathrm{~cm}$. long and sometimes 25 mm . wide; heads commonly numerous, $18-25 \mathrm{~mm}$. broad, on glandular peduncles; involucre hemispheric, its bracts glandular, acute, viscid-pubescent; achenes obovate. In dry soil, southern N. Y. and Penn. to Fla. and La. Aug.-Sept.
5. Chrysopsis campòrum Greene. Prairie Golden Aster. (I. F. f. 3656.) Stem erect, 3-7 dm. high, leafy up to the inflorescence. Leaves lanceolate to ob-long-lanceolate, entire, or with a few low distant teeth, acute, sessile, or the lower narrowed into petioles, appressed-pubescent with short hairs, ciliate, at least near the base, $2-7 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide; heads $25-35 \mathrm{~mm}$. broad, showy; involucre nearly hemispheric, $I \mathrm{~cm}$. high, its bracts lanceolate, acuminate, pubescent; outer pappus-bristles subulate. On prairies, Ill. and Ky. to Mo. July-Sept.
6. Chrysopsis villòsa (Pursh) Nutt. Hairy Goldes Aster. (I. F. f. 3657.) Stem villous or strigose-pubescent, 3-6 dm. high. Leaves oblong, lanceolate, or oblanceolate, obtuse, $2-5 \mathrm{~cm}$. long, 4 -Io mm . wide, the upper sessile, the lowernarrowed into a petiole, pale, persistently canescent with appressed hairs; heads rather few, 25 mm . broad or more; involucre hemispheric, 8 -Io mm . high, its bracts linear-subulate, pubescent and often ciliate; achenes obovate. In dry soil, Minn. and Ill. to Ala., Manitoba, Br. Col. and Neb. July-Aug.
7. Chrysopsis stenophýlla (A. Gray) Greene. Stiff-Leaved Golden AsTER. (I. F. f. 3658.) Low, slender, $15-25 \mathrm{~cm}$. high. Leaves linear or slightly broadened above, densely canescent and ciliate, acutish, $2-3 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, the margins revolute in drying; involucre hemispheric or broadly campanulate, its bracts pubescent or the outer densely ciliate; heads few, $12-20 \mathrm{~mm}$. broad. In dry soil, Neb. to Ark. and Tex. Aug.-Sept.
8. Chrysopsis híspida (Hook.) Nutt. Hispid Golden Aster. (I. F. f. 3659.) Lower than C. villosa, stem rarely over 3 dm . high, with spreading hirsute or hispid pubescence. Leaves spatulate to oblong, entire, spreading, $18-35 \mathrm{~mm}$. long, obtuse at the apex, narrowed at the base, often into petioles half as long as the blade or more; heads smaller, often more numerous; involucre not over 8 mm . high, its bracts lanceolate, hirsute. In dry soil, Manitoba to Idaho, Kans. and Tex. July-Sept.
9. Chrysopsis Nuttàllii Britton. Nuttall's Golden Aster. (I. F f. 3660.) Pilose-pubescent with soft hairs and minutely glandular, $3^{-6} \mathrm{dm}$. high, branched above. Leaves oblong-lanceolate, mostly acute, $2.5-6 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide, entire, or the lower serrate or even incised; heads few, $15-25 \mathrm{~mm}$. broad, terminating the branches; involucre hemispheric, its bracts glandular-viscid; achenes obovate. In dry soil, Kans. to La., Ark. and Tex. July-Sept.
10. CHONDRÓPHORA Raf.

Perennial stiff herbs, with alternate entire leaves, and corymbose-paniculate discoid heads of yellow flowers. Involucre oblong or campanulate, its bracts rigid and glutinous, imbricated in several series. Receptacle flat. generally foveolate, naked. Corolla regular, tubular, the limb 5 -cleft. Anthers obtuse at the base. Style-branches flattened, their appendages lanceolate. Achenes oblong,
somewhat compressed, $\mathbf{1 - 2}$-ribbed on each side. Pappus of $\mathbf{1}$ or 2 series of numerous capillary unequal bristles. [Greek, cartilage-bearing.] One, or perhaps two species, of eastern N. Am.
I. Chondrophora nudàta (Michx.) Britton. Rayless Goldenrod. (I. F.f. 3661.) Glabrous, erect, simple, 3-7 dm. high. Lower and basal leaves spatulate, obtuse, or obtusish, $7-15 \mathrm{~cm}$. long, 6-12 mm . wide, attenuate into a margined petiole; stem leaves distant, small, linear or subulate; heads numerous, 4-6 mm. high, crowded in a compound terminal corymbose cyme; involucre narrowly campanulate, acute at the base, its bracts coriaceous, appressed, linear-oblong, imbricated in 3 or 4 series, the outer much smaller than the inner. In moist pine-barrens, N. J. to Fla. and Tex. Aug.-Oct.

Chondrophora nudàta virgàta (Nutt.) Britton. Lower leaves linear, shorter, or the basal ones linear-spatulate. Perhaps specifically distinct. With the type, southward, not certainly known north of N. Car.

## 16. CHRYSOTHÁMNUS Nutt.

Low shrubs, with equably leafy branches, hard wood, linear leaves, and discoid heads of yellow perfect flowers. Heads narrow, 5-7-flowered. Involucre oblong to narrowly campanulate, its bracts more or less keeled, thin, or papery, imbricated in several series, often so as to form 5 vertical rows. Corolla 5 -toothed. Anthers obtuse at the base. Style-branches exserted, their appendages subulate to filiform. Achenes narrow, mostly pubescent. Pappus of copious capillary roughened bristles. [Greek, golden-bush.] About 25 species, of western N. Am.

Heads about 12 mm . high; involucral bracts obtuse or mucronulate. Heads $14-20 \mathrm{~mm}$. high; involucral bracts_subulate-tipped.

1. C. nauseosus.
2. C. Howardi.
3. Chrysothamnus nauseòsus (Pursh) Britton. Fetid Rayless GoldenROD. (I. F. f. 3662.) Densely white-tomentose, at least when young, much branched, very leafy, $3-12 \mathrm{dm}$. high, odorous. Leaves linear, or slightly spatulate, $2-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide; heads $10-15 \mathrm{~mm}$. high, very numerous and crowded in terminal compound corymbose cymes; rays none; involucre narrowly campanulate, acute at the base, its bracts oblong or linear-oblong, acutish, puberulent, imbricated in about 4 series; achenes linear; pappus-bristles soft, copious. In sterile soil, N. W. Terr. to Neb., N. Mex., Br. Col. and S. Cal. Aug.-Oct.
4. Chrysothamnus Hówardi (Parry) Greene. Howard's Rayless Goldenrod. (I. F. f. 3663.) Densely white-tomentose when young, glabrous or nearly so when old, tufted, much branched, r.5-2.5 dm. high. Leaves narrowly linear, entire, $2-5 \mathrm{~cm}$. long, about 2 mm . wide; heads narrow, 5 -flowered, more or less glomerate, usually surpassed by the upper leaves; involucre slightly pubescent, or glabrous, its bracts lanceolate, thin, acuminate or subulate-tipped; achenes nearly linear, pubescent. In dry soil, western Neb., Colo. and Utah to N. Mex. July-Sept.

## 17. OONÓPSIS Greene.

Perennial herbs, the following species glabrous, mostly tufted, with woody ronts, the stems leafy to the top. Leaves entire, linear to lanceolate. Heads cymose at the end of the stem or branches. Involucre campanulate to ovoid, its bracts flat, imbricated in several series, herbaceous, cuspidate, appressed and erect, or the outer spreading. Disk-flowers with a nearly cylindric 5 -toothed corolla. Stamens and style included or scarcely exserted. Ray-flowers present or wanting. pistillate. Style-appendages ovate to subulate. Achenes glabrous, or somewhat pubescent. Pappus-bristles coarse, rigid. [Greek, resembling an egg, referring to the ovoid involucre.] Four known species, natives of central N. Am.
I. Oonopsis Engelmanni (A. Gray) Greene. ExiklamiN's Oonopsls. (I. F. f. 3664.) Perennial by a deep woody root, glabous throughout: stems stiff. about 2 dm . high, densely leafy. Leaves narrowly linear, sessile, 18 - 35 mm . long. less than 2 mm . wide, brittle when dry; heads chustered, or sometmes solitary at the ends of the branches, about 1 cm . wide, sessile among the upper leaves; involucre oblong-campanulate, its bracts in about + serics, oblong to spatulate, shortacuminate or mucronate, appressed; ray-flowers none; whenes linear oblong, narrowed at the base, many-striate. Western Kans. and Neb. Sept.-()ct.

## 18. PRIONÓPSIS Nutt.

A glabrous annual or biennial herb, leafy to the top, with sessile spinulosedentate leaves, and large heads of yellow radiate and tubular flowers. Involucre broadly hemispheric, its bracts imbricated in several series, lanceolate, acuminate, the outer more or less spreading. Receptacle naked. Disk-flowers perfect, their corollas 5 -toothed. Ray-flowers very numerous, pistillate. Achenes glabrous, those of the ray-flowers broader than those of the disk; pappus of a few deciduous rigid unequal bristles, the outer very short. [Greek, resembling a saw, referring to the leaf-margins.] A monotypic genus.
I. Prionopsis ciliata Nutt. Prionopsis. (I. F. f. 3665.) Stem erect, stout, branched, very leafy, $6-15 \mathrm{dm}$. high. Leaves sessile, oval or the lower obovate, obtuse, conspicuously veined, $2-7 \mathrm{~cm}$. long, $\mathrm{I}-3 \mathrm{~mm}$. wide, sharply serrate with bristle-pointed teeth; heads few, clustered, stalked or nearly sessile, $25-35 \mathrm{~mm}$. broad; involucre depressed-hemispheric, its bracts glabrous; achenes of the rayflowers ellipsoid, those of the disk-flowers oblong, the central sterile; pappus-bristles rigid, the inner ones rough or ciliate. On hillsides and river-banks, Mo. and Kans. to Tex. Aug.-Sept.

## 19. SIDERÀNTHUS Fraser.

[Eriocarpum Nutt.]
Herbs or shrubs with alternate spinulose-dentate or lobed leaves and manyflowered heads of tubular or of both tubular and radiate yellow flowers (heads rarely without rays). Involucre hemispheric to campanulate, its bracts imbricated in several series, the outer ones gradually smaller. Receptacle flat or convex, gen . erally foveolate, naked. Ray-flowers fertile. Disk-flowers usually perfect. Anthers obtuse and entire at the base. Style-branches flattened, their appendages short, lanceolate. Achenes oblong or obovoid, obtuse, white-tomentose, or canescent, usually 8 -Io-nerved, Pappus of I-3 series of numerous capillary persistent more or less unequal bristles. [Greek, iron-flower.] About 15 species, of America. Besides the following, about II others occur in the western U. S.

Rays none; leaves dentate.
Rays present.
Leaves dentate; annual.
Leaves pinnatifid; perennial. Tomentose-canescent. Glabrous or slightly puberulent.

1. S. grindelioides.
2. S. rubiginosus.
3. S. spinulosus.
4. S. glaberrimus.
I. Sideranthus grindelioides (Nutt.) Britton. Rayless Sideranthus. (I. F. f. 3666.) Perennial by a deep woody root, finely pubescent; stems tufted, simple, erect, I-3 dm. high. Leaves oblong-lanceolate to spatulate, sessile, or the lower petioled, $\mathbf{I}-\mathbf{2 . 5} \mathrm{cm}$. long, firm, spinulose-dentate; heads terminating the stem or branches; involucre campanulate, its bracts linear, acute, puberulent, their tips somewhat spreading, the outer shorter than the inner; achenes densely silky tomentose. In dry soil, N. W. Terr. to S. Dak., Neb., Utah and Arịz. July-Aug. [Eriocarpum grindelioides Nutt.]
5. Sideranthus rubiginòsus (T. \& G.) Britton. Viscid Sideranthus. (I. F. f. 3667 .) Viscid, glandular-pubescent, erect, annual, branched near the summit, 3-9 dm. high. Leaves sessile, or the lowest narrowed into short petioles, oblong, lanceolate, or oblanceolate, conspicuously dentate with distant awn-pointed teeth, $3-6 \mathrm{~cm}$. long, 4-12 mm . wide; heads several, cymose-paniculate, $16-30 \mathrm{~mm}$. broad; involucre hemispheric, its bracts linear-subulate with spreading tips; pap-pus-bristles rigid, very unequal; achenes villous-canescent, turbinate, not compressed. Neb. and Colo. to Tex. Autumn.
6. Sideranthus spinulòsus (Nutt.) Sweet. Cut-Leaved Sideranthus. (I. F. f. 3668.) Canescent, much branched at the base, perennial from thick woody roots, $1-4 \mathrm{dm}$. high. Leaves pinnatifid, sessile, linear to ovate in outline, $1-3.5 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, the lobes with bristle-pointed teeth; heads several or numerous (rarely solitary), $12-25 \mathrm{~mm}$. broad; involucre hemispheric, its bracts linear, acute, appressed; achenes pubescent, narrowed below; pappus soft and capillary. In dry soil, N. W. Terr. to Neb. and Tex., Mont., Ariz. and Mex. March-Sept.
7. Sideranthus glabérrimus Rydb. Northern Sideranthus. Very similar to the preceding species, but wholly glabrous, or a little puberulent, wholly destitute of tomentum. S. Dak. to Wyo., Kans. and Oklahoma.
8. STENÒTUS Nutt.

Low undershrubs, with coriaceous narrow entire evergreen leaves, scapose or leafy stems, and rather large heads of both radiate and tubular yellow flowers. Involucre mostly hemispheric, its bracts imbricated in several series, appressed, ovate to lanceolate. Receptacle alveolate. Disk-flowers perfect, their corollas tubular, usually somewhat enlarged upward, deeply 5 -toothed. Ray-flowers fertile. Anthers obtuse at the base. Appendages of the style-branches short, lanceolate. Achenes white-villous. Pappus of soft white capillary bristles. [Greek, narrow, referring to the leaves.] About 20 species, natives of western N. Am.
I. Stenotus armerioldes Nutt. Narrow-Leaved Stenotus. (I. F. f. 3669.) Perennial, tufted from a branched woody caudex, glabrous throughout; flowering stems slender, naked above, or quite leafless, $1-2 \mathrm{dm}$. high. Basal leaves numerous, narrowly spatulate or linear, acute or acutish, firm, $2-7 \mathrm{~cm}$. long, 2-4 mm . wide, entire, narrowed below; stem leaves usually $\mathbf{I}-3$, sessile, linear, sometimes none; head commonly solitary, about 2.5 cm . broad; involucre campanulate, $8-12 \mathrm{~mm}$. high, its bracts broadly oval, green, appressed, obtuse or retuse, scari-ous-margined, rays 8 -Io. In dry, mostly rocky soil, western Neb. to Wyo., Utah and N. Mex. June-July.
21. ISOPÁPPUST. \& G.

Rough-hairy annual or biennial herbs, loosely paniculately branched, with alternate linear to lanceolate I-nerved entire or somewhat toothed leaves, and small slender peduncled heads of radiate and tubular yellow flowers. Involucre cam-panulate-cylindric, its appressed lanceolate or subulate bracts in 2 or 3 series. Receptacle alveolate. Ray-flowers 5-12, pistillate. Disk-flowers 10-20, perfect. Anthers not sagittate. Style-appendages narrow, hirsute. Achenes terete, narrowed below, silky-villous. Pappus a single series of rough capillary bristles, nearly equal in length. [Greek, equal pappus.] Two known species, of the southern U. S.
I. Isopappus divaricàtus (Nutt.) T. \& G. Isopappus. (I. F. f. 3670.) Annual or biennial, erect, paniculately much branched, slender, rough-pubescent or glandular, 3-9 dm. high. Leaves linear, linear-lanceolate, or the lowest linearspatulate, acute or cuspidate, dentate with distant teeth, or sometimes entire, 2-7 cm . long, $2-6 \mathrm{~mm}$. wide, the uppermost much smaller, subulate or bractlike; heads numerous, $6-10 \mathrm{~mm}$. broad; involucre campanulate, its bracts linearlanceolate, subulate-tipped, pubescent. In dry soil, Kan. to Tex. east to Ga. and Fla. Aug.-Oct.

## 22. SOLIDÀGO L.

Perennial erect herbs, sometimes woody at the base, simple, or little branched, with alternate simple, toothed or entire leaves, and small heads of both tubular and radiate yellow or rarely white flowers, in terminal or axillary panicles, thyrsi, or cymose-corymbose or capitate clusters. Involucre oblong or narrowly campanulate, its bracts imbricated in several series, the outer successively shorter. Receptacle small, flat, or somewhat convex, generally alveolate. Ray-flowers in one series, pistillate. Disk flowers mostly all perfect, their corollas tubular or narrowly campanulate, 5 -cleft or 5 -lobed. Anthers obtuse and entire at the base. Stylebranches flattened, their appendages lanceolate. Achenes terete or angled, usually ribbed. Pappus of numerous capillary rough nearly equal bristles in I or 2 series. [Greek, to make whole.] About 100 species, mostly of N. Am., several in Europe, a few in Mex. and S. Am.

## A. Tips of the involucral bracts, or some of them spreading or recurved.

Leaves glabrous or glabrate, $\mathrm{x}-2.5 \mathrm{dm}$. long.

1. S. squarrosa.

Leaves rough-ciliate, $2-8 \mathrm{~cm}$. long.
Leaves green.
2. S. petiolaris.

Leaves silvery.
3. S. Wardi.

## B. Tips of the involucral bracts all erect and appressed.

* Heads in axillary clusters, or also in a terminal spike-like, sometimes branched thyrsus.

1. Heads $4^{-6} \mathrm{~mm}$. high, chiefly in axillary clusters; achenes pubescent.

Stem and branches terete; leaves lanceolate to oblong. Stem and branches grooved or angled.

Leaves broadly oval, contracted into margined petioles.
Leaves lanceolate, sessile.
4. S. caesia.
5. S. flexicaulis.
6. S. Curtisii.
2. Heads $4^{-6} \mathrm{~mm}$. high, chiefly in a terminal spike-like thyrsus; achenes glabrous, or nearly so.

Rays white; stem pubescent.
Rays yellow; stem densely pubescent.
Rays yellow; stem glabrous, or sparingly pubescent.
Leaves thick, not acuminate, dentate, or the upper entire.
Leaves thin, acuminate, sharply serrate.
10. S. monticola
3. Heads $10-12 \mathrm{~mm}$. high; bracts elongated, acute; leaves ovate.
II. S. macrophylla.

* Heads in a terminal simple or branched thyrsus, not at all secund on its branches, or scarcely so.

1. Bracts of the involucre acute or acutish.

Plants not glutinous.
High northern; leaves spatulate, glabrous.
44. S. multiradiata.

Eastern; stem minutely puberulent or glabrous; heads 5-6 mm. high.
12. S. puberula.

Western; stem and leaves scabrous or rough-pubescent. Involucre and upper leaves glutinous.
13. S. Lindheimeriana.
14. $S$. Randiz.
2. Bracts of the involucre obtuse (or the inner acutish in No. 15.)
a. Upper leaves abruptly smaller than the lower, appressed. 15. S. stricta.
b. Leaves gradually smaller upward, spreading or ascending.
$\dagger$ Lower leaves large, oblong, or oval, acute or obtusish.
$\ddagger$ At least the lowest leaves dentate; plants $6-18 \mathrm{dm}$. high.
Lower leaves oblong-lanceolate; branches of the thyrsus appressed.
16. S. uliginosa.

Lower leaves ovate or broadly oval; branches of the thyrsus ascending.
17. S. speciosa.
$\ddagger \ddagger$ Leaves lanceolate or oblong-lanceolate, entire, $2-12 \mathrm{~cm}$. long. 18. S. rigidiuscula. $\dagger+$ Basal leaves narrowly spatulate. 19. S. Purshii.
$\dagger \dagger+$ Basal leaves obovate, oblanceolate, or broadly spatulate.
Plant 7-30 cm. high, on alpine summits; stem angular. 20. S. alpestris. Plant 3-9 dm. high, not alpine; heads $6-8 \mathrm{~mm}$. high. 21. S. Virgaurea.

*     * Heads in a terminal, usually large panicle, secund on its spreading or recurved branches.
$\ddagger$ Plant maritime; leaves thick, fleshy, entire. 22. S. sempervirens.
$\ddagger \ddagger$ Plants not maritime; leaves not fleshy.

1. Leaves pinnately veined, not triple-nerved.
a. Leaves all entire, thin and glabrous. 23. S. odora.
(b) Leaves, at least the lower, more or less dentate or serrate.
$\dagger$ Leaves linear or linear-oblong, 2.5-5 cm. long, scabrous. 24. S. tortifolia.
$\dagger+L e a v e s ~ b r o a d e r, ~ l a n c e o l a t e$, oblong, or ovate, 5-25 cm. long. $\ddagger$ Stem densely pubescent; leaves more or less so.
Leaves rugose-veiny beneath, sharply serrate. 25. S. rugosa.
Leaves not rugose, sparingly dentate or entire.
2. S. fistulosa.
$\ddagger \ddagger$ Stem glabrous, or puberulent, or pubescent only above.
Leaves very scabrous on the upper surface, serrulate.
3. S. patula.

Leaves smooth, or minutely roughened on the upper surface (pubescent in forms of No. 33.).

Racemes few, widely divergent, very slender.

Lower leaves oblong, coarsely serrate.
Lower leaves ovate or lanceolate, rather finely serrate.
Racemes numerous, spreading, recurved or ascending.
Leaves all oblong or oblong-lanceolate, sessile.
At least the lower leaves petioled, lanceolate or ovate-lanceolate.
Leaves firm, ovate-lanceolate or oblong-lanceolate; heads about 4 mm . high; racemes short; rays several.
31. S. neglecta.

Leaves firm, narrowly lanceolate; heads about 4 mm . high: racemes few, short; rays $1-3$.
Leaves firm, lanceolate or oval-lanceolate; heads $3-4 \mathrm{~mm}$. high; racemes numerous, slender. 33. S. juncea.
Leaves thin, the lower broadly ovate, short-acuminate; heads 5-7 mm. high; racemes numerous.
34. S. arguta.
2. Leaves triple-nerved, i.e., with a pair of lateral veins stronger than the others, these often obscure in No. 41 .
Stem glabrous; bracts of the involucre obtuse.
Leaves and bracts of the involucre thin.
Leaves linear-lanceolate, entire or sparingly serrate.
35. S. rupestris.

Leaves lanceolate, sharply serrate. 36. S. serotina.
Leaves and bracts of the involucre thick, somewhat rigid.
Leaves linear-lanceolate or lanceolate; achenes glabrous.
37. S. Missouriensis.

Leaves oblong-lanceolate; achenes silky-pubescent.
38. S. Shortii.

Basal leaves oblanceolate; upper bract-like. 39. S. Gattingeri. Stem pubescent or scabrous.

Leaves lanceolate, sharply serrate or entire, rough above.
40. S. Canadensis.

Leaves oblanceolate, spatulate, oblong or ovate; the lower crenate.
Minutely rough-pubescent, grayish; lower leaves oblanceolate; heads 4 mm . high.

4I. S. nemoralis.
Canescent and pale ; leaves oblong, or ovate; heads 6 mm . high.
42. S. mollis.

Very scabrous, green, not grayish, nor canescent. 43. S. radula.
Leaves broadly ovate-oval, sharply serrate, finely pubescent.
44. S. Drummondii.
**** Heads in a terminal, corymbiform, sometimes thyrsoid cyme, forming a flattopped inflorescence.
Leaves ovate, oblong or oval, very rough on both sides. 45. S. rigida.
Leaves lanceolate, linear, oblong, or oblanceolate, glabrous or nearly so.
Leaves, at least the lower, oblanceolate; high northern. 46. S. multiradiata.
Leaves not oblanceolate nor spatulate.
Lower leaves oblong-lanceolate, serrulate. 47. S. Ohioensis.
Leaves all lanceolate or linear, entire.
Stout ; leaves lanceolate, the basal $2-3 \mathrm{dm}$. long. 48. S. Riddellii.
Slender; leaves linear, the basal $10-12 \mathrm{~cm}$. long. 49. S. Houghtoni.
I. Solidago squarròsa Muhl. Stout Ragged Goldenrod. (I. F. f. 367 I.) Stem stout, simple, or rarely branched above, glabrous or puberulent, 6-15 dm. high. Upper leaves oblong, acute, entire or nearly so, sessile; lower and basal leaves obovate, oval, or broadly spatulate, acute or obtuse, sharply dentate, often narrowed into a margined petiole; heads $15-25$-flowered, 8 -10 mm. high, numerous in a terminal narrow often leafy thyrsus sometimes 3 dm . in length; rays io- 15 , showy, $4^{-6} \mathrm{~mm}$. long; tips of the involucral bracts green, acute or obtuse, all usually strongly recurved; achenes glabrous. In rocky soil, N. B. and Ont. south to Va. and Ohio. Aug.-Oct.
2. Solidago petiolàris Ait. Downy Ragged Goldenrod. (I. F. f. 3672 .) Stem rather slender, pubescent or puberulent, 3-9 dm. high, simple or branched above. Leaves sessile, or very short-petioled, oblong to oval, acute, obtuse or mucronate, entire or dentate, $1-7 \mathrm{~cm}$. long, rough or ciliate on the margins; heads $6-8 \mathrm{~mm}$. high, in a terminal narrow more or less compound thyrsus; involucral bracts with green acute to acuminate tips, the outer spreading, the inner appressed; achenes glabrous or nearly so. In dry soil, Ill. to Kans. and Tex., east to N. Car. and Fla. Sept.-Oct.
3. Solidago Wàrdii Britton, n. sp. Ward's Goldenron. Stem puberulent. 4-9 dm. high. Leaves lanceolate to ovate-lanceolate, entire or with a few teeth, rather firm, 5-9 cm. long, pale and silvery shining on both sides, or only above, the margins ciliate; thyrsus I-2 dm. long. sometimes quite leafy; heads short-peduncled, about 8 mm . high, the bracts linear-lanceolate to linear-oblong. acute. distinctly squarrose. canescent; rays large, bright yellow. Mo. and Kans. to Ark. and Ind. Terr. Sept.Oct. Type collected by L. F. Ward, in Clark Co.. Kans., Oct. 2, ISo7.
4. Solidago caèsia L. Blue-stemmed or Wreath Goldenrod. Woodland Goldenrod. (I. F. f. 3673 .) Stem glabrous, slender, often glaucous, usually
bluish or purple, branched or simple, $3^{-9}$ dm. high. Leaves sesile bluish or purple, branched or simple, 3-9 dm. high. Leaves sessile, acuminate at the apex, narrowed at the base, glabrous, sharply serrate; $5-12 \mathrm{~cm}$. long, $6-30$ mm . wide; heads $4-6 \mathrm{~mm}$. high, in axillary clusters or raccmes, or occasionally with some in a short terminal thyrsus; bracts of the involucre obtuse; achenes
pubescent. In woods and thickets, Me. and Ont. to Minn., Fla., Ark. and Tex. Aug.-Oct.

Solidago caèsia axillàris (Pursh) A. Gray. Heads few, in dense short axillary clusters, much exceeded by the long thin leaves; upper leaves often entire. N. S. to Ont. and N. J.
5. Solidago flexicàulis L. Zig-Zag or Broad-leaved Goldenrod. (I. F.f. 3674.) Stem glabrous, angled, usually simple, zig-zag, 3-9 dm. high. Leaves thin, ovate, acuminate at the apex, somewhat pubescent, or glabrous beneath, sharply serrate, $5-17 \mathrm{~cm}$. long, $2-10 \mathrm{~cm}$. wide, the uppermost sometimes lanceolate and entire or nearly so; heads about 6 mm . high; bracts of the involucre obtuse to acutish; achenes hirsute-pubescent. In rich woods, N. B. to Ga., west to S. Dak. and Kans. July-Sept.
6. Solidago Curtísii T. \& G. Curtis' Goldenrod. (I. F. f. 3675.) Stem glabrous or sparingly pubescent, simple or branched, slender, 4-9 dm. high, angled and grooved. Leaves thin, sometimes broader above the middle, longacuminate, narrowed below into an entire base, sharply serrate, $7-15 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide, glabrous or nearly so; heads $4-6 \mathrm{~mm}$. high; bracts of the involucre few, obtuse. In mountain woods, Va. and W. Va. to Ga. Aug.-Sept.
7. Solidago bícolor L. White Goldenrod. Silver-Rod. (I. F. f. 3676 .) Stem rather stout, hirsute-pubescent, or nearly glabrous, I.5-12 dm. high, simple or branched. Basal and luwer leaves obovate or broadly oblong, mostly obtuse, $5-10 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide, narrowed into long margined petioles, dentate or crenate-dentate, more or less pubescent; upper leaves smaller and narrower, oblong or sometimes lanceolate, subsessile, often entire; heads $4^{-6} \mathrm{~mm}$. high; bracts of the involucre obtuse; rays white. In dry soil, N. B. to Ga., west to Ont., Minn. and Mo. July-Sept.
8. Solidago hispida Muhl. Hairy Goldenrod. (I. F. f. 3677.) Stout, stem densely pubescent or hirsute, simple, or sometimes branched, 4-9 dm. high. Lower leaves oval, acute, or obtuse, petioled, pubescent on both sides, usually dentate, $5-12 \mathrm{dm}$. long, $2-5 \mathrm{~cm}$. wide; upper leaves oblong, sessile, acute, dentate or entire, smaller, sessile; heads about 6 mm . high, crowded; involucral bracts obtuse; achenes with a few appressed hairs, or glabrous. In dry soil, N. S. to W. Ont. and Minn., south to Penn. and Wis. Aug.-Oct.
9. Solidago erécta Pursh. Slender Goldenrod. (I. F. f. 3678.) Stem slender, 6-9 dm. high, simple or rarely branched. Leaves firm, nearly glabrous on both sides, ciliolate on the margins, the lower and basal ones broadly oblong or oval, obtuse or obtusish, crenate-dentate, the upper lanceolate or oblong-lanceolate, acute, usually quite entire; heads $4^{-6} \mathrm{~mm}$. high; bracts of the involucre obtuse. In dry soil, N. J. and Penn. to Ga. and N. Car. Reported from Minn. and S. Dak. Aug.-Sept.
10. Solidago montícola T. \& G. Mountain Goldenrod. (I. F. f. 3679.) Slender, glabrous or nearly so, 3-9 dm. high. Stem-leaves ovate-oblong, or oblonglanceolate, narrowed at the base, sharply and sparingly serrate, or the upper entire, $2-15 \mathrm{~cm}$. long. $8-35 \mathrm{~mm}$. wide. the upper sessile, the lower petioled; basal leaves broadly oblong, obtuse, with slender petioles; heads about 4 mm . high: bracts of the involucre acutish or obtuse. In mountain woods, Penn. and Md. to Ga. and Ala. July-Sept.
ir. Solidago macrophylla Pursh. Large-leaved Goldenrod. (I. F. f. 3680.) Stem glabrous or sparingly pubescent, stout. I.5-12 dm. high. Leaves thin, ovate, acuminate, or the basal ones obtuse. sharply serrate, glabrous, or sparingly pubescent beneath. $7-12 \mathrm{~cm}$. long. $2-6 \mathrm{~cm}$. wide, abruptly contracted into margined petioles, or the uppermost lanceolate, entire, sessile; heads in a terminal compact or loose thyrsus and usually also in axillary clusters; bracts of the involucre linear. acute; rays 8 -Io. linear-oblong. conspicuous; achenes glabrous or nearly so. In rocky woods, Catskill Mts., N. Y. to Lab. and Hudson Bay, west to Lake Superior. July-Sept.
12. Solidago pubérula Nutt. Downy Goldenrod. (I. F. f. 3681.) Minutely puberulent, or glabrous, usually simple, rather slender, 4-9 dm. high, leafy. Stem-leaves oblong-lanceolate. acute. sparingly serrate or entire, $3-5 \mathrm{~cm}$. long, sessile. or the lower petioled; basal leaves and sometimes the lowest ones of the stem spatulate. obtuse, sharply serrate, $5-10 \mathrm{~cm}$. long, narrowed into margined petioles;
$\therefore$ acts of the involucre subulate; achenes glabrous; heads rarely a little secund. in sandy soil, N. B. to northern N. Y., Fla. and Miss. Aug.-Sept.
13. こolidago Lindheimeriàna Scheele. Lindheimer's Goldenrod. (I. F. f. 3682.) Scabrous, simple, 4-9 dm. high, leafy, rather stout and rigid. Leaves oblong, oblong-lanceolate or oval, acute or acutish at the apex, narrowed or rounded at the base, all entire, thickish, rough on both surfaces, sessile or the lowest petioled; heads about 6 mm . high in a terminal, often short thyrsus; bracts of the involucre acute or the outer obtuse, puberulent; achenes nearly glabrous. Southern Kans. to Tex., Ariz. and northern Mex. Aug.-Nov.

Solidago Bigelòvii A. Gray, another southwestern species, which is rougher than this one, and with oval or oblong leaves obtuse or obtusish at both ends, is reported from Kans.
14. Solidago Ràndii (Porter) Britton. Rand's Goldenrod. Stem stout, often purple, glabrous, 3-7 dm. tall. Basal leaves spatulate, mostly obtuse, dentate or crenate-dentate, narrowed into margined petioles; stem-leaves spatulate to lanceolate, the upper sessile, acute, entire; inflorescence and upper leaves distinctly glutinous, adhering to paper when drying; heads about 8 mm . high; bracts of the involucre acute, or the outer obtuse. Me. to northern N. Y. [S. Virgaurea Randii Porter; S. Virgaurea Redfieldii Porter.]
15. Solidago strícta Ait. Wand-like or Willow-leaf Goldenrod. (I. F. f. 3683.) Glabrous throughout, slender, erect, simple, 6-25 dm. high. Basal and lowest stem-leaves oblong, or somewhat spatulate, with few lateral veins, obtuse, entire, or very sparingly dentate, $4-20 \mathrm{~cm}$. long, $\mathbf{I}-2.5 \mathrm{~cm}$. wide, narrowed into long petioles; upper stem-leaves narrowly oblong, spatulate or linear, the uppermost very small and bract-like; heads about 6 mm . high in a dense simple, or sometimes branched, naked thyrsus; bracts of the involucre oblong; achenes glabrous, or sparingly pubescent. In wet sandy pine-barrens, N. J. to Fla. and La. Also in Cuba. Aug.-Oct.
16. Solidago uliginòsa Nutt. Bog Goldenrod. (I. F. f. 3684.) Stem glabrous, rather stout, simple, $6-\mathbf{1} 2 \mathrm{dm}$. high. Leaves glabrous, firm, more or less ciliolate or scabrous on the margins, few-veined, acute or acuminate, the lower and basal ones $\mathbf{I O}-22 \mathrm{~cm}$. long, $\mathbf{I}-2.5 \mathrm{~cm}$. wide, more or less serrate and narrowed into petioles, the upper smaller, mostly sessile and entire; heads 4-6 mm. high; bracts of the involucre linear-oblong, oltuse; achenes glabrous. In swamps and bogs, Newf. to northern N. J. and Penn. west to W. Ont., Minn. and Wis. Aug.-Sept.

I7. Solidago speciòsa Nutt. Showy or Noble Goldenrod. (I. F. f. 3685.) Stem stout, glabrous below, often rough above, usually simple, $\mathbf{I}-2 \mathrm{~m}$. high. Leaves glabrous, firm, the basal $\mathbf{x - 2 . 5 ~ d m}$. long, $2-10 \mathrm{~cm}$. wide, dentate or crenate, pinnately veined, acute or obtuse at the apex, long-petioled; upper leaves smaller, oblong or oval, acute at each end, crenate-dentate, or entire, sessile or short-petioled, rough-margined; heads $6-8 \mathrm{~mm}$. high, in a large terminal thyrsus, the branches of which are ascending and often leafy; bracts of the involucre oblong, very obtuse; achenes glabrous or nearly so. In rich soil, N. S. to N. Car. west to Minn., Ky., Kans. and Ark. Aug.-Oct.

Solidago speciòsa pállida Porter. Leaves ovate or oblong, coriaceous, prominently veined, pale green : stems stout, tufted, $3^{-6 ~ d m}$. high, densely pubescent above. On the rocky summit of Mt. Mackay, W. Ont.
18. Solidago rigidiúscula (T. \& G.) Porter. Slender Showy Goldenrod. (I. F. f. 3686.) Stem rather slender, usually glabrous below, rough-pubescent above, simple, 6-12 dm. high. Basal leaves sometimes crenate, strongly ciliolate on the margins, $2-7 \mathrm{~cm}$. long, 6-25 mm. wide, the upper sessile, the lower sometimes narrowed into petioles; heads similar to those of the preceding species; thyrsus generally narrow, dense, simple or rarely branched. In dry soil, mostly on prairies, Ohio to Ala., S. Dak., Neb., Kans. and Tex. Aug.-Oct.
19. Solidago Púrshii Porter. River-bank Goldenrod. (I. F. f. 3687 .) Glabrous or nearly so; stems simple, usually somewhat glutinous, $1.5-4.5 \mathrm{dm}$. high. Lower and basal leaves oblanceolate, obtuse or acutish, dentate, or crenate, 5-15 cm . long, $\mathbf{x}-2.5 \mathrm{~cm}$. wide, narrowed into slightly margined petioles; stem-leaves sessile, lanceolate, oblong or linear, numerous, crenate or entire, mostly acute. smaller; heads 6-8 mm. high, in a terminal simple or branched thyrsus; bracts of
the involucre linear-oblong, obtuse, or the inner acutish; achenes striate, pubescent. On rocky river-banks, Newf. to northern N. Y., Vt. and Va. July-Sept.
20. Solidago alpéstris Wald. \& Kit. Alpine Goldenrod. (I. F. f. 3688.) Glabrous, or somewhat pubescent; stems simple, often tufted, $7-30 \mathrm{~cm}$. high, ascending, or erect, angular. Basal leaves serrate, at least above the middle, obtuse, or acute, $5-10 \mathrm{~cm}$. long, narrowed into petioles; stem-leaves oblanceolate, spatulate, or oblong, sessile, or the lower petioled, mostly distant; inflorescence a short raceme or thyrsus, with clusters of heads in the axils of the leaves; heads 6-8 mm . high; bracts of the involucre obtuse or acute; achenes pubescent. Alpine summits of the mountains of Me., N. H. and northern N. Y., mostly above timber line. Also in Europe. Aug.-Sept.
31. Solidago Virgàurea L. European Goldenrod. (I. F. f. 3689.) Somewhat pubescent, at least above; stem usually simple, rather stout, $3-6 \mathrm{dm}$. high. Basal leaves $7-12 \mathrm{~cm}$. long, 2.5 cm . wide, or less, obtuse or acute, mostly dentate, narrowed into margined petioles; stem-leaves sessile, or the lower petioled, oblong-lanceolate to spatulate, acute; heads $6-8 \mathrm{~mm}$. high, in a narrow, dense or interrupted, rarely branched thyrsus which is often 2 dm . long; bracts of the involucre obtuse or acute; achenes more or less pubescent. Me., N. H., Vt. and northern N. Y., mostly at middle altitudes. Also in Europe. Aug.-Sept.

Solidago Virgàurea Dèanei Porter. Stem only o.7-3 dm. high, often slender; thyrsus short, $5^{-10} \mathrm{~cm}$. long; heads $3^{-6} \mathrm{~mm}$. high. Mountains, Me., Vt. and N. H.

Solidago Virgàurea Gíllmani (A. Gray) Porter. Stout, $4-9 \mathrm{dm}$. high; thyrsus paniculately branched; basal leaves very large, sometimes 25 cm . long, sharply serrate. Sand hills, southern shore of Lake Superior. Perhaps not referable to this species.
22. Solidago sempérvirens L. Sea-side Goldenrod. Salt-marsh GoldENROD. (I. F. f. 3690 .) Stem stout, leafy, usually simple, 6-25 dm. high, glabrous, or slightly puberulent above. Leaves with 2-5 pairs of lateral veins, the lower and basal ones oblong, spatulate or lanceolate, mostly obtuse, sometimes 3 dm . long, narrowed into long petioles; upper leaves sessile, lanceolate to oblonglanceolate, acute; heads, $6-10 \mathrm{~mm}$. high; rays $8-10$, showy; bracts of the involucre lanceolate, acute. On salt marshes, sea beaches, along tidal rivers and in sandy soil near the sea, N. B. to Fla. and Mex. Also in Bermuda. Aug.-Dec.
23. Solidago odòra Ait. Sweet or Anise-scented Goldenrod. Blue Mountain Tea. (I. F. f. 3691.) Slender; stem simple, glabrous, or minutely pubescent above, $6-12 \mathrm{dm}$. high. Leaves punctate, anise-scented when bruised, lanceolate, quite entire, acute or acuminate, $5-10 \mathrm{~cm}$. long, $6-16 \mathrm{~mm}$. wide, sessile, or the lower ones petioled; heads $4-5 \mathrm{~mm}$. high, rays 3 or $4,4-6 \mathrm{~mm}$. long: bracts of the involucre oblong-lanceolate, acute. In dry soil, N. S. (?), Mass. to Fla., west to N. Y., Ky. and Tex. July-Sept.

Solidago odòra inodòra A. Gray. Leaves not punctate, scentless when bruised. Probably a mere form.
24. Solidago tortifòlia Ell. Twisted-leaf Goldenrod. (I. F. f. 3692.) Stem slender, rough-pubescent or puberulent, 6-9 dm. high, simple. Leaves often twisted, scabrous, sessile, acute, 2.5-5 cm. long, 3-6 mm. wide, obscurely veined but with a distinct midrib, the lower serrate, the upper entire; heads about 4 mm . high; rays $3-5$, short; bracts of the involucre linear, obtuse or obtusish. In dry sandy soil, Va. to Fla. and Tex., mostly near the coast. Autumn.
25. Solidago rugòsa Mill. Wrinkle-leaved, or Tall Hairy Goldenrod. Bitter-weed. (I. F. f. 3693.) Stem hirsute, usually stout, 3-22 dm. high, simple, or branched at the summit. Leaves rather thin, oval or oblong-lanceolate, acute or acuminate (rarely obtusish) at the apex, narrowed at the base, sharply serrate, $2-10 \mathrm{~cm}$. long, $8-35 \mathrm{~mm}$. wide, sessile, or the lowest sometimes tapering into petioles; heads 3-4 mm. high; panicle usually large and compound; bracts of the involucre linear, obtuse or obtusish. Usually in dry soil, in fields and along roadsides, Newf. to W. Ont., south to Fla. and Tex. July-Nov.
26. Solidago fistulòsa Mill. Pine-barren Goldenrod. (I. F. f. 3694.) Stem rather stout, simple, or branched above, I-2 m. high, hirsute. Leaves numerous, sessile, ovate-oblong, oblong-lanceolate, or sometimes lanceolate, thick, rough or hirsute on the margins and midrib beneath, the upper small, obtuse or obtusish, entire, the lower sparingly serrate, obtuse or acute, $3-10 \mathrm{~cm}$. long, with a
broad base; heads about 4 mm . high; rays $7-10$, small; bracts of the involucre, at least the outer, acute. In moist pine-barrens, N. J. to Fla. and La. Aug.-Oct.
27. Solidago pátula Muhl. Rough-Leaved or Spreading Goldenrod. (I. F. f. 3695.) Stem stout, rather rigid, usually simple, 6-20 dm. high, strongly angled, at least below. Leaves thick, glabrous beneath, rough above, the lower and basal ones very large, 7-40 cm. long, $4-12 \mathrm{~cm}$. wide, oval or elliptic, narrowed into margined petioles, the upper smaller, oval or oblong, sessile. acute, finely serrate, or the uppermost entire; heads $6-8 \mathrm{~mm}$. high; rays small; bracts of the involucre linear-oblong, obtuse. In swamps, Me. and Ont. to Minn., south to Ga., Mo. and Tex. Aug.-Oct.
28. Solidago ulmifòlia Muhl. Elm-leaved Goldenrod. (I. F. f. 3696.) Stem slender, 6-12 dm. high, simple, or branched above, the arched branches puberulent or pubescent. Leaves thin, oblong, acute, or acuminate at the apex and base, pinnately veined, glabrous or sparingly pubescent, the lower and basal ones $7-12 \mathrm{~cm}$. long, $2-4 \mathrm{~cm}$. wide, narrowed into margined petioles, the upper smaller, sessile; heads $4-6 \mathrm{~mm}$. high; rays small, deep yellow; bracts of the involucre oblong-lanceolate, obtusish. In woods and copses, Me. to Ga., west to Minn., Kans. and Tex. July-Sept.

29 Solidago Boòttii Hook. Bootr's Goldenrod. (I. F. f. 3697.) Stem slender, usually branched near the summit, 6-15 dm. high. Leaves firm, pinnately and finely reticulate-veined, the lower and basal ones ovate or oblong-lanceolate, narrowed into margined, sometimes ciliate petioles, acuminate at the apex, $7-15 \mathrm{~cm}$. long, the upper smaller, entire, or finely serrate, sessile; heads $4-6 \mathrm{~mm}$. high; rays few, small; bracts of the involucre linear-oblong, obtuse; achenes pubescent. In dry woods, Va. to Fla. and Tex. July-Sept.
30. Solidago Ellióttii T. \& G. Elliott's Goldenrod. (I. F. f. 3698.) Stem stout, $9-18 \mathrm{dm}$. high, simple, or branched at the inflorescence. Leaves firm, acute or acuminate, sessile by a broad base, or sometimes narrowed below, finely serrate, crenate-serrate, or the upper entire, rough on the margins, glabrous on both sides, or puberulent on the veins beneath, $3-12 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide; heads about 6 mm . high; bracts of the involucre linear-oblong, obtuse; rays $6-12$, short; achenes pubescent. In swamps, N. H. and Mass. to N. Car. and Ga., mainly near the coast. Sept.-Oct.

3I. Solidago neglécta T. \& G. Swamp Goldenrod. (I. F. f. 3699.) Stem simple, rather stout, 6-8 dm. high. Leaves firm, the basal and lower ones large, sometimes 3 dm . long, acute or obtusish, serrate or serrulate, tapering into margined petioles, rough on the margins; upper leaves smaller, lanceolate, acute, sessile, serrate or nearly entire; heads $5-6 \mathrm{~mm}$. high; rays $3-8$, small; bracts of the involucre linear-oblong, obtuse; achenes glabrous, or nearly so. In swamps, N. B. to Wis., Md. and Ill. Aug.-Sept.
32. Solidago uniligulàta (DC.) Porter. Few-rayed Goldenrod. (I. F. f. 3700.) Stem simple, slender, 4-7 dm. high. Leaves firm, lanceolate or oblonglanceolate, finely and sharply serrate, acute or acuminate, the lower long-petioled. 10-22 $\mathbf{c m}$. long, $8-18 \mathrm{~mm}$. wide, the upper sessile, the uppermost very small and erect; rays $\mathbf{I}-4$; bracts of the involucre linear-oblong, obtuse; achenes glabrous. In swamps, Me. to N. Y. and N. J. Aug.-Sept.
33. Solidago júncea Ait. Early or Sharp-toothed Goldenrod. Vellowtop. Plume Goldenrod. (I. F.f. 37oi.) Stem rigid, rather stout, simple, or branched at the inflorescence, $4 \mathbf{- 1 2 ~ d m}$. high. Leaves firm, glabrous, a cute or acuminate, serrate, serrulate, or nearly entire, the lower large, sometimes j dm. long and 5 cm . wide, long-petioled; the upper smaller, sessile; rays $7-12$, small; bracts of the involucre oblong or ovate-oblong, obtuse or acute: achenes glabrous or sparingly pubescent. In dry or rocky soil, N. B. to Hudson Bay and Manitoba. N. Car. and Mo. June-Nov.

Solidago júncea scabrélla (T. \& G.) A. Gray. Leaves rigid, scabrous, ciliate, pubescent on the upper surface or also beneath. Ind. to Wis., Ky, and Mo.

Solidago juncea ramosa Porter and Britton. Much branched at the summit, the branches slender, erect, slightly curved, the heads in short small racemes. Me. to western N. J., W. Va. and Ohio.
34. Solidago argùta Ait. Cut-meaten Gulnenron) (I. F. f. 3\%Oz.) Stem simple, rather stout, $6-12 \mathrm{dm}$. high. Leaves thin, the lower and basal ones broadly
ovate or oval, short-acuminate, $7-40 \mathrm{~cm}$. long, $2-12 \mathrm{~cm}$. wide, narrowed into margined petioles, sharply and coarsely serrate; upper leaves sessile, ovate to oblong, acute or acuminate, more or less serrate, smaller; rays $5-7$, large; bracts of the involucre oblong, obtuse; achenes glabrous or nearly so. In rich woods, Me. and Ont. to Ohio, south to Va. July-Oct.
35. Solidago rupéstris Raf. Rock Goldenrod. (I. F. f. 3703.) Stem slender, 6-9 dm. high. Leaves thin, 5-12 cm. long, 6-10 mm . wide, acuminate at the apex, narrowed at the base, sessile, or the lowest petioled, glabrous; heads small, 3 mm . high, secund on the short spreading branches of the small panicle; rays $4-6$, short; bracts of the involucre thin, linear; achenes small, nearly glabrous. Rocky banks of streams, Penn. to D. C., W. Va., Tenn. and Ind. Aug.-Sept.
36. Solidago serótina Ait. Late Goldenrod. (I. F. f. 3704.) Stem stout, 9-25 dm. high, glabrous, sometimes glaucous. Leaves thin, sessile, or the lowest petioled, glabrous on both sides but more or less rough-margined, $7-15 \mathrm{~cm}$. long, $4-25 \mathrm{~mm}$. wide, acuminate at the apex, narrowed at the base; heads $5-7 \mathrm{~mm}$. high; bracts of the involucre oblong, thin, obtuse; rays 7-15, rather large; achenes finely pubescent. In moist soil, Newf. to Br. Col., south to Ga., Tex., Nev. and Ore. Aug.-Oct.

Solidago serótina gigantèa (Ait.) A. Gray. Leaves hispid or pubescent on the lower surface, at least on its prominent veins. With the type, at least in the East.
37. Solidago Missouriénsis Nutt. Missouri Goldenrod. (I. F. f. 3705.) Stem rather slender, $9-15 \mathrm{dm}$. high. Leaves firm or thick, those of the stem sessile, acuminate at the apex, narrowed at the base, $5-10 \mathrm{~cm}$. long, very roughmargined, entire, or sparingly serrate with low sharp teeth, the basal and lowest ones larger, spatulate, petioled; heads $5-6 \mathrm{~mm}$. high; bracts of the involucre oblong, greenish-tipped, obtuse, or the inner acute, thick; rays 6-I3, short. On dry prairies, Manitoba and Minn. to Tenn., Wash., Neb. and Tex. Autumn.
38. Solidago Shórtii T. \& G. Short's Goldenrod. (I. F. f. 3706.) Stem slender, $6-12 \mathrm{dm}$. high. Leaves sessile (the lowest petioled ?). acute or acuminate at the apex, glabrous on both sides, the larger $5-10 \mathrm{~cm}$. long, $10-12 \mathrm{~mm}$. wide, sharply serrate with rather small and distant teeth, the upper gradually smaller, sparingly serrate, or entire; heads about 6 mm . high; involucre narrowly campanulate, its bracts linear-oblong, obtuse; rays 5-7, rather small. On rocks at the Falls of the Ohio River and in northwestern Ark. July-Aug.
39. Solidago Gattingeri Chapm. Gattinger's Goldenrod. (I. F. f. 3707.) Stem slender, 6-9 dm. high, branched at the inflorescence. Leaves firm, glabrous beneath, rough above, ciliolate, the lower and basal ones acutish, $7-15 \mathrm{~cm}$. long, $12-20 \mathrm{~mm}$. wide, serrate with low distant teeth, narrowed into margined petioles, entire, sessile; heads $4-5 \mathrm{~mm}$. high; bracts of the involucre oblong, very obtuse; rays $6-\mathrm{IO}$; achenes puberulent, or glabrous below. In dry soil, Tenn. and Mo. July-Aug.
40. Solidago Canadénsis L. Canada Goldenrod. (I. F. f. 3708.) Stem stout, puberulent-pubescent, or hirsute, $6-25 \mathrm{dm}$. high. Leaves acute at each end, the lower ones sharply serrate and petioled, $7-15 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide, the upper smaller, entire, sessile; heads $3-4 \mathrm{~mm}$. high, very numerous; bracts of the involucre linear, obtuse or acutish; rays $9-15$; achenes glabrous or somewhat pubescent. Usually in dry soil, N. B. to the N. W. Terr. and Br. Col., south to Fla. and Ariz. Aug.-Nov.

Solidago Canadénsis prócera (Ait.) T. \& G. Leaves less serrate, sometimes all entire, cinereous-pubescent with short appressed hairs. With the type.

Solidago Canadénsis glabràta Porter. Stems $6-12 \mathrm{dm}$. high, glabrous or nearly so below, puberulent above; leaves narrowly lanceolate, smooth above, pubescent on the veins beneath; panicles and heads smaller than in the type. Me. to northern N. Y. and Penn.

Solidago Canadénsis scabriúscula Porter. Leaves shorter, sparingly serrate or entire, rough above, rugose beneath; heads mostly larger than in the type. N. Y. and Penn. to Fla. and Tex.

Solidago 'Canadénsis gilvocanéscens Rydberg. A foot high, or less, leafy, canescent, yellowish: leaves remotely serrate above the middle, or entire; inflorescence dense; heads smaller than in the type. Minn. to Mont. and Kans.
41. Solidago nemoràlis Ait. Gray or Field Goldenrod. Dyer's Weed. (I. F. f. 3709.) Slender, I-6 dm. high, finely and densely pubescent.

Leaves thick, roughish; basal and the lower stem-leaves petioled, obscurely triple-nerved, obtuse or acutish, crenate-dentate, $7-15 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide; upper leaves gradually smaller, oblanceolate or linear-oblong, acute or acutish, entire; heads $4^{-6} \mathrm{~mm}$. high; panicle usually one-sided; bracts of the involucre linear-oblong; rays 5-9; achenes pubescent. In dry soil, Quebec to the N. W. Terr., Fla. and Tex. July-Nov.

Solidago nemoràlis arenícola Burgess. Depressed, or prostrate, about 15 cm . high; inflorescence dense, flattened, composing most of the plant. Sand hills, Cape Cod to L. I.

Solidago pulchérrima A. Nelson, is the western representative of this species, extending east into Kans. and Neb. It differs in its pale color and narrower basal leaves, but I have not been able to separate it specifically.
42. Solidago móllis Bartl. Velvety Goldenrod. (I. F. f. 37 Io.) Stem rigid, stout, low, canescent or slightly scabrous, 1.5-3 dm. high. Leaves pale, canescent or rough, entire or dentate, strongly 3 -nerved, oblong, ovate or oblanceolate, the lower petioled, $5-7 \mathrm{~cm}$. long, 6- 25 mm . wide, very obtuse, the upper sessile, smaller; heads $4-6 \mathrm{~mm}$. high, somewhat or scarcely secund on the short branches of the erect, dense panicle; bracts of the involucre oblong; rays 5-9; achenes pubescent. Dry plains, Minn. to the N. W. Terr., south to Tex. and Mex. July-Sept.
43. Solidago Radula Nutt. Western Rough Goldenrod. (I. F. f. 37 II.) Stem rough-pubescent, rather slender, 3-9 dm. high. Leaves thick, green, rough on both sides, the lower oblanceolate or spatulate, dentate-crenate, obtuse or acutish, petioled, 7-20 cm. long, 12-40 mm. wide, obscurely 3 -nerved, the upper smaller, oblanceolate, entire or nearly so, sessile, distinctly 3 -nerved; heads $4-6 \mathrm{~mm}$. high; bracts of the involucre oblong or linear-oblong, obtuse; rays 3-7, very short; achenes minutely pubescent. In dry soil, Ill. to Mo., La. and Tex. Aug.-Sept.
44. Solidago Drummóndii T. \& G. Drummond's Goldenrod. (I. F. f. 37 12.) Stem rather slender, 3-9 dm. high, finely soft-pubescent. Leaves rather thin, glabrous or nearly so above, finely, but sometimes sparingly pubescent, or roughish beneath, sharply serrate, acute at the apex, narrowed at the base, petioled, or the upper sessile, the larger $7-10 \mathrm{~cm}$. long, $4-5 \mathrm{~cm}$. wide; heads $4-5 \mathrm{~mm}$. high; bract-like upper leaves obtuse, or acute, entire; rays 4-6, conspicuous; bracts of the involucre oblong-lanceolate, obtuse; achenes pubescent. In rocky soil, Ill. to La. and Mo. Sept,-Oct.
45. Solidago rigida L. Stiff or Hard-leaved Goldenrod. (I. F. f. 3713.) Stem stout, simple, or branched above, densely and finely rough-pubescent, hoary, 3-15 dm. high. Leaves thick, rigid, often obtuse, rough on both sides, the upper sessile, clasping, and rounded or sometimes narrowed at the base, $3-5 \mathrm{~cm}$. long, mostly entire; lower and basal leaves long-petioled, sometimes 3 dm . long and 7 cm . wide, entire or serrulate; heads $8-10 \mathrm{~mm}$. high, many-flowered, in a terminal dense corymbose cyme; involucre broadly campanulate, its bracts oblong, obtuse, the outer pubescent; rays 6-10, large; achenes glabrous, IO-15-nerved. In dry sandy, gravelly, or rocky soil, Ont. to the N. W. Terr., south to Ga., Tex. and Colo. Aug.-Oct.
46. Solidago multiradiàta Ait. Northern Goldenrod. (I. F. f. 37 I . .) Stem glabrous or somewhat pubescent above, rather slender, I.5-4 dm. high. Leaves firm, the basal and lower ones spatulate or oblanceolate, entire, or sparingly serrate, obtuse, finely reticulate-veined, $7-\mathbf{1 2} \mathrm{cm}$. long, 6-18 mm. wide, the upper smaller, narrower, sessile, entire; heads about 8 mm . high, usually few in a terminal rather compact, corymbose cyme; bracts of the involucre thin, linear-lanceolate. acute, glabrous; rays $8-\mathbf{1 5}$, prominent, linear; achenes pubescent. Lab. to Br. Col., south in the Rocky Mts. to Colo. July-Aug.
47. Solidago Ohioénsis Riddell. Ohio Goldenrod. (I. F. f. 3715 .) Very smooth throughout; stem rather slender, simple, 6-n dm. high. Leaves firm, the basal and lower ones obtuse, long-petioled, serrulate toward the end, or sometimes entire, often 3 dm . long; upper leaves sessile, lanceolate. entire, gradually smaller; heads 5-6 mm. high, numerous in a terminal compound cyme, 15-25flowered; rays 6-9, small: bracts of the narrowly campanulate involucre oblong. obtuse, glabrous; achenes glabrous, 5 -nerved. In moist soil, western N. Y. to Ill. Aug.-Sept.
48. Solidago Riddéllii Frank. Riddell's Goldenrod. (I. F. f. 3716.) Stem stout, glabrous, or slightly pubescent above, 3-9 dm. high. Leaves numerous, thick, glabrous on both sides, entire, acute at each end, the lower and basal ones long-petioled, elongated, often 3 dm . long, $8-20 \mathrm{~mm}$. wide, the upper smaller, similar, sessile and clasping at the base, conduplicate, somewhat falcate; heads $6-8 \mathrm{~mm}$. high, 20-30-flowered, very numerous in a dense corymbose cyme, involucre oblongcampanulate, its bracts broadly oblong, obtuse; rays 7-9, narrow; achenes 5 nerved, glabrous. On moist prairies, Ohio to Minn. and Mo. Also at Fortress Monroe, Va. Aug-Sept.
49. Solidago Hoùghtonii T. \& G. Houghton's Goldenrod. (I. F. f. 3717.) Stem glabrous below, sparingly pubescent above, 3-6 dm. high. Leaves linear, the basal and lower ones petioled, 4-8 mm. wide, 3 -nerved, entire, acute at each end, the upper sessile, slightly conduplicate, otherwise similar, the uppermost small and bract-like; heads about 6 mm . high, few, in a small corymbose cyme, 20-30-flowered; involucre broadly campanulate, its bracts oblong, obtuse; achenes glabrous, 4-5-nerved. In swamps, north shores of Lakes Superior and Huron, and in Genesee Co., N. Y. Autumn.

## 23. EUTHAMMIA Nutt.

Erect, paniculately branched herbs, perennial by long rootstocks, with linear or linear-lanceolate entire sessile I-5-nerved punctate leaves, and numerous small heads of both tubular and radiate yellow flowers, clustered in the large cymose, convex or nearly flat-topped inflorescence. Bracts of the involucre obtuse, appressed, somewhat glutinous. Receptacle flattish, fimbrillate, or pilose. Rayflowers pistillate, usually more numerous than the disk-flowers, the rays small. Disk-flowers perfect. Anthers obtuse at the base. Style-branches with lanceolate appendages. Achenes top-shaped or oblong, villous-pubescent. [Greek, referring to the clustered heads.] Four known species, the following, and one of western N. Am.

Leaves distinctly 3-5-nerved; ray-flowers 12-20.

1. E. graminifolia.

Leaves I-nerved, or with a pair of indistinct lateral nerves; ray-flowers 5 -10.
Stem-leaves $4^{-6} \mathrm{~mm}$. wide ; disk-flowers 3 or 4 .
2. E. leptocephala.

Leaves $1-4 \mathrm{~mm}$. wide; disk-flowers 5 or 6 .
3. E. Caroliniana.
I. Euthamia graminifòlia (L.) Nutt. Bushy or Fragrant Goldenrod. (I. F. f. 37 18.) Stem glabrous, sometimes slightly rough above, 6-12 dm. high. Leaves numerous, linear-lanceolate, acuminate or acute at each end, $2-\mathbf{I 2} \mathbf{c m}$. long, $4-8 \mathrm{~mm}$. wide, minutely rough-pubescent on the margins and nerves of the lower surface; resinous dots few; heads $4^{-6} \mathrm{~mm}$. high, sessile in capitate clusters arranged in a flat-topped corymbose cyme; involucre ovoid-campanulate, its bracts oblong or oblong-lanceolate, slightly viscid; disk-flowers 8-12. In moist soil, fields and roadsides, N. B. to the N. W. Terr., Fla., Neb. and Kans. July-Sept.
2. Euthamia leptocéphala (T. \& G.) Greene. Western Bushy GoldenROD. (I. F. f. 371 I9.) Stem much branched, smooth, 4-7 dm. high. Leaves linear to linear-lanceolate, acuminate or acute at each end, rough-margined, those of the stem usually $5-7 \mathrm{~cm}$. long, 4-6 mm. wide; heads $4^{-6} \mathrm{~mm}$. high, rather narrower than those of the preceding species, sessile in the clusters of the flat-topped inflorescence; bracts of the involucre linear-oblong. In moist soil, Mo. to La. and Tex. Aug.-Oct.
3. Euthamia Caroliniàna (L.) Greene. Slender Fragrant Goldenrod. (I. F. f. 3720 .) Resembles the preceding species but is smaller, glabrous, and somewhat resinous, seldom over 4 dm . high. Leaves narrowly linear, entire, acuminate, sessile, narrowed at the base, $2-7 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide; punctate, often with smaller ones clustered in the axils; heads about 3 mm . high, very numerous and crowded in the dense corymbose cyme; involucre oblong-campanulate, its bracts oblong. In dry sandy soil, eastern Mass. to Ill., Fla., La. and Tex., mainly near the coast. Aug.-Oct.
24. BRACHYCHAÈTAT. \& G.

An erect, perennial herb, with the aspect of a Goldenrod. Leaves alternate, the lower and basal ones large, cordate, long-petioled, the upper ovate, short-
petioled or sessile. Heads composed of both tubular and radiate flowers, in a terminal narrow spike-like thyrsus. Involucre narrowly campanulate, its bracts coriaceous, imbricated in few series, the outer successively smaller. Receptacle small, naked. Rays small, yellow, pistillate. Disk-flowers perfect, their corollas tubular, somewhat expanded above, 5 -cleft. Anthers obtuse and entire at the base. Style-branches flattened, their appendages lanceolate. Achenes 8-10-ribbed. Pappus a single row of scale-like bristles, shorter than the achene. [Greek, shortbristle, referring to the pappus.] A monotypic genus.
I. Brachychaeta sphacelata (Raf.) Britton. False Goldenrod. (I. F. f. 372 I.) Stem pubescent, 6-12 dm. high. Basal and lower leaves broadly ovate, cordate or truncate at the base, acute at the apex, sharply serrate, $7-15 \mathrm{~cm}$. long, the slender petioles $7-22 \mathrm{~cm}$. long; stem-leaves gradually smaller and shorter-petioled, the uppermost very small and sessile; heads about 5 mm . high, racemosesecund or densely clustered on the short branches of the narrow elongated terminal thyrsus; bracts of the involucre oblong or linear-oblong, obtuse or acutish; rays and disk-flowers each about 5. In dry woods, western Va. to Ind., south to N. Car. and Ga. Aug.-Sept.

## 25. APHANÓSTEPHUS DC.

Erect or ascending canescent branching herbs, with alternate leaves, and rather large heads of both tubular and radiate flowers, solitary at the ends of the branches. Involucre hemispheric, its bracts lanceolate or linear, scarious-margined, imbricated in a few series, the outer smaller. Receptacle convex or conic, naked. Rayflowers pistillate, white or purplish. Disk-flowers perfect, yellow, their corollas tubular, the limb expanded above, 5 -dentate. Anthers obtuse and entire at the base. Style-branches flattened, their appendages short, obtuse. Achenes manyribbed. Pappus a short dentate crown. [Greek, faint-crown.] About 5 species, of the southwestern U. S. and Mex.
I. Aphanostephus skirróbasis (DC.) Trelease. Aphanostephus. (I. F. f. 3722.) Erect, or diffusely branched, densely canescent, I.5-6 dm. high. Basal and lower leaves spatulate, obtuse, $2-10 \mathrm{~cm}$. long, somewhat dentate, laciniate or entire, narrowed into margined petioles; upper leaves lanceolate, oblong or oblanceolate, obtuse or acute, mostly sessile, smaller; heads $16-25 \mathrm{~mm}$. broad, $6-10 \mathrm{~mm}$. high; rays numerous, narrow, entire. In dry soil, Kans. to Tex. Also in Fla. May-Aug.

## 26. BÉLLIS L.

Tufted herbs, with branching or scapose stems, alternate or basal leaves, and rather large heads of both tubular and radiate flowers, solitary at the ends of the branches, or of the monocephalous scape. Involucre hemispheric or broadly campanulate, its bracts herbaceous, imbricated in I or 2 series, nearly equal. Receptacle convex or conic, naked. Ray-flowers white or pink, pistillate. Disk-flowers yellow, perfect, their corollas tubular, the limb $4-5$-toothed. Anthers obtuse and entire at the base. Style-branches flattened, their appendages short, triangular. Achenes flattened, nerved near the margins. Pappus nonc, or a ring of minute bristles. [Latin, pretty.] About 9 species, of the northern hemisphere. Only the following are known to occur in N. Am., but 2 others are found in Mex.
$\begin{array}{ll}\text { Stem branched, } 15-40 \mathrm{~cm} \text {. high; involucral bracts acute. } & \text { 1. B. integrifolia. } \\ \text { Scapes monocephalous, } 3^{-17} \mathrm{~cm} \text {. high; involucral bracts obtuse. } & \text { 2. B. ferinnis. }\end{array}$

1. Bellis integrifòlia Michx. Western Daisy: (I. F. f. 3723 .) Slender. diffusely branched, pubescent. Leaves thin, entire, obtuse, the lower and basal ones spatulate, $2-7 \mathrm{~cm}$. long, narrowed into margined petioles, the upper smaller. oblong, oblanceolate or linear: heads $\mathbf{1 2 - 3 0} \mathrm{mm}$. broad; hracts of the involucre acute or acuminate, scarious-margined, clabrous or nearly so; rays usually violet. oblong-linear. In moist soil, Ky, and Temn. to Ark, and Tex. May-July.
2. Bellis perénnis L. Europfan or Garimen Daisy. (I. F.f. 3724.) Perennial, tufted. Leaves all basal, obovate, obtuse, slightly dentate, $2-5 \mathrm{~cm}$. long. narrowed into margined petioles, pubescent and ciliate; heads $12 \cdots 25 \mathrm{~mm}$. broad: rays numerous, linear, white, pink, or purple: bacts of the inwolucre oblong, whtuse, usually purple. In waste places, or occasionally spontaneous on lawns.

Southern N. Y. and eastern Penn. to N. S. and Ont. Fugitive from Europe. Native also of Asia. Nat. in Cal. and Br. Col. April-Nov.

## 27. TOWNSÉNDIA Hook,

Tufted scapose or branching herbs, with alternate entire linear or spatulate leaves and large heads of both tubular and radiate flowers. Involucre hemispheric or broadly campanulate; bracts imbricated in several series, the outer shorter. Receptacle nearly flat. Ray-flowers pink or white, pistillate. Disk-flowers tubular, mostly perfect, their corollas regular, 5 -lobed. Anthers obtuse and entire at the base. Style-branches flattened, their appendages lanceolate. Achenes of the diskflowers compressed, those of the rays commonly 3-angled. Pappus a single series of rigid bristles or short scales. [Named for David Townsend, botanist of Philadelphia.] About 20 species, natives of western N. Am.
Branching from the base; heads terminal.

1. T. grandiflora.

Acaulescent, or nearly so; heads sessile among the leaves.
Leaves narrowly oblanceolate or spatulate, green, $2.5-5 \mathrm{~mm}$. wide.
2. T. intermedia.

Leaves narrowly linear or nearly so, canescent, $\mathrm{I}-2 \mathrm{~mm}$. wide.
3. T. exscapa.

1. Townsendia grandifiòra Nutt. Large-flowered Townsendia. (I. F. f. 3725.) Perennial from a long woody root, branching at the base and sometimes also above, pubescent, or at length glabrate, $5-20 \mathrm{~cm}$. high. Leaves linear or linear-spatulate, $3-7 \mathrm{~cm}$. long, $3-6 \mathrm{~mm}$. wide, canescent; heads $3-4 \mathrm{~cm}$. broad, solitary at the ends of the branches; involucre hemispheric, its bracts scarious-margined, lanceolate, conspicuously acuminate; rays violet or purple; pappus of the rayflowers a crown of short scales, that of the disk-flowers of rigid bristles longer than the achene. In dry soil, Neb. to Wyo. and N. Mex. May-Aug.
2. Townsendia intermédia Rydb. n.sp. Intermediate Townsendia. Acaulescent from a woody root but less branched than the next, $2-5 \mathrm{~cm}$. high. Leaves oblanceolate or rarely spatulate, mostly acute, green, finely strigose, or in age glabrate; heads closely sessile, I. $5-3 \mathrm{~cm}$. broad, surpassed by the leaves; involucre broadly campanulate, its bracts broadly lanceolate, often tinged with purple, the inner scarious-margined; rays rose-color or white; pappus as in the next. In dry soil, Neb., Kans. and Colo. May-July. Type from Trego Co., Kans.
3. Townsendia exscàpa (Richards) Porter. Silky or Low Townsendia. (I. F. f. 3726.) Acaulescent, or nearly so, from a deep woody root, tufted, $2-3 \mathrm{~cm}$. high. Leaves all clustered at the base, narrowly linear or slightly broader upward, $2-5 \mathrm{~cm}$. long, permanently strigose-canescent; heads closely sessile, $2-4 \mathrm{~cm}$. broad, equalled or surpassed by the leaves; involucre broadly campanulate, its bracts lanceolate, acute, the inner searious-margined; rays white or purplish; pappus of both ray and disk-flowers a row of rigid bristles, that of the rays shorter and smaller. In dry soil, N. W. Terr. to Neb., Ariz. and N. Mex. April-July.

## 28. CHAETOPÁPPA DC.

Annual slender much-branched herbs, with small alternate entire leaves, and small long-peduncled heads of both tubular and radiate flowers. Involucre narrowly campanulate, its bracts lanceolate, acute or acuminate, imbricated in few series, the outer slightly shorter. Receptacle small, naked. Ray-flowers in one row, pistillate. Disk-flowers perfect, or the central ones staminate, their corollas 5 -lobed. Anthers obtuse and entire at the base. Style-branches narrow, flattened, their appendages short, obtuse. Achenes nearly terete, fusiform, or linear, 5 -ribbed. Pappus usually of 5 rigid awn-like scabrous bristles, alternating with as many short scales or more. [Greek, bristle-pappus.] Two known species, natives of the central and southwestern U.S.
I. Chaetopappa asteroides DC. Chaetopappa. (I. F. f. 3727.) Annual, pubescent, erect, 5-30 cm. high, the branches filiform. Lower and basal leaves spatulate, obtuse, $\mathbf{I}-2.5 \mathrm{~cm}$. long, petioled, the upper linear, much smaller and bractlike. sessile; heads about 6 mm . broad; involucre about 4 mm . high, its bracts scarious-margined, glabrous or nearly so; rays 5-12, raised on slender tubes; central sterile flowers usually awnless; shorter scales of the pappus of the fertile flowers hyaline, sometimes lacerate. Dry soil, Mo. to Tex. and northern Mex. April-July.

## 29. BOLTÒNIA L'Her.

Perennial glabrous herbs, with striate or angled stems, alternate entire sessile, or clasping leaves, and numerous rather large heads of both tubular and radiate flowers, paniculate, or solitary at the ends of the branches. Involucre hemispheric or broadly campanulate, its bracts scarious-margined, imbricated in few series, the outer slightly shorter. Receptacle convex or conic, foveolate. Ray-flowers pistillate. Disk-flowers perfect, their corollas elongated, 5 -lobed. Anthers obtuse and entire at the base. Style-branches flattened, their appendages short, lanceolate. Achenes flattened, obovate, their margins thickened or narrowly winged, glabrous or nearly so. Pappus a series of short scales, usually with 2-4 slender rigid bristles. [Named for, James Bolton, an English botanist of the 18th century.] As here limited, the genus consists of the 4 following species, with perhaps a fifth in Oregon.

Disk about 4 mm . broad; leaves linear. Disk $6-12 \mathrm{~mm}$. broad; leaves lanceolate.

Leaves narrowed at the base, sessile, not decurrent on the stem. Involucre-bracts lanceolate, acute.
Involucre-bracts spatulate, obtuse, or mucronate.

1. B. diffusa.
2. B. asteroides.
3. B. latisquama.

Stem-leaves, and sometimes those of the branches, decurrent, sagittate.
4. B. decurrens.
I. Boltonia diffùsa Ell. Panicled Boltonia. (I. F. f. 3728.) Paniculately much branched, $6-20 \mathrm{~cm}$. high, the branches very slender or filiform. Leaves acutish, the larger $3-5 \mathrm{~cm}$. long, 4 mm . wide, those of the branches very small and subulate; heads about 4 mm . high; rays usually white, $2-4 \mathrm{~mm}$. long; involucre broadly campanulate, its bracts oblong or oblong-lanceolate, acutish or obtuse; achenes obovate, narrowly winged; pappus of several short scales and 2 subulate bristles shorter than the achene. In dry soil, southern Ill. to Tex., east to S. Car. and Fla. Aug.-Oct.
2. Boltonia asteroìdes (L.) L’Her. Aster-like Boltonia. (I. F. f. 3729.) Rather stout, 6-24 dm. high, somewhat cymosely paniculate. Leaves lanceolate to oblanceolate, sessile, $5-12 \mathrm{~cm}$. long, 6-25 mm. wide, the upper linear-lanceolate, smaller; rays white, pink or purple, ${ }^{-12} \mathrm{~mm}$. long; involucre hemispheric, its bracts lanceolate or oblong-lanceolate, acute or acuminate; pappus of setose scales, with or without 2-4 slender bristles nearly as long as the obovate or oval achene. In moist soil, N. J. to Fla., west to Minn., Neb. and La. July-Sept.
3. Boltonia latisquàma A. Gray. Broad-scaled Boltonia. (I. F. f. 3730.) Similar to the preceding species and perhaps a variety or form of it. Leaves lanceolate, acute, sessile; heads rather larger; rays blue-violet; bracts of the involucre oblong-spatulate, obtuse or mucronate; pappus of numerous small short broad scales and 2 long bristles. Western Mo., eastern Kans. and Ark. Autumn.
4. Boltonia decúrrens (T. \& G.) Wood. Clasping-leaved Boltonia. (I. F. f. 373 I.) Stout, 9-18 dm. high, branched above. Leaves oblong-lanceolate or elongated lanceolate, mucronate at the apex, those of the stem decurrent and sagittate at the base, $7-15 \mathrm{~cm}$. long, $12-16 \mathrm{~mm}$. wide, those of the branches smaller and merely sessile or some of them also decurrent; heads 5-6 mm. high; involucre hemispheric; rays about 6 mm . long, violet or purple; pappus of several or numerous short scales and 2 very slender bristles. In wet prairies, Ill. and Mo. Aug.-Sept.

## 30. SERICOCÀRPUS Nees.

Erect perennial herbs, with alternate leaves, and middle-sized heads of both tubular and radiate flowers, in terminal cymose panicles. Involucre ovoid, oblong. or campanulate, its bracts coriaceous, with herbaceous or squarrose tips, imbricated in several series, the outer shorter. Receptacle small, foveolate. Ray-flowers white, pistillate. Disk-flowers mostly perfect, their corollas tubular, narrow, yellowish or purplish, 5 -lobed. Anthers obtuse and entire at the base. Stylebranches with lanccolate-subulate appendages. Achenes slightly compressed, linear-oblong, r-nerved on each side, pubescent. Pappus of numerous capillary scabrous bristles, the outer usually shorter. [Greek, silky fruit, referring to the achenes.] Four known species, natives of N. Am.

Leaves entire, linear, spatulate, or obovate, rigid.
Glabrous, or nearly so; leaves linear or linear-spatulate.

1. S. linifolius.

Puberulent or scabrous; leaves obovate.
Leaves dentate, oblong, or obovate, thin.
2. S. bifoliatus.
3. S. asteroides.
I. Sericocarpus linifolius (L.) B.S.P. Narrow-leaved White-topped Aster. (I. F. f. 3732.) Glabrous or very nearly so throughout; stem rather slender, striate, $3-5 \mathrm{dm}$. high. Leaves spreading, faintly 3 -nerved, thick, obtuse at the apex, narrowed at the base, $3-5 \mathrm{~cm}$. long, $3-6 \mathrm{~mm}$. wide, sessile, or the lowest with short margined petioles, their margins scabrous; heads about $6-8 \mathrm{~mm}$. high, clustered in 2's-6's at the ends of the cymose branches; involucre oblong-campanulate, its bracts oblong, obtuse, the outer with somewhat spreading or reflexed green tips, the inner scarious and often lacerate or ciliate at the apex; rays 4 or 5 , 8 -10 mm. long; pappus white. In dry, usually sandy soil, Canada, Vt. to Ohio, Ga. and La. June-Sept.
2. Sericocarpus bifoliàtus (Walt.) Porter. Rough White-topped Aster. Rattlesnake Master. (I. F. f. 3733.) About 6 dm . high, the stem terete, or slightly angled. Leaves sessile, obscurely veined, thick, obtuse, ascending or erect by a twist at the base, $\mathbf{I}-2.5 \mathrm{~cm}$. long, $8-16 \mathrm{~mm}$. wide, mucronulate, densely appressed-puberulent on both sides, the upper mostly oblong, much smaller; heads 8 -10 mm. high, cymose-paniculate; involucre narrowly campanulate, its bracts oblong or the inner linear, pubescent, their tips somewhat spreading; rays short; pappus white. In dry soil, Va. to Fla. and La., mainly near the coast. JulySept.

Sericocarpus asteròides (L.) B.S.P. Toothed White-topped Aster. (I. F. f. 3734.) Stem pubescent, or glabrate, slightly angled, 3-6 dm. high. Leaves pubescent or glabrous, ciliate, the basal and lower ones obovate or spatulate, dentate or rarely entire, $5-10 \mathrm{~cm}$. long, $5-35 \mathrm{~mm}$. wide, narrowed into margined petioles; upper leaves oblong or oblong-lanceolate, entire or dentate, acute or obtuse, smaller; heads $10-12 \mathrm{~mm}$. high, densely clustered; involucre campanulate, its bracts oblong, ciliate or pubescent, the outer with green reflexed tips; pappus brown or white. In dry woods, Me. to Fla., Ohio, Ky. and Ala. July-Sept.

## 3r. ÁSTER L.*

Perennial or rarely annual, mostly branching herbs, with alternate leaves, and corymbose or paniculate (rarely racemose or solitary) heads of both tubular and radiate flowers. Involucre hemispheric, campanulate or turbinate, its bracts various, imbricated in several series, the exterior ones usually smaller and shorter. Receptacle flat or convex, generally foveolate. Ray-flowers white, pink, purple, blue, or violet, pistillate. Disk-flowers tubular, perfect, their corollas 5-lobed, usually yellow and changing to red, brown, or purple. Anthers obtuse and entire at the base. Style-branches flattened, their appendages subulate, lanceolate or ovate, acute. Pappus-bristles slender, numerous, scabrous or denticulate, usually in I series, sometimes in 2 series. Achenes mostly flattened and nerved. [Greek, star.] A genus of not less than 250 species, most abundant in N. Am. where, in addition to the following, about 70 others occur beyond our limits. The species are very variable, as is expressed in the large number of subspecies here admitted.

## A. Basal and lower leaves, or some of them, cordate and slender-petioled. (See No. 52.) 1. None of the stem-leaves cordate-clasping.

## * Rays white, violet or rose.

§ Rays white, or rarely rose, usually 2 -toothed; plants not glandular.
$\dagger$ Involucre ovoid, campanulate or turbinate, its bracts mostly obtuse or rounded; basal leaves few and small, or commonly none (except in No. 6).
(a) Leaves membranous or thin, smooth, or nearly so.

Heads 18 mm . broad or less, the disk turning crimson; leaves acute or short-acuminate, chiefly crenate-serrate.

1. A. carmesinus.

Heads 18 mm . broad or more, the disk turning brown or reddish brown; leaves longacumiriate, sharply serrate.

Heads $18-25 \mathrm{~mm}$. broad; leaves of the branches small, obtuse, or acute.

Heads 25 mm . broad or more; leaves of the branches large, long, lanceolate, acuminate.

Involucral bracts mainly acute; teeth of leaves salient. 3. A. tenebrosus.
Involucral bracts, all but the lowest, obtuse; leaves low-serrate, the teeth chiefly appressed.
4. A. leptocaulis.
(b) Leaves thick, firm, rough, at least when dry.

Heads $12-16 \mathrm{~mm}$. high; inflorescence forking.
5. A. furcatus.

Heads $8-10 \mathrm{~mm}$. high; inflorescence paniculate or glomerate.
Leaves acute, or short-acuminate, pilose beneath; inflorescence glomerate.
6. A. glomeratus.

Leaves long-acuminate, not pilose beneath; inflorescence open-paniculate.
7. A. Claytoni.
$\dagger \dagger$ Involucre cylindric, its bracts tapering to an obtuse apex ; basal leaves large, tufted. Bracts of the involucre pale, scarious, usually without herbaceous tips.
8. A. curvescens.
9. A. Schreberi.

Bracts of the involucre broader, with herbaceous tips.
§ § Rays violet, usually 3 -toothed; plants glandular.

+ Predominant glands large, capitate; leaves thick, coarse, heavy. Sinus broad; glands chiefly on the inflorescence; plant usually harsh. 1.. A. macrophyllus.

Sinus narrow; glands abundant on the leaves and stem; growing plant clammy.
11. A. roscidus.
$\dagger \dagger$ Predominant glands minute, scarcely capitate; leaves usually thin.
(a) Inflorescence rather regular, flat, or convex-topped; plants usually less than 8 dm . tall. Sinus broad, shallow.

Broader leaves orbicular-cordate, their teeth and the inflorescence-leaves inconspicuous. 12. A. ianthinus.
Broader leaves reniform, sharply incised; some inflorescence-leaves conspicuous. 13. A. violaris. Sinus rather deep and narrow; broader leaves ovate-cordate, sharply serrate. 14. A. multiformis.
(b) Inflorescence very irregular, paniculate-corymbose; plants often $1.2-1.6 \mathrm{~m} . \mathrm{high}$; broader leaves large, cordate, acute. 15. A. nobilis.

*     * Rays blue or purple; plants not glandular.
$\dagger$ Bracts of the involucre spreading or recurved ; rays 30-45.

16. A. anomalus.
$\dagger \dagger$ Bracts of the involucre appressed, or erect; rays 8-20.
(a) Leaves all entire, or nearly so, thick, or firm.

Leaves nearly or quite glabrous above. 17. A. Shortii.
Leaves rough-puberulent on both sides, the upper bract-like. 18. A. azureus.
(b) Leaves nearly all sharply serrate, thin.

Heads 4-6 mm. high, numerous; bracts obtuse or obtusish.
Leaves rough; petioles not wing-margined; bracts appressed.
19. A. cordifolius.

Leaves smooth, or nearly so ; petioles, or some of them, wing-margined.
20. A. Lowrieanus.

Heads 8-ro mm. high, usually few ; bracts acute or acuminate. 21. A. Lindleyanus.
Heads $6-10 \mathrm{~mm}$. high, numerous; bracts acute or acuminate.
Stem densely and finely pubescent.
22. A. Drummondii.

Stem glabrous or nearly so ; bract-tips spreading.
Inflorescence racemose-paniculate.
Inflorescence corymbose-paniculate.
23. A. sagittifolius.
24. A. Saundersiz.
2. Stem-leaves, or some of them, cordate-clasping; plant rough when dry. 25. A. undulatus.
B. No cordate and petioled leaves; those of the stem, or some of them, with more or less cordate or auricled clasping bases.

1. Stem rough, or hirsute-pubescent.

* Leaves entire, oblong, linear, or lanceolate.
§ Heads $2.5-5 \mathrm{~cm}$. broad; leaves sessile, strongly cordate-clasping. $\dagger$ Stem rough ; leaves oblong to lanceolate: involucre turbinate.

Leaves thick, firm, very rough, oblong to oval.
Leaves thin, roughish, oblong-lanceolate.
$\dagger \dagger$ Stem hirsute; leaves lanceolate; involucre hemispheric.
28. A. Novac-Anglaze.
§ § Heads $\mathrm{I}-2.5 \mathrm{~cm}$. broad ; leaves but slightly clasping.
Involucre hemispheric, its bracts glandular.
29. A. oblongifolius.

Involucre turbinate, its bracts hispid.
30. A. amelhystinus.

Stems usually pilose ; bracts very glandular.
Stems hispid-pubescent; bracts glabrous, or ciliate.
31. A. major.
32. A. puniceus.
2. Stem glabrous, or only sparingly pubescent above (villous in forms of No. 33).

## * Leaves sharply serrate.

§ Leaves tapering to the base.
Outer bracts of the involucre foliaceous.
33. A. tardifiorus.

Bracts of the involucre narrow, not foliaceous.
Leaves lanceolate to oblong-lanceolate, sessile. 32. A. puniceus.
Leaves oval to ovate, the lower often petioled.
34. A. patulus.
§ § Leaves abruptly contracted into margined petioles, often enlarged near the base. 35. A. prenanthoides.
§ § § Leaves strongly cordate-clasping; bracts green-tipped.
36. A. laevis.

*     * Leaves entire, or very nearly so.
§ Involucre campanulate, its bracts appressed, green-tipped.
$\dagger$ Bracts of the involucre with rhomboid green tips.
Stem-leaves oblong, lanceolate or oval-lanceolate.

36. A. laevis.

Stem-leaves elongated-lanceolate to linear.
37. A. concinnus.
$\dagger+$ Bracts of the involucre linear, the tips narrower, lanceolate; stem-leaves linear or narrowly lanceolate.
38. A. purpuratus.
§ § Involucre hemispheric.

+ Bracts of the involucre narrow, not foliaceous.
(a) Bracts in several series, unequal.

Bracts linear-subulate; leaves narrowly linear.
39. A. junceus.

Bracts lanceolate, linear, or spatulate; leaves lanceolate to linear.
Western dry-soil plant, 3-6 dm. tall; leaves $2.5-7.5 \mathrm{~cm}$. long. 40. A. adscendens.
Eastern swamp plant, $6-15^{\mathrm{dm}}$. tall; leaves $5^{-1} 5 \mathrm{~cm}$. long. 41. A. Novi-Belgii.
(b) Bracts in only 1 or 2 series; leaves linear to lanceolate.
42. A. longifolius.
$\dagger+$ Bracts of the involucre green, foliaceous; western.
43. A. foliaceus.

## C. Leaves sessile, or petioled, not at all clasping, or scarcely so.

1. Leaves silky, silvery or canescent on both sides, entire.

Heads corymbose-paniculate ; bracts oblong ; achenes glabrous. 44. A. sericeus.
Heads in a narrow raceme; bracts linear; achenes silky. a 45. A. concolor.
2. Leaves neither silky, silvery nor canescent, often toothed.

* Rays normally purple, blue, pink, or violet; not white.
§ Leaves bristly ciliate, linear, rigid; western species. 46. A. Fendleri. § § Leaves not bristly ciliate.
$\dagger$ Tips of the involucral bracts strongly squarrose.
Leaves linear to linear-oblong, rigid, obtuse, entire ; heads 2.5 cm . broad.

47. A. grandiflorus.

Leaves lanceolate to oblong, at least the lower dentate.
Involucre hemispheric, or nearly so; heads 2.5 cm . broad or more.
Bracts of the involucre glandular.
48. A. spectabilis.

Bracts of the involucre ciliate, or glabrous.
Involucre turbinate; heads $12-18 \mathrm{~mm}$. broad.
49. $A$. surculosus.
$t+$ Tips of the involucral bracts appressed, or erect (except in forms of No. 52),
(a) Bracts of the involucre coriaceous or herbaceous, oblong, linear, lanceolate, on spatulate.
Bracts of the involucre coriaceous, obtuse.
Involucre hemispheric; leaves oblong, sharply serrate; stem smooth.
51. A. Radula.

Involucre turbinate.
Leaves ovate-oblong, the lower dentate; stem rough.
Leaves linear-oblong, entire, ciliolate.
52. A. Herveyi.

Bracts of the involucre herbaceous, acute.
Involucral bracts foliaceous; leaves oblong, very rough.
53. A. turbinellus.

Involucral bracts not foliaceous; leaves linear or the lower spatulate, Nebraskensis,
Pubescent; inner involucral bracts abruptly acuminate or obtusish.
55. A. Priceae.

Glabrous ; involucral bracts all narrowly linear, gradually acuminate.
56. A. Kentuckiensis.

Bracts of the involucre rigid, lanceolate, large, acute; leaves linear.
57. A. paludosus.
(b) Bracts of the involucre linear-subulate, membranous, acute.
58. A, nemoralis.

*     * Rays mostly white or nearly so (often pink or purple in Nos. 59, 61, 63, 64, and 73). $\S$ Heads corymbose, $20-40 \mathrm{~mm}$. broad.
Leaves ovate-oblong, acuminate, sharply serrate; bracts linear-subulate.

59. A. acuminatus.

Leaves linear, entire or nearly so; bracts oblong, obtuse. 60. A. ptarmicoides. § § Heads solitary at the ends of slender branchlets.
Leaves linear or linear-lanceolate, acute or obtuse. 6I. A. dumosus.
Leaves oblong-lanceolate, acuminate at both ends. 62. A. Gravesii.
§ § § Heads paniculate, or racemose, $8-20 \mathrm{~mm}$. broad
$\dagger$ Bracts of the involucre acute to obtusish; plants glabrous or pubescent.
(a) Heads paniculate, not in r-sided racemes.

Stem-leaves lanceolate, serrate or entire.
Heads $16-20 \mathrm{~mm}$. broad.
Plants glabrous, or sparingly pubescent above.
Leaves firm, roughish or rough; rays often bluish. 63. A. salicifolius.
Leaves thin, smoothish; rays chiefly white.
64. A. paniculatus. Plant puberulent all over.
Heads $12-16 \mathrm{~mm}$. broad; stem-leaves narrowly lanceolate. 65. A. Missouriensis. 66. A. Tradescanti.

Stem-leaves linear-lanceolate to subulate, mostly entire.
Heads scattered, $12-18 \mathrm{~mm}$. broad; upper leaves linear.
Heads numerous, $8-14 \mathrm{~mm}$. broad; upper leaves subulate.
Paniculately branched, bushy.
67. A. Faxoni.

Simple, or with ascending slender branches; northern.
68. A. cricoides.
(b) Heads
69. A. Pringlei.
(b) Heads racemose and I -sided on the branches.

Stem-leaves oval, oblong, or lanceolate, serrate, or chiefly so.
Stem pubescent or glabrate.
Stem villous; leaves narrowly lanceolate, thin.
70. A. lateriflorus.
71. A. hirsuticaulis.

Stem-leaves linear-lanceolate to linear, nearly entire ; stem glabrate.
72. A. vimineus.
$\dagger \dagger$ Bracts of the involucre, at least the outer, obtuse; Flants very rough.
Heads 6-8 mm. broad, very numerous, densely clustered.
Pubescence appressed; leaves nearly glabrous.
Pubescence spreading; leaves pubescent and ciliate.
73. A. multiflorus.

Heads $12-16 \mathrm{~mm}$. broad, rather loosely clustered; western.
74. A. exiguts.
75. A. commutatus.

## D. Leaves fleshy, narrow, entire ; plants of salt marshes or saline soil (No. 7 sometimes in non-saline situations).

Perennial; heads $12-25 \mathrm{~mm}$. broad; involucral bracts lanceolate, acuminate.
76. A. tenuifolius.

Annuals; heads 6-10 mm. broad ; involucral bracts linear-subulate.
Involucre campanulate; disk-flowers more numerous than the rays; rays about 4 mm . long.
77. A. exilis.

Involucre cylindraceous; disk-flowers fewer than the very short rays.
78. A. subulatus.

1. Aster carmesìnus Burgess. Crimson-disk Aster. (I. F. f. 3735.) Stems erect, delicate, $3^{-6} \mathrm{dm}$. high, glabrous, reddish brown, terete. Leaves all petioled, glabrate, very thin, but firm and crisp, the lower and basal ones somewhat oval, rounded into a small deep sinus at the base, bluntly acute or short-acuminate at the apex, crenate-serrate, the upper ones sometimes ovate-lanceolate, the uppermost short-elliptic; petioles slender ; inflorescence 12.5 cm . broad, or less ; rays chiefly 6, white ; disk at first golden yellow, finally deep purplish crimson; florets broadly bell-shaped; outer bracts obtuse, ciliate, pale, with a green tip. On shaded rocks in the lower Hudson valley. Sept.
2. Aster divaricàtus L. White Wood Aster. (I. F. f. 3737.) Stems tufted, assurgent, flexuous, brittle. terete, +6 dm . high, glabrate at maturity. Leaves thin, smoothish, slender-petioled, ovate, lanceolate, chosch dentate with sharp teeth, or the small basal ones coarsely serrate, acute to acuminate, the basal sinus moderate; leaves of the inflorescence small. short, orate and acute to orbicular, subentire; corymb broad, flattish, repeatedly forked, the slender hranches long, divergent; heads 18.25 mm . broad; mays hicfly $6-0$, white: disk turning reddish brown; bracts of the involucre broad, ciliate, the rounded tip with an inconspicuous green spot. In open woodlands and thickets, in rather dry soil, Canada to Man., (ria. and Tenn. Variable; mays rarely rose-purple. Sept.-Oct.

Aster divaricitus cymulosus Rurgess. Smaller, bearing a sincle dense corrmb about I dn. broad, or several smaller ones; the branches short, suherect; rays short, broad,
chiefly $6-8 \mathrm{~mm}$. long. In grassy openings in woods, often in dense patches, N. Eng. and N. Y. to Va.

Aster divaricàtus curtifòlius Burgess. Stem erect, reddish, smooth, sometimes glaucous; leaves small, dull green, firm, ovate to orbicular, the sinus broad, rounded, the apex obtuse or apiculate; inflorescence loose, flattish; disks turning purple; rays about I cm . long; green tips of the involucral bracts conspicuous. In moist woods, N. Y. to Va.

Aster divaricàtus deltoideus Burgess. Delicate, 4.5 dm . high or less; lower leaves triangular, cordate with a broad sinus or subtruncate, the apex incurved-acuminate; the teeth large, sharp; petioles often all filiform; veins directed forward; heads nearly as in the preceding variety. In moist shaded places, N. Eng. to N. Y., Va. and Tenn.

Aster divaricàtus persàliens Burgess. Stems virgate, 7.5 dm . high, or less; leaves extremely thin, firm, chiefly lanceolate-acuminate, long and narrow, the teeth very slender, salient or recurved, the lowest ovate with a small narrow sinus; disk maroon. In deep shade, N. Eng. and N. Y. to Va. and Ky.

Aster divaricàtus fontinalis Burgess. Plants solitary; basal leaves often numerous, tufted, thin, smoothish, sharply serrate or dentate, 15 cm . long by 11 cm . broad, or smaller, broadly oval, acute, the base subcordate or rounded; involucre turbinate, its bracts with definite green tips. In springy places and grassy ditches in open sunny situations, N. Eng. and N. Y. to Va.
3. Aster tenebròsus Burgess. Long-Leaved Wood Aster. (I. F. f. 3736.) Stems solitary or scattered, glabrate, striate, 6-9 dm. high. Leaves very thin and smooth, slender-petioled, broadly oblong, coarsely toothed with remote acuminate teeth, abruptly long-acuminate at the apex, the basal sinus broad, rounded, shallow, except in the lowest ones; leaves of the inflorescence lanceolate, subentire, sessile, sometimes I din. long; inflorescence broadly corymbose, heads about 8 mm . high, often 3 cm . broad; rays usually 9-12; disk pale yellow, becoming purplish brown, the florets funnelform with a long slender tube; outer bracts chiefly elon-gated-triangular, acute, green, the others linear. obtusish, the green tips lancelinear. In moist dark woodlands, N. Y. to Va. Peculiar in its large dark leaves with coarser teeth than in the preceding species. Aug.-Sept.
4. Aster leptocaùlis Burgess, n.sp. Smooth-stemmed Aster. Stem slender, smooth, 4 dm . high or more, the branches puberulent, erect-ascending, leafy to the inflorescence. Stem-leaves lanceolate or the lower ovate-lanceolate, the larger 1.5 dm . long, thin, slightly rough above, finely and densely pubescent beneath, long-acuminate, sharply serrate nearly or quite to the base, the upper sessile, or very nearly so, the lower petioled and cordate or subcordate at the base; inflorescence corymbose, leafy; peduncles slender, $\mathrm{I}-2.5 \mathrm{~cm}$. long; involucre turbinate-campanulate, about 8 mm . high, its bracts obtuse or obtusish, ciliate; heads about 2.5 cm . broad. Milwaukee. Wis., collected by Dr. H. E. Hasse.
5. Aster furcàtus Burgess. Forking Aster. (I. F. f. 3738.) Stem leafy, 4.5 dm . high, or less, loosely forked above. Leaves hispid above, hispidulous beneath, firm, saliently cut-toothed, the lower ovate, short-petioled, with a small or shallow sinus, the upper sessile, often 12.5 cm . long by 6 cm . wide, the uppermost elliptic-oblong, often 8.5 cm . long; heads few (5-20), slender-peduncled; involucre with a truncate or rounded base; rays 3 -toothed; disk turning brown, the florets funnelform with rather broad lobes; pappus long, straight; achenes pubescent. subangular, not constricted at the summit. In woods, especially on shaded cliffs, Ill. and Mo. Aug.-Oct.
6. Aster glomeràtus (Nees) Bernh. Bernhardi's Aster. (I. F. f. 3739.) Loosely clustered, dull green. Leaves not large, mostly short-pilose beneath, thickish, rough above; basal leaves present. these and the lower stem-leaves cordate with a deep narrow sinus, the teeth sharp, rather close and small; petioles slender, ciliate; upper leaves much smaller. ovate, truncate with a short broadly winged base, or the uppermost ovate to lanceolate, sessile, entire; inflorescence compact, of many glomerate clusters, round-topped; heads about 8 mm . high; bracts pubescent, obtuse, green, the inner twice as long as the outer; rays about 6, cream-white, short, soon deciduous: disk turning brown. In moist thickets, swamps, or ravines, N. Y. and Penn. July.
7. Aster Clàytoni Burgess. Clayton's Aster. (I. F. f. 3740.) Similar to A. divaricatus; stems red, tough. Leaves chiefly ovate-lanceolate, not large, rough, thick, slender-petioled, coarsely serrate, pale, or dull. acuminate, the upper sessile by a broad base, lanceolate-triangular, serrulate; inflorescence high, with percurrent axis, the long suberect branches each bearing a small umbelliform clus-
ter of heads; peduncles filiform, as long as the heads, $6-8 \mathrm{~mm}$. long; bracts pale; rays short, narrow, chiefly 6 , snow-white; disks at first golden yellow, finally sienna brown; florets about 20; achenes densely short-hairy. In sunny or slightly shaded rocky places, N. Y. to the mountains of Va. Sept.

Aster Clàytoni crispicans Burgess. Basal leaves often not cordate, deeply incised those of the stem long-acuminate or even caudate, sharply serrate with large acute close teeth, some of which are suberect; chief bracts of the involucre acute. On rocky banks, solitary or in small clusters. Me. to N. Y. and N. J.
8. Aster curvéscens Burgess. Dome-topped Aster. (I. F. f. 3741.) Dark green, chiefly glabrous; stem pale green, striate, delicate, 4-6 dm. high. Basal leaves tufted, conspicuous, these and the lowest stem-leaves with a broad shallow sinus, abruptly incurved-acuminate; middle leaves ovate, short-petioled, rounded at the base, the upper lanceolate, slenderly acuminate, often falcate; leaves firm, smoothish, the teeth broad, curved; inflorescence small, convex, $7-12 \mathrm{~cm}$. broad, its short filiform naked branches widely ascending; heads $8-10 \mathrm{~mm}$. high; lower bracts short, obtuse, the others longer, nearly uniform, scarious, shining, linear, often acute, usually glabrous; rays about 8 , cream-white, about 10 mm . long; disk becoming purple-brown; pappus early reddening; achenes slender, glabrous. In loose moist shaded soil, N. Eng. and N. Y. to Va. Aug.-Sept.

Aster curvéscens umbellifórmis Burgess. Stem very smooth, deep red, robust, straight, sometimes 1 m . tall; leaves apple-green, smooth when dry, sparingly toothed; inflorescence symmetrically umbelliform, decompound; sinus of the lower leaves rather deep and narrow. In grassy woods and thickets, Conn. to Va. July.

Aster curvéscens ovifórmis Burgess. Stem about 7 dm . high, leafy; leaves dull green, not acuminate, very thin but rough, ovate, cordate with deep narrow sinus, 2 dm . long by 12 cm . wide, or smaller ; some of the bracts broader and green-tipped; inflorescence smaller and less branched. Range of the preceding.
9. Aster Schréberi Nees. Schreber's Aster. (I. F. f. 3742.) Stem stout, $6-9 \mathrm{dm}$. high, with long internodes. Basal leaves often in extensive colonies, thin, ¿ull green, firm, rough above, with scattered slender appressed bristles, pubescent beneath on the veins, reniform-cordate or cordate-triangular, often 17 cm . long by 12 cm . wide, the basal sinus, when well developed, rectangular, 5 cm . across and 2.5 cm . deep; upper leaves ovate-oblong to lanceolate, with a short broad basal wing, or sessile; lower petioles long, ciliate when young; inflorescence decompound, flattish, or irregularly convex, $15-30 \mathrm{~cm}$. broad; heads about 1 cm . high; bracts greenish, mostly obtuse, ciliate; rays usually io. In borders of woods, and along fence rows in partial shade, N. Y. to Mich. and Va. July-Aug.
io. Aster macrophýllus L. Large-leaved Aster. (I. F. f. 3743.) Rough; rootstocks long, thick; stem reddish, angular, 6-9 dm. high. Basal leaves forming large colonies, 3 or 4 to each stem, broad, cordate with a large irregular sinus, rough above, harsh, thick, the teeth broad, curved; upper stem-leaves oblong with short broadly-winged petioles, the uppermost sessile, acute; inflorescence strigose and glandular, broadly corymbose, irregular; heads $10-12 \mathrm{~mm}$. high; peduncles rigid, thickish; rays about $\mathbf{1 6}, \mathbf{1 0}-\mathbf{1} 4 \mathrm{~mm}$. long, chiefly lavender, sometimes violet, rarely pale; bracts conspicuously green-tipped, the lower acute, the inner oblong, obtuse; disk turning reddish brown; florets short-lobed. In moderately dry soil, in shaded places, Canada to Minn. and N. Car. Aug.

Aster macrophýllus velùtinus Burgess. Smaller; leaves small, ovate-triangular, slender-petioled, often truncate at the base, about 6 cm . long by 5 cm . wide, sometimes none of them cordate ; glands fewer; pubescence subpilose or velvety ; bracts broad, flat, green ; rays violet or blue. In grassy woods and thickets, especially in mountainous regions, Me. to Minn. and W. Va.

Aster macrophýllus sejúnctus Burgess. Strigose-pubescent; glands numerous: leaves apple-green above, pale beneath, chiefly cordate-orbicular, abruptly short-acuminate, thick, spongy, commonly minutely wrinkled : basal leaves few ; bracts narrow, obtuse : peduncles slender; inflorescence dense, convex, $\mathrm{r}-2 \mathrm{dm}$. broad, not leafy ; rays lilac. In open grassy places, Me. to Penn. and Wis.

Aster macrophyllus apricénsis Burgess. Glabrate, deeply branched, the branches numerous, often 45 cm . high ; rays short, pinkish lavender : leaves broad, oval to ovate, the teeth and sinus little developed; petioles often expanded into a long wing, sometimes

7 cm . long and 1 cm . wide; uppermost leaves short-oblong with a narrowed sessile base. In clearings and open gravelly or sandy places, N, Y. and Penn.

Aster macrophýllus bifórmis Burgess. Small, stocky, with 3 or 4 small oval closely crenate spongy-thickened lower leaves with long slender petioles, the sinus deep, narrow, the teeth triangular to semicircular; stem-leaves crowded, much reduced, subentire, ovateoblong, subsessile ; inflorescence nearly naked, dense, convex, usually 1 dm. broad ; strigose pubescence little developed; rays lilac. In open grassy sunny situations, forming small patches, Me. to Ont. and Lake Erie.

Aster macrophýllus pinguifolius Burgess. Stems stout, leafy, glabrous, about 6 dm. high ; basal and lower leaves large, forming extensive patches, deep green above, very pale beneath, many of them appearing greasy, some roughening in drying; petioles fleshy, sometimes 23 cm . long; inflorescence broad, flat-topped; heads large ; rays lavender to almost white; only the upper leaves sessile. Borders of woods, Coun. and L. I. to Minn.

Aster macrophýllus excélsior Burgess. Stem robust, glabrous, often 12 dm , tall, purple, or glaucous; leaves mostly very smooth, pale, numerous, narrower, cordateoblong to ovate-lanceolate, chiefly sessile; rays deep lilac to violet. Along paths and borders of rocky woods, Ont. and western N. Y. to Mich.
ir. Aster róscidus Burgess. Dewy-leaf Aster. (I. F. f. 3744.) Clam-my-hairy, odorous, copiously glandular when young, somewhat so at maturity; stem 9 dm . high, or less. Basal leaves in close colonies, coriaceous, cordate-quadrate, lowserrate, the sinus deep, narrow; stem-leaves chiefly orbicular and not cordate, with short broadly winged petioles, rarely slender-petioled; involucre hemispheric, its bracts chiefly with rounded ciliate tips; rays $14-16$, broad, clear violet; disks at first golden yellow, soon turning red. In slight shade and rich cleared woodlands, Me. to Penn. and Mich., Aug.-Sept.
12. Aster iánthinus Burgess. Violet Wood Aster. (I. F. f. 3745.) Glandular, dark green, slightly strigose-pubescent. Stem erect, or decumbent, 6-9 dm . tall ; leaves thinnish, rough, the lower and basal ones orbicular to oblong, 12 cm . long, or less, abruptly acuminate, low-serrate or crenate, the sinus broad, open, shallow ; inflorescence open, nearly naked; peduncles slender, divergent ; heads large ; rays $10-13$, long, very deep violet or sometimes pale, $8-12 \mathrm{~mm}$. long. bracts green-tipped, little pubescent. On shaded banks and along woodland paths, Me. to Lake Erie and W. Va. July-Oct.
13. Aster violàris Burgess. Violet-leaf Aster. (I. F. f. 3746.) Caudex thick, fleshy; plant glabrate, bluish green, minutely glandular. Stem slender, erect, or assurgent, 6 dm . high, or less; basal and lower leaves broadly reniform, abruptly acuminate or apiculate, often 7 cm . long and 10 cm . wide, their slender petioles $15-20 \mathrm{~cm}$. long, the sinus very broad and shallow; middle stem-leaves similar, not cordate; the upper numerous, long-elliptic, chiefly with narrowed bases, all thin, firm; rough above; inflorescence leafy, small, loose, nearly leveltopped; heads 12 mm . high, or more; rays $12-15$, pale violet, narrow. In shaded moist places, sometimes in leaf-mold among rocks, N. Y. from the Hudson to Lake Erie. Sept.-Oct.
14. Aster multifórmis Burgess. Various-Leaved Aster. (I. F. f. 3747.) Deep green, minutely glandular. Stem erect, slender, 3-6 dm. high, angularstriate in drying. Basal leaves usually 2, large, cordate-oblong; stem-leaves very thin, sharply serrate, rough above, minutely puberulent beneath, the lower ovate, acuminate, usually with a narrow sinus, the upper oval to ovate-lanceolate, petioled, the uppermost elliptic-lanceolate, serrulate, sessile or nearly so; inflorescence small, its branches upwardly curved; heads about 14 mm . high, rays about 13 , rounded and retuse at the apex; bracts green, glands few, almost hidden by the minutely strigose pubescence of the peduncles. In moist shaded places, Me. to western N. Y., Penn. and Md. July-Aug.
15. Aster nóbilis Burgess. Stately Aster. (I. F. f. 3748.) Tall, minutely glandular above; stem shining, bright green, 12-15 dm. high. Leaves thin, but firm, smooth in growth, roughened in drying, minutely puberulent beneath, dark green, basal and lower leaves large, the blade often 22 cm . long by 15 cm . wide, about as long as the stout petiole, sharply toothed, the sinus deep, broad, or the lobes overlapping; stem-leaves similar, the upper oblonglanceolate, sessile; inflorescence irregularly cymose-paniculate: bracts long, acute, green; heads 12 mm . high, or less; rays $\mathbf{I}^{-15} 5$, violet-blue or pale violet. In leafmold, Lake Champlain to Lake Erie. Aug.
16. Aster anómalus Engelm. Many-rayed Aster. (I. F. f. 3749.) Stem rough, rather stout, branched above, 3-9 dm. high. Leaves thin, the lower and basal ones deeply cordate, ovate, or ovate-lanceolate, entire or slightly repand, rough-pubescent on both surfaces, acute or acuminate, $7-10 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide, with slender naked petioles; upper leaves short-petioled or sessile, lanceolate, oblong, or linear, much smaller; heads few, $8-12 \mathrm{~mm}$. high, $25-30 \mathrm{~mm}$. broad; receptacle hemispheric, its bracts lanceolate, acute, or acuminate, hirsute, imbricated in several series, their foliaceous tips spreading or reflexed; rays 30-45, 10-12 mm . long, bright violet blue; pappus whitish. On limestone cliffs, Ill. to Mo. and Ark. Sept.
17. Aster Shórtii Hook. Short's Aster. (I. F. f. 3750.) Stem roughish or smooth, slender, paniculately branched above, 6-12 dm. high. Leaves thick, glabrous or nearly so above, finely and sparingly pubescent beneath, the lower and basal ones ovate or ovate-lanceolate, cordate at the base, acute or acuminate, often entire, $5-15 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide, borne on slender naked petioles; upper leaves lanceolate, entire, sessile or short-petioled, not cordate, those of the branches small and bract-like; heads numerous, $10-14 \mathrm{~mm}$. high; involucre broadly campanulate, its bracts linear, acute, puberulent, imbricated, their green tips appressed; rays $10-15$, linear, violet blue, $10-12 \mathrm{~mm}$. long; pappus tawny. On banks and along edges of woods, western Penn. to Va., Ga., Ill. and Tenn. Sept.-Oct.
18. Aster azùreus Lindl. Sky-blue Aster. (I. F.f. 3751.) Stem slender, stiff, rough, branched above, 3-12 dm. high. Leaves thick, usually all entire, scabrous on both sides, the lower and basal ones cordate, ovate, ovate-lanceolate, or lanceolate, acute, acuminate, or obtusish, $5-15 \mathrm{~cm}$. long, with slender often pubescent petioles; upper leaves short-petioled or sessile, lanceolate or linear, those of the branches reduced to small appressed bracts; heads numerous, $8-10 \mathrm{~mm}$. high; involucre turbinate, its bracts glabrous, linear-oblong, abruptly acute, imbricated, their green tips appressed; rays $\mathbf{1 0}-20$, bright blue, $6-8 \mathrm{~mm}$. long: pappus tawny. On prairies and along borders of woods, western N. Y. to Ga., Minn., Kans. and Tex. Aug.-Oct.
19. Aster cordifolius L. Common Blue Wood Aster. (I. F. f. 3752.) Stem glabrous or nearly so, much branched, bushy, 3-15 dm. high. Leaves thin, rough, more or less pubescent, sharply serrate, acuminate, the lower and basal ones slender-petioled, broadly ovate-cordate, $5 \mathbf{- 1 2} \mathrm{~cm}$. long, the upper shortpetioled or sessile, ovate or lanceolate; heads very numerous, small, 4-6 mm. high, $12-18 \mathrm{~mm}$. broad, handsome; involucre turbinate to cylindric, its bracts oblonglinear, obtuse or obtusish, green-tipped, appressed; rays $10-20,6-8 \mathrm{~mm}$. long, violet or blue, sometimes pale (rarely white); pappus whitish. Woods and thickets, N. B. to Minn., Ga. and Mo. Sept.-Dec.

Aster cordifolius Furbishiae Fernald. Similar; stem and petioles densely villous, the leaves somewhat so beneath. Northern Me.

Aster cordifolius polycéphalus Porter. More robust and more branched than the type, leaves smaller, often rough only when dry, the upper ones sessile, ovate: panicle large; heads usually smaller, very numerous. Me. and Mass. to eastern Penn, and Va.

Aster cordifolius alvearius Burgess. Leaves thin, usually smoothish, cordate, tri-angular-lanceolate, or broader; inflorescence dense, thyrsoid, not leafy, in form resembling that of the lilac; bracts linear, acute ; heads medium sized; rays blue. On shaded banks, Mass. to N. Car. and Tenn.

Aster cordifolius pedicellatus Burgess. Stem leafy, often 12 dm. high; leaves thin, the lower ovate, cordate, the upper ovate-lanceolate, or those of the branches elliptic and subentire ; inflorescence loosely pyramidal, often 6 dm . high and 4 dm . broad, its ultimate branchlets long and often naked; heads large, 18 mm . broad or more, often 10 mm . high; rays chiefly purple blue; bracts obtuse. In moist wood borders, Ont. to Va. and Ky .
20. Aster Lowrieànus Porter. Lowrif's Aster. (I. F. f. 3753.) Glabrous, or very nearly so, throughout; stem branched, 3-12 dm. high. Leaves thickish. firm, a little succulent, the basal slender-petioled, ovate to ovate-lanceolate, cordate, acute or obtusish, serrate, 5-15 cm. long, those of the stem orate to oblong, often cordate, contracted into winged petioles the uppermost lameoolate; heads usually not very numerous. 5-6 mm. high, loosely panicled; involucre turbinate, its bracts obtuse or obtusish, appressed; rays light blue, $0-8 \mathrm{~mm}$. long, but
variable in length. In woods, Conn. and southern N. Y. to Penn., Iowa, N. Car. and Ky. Sept.-Oct.

Aster Lowrieànus lancifolius Porter. Leaves lanceolate, appressed-serrate, only the basal ones cordate. Southern N. Y. and Penn. to W. Va. and Ala.

Aster Lowrieànus Bicknéllii Porter. Leaves all lanceolate. all sharply serrate, or the lowest incised, usually none of them cordate. Southern N. Y. and Penn.

2I. Aster Lindleyànus T. \& G. Lindley's Aster. (I. F. f. 3754.) Stem usually stout, glabrous. or sparingly pubescent, 3-10 dm. high, branched above. Leaves rather thick, glabrous, or slightly pubescent, especially on the veins, the lower and basal ones cordate at the base, sharply serrate, ovate, acute or acuminate, $5-10 \mathrm{~cm}$. long, with slender naked petioles; upper leaves ovate, or lanceolate, less serrate, or entire, sessile, or with margined petioles, those of the branches lanceolate or linear-lanceolate, smaller; heads usually not numerous, $8-10 \mathrm{~mm}$. high; involucre broadly turbinate or nearly hemispheric, its bracts linear-lanceolate, acute, rather loosely imbricated, glabrous, or nearly so, their tips green; rays 10-20, blue or violet, 6-10 mm. long; pappus nearly white. In open places, Lab. to the N. W. Terr. and Br. Col., south to Me. and Mich. Aug.-Oct.

Aster Lindleyànus exímius Burgess. Tall, sometimes 2 m . high; leaves thick. usually rough and strigose-pubescent above, almost glabrous beneath; inflorescence widely branched, loosely paniculate, often over 6 dm . long; rays bluish purple; heads nearly 2.5 cm . broad; bracts linear, abruptly acute. N. H. to Ohio and Va.
22. Aster Drummóndii Lindl. Drummond's Aster. (I. F. f. 3755.) Stem usually stout, finely and densely canescent, 6-15 dm. high. Leaves mostly thin, ovate or ovate-lanceolate, acuminate, rough above, canescent beneath, the lower and basal ones cordate, with slender naked petioles, sharply toothed, $5-10 \mathrm{~cm}$. long, the upper cordate or rounded at the base, usually on margined petioles, those of the branches sessile and entire or nearly so, much smaller; heads $6-8 \mathrm{~mm}$. high, rather numerous on the racemose branches; involucre turbinate, its bracts linear, slightly pubescent, acute or acuminate, their green tips appressed; rays $8-15$, blue, $\sigma-8 \mathrm{~mm}$. long; pappus whitish. In dry soil, borders of woods and on prairies, Ohio to Minn., Kans., Ark. and Tex. Sept.-Oct.
23. Aster sagittifòlius Willd. Arrow-leaved Aster. (I. F. f. 3756.) Stem stout, or slender, strict, glabrous, or sparingly pubescent above, $6-15 \mathrm{dm}$. high, paniculately branched at the inflorescence, the branches ascending. Leaves thin, slightly roughened, or glabrous above, usually glabrate beneath, the lower and basal ones cordate or sagittate, ovate-lanceolate, sharply serrate, acuminate, $7-15 \mathrm{~cm}$. long, with slender naked or narrowly margined petioles; upper leaves lanceolate, sessile, or on short and usually margined petioles, serrate or entire, those of the branches very small; heads $5-8 \mathrm{~mm}$. high, $16-20 \mathrm{~mm}$. broad, numerous, crowded, racemose; involucre turbinate, its bracts linear-subulate, glabrous or nearly so, their tips green and slightly spreading; rays io-15, light blue or purplish, 6-8 mm. long; pappus whitish. In dry soil, N. B. to N. Dak., N. J., Ky. and Kans. Aug.-Oct.

Aster sagittifolius dissitiflòrus Burgess. Differs from the typical form of the species in its broader looser pyramidal inflorescence, the somewhat larger and longer peduncled heads, the leaves less serrate, often none cordate. N.Y. to Fla., Miss. and Oklahoma.

Aster sagittifolius urophýllus (Lindl.) Burgess. Leaves pilose beneath during growth, persistently so on the veins rough, above, lanceolate, acuminate, the lower, or all of them, cordate; stem often 15 dm . tall, the narrow inflorescence sometimes 9 dm . long; heads about 6 mm . high; rays white. Grassy thickets and river-banks, N.Y. to Minn.
24. Aster Saún Jersii Burgess, n. sp. Saunders' Aster. Puberulent on the branches of the inflorescence, otherwise glabrous, or the petioles sparingly ciliate; stem 3-6 dm. high. Basal leaves with narrowly margined or marginless petioles, longer than the blades, the latter ovate, rather deeply cordate, serrate, $6-$ Io cm . long; lower stem-leaves similar, but with margined petioles, often broadly so, the uppermost lanceolate, chiefly entire, much smaller, partly clasping; heads corymbose-paniculate 2.5 cm . broad or less; rays apparently purple; involucre
about 8 mm . high, its bracts linear-lanceolate with acuminate green bracts. S . Dak. and Iowa. Type from Roberts Co., S. Dak. (De Alton Saunders, No. 8067.)
25. Aster undulàtus L. Wavy-leaf Aster. Small Fleabane. Variousleaved Aster. (I. F. f. 3757.) Stem stiff, very rough and pubescent, divaricately branched above, $3-10 \mathrm{dm}$. high. Leaves usually thick, rough on both sides, pubescent beneath, dentate, undulate or entire, acute or acuminate, the lowest and basal ones ovate, cordate, $5-12 \mathrm{~cm}$. long, with naked or margined petioles; middle ones ovate, lanceolate or oblong, with margined petioles dilated and clasping at the base, the upper sessile or clasping, those of the branches small and subulate; heads numerous, racemose and often secund on the spreading branches, about 8 mm . high, $16-20 \mathrm{~mm}$. broad; involucre broadly turbinate, its bracts linear-oblong, pubescent, acute or acutish, their green tips appressed; rays $8-15$, pale blue to violet, $6-10 \mathrm{~mm}$. long; pappus whitish. In dry soil, N. B. and Ont., south to Fla., Ala. and Ark. Sept.-Oct.

Aster undulàtus abruptifolius Burgess. Tall, I-I. 5 m . high; leaves rougher, chiefly short-ovate, sessile, entire and about 5 cm . long, 4 cm . broad; inflorescence pyramidal; heads much darker, more crowded. N. Eng. to Va.

Aster undulatus lorifórmis Burgess. Predominant leaves greatly elongated, linearoblong to linear-lanceolate, often 15 cm . long, with the clasping base narrowed or broadened, only a few of the lower ones contracted into winged petioles; plant little pubescent at maturity. Eastern Mass, to Va. and Penn.

Aster undulàtus torquàtus Burgess. Leafy, 2-3.5 dm. high, dark green, shortdowny; leaves small, very short and broad, close together, entire, their bases clasping the stem as a succession of collars, often 1 cm . in diameter; lowest leaves petioled; inflorescence much branched, paniculate. Martha's Vineyard, Mass., to Long Island.

Aster undulàtus triangulàris Burgess. Tall, leafy, $1-2 \mathrm{~m}$. high, pale; pubescence slight; leaves hispid above, ovate-triangular, acuminate, chiefly $5-7 \mathrm{~cm}$. long, 18 mm . broad and sessile. N.Y. to S. Car.
26. Aster pàtens Ait. Late Purple Aster. (I. F. f. 3758.) Stem slender, rough, 3-9 dm. high, divergently branched. Leaves ovate-oblong to oblonglanceolate, rough, pubescent, somewhat rigid, strongly cordate or auriculate-clasping at the broad base, entire, acute, or the lowest obtuse, $2.5-7.5 \mathrm{~cm}$. long, those of the branches much smaller and bract-like, the margins rough-ciliate; heads 25 mm . broad or more, solitary at the ends of the branches; involucre broadly turbinate, its bracts linear-oblong, finely pubescent or scabrous and somewhat glandular, imbricated, their green acute tips spreading; rays 20-30, purplish blue, or deep violet, $8 \mathbf{- 1 2} \mathrm{~mm}$. long; pappus tawny; achenes pubescent. In dry, open places, Mass, to northern N. Y., Minn., Kans., Fla., La. and Tex. Reported from Canada. Aug.-Oct.
27. Aster phlogifòlius Muhl. Thin-leaved Purple Aster. (I. F. f. 3759.) Similar to the preceding species, usually taller. Leaves larger, lanceolate to ob-long-lanceolate, entire, thin or membranous, acuminate at the apex, strongly auri-culate-clasping at the base, roughish above, pubescent beneath, usually narrowed below the middle, sometimes 15 cm . long; heads usually numerous, $3-5 \mathrm{~cm}$. broad, panicled, or somewhat racemose on the branches; bracts of the involucre lanceolate, glabrate, rather loose, with herbaceous tips; rays numerous, purple-blue. In woods and thickets, N. Y. to Ohio, N. Car. and Tenn. Aug.-Sept.
28. Aster Nòvae-Angliae L. Neiv England Aster. (I. F. f. 3760.) Stem stout, hispid, pubescent, corymbosely branched above, 6-25 dm. high, very leafy. Leaves oblong-lanceolate, entire, acute, pubescent. $5-12 \mathrm{~cm}$. long. 12-25 mm . wide, clasping the stem by an auriculate or broadly cordate base: heads numerous, $3-5 \mathrm{~cm}$. broad, clustered at the ends of the branches: involucre hemispheric, its bracts linear-subulate, somewhat unequal, green, spreating, pubescont and more or less glandular-viscid; rays $40-50$. linear, $10-10 \mathrm{~mm}$. long, violetpurple, rarely pink or red, or white; achenes pubescent; pappus reddish white. In fields, and along swamps, Quebec to the N. W. Terr., south to S. Car., Mo., Kans. and Colo. Aug.-Oct.
29. Aster oblongifòlius Nutt. Aromatic Aster. (I. F. f. 376 r.) Stem much branched, hirsute-pubescent. 3-7 dm. hish. the branches divarieate or ascending. Leaves crowded, oblong or oblong-lanceolate. sessile by a broad, partly clasping base, usually rigid, entire, acute or mucronulate at the apex. rough
or hispidulous on both sides, rough-margined, those of the stem $3-5 \mathrm{~cm}$. long, 4-8 mm . wide, those of the branches gradually smaller; heads corymbose, nearly 25 mm . broad; involucre hemispheric, its bracts much imbricated, glandular, aromatic, linear or linear-oblong, the acute green tips spreading; rays $20-30$, violetpurple, rarely rose-pink, $6-10 \mathrm{~mm}$. long; pappus light brown; achenes canescent. On prairies and bluffs, central Penn. to Minn., Neb., Va., Tenn. and Tex. Aug.-Oct.
30. Aster amethýstinus Nutt. Amethyst Aster. (I. F. f. 3762.) Resembles the preceding species, but is often taller, sometimes 15 dm . high. Leaves often crowded, linear-lanceolate, entire, rough or hispidulous on both sides, partly clasping, sessile, acute, those of the stem $3-5 \mathrm{~cm}$. long, 4-6 mm . wide; heads rather numerous, racemose or corymbose, $\mathbf{I}-2.5 \mathrm{~cm}$. broad; involucre broadly turbinate, its bracts much imbricated, linear, hispid, not glandular, the acutish green tips spreading; rays 20-30, blue-purple, about 6 mm . long; pappus brown; achenes canescent. In moist soil, Mass. to southern N. Y., eastern Penn., Ill. and Iowa. Sept.-Oct.
31. Aster màjor (Hook.) Porter. Great Northern Aster. (I. F. f. 3763.) Stem stout, leafy to the summit, usually densely pilose-pubescent with many-celled hairs, rarely glabrate, branched above, 12-18 dm. high. Leaves membranous, lanceolate, partly clasping by a narrowed base, acuminate, sharply serrate with low distant teeth, dark green and slightly pubescent above, villous-pubescent on the veins beneath, $7-12 \mathrm{~cm}$. long, $10-20 \mathrm{~mm}$. wide; heads mostly solitary at the ends of short branches, 3.5 cm . broad; involucre hemispheric, its bracts imbricated, green, linear-subulate, densely glandular; rays $35-45$, purple, $10-14 \mathrm{~mm}$. long; achenes appressed-pubescent; pappus tawny. In moist soil, western Ont. to Dak., Ore. and Br. Col. Sept.-Oct.
32. Aster puníceus L. Red-stalk or Purple-stem Aster. (I. F. f. 3764.) Stem usually stout, reddish, corymbosely or racemosely branched above, hispid with rigid hairs, $9-25 \mathrm{dm}$. high. Leaves lanceolate to oblong-lanceolate, acuminate, sessile and clasping by a broad or narrowed base, sharply serrate, or some of them entire, usually very rough above, pubescent on the midrib beneath, $7-15 \mathrm{~cm}$. long, $1-4 \mathrm{~cm}$. wide; heads generally numerous, $2-4 \mathrm{~cm}$. broad; involucre nearly hemispheric, its bracts linear or oblong, attenuate, imbricated in about 2 series, glabrous or ciliate, green, loose, spreading, nearly equal, sometimes broadened; rays $20-40$, violet purple or pale, $10-14 \mathrm{~mm}$. long, showy; pappus nearly white; achenes pubescent. In swamps, N. S. to western Ont. and Minn., south to N. Car., Ohio and Mich. July-Nov.

Aster puníceus firmus (Nees) T. \& G. Stem sparingly hispid, or glabrous, 6-15 dm. high; leaves sharply serrate. With the type.

Aster puníceus oligocéphalus Fernald. Stem seldom over 7 dm . high, glabrate below; branches of the inflorescence short ; heads few or solitary, large, the outer involucral bracts commonly large and foliaceous. Newf. and Lab. to Ont., N. H. and northern N. Y.

Aster puniceus compáctus Fernald. Stem very hispid; leaves firm, large, the upper mostly longer than the short branches of the inflorescence; heads compactly clustered, large. Eastern Mass, to Penn.

Aster puníceus lucídulus A. Gray. Stem nearly or quite glabrous; leaves crowded, entire, or nearly so, thin, glabrous or slightly rough-pubescent. Quebec to N. Eng., Ont. and Mich.

Aster puníceus Cráwfordì Porter. Stems slender, in height 7.5-8 dm., somewhat hispid; lower and middle leaves linear and lance-linear, acuminiate, $5-10 \mathrm{~cm}$. long and about 5 mm . broad, becoming revolute, scantily denticulate, very scabrous above, pubescent on the midribs beneath: the upper ones on the panicle much smaller and ovate. Collected at Tullytown, Bucks County, Pa., by Mr. Joseph Crawford.
33. Aster tardiflòrus L. Northeastern Aster. (I. F. f. 3765.) Stem glabrous, slightly pubescent above, or sometimes villous, corymbosely branched near the summit, 3-9 dm. high. Leaves lanceolate or oblong-lanceolate, serrate with low teeth, or some of them entire, acuminate, narrowed into a clasping base, glabrous or nearly so on both sides, roughish margined, $7-15 \mathrm{~cm}$. long, $8-20 \mathrm{~mm}$. wide: heads about 25 mm . broad, not very numerous; involucre hemispheric, its outer bracts broad and foliaceous, often 12 mm . long, acute, somewhat unequal; rays $20-30$, violet; pappus nearly white; achenes pubescent. Along streams, Mass. to Lab. Aug.-Oct.
34. Aster pátulus Lam. Spreading Aster. (I. F. f. 3766.) Pubescent, or nearly glabrous; stem 3-12 dm. high. Leaves oval, ovate, or oblong-lanceolate, sharply and irregularly serrate, rather thin, acute, acuminate, or blunt, the lower $7-15 \mathrm{~cm}$. long, $2.5-6 \mathrm{~cm}$. wide, narrowed into margined petioles, the upper sessile and somewhat clasping; heads numerous, panicled, about 25 mm . broad; involucre campanulate, $6-8 \mathrm{~mm}$. high, its bracts linear to linear lanceolate, acuminate, not foliaceous, loosely imbricated in 3 or 4 series, the outer shorter; rays violet-purple or rarely white. N. B. to N. H. Sept.
35. Aster prenanthoides Muhl. Crooked-stem Aster. (I. F. f. 3767 .) Stem glabrous, or pubescent in lines above, flexuous, much branched, 3-6 dm. high. Leaves thin, oblong to ovate-lanceolate, sharply and coarsely serrate, scabrous above, glabrous or nearly so beneath, 7-15 cm. long, $18-35 \mathrm{~mm}$. wide, acuminate, abruptly narrowed below into a broad-margined entire petiole, the base auriculate-clasping; heads usually numerous, 25 mm . broad or more; involucre hemispheric, its bracts linear, acute, green, spreading, imbricated in 3 or 4 series, the outer shorter; rays $20-30$, violet, $8-\mathbf{1} 2 \mathrm{~mm}$. long; pappus tawny; achenes pubescent. In moist soil, Mass. to Wis., south to W. Va., Ky. and Iowa. Aug.Oct.

Aster prenanthoides porrectifolius Porter. Leaves narrowly lanceolate, much elongated, sometimes 2 dm . long, gradually contracted into an entire clasping base. Penn.
36. Aster laèvis L. Smooth Aster. (I. F. f. 3768.) Stem usually stout, glabrous often glaucous, 6-12 dm. high, branched or simple. Leaves thick, entire, or serrate, glabrous, slightly rough-margined, the upper all sessile and strongly cordate-clasping, oblong-lanceolate, oblanceolate or ovate, acute or obtusish, 2-10 cm . long, $8-50 \mathrm{~mm}$. wide, the basal and lower gradually narrowed into winged petioles, those of the branches often small and bract-like; heads usually numerous, about 25 mm . broad; involucre campanulate, its bracts rigid, acute, appressed, green-tipped, imbricated in several series; rays $15-30$, blue or violet; pappus tawny; achenes glabrous or nearly so. Usually in dry soil, Me. and Ont. to Penn., La., the N. W. Terr. and Kans. Sept.-Oct.

Aster laèvis amplifòlius Porter. Stout, somewhat fleshy; leaves broadly ovate, narrowed toward the base, strongly clasping. Mass. to eastern Penn., Minn. and Mo.

Aster laèvis Potomacénsis Burgess. Lower stem-leaves abruptly contracted into winged petioles, sharply serrate; heads few, usually racemose; green tips of the bracts broad, conspicuous. Md. and Va.
37. Aster concínnus Willd. Narrow-leaved Smooth Aster. (I. F. f. 3769.) Similar to narrow-leaved forms of Aster laevis, glabrous or sparingly pubescent above; stem paniculately branched, 3-9 dm. high. Leaves light green, lanceolate to linear, entire, or sometimes serrulate, the upper sessile, somewhat clasping, $2-7 \mathrm{~cm}$. long, the lower and basal ones spatulate, or oblong, narrowed into margined petioles, sometimes coarsely toothed; heads usually numerous, about 25 mm . broad; bracts of the involucre with rhomboid acute herbaceous tips; rays violet to purple. Conn. to Penn., Va., N. Car.(?) and Ark.
38. Aster purpuràtus Nees. Southern Smooth Aster. (I. F. f. 3770.) Stem slender, glabrous, simple, or branched above, 4-12 dm. high, the branches sometimes puberulent. Leaves firm, glabrous, dark green, entire, the upper sessile and clasping at the base, elongated-lanceolate or linear-lanceolate, acuminate, $5-12 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide, the lower and basal ones petioled, oblong-lanceolate, obtusish, those of the branches very small; heads rather few, loosely paniculate, $10-25 \mathrm{~mm}$. broad; involucre campanulate to turbinate, its bracts coriaceous. linear, appressed, green-tipped, acute, imbricated in several series; rays 5 10, bhee or violet, 0 -10 mm. long; pappus tawny; achenes glabrous. Va. and W. Va. to Ga. and Tex. Aug.-Sept.
39. Aster júnceus Ait. Rusir Aster. (I. F. f. 3771 .) Stem very slender. glabrous, or minutely pubescent above, simple or little branched, 31 dm. hish. Leaves firm, glabrous, narrowly linear, entire, or sometimes with a few distant teeth, acute or acuminate, sessile by a broad clasping and often slightly cordate base, $7-15 \mathrm{~cm}$. long, 3- 8 mm . wide; heads paniculate, rather distant, about 25 mm . broad; involucre hemispleric, about 0 mm . high, its hacts glabrous, linearsubulate, very acute, imbricated in 3 or + series, the outer shorter; rays violet to
nearly white, 8-10 mm. long; pappus pale. In swamps and bogs, N. S. to the N. W. Terr., south to N. J., Ohio, Wis. and in the Rocky Mts. July-Sept.
40. Aster adscéndens Lindl. Western Aster. (I. F. f. 3772.) Stem slender, rigid, glabrous, or sparingly hirsute-pubescent, branched or simple, 1.5-6 dm . high. Leaves firm, entire, rough-margined, sometimes ciliolate, those of the stem linear-lanceolate or linear-oblong, acute or obtusish, $2-7 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide, sessile by a more or less clasping base; basal leaves spatulate, narrowed into short petioles; heads not numerous, about 25 mm . broad; involucre hemispheric, its bracts imbricated in 3-5 series, oblong-linear or spatulate, their tips obtuse or obtusish, slightly spreading, the inner often mucronulate; pappus nearly white; achenes pubescent. On prairies and moist banks, western Neb. to Wyo., Mont. and the N. W. Terr., west to Colo., N. Mex. and Nev. July-Sept.

4I. Aster Nòvi-Bélgii L. New York Aster. (I. F. f. 3773.) Stem slender, usually much branched, glabrous, or slightly pubescent above, 3-9 dm. high. Leaves lanceolate, oblong-lanceolate, or linear-lanceolate, firm, entire, or slightly serrate, glabrous, or very nearly so, acuminate at the apex, narrowed, sessile and more or less clasping at the base, $5-12 \mathrm{~cm}$. long, $6-16 \mathrm{~mm}$. wide, the lowest petioled; heads corymbose-paniculate, usually numerous, $2-3 \mathrm{~cm}$. broad; involucre hemispheric to campanulate, its bracts linear, acute, green, somewhat spreading, in $3-5$ series, the outer shorter; rays $15-25$, violet, $8-10 \mathrm{~mm}$. long; pappus whitish; achenes glabrous or nearly so. In swamps, Newf. to Me. and Ga., mainly near the coast. Aug.-Oct.

Aster Nòvi-Bélgii litòreus A. Gray. Low and spreading, more or less fleshy, much branched; leaves shorter, broader, thickish, acute, $3-6 \mathrm{~cm}$. long; principal bracts of the involucre obtuse, loose, spatulate. Along salt-marshes, Pr. Edw. Isl. and Quebec to Ga.

Aster Nòvi-Bélgii elòdes (T. \& G.) A. Gray. Leaves narrowly linear-lanceolate, often elongated to $10-15 \mathrm{~cm}$.; bracts of the involucre acute. In moist ground, southern N. Y. to N. Car.

Aster Nòvi-Bélgii Atlánticus Burgess. Leaves lanceolate, tapering from the middle to an acuminate base and apex, sometimes 25 mm . wide ; heads usually fewer; inflorescence racemose-corymbose. In shaded swamps, Mass. to N. Car.

Aster Nòvi-Bélgii Brittònii Burgess. Leaves thick; heads short-peduncled, racemosespicate toward the ends of the branches; green tips of the bracts short. Mass. to southeastern N. Y. and Va., near the coast.
42. Aster longifòlius Lam. Long-Leaved Aster. (I. F. f. 3774.) Stem glabrous, or somewhat pubescent, leafy, paniculately branched, 3-9 dm. high. Leaves lanceolate to linear lanceolate, entire or nearly so, acuminate, narrowed into a sessile clasping usually slightly cordate base, $7-20 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide; heads rather numerous, about 25 mm . broad; involucre hemispheric, $8-10 \mathrm{~mm}$. high, its bracts glabrous, narrow, green, acute, imbricated in only 1 or 2 series, nearly equal; rays numerous, about 8 mm . long, violet or pale purple; pappus pale. In swamps and moist ground, Lab. to the N. W. Terr., south to northern N. Eng., Ont. and Mont. Summer.

Aster longifôlius villicàulis A. Gray. Stem densely white-villous; leaves narrowly linear-lanceolate, the midrib villous beneath; heads fewer, long-peduncled; rays dark violet. Northern Me. and N. B.
43. Aster foliàceus Lindl. Leafy-bracted Aster. (I. F. f. 3775.) Stem usually stout, sparingly pubescent in lines, 6-9 dm. high, branched above, the branches ascending. Leaves rather thin, obiong-lanceolate, acute, entire, or with a few small distant teeth, glabrous on both sides, very rough-margined, $5-10 \mathrm{~cm}$. long, $\mathbf{I}-2.5 \mathrm{~cm}$. wide, the upper all strongly clasping at the base, the lowest petioled: heads corymbose-paniculate, numerous, 25 mm . broad or more; involucre hemispheric, its bracts green, foliaceous, oblong, mucronate, the inner mostly narrower and acute; rays about 30 , violet, $8-10 \mathrm{~mm}$. long; pappus nearly white; achenes pubescent. Neb. to Mont. and Cal. August.
44. Aster seríceus Vent. Western Silvery or Silky Aster. (I. F.'f. 3776.) Stem slender, paniculately or corymbosely branched, stiff, glabrous, leafy, 3-6 dm. high. Stem-leaves sessile, with a broad base, oblong, entire, mucronate, I-4 cm. long, 4-10 mm. wide, erect or ascending, with a dense silvery-white silky pubescence on both sides; basal and lowest leaves oblanceolate, narrowed into margined petioles; heads numerous, about 35 mm , broad; involucre turbinate, its
bracts oblong, or the inner lanceolate, canescent, imbricated in 3 or 4 series, their tips green, acute, spreading; rays $15-25$, violet-blue, $12-16 \mathrm{~mm}$. long; pappus tawny; achenes glabrous. In dry open soil, Ill. to Minn. and Man., south to Tenn., Kans. and Tex. Aug.-Sept.
45. Aster cóncolor L. Eastern Silvery Aster. Lilac-flowered Aster. (I. F. f. 3777.) Stem slender, glabrous, or pubescent above, 3-7 dm. high, leafy, single, or with few erect branches. Leaves oblong or linear-oblong, finely and densely canescent on both sides, or the lower glabrate, sessile, obtuse or mucronate, $4-5 \mathrm{~cm}$. long; heads in an elongated narrow raceme resembling that of Lacinaria; involucre broadly turbinate, its bracts linear or linear-oblong, appressed, canescent, imbricated in 4 or 5 series, their tips green, acute, the outer shorter; rays $10-15$, lilac, $\bar{b}-8 \mathrm{~mm}$. long; pappus tawny; achenes villous. In dry, sandy soil, eastern Mass. and R. I. to Fla. and La., near the coast. Aug.-Oct.
46. Aster Féndleri A. Gray. Fendler's Aster. (I. F. f. 3778.) Stems several or solitary from thick woody roots, rigid, hirsute, 1.5-3 dm. high. Leaves linear, rigid, I-nerved, acute or acuminate, $16-30 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. wide, glabrous on both sides, but the margins bristly-ciliate; heads usually few and racemose, $1-2.5 \mathrm{~cm}$. broad; involucre turbinate, its bracts glandular, linear-oblong, imbricated in about 4 series, the inner acute, the outer shorter and obtuse; rays io-15, violet, 6-10 mm. long. In dry soil on the plains, western Kans. to Colo. and N. Mex. Aug.-Sept.
47. Aster grandifiòrus L. Large-flowered Aster. (I. F. f. 3779.) Stem rather stiff, divaricately much branched, hispid with short hairs, 3-7 dm. high. Leaves oblong, linear, or somewhat spatulate, rigid, sessile by a broad, sometimes slightly clasping base, reflexed, entire, obtusish, hispid, the larger 5 cm . long and 8 mm . wide, those of the branches very numerous, $4-10 \mathrm{~mm}$. long; heads about 5 cm . broad, terminating the branches; involucre hemispheric, its bracts very squarrose and foliaceous, imbricated in 5-7 series, linear, or linear-oblong, glandular, the outer obtusish, the inner acute; rays very numerous, deep violet, nearly 25 mm . long, 3 mm . wide; pappus brownish; achenes ribbed, canescent. In dry soil, Va., east of the mountains, to Fla. Sept.
48. Aster spectábilis Ait. Low Showy Aster. Seaside Purple Aster. (I. F. f. 3780 .) Stem stiff, simple, or corymbosely branched above, puberulent, or rough below, more or less glandular above, 3-6 dm. high. Leaves firm, thickish, the basal and lower ones oval, acute or acutish, 7-12 cm. long, $2-4 \mathrm{~cm}$. wide, sparingly dentate with low teeth, narrowed at the base into slender petioles; upper leaves sessile, entire or very nearly so, acute, linear-oblong; heads several or numerous, about 35 mm . broad, corymbose, very showy; involucre nearly hemispheric, its bracts linear-oblong or slightly spatulate, glandular, imbricated in about 5 series, the green obtusish tips spreading; rays $15-30$, bright violet. 12-20 mm . long; pappus whitish; achenes slightly pubescent. In dry sandy soil, Mass. to Del., mostly near the coast. Aug.-Oct.
49. Aster surculòsus Michx. Creeping Aster. (I. F. f. 37 Si.) Stem slender, from elongated-filiform rootstocks, minutely scabrous-pubescent, $25-45 \mathrm{~cm}$. high. corymbosely branched above. Leaves firm, lanceolate or linear, the lower petioled, $5-7 \mathrm{~cm}$. long, $8-16 \mathrm{~mm}$. wide, rough-margined, slightly scabrous above, sparingly dentate, the upper narrower, sessile, entire; heads few or sometimes solitary, abreut 3 cm . broad; involucre turbinate-hemispheric, its bracts coriaceous, imbricated in about 5 series, ciliate, but scarcely glandular, their green tips spreading; rays 15 30, violet; pappus whitish; achenes nearly glabrous. In sandy or gravelly soil, N. Car. and Ga. Reported from N. J. Sept.-Oct.
50. Aster grácilis Nutt. Slender or Tuhe Aster. (I. F. f. 3782.) Stem slender, finely puberulent and scabrous, corymboscly branched above, $3^{-4} \mathrm{dm}$, high. Leaves minutely scabrous, the basal and lower ones oval, acute or obtusish. $5-7 \mathrm{~cm}$. long, $8-16 \mathrm{~mm}$. wide, dentate, narrowed into slender petioles; upper leaves linear. linear-oblong, or slightly oblanceolate, acute, entire, sessile or a little clasping: heads usually numerous, $12-20 \mathrm{~mm}$. broad; involucte narrowly turbmate, its bracts coriaceous, glabrous or very nearly so, imbricated in aluout 5 series, their tips green and spreading, obtusish; rays $0-15$, violet, $0-0 \mathrm{~mm}$. long; pappus nearls white ; achenes minutely pubescent. In dry sandy soil. N. J. to Ky.. Tenn. and N. Car. Rootstock tuberous thickened. July-Sept.
51. Aster Rádula Ait. Low Rough Aster. File-blade Aster. (I. F. f. 3783.) Stem glabrous, or puberulent above, corymbosely branched near the summit, 3-6 dm. high. Leaves sessile, rough above, more or less pubescent beneath, oblong-lanceolate, acute, sharply serrate, strongly pinnately veined, $5-7 \mathrm{~cm}$. long, $6-25 \mathrm{~mm}$. wide; heads several, or sometimes numerous, $25-35 \mathrm{~mm}$. broad; involucre hemispheric, its bracts oblong or oblong-spatulate, coriaceous, appressed-pubescent, conspicuously ciliolate, their green obtuse tips appressed; rays 20-30, violet, 8-12 mm. long; achenes glabrous, striate; pappus nearly white. In swamps, Del. and southern Penn. to Newf. July-Sept.

Aster Rádula biflòrus (Michx.) Porter. Lower, very slender; heads $1-3$; leaves narrower, less serrate or entire; involucral bracts, or some of them, acute. Mountains of N. Eng. to Labr. and Newf. Perhaps a distinct species.
52. Aster Hérveyi A. Gray. Hervey's Aster. (I. F. f. 3784.) Stem roughish, at least above, slender, simple or corymbosely branched, rarely paniculate, 3-9 dm. high, the branches glandular-puberulent. Leaves firm, rough above, pubescent on the veins beneath, the basal and lower ones on slender naked petioles, ovate, with low usually distant teeth, acute, narrowed, rounded or rarely cordate at the base, $5-15 \mathrm{~cm}$. long, $2-7 \mathrm{~cm}$. wide; upper leaves sessile, or narrowed into winged petioles, smaller, entire or nearly so; heads $25-35 \mathrm{~mm}$. broad; involucre turbinate or campanulate, its bracts appressed, or sometimes spreading, densely glandular, oblong or spatulate, obtuse or mucronulate; rays 15-25, violet, 10-14 mm. long; achenes minutely pubescent, striate; pappus nearly white. In dry soil, eastern Mass., Conn. and R. I. Aug.-Oct.
53. Aster turbinéllus Lindl. Prairie Aster. (I. F. f. 3785.) Stem slender, paniculately branched, glabrous below, puberulent above, 6-9 dm. high. Leaves firm, lanceolate, or oblong-lanceolate, entire, ciliate, acute or acuminate, 5-7 cm. long, the lower and basal ones petioled, the upper sessile, those of the branches much smaller; heads about 25 mm . broad, mostly solitary at the ends of the branches; involucre turbinate, its bracts oblong, coriaceous, obtuse, appressed, imbricated in 5 or 6 series, their tips green only at the apex; rays $10-20,6-10 \mathrm{~mm}$. long, violet; pappus tawny; achenes finely pubescent. In dry soil, especially on prairies, Ill. to Mo., Kans., La. and Ark. Sept-Oct.
54. Aster Nebraskénsis Britton. Nebraska Aster. (I. F. f. 3786.) Stem strictly erect, slender, stiff, rough to the base, simple, or with a few short nearly erect branches, very leafy, 4-7 dm. tall. Leaves thick, rather rigid, ascending, lanceolate to oblong-lanceolate, sessile by a subcordate base, acute or acuminate at the apex, $2-7 \mathrm{~cm}$. long, $8-12 \mathrm{~mm}$. wide; very rough on both sides, the midvein prominent beneath, the lateral veins obscure; heads few, terminating short leafy branchlets, $25-30 \mathrm{~mm}$. broad; involucre broadly campanulate or hemispheric, about 6 mm . high, its bracts green, oblong, acute, imbricated in several series, the outer quite foliaceous; rays purple, about 12 mm . long. Lake shores, central Neb. Sept.
55. Aster Prìceae Britton, n. sp. Miss Price's Aster. Stem pubescent, widely branched, 3-7 dm. high. Basal leaves oblanceolate, obtuse or acutish, entire, petioled, $3-7 \mathrm{~cm}$. long, the petioles ciliate, broad; stem-leaves linear-lanceolate, sessile, ciliate, acuminate, $2-5 \mathrm{~cm}$. long, those of the branches similar but smaller; involucre nearly hemispheric, about 6 mm . high, its bracts linear, the outer gradually acuminate, green, the inner a little broader, abruptly acuminate, acute or obtusish; heads about 2.5 cm . broad; rays bright purple or pink. Ky. and N. C. Type collected by Sadie F. Price near Bowling Green, Ky. Oct. Similar to A. ericoides pilosus but with pink or purple rays.
56. Aster Kentuckiènsis Britton, n. sp. Kentucky Aster. Glabrous, over 3 dm . high, the numerous branches diverging. Upper leaves all linear-subulate, $\mathbf{I} .5 \mathrm{~cm}$. long or less, ascending, sessile, revolute-margined; heads solitary at the ends of the branchlets, about 2.5 cm . broad; rays pink or purple; involucre about 8 mm . high, its linear-subulate bracts all gradually acuminate, much resembling the upper leaves. Near Bowling Green, Ky., Sadie F. Price, Oct., 1898.
57. Aster paludòsus. Ait. Southern Swamp Aster. (I. F. f. 3787.) Stem roughish, or rough-pubescent, slender, simple, or somewhat branched above, $3-7 \mathrm{dm}$. high. Leaves linear, entire, glabrous, the margins rough or ciliate, rather
rigid, $5-15 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide, mostly I -nerved, acute, the lower part commonly sheathing the stem; heads few or several, racemose or paniculate, $3 \cdot 5-5 \mathrm{~cm}$. broad; involucre broadly campanulate or hemispheric, its bracts imbricated in about 5 series, foliaceous, ciliate, the outer lanceolate, acute, the inner oblong or spatulate; rays $20-30$, deep violet, $10-14 \mathrm{~mm}$. long, pappus tawny; achenes 8 -10-nerved, glabrous or nearly so. Swamps, Kans. and Mo. to Tex., N. C. and Fla. Aug.-Oct.
58. Aster nemoràlis Ait. Bog Aster. (I. F. f. 3788.) Stem puberulent, slender, simple, or corymbosely branched above, 1.5-6 dm. high. Leaves sessile, membranous, oblong-lanceolate or linear-oblong, acute at each end, pubescent or puberulent on both sides, dentate or entire, $2-5 \mathrm{~cm}$. long, $3-8 \mathrm{~mm}$. wide, margins often revolute; heads several, or solitary, $25-35 \mathrm{~mm}$. broad, the peduncles slender; involucre hemispheric, its bracts appressed, linear-subulate, acute or acuminate, imbricated in about 3 series; rays $\mathbf{1 5 - 2 5}$, light violet-purple to rose-pink; achenes glandular-pubescent; pappus white. In sandy bogs, N. J. to northern N. Y., Ont., Newf. and Hudson Bay. Aug.-Sept.

Aster nemoralis Blakei Porter. Stems 3-7 dm. high, ascending, leafy from the base; leaves $5-10 \mathrm{~cm}$. long, $10-25 \mathrm{~mm}$. wide, oblong-lanceolate, remotely and sharply dentate, or nearly entire; heads rather few, sometimes solitary. Me., N. H. and northern N. Y. Forms resemble the following species.
59. Aster acuminàtus Michx. Whorled or Mountain Aster. (I. F. f. 3789 .) Stem pubescent or puberulent, zigzag, corymbosely branched, often leafless below, 3-9 dm. high. Leaves thin, broadly oblong, acuminate at the apex, narrowed to a somewhat cuneate sessile base, sharply and coarsely dentate, pinnately veined, glabrous or pubescent above, pubescent at least on the veins beneath, 7-15 cm . long, $\mathbf{I}-4 \mathrm{~cm}$. wide, often approximate above, and appearing whorled; heads several or numerous, $25-37 \mathrm{~mm}$. broad; involucre nearly hemispheric, its bracts subulate-linear, acuminate, the outer much shorter; rays 12-18, narrow, 12-16 mm. long, white or purplish; pappus soft, fine, nearly white; achenes pubescent. Moist woods, Lab. to Ont., western N. Y., and in the mountains to Ga. July-Oct.
60. Aster ptarmicoides (Nees) T. \& G. Upland White Aster. (I. F. f. 3790.) Stems tufted, slender, rigid, usually rough above, corymbosely branched near the summit, 3-6 dm. high. Leaves linear-lanceolate, 3 -ribbed, entire, or with a few distant teeth, firm, shining, rough-margined or ciliate, sometimes scabrous, acute, narrowed to a sessile base, or the lower petioled, the lowest and basal ones $7-15 \mathrm{~cm}$. long, 4-8 mm . wide, the upper smaller, those of the branches linearsubulate; heads not numerous, $16-25 \mathrm{~mm}$. broad, terminating the branches of the corymb; involucre nearly hemispheric, 4-6 mm. high, its bracts linear-oblong, obtuse, appressed, nearly glabrous, green, imbricated in about 4 series; rays 10-20, snow-white, $6-8 \mathrm{~mm}$. long; pappus white; achenes glabrous. In dry or rocky soil, Mass., Vt. and Ont., to the N. W. Terr., Ill., Mo. and Colo. July-Sept.

Aster ptarmicoides lutés ens (Hook.) A. Gray. Rays pale yellow, short; involucre narrower. Northern Ill. to the N. W. Terr.

6i. Aster dumòsus L. Bushy Aster. Rice button Aster. (I. F. f. 3791.) Glabrous or very nearly so throughout, paniculately much branched, 3-9 dm . high. Leaves firm, those of the stem linear or linear-lanceolate, entire, acute, or obtusish, $2-7 \mathrm{~cm}$. long, $3-9 \mathrm{~mm}$. wide, roughish margiued, often reflexed, those of the branches very numerous, small and bract-like, the basal ones spatulate, dentate; heads 8-14 mm. broad, terminating the usually divergent slender hanches and branchlets, usually numerous; involucre broadly campanulate, its bracts linearsubulate, obtuse or acutish, appressed, imbricated in about 4 series, green-tipped: rays $15-30$, white to pale violet, 4 mm . long, pappus white; achencs minutely pubescent. Sandy soil, Me. to western N. Y., Ont., Fla., La. and Mu. Aug.-()ct.

Aster dumòsus coridifolius (Michx.) T. \& G. More rigid and stouter; branchlets elongated; bracts of the involucre coriaceous: leaves of the branchess small and numerous, very close, divergent. Pine-barrens, Martha's Vineyard to Fla.

Aster dumosus strictior T. \& G. Stem sparingly branched, the branches ascending, terminated by rather larger heads; leaves sessile hy a broad base, acuminate, mostly quite entire, Swamps, Mass. to N. J., Penn. and Md.
62. Aster Grávesii Burgess, n.sp. Gratrs' Astre. Cilabrous; stem slender, 6 dm . high or more. Stem-leaves oblong-lanceolate, entire, firm, sessile, or the
lower petioled, acuminate at the apex, narrowed at the base, roughish-margined, the larger about 7.5 cm . long; branches very slender, recurved, bearing few or solitary heads, clothed with leaves $\mathbf{I}-2 \mathrm{~cm}$. long, the uppermost leaves very small and bract-like; involucre about 6 mm . high, its bracts linear, acute, greenishtipped; heads nearly 2.5 cm . broad, the rays purple. In dry woods, Waterford, Conn., C. B. Graves. Sept.
63. Aster salicifòlius Lam. Willow Aster. (I. F. f. 3792.) Stem rather slender, paniculately much branched, usually very leafy, 6-15 dm. high, glabrous, or somewhat pubescent above. Leaves firm, lanceolate or linear-lanceolate, roughmargined, acute or acuminate, narrowed and sessile or slightly clasping at the base, entire or sparingly dentate with low teeth, glabrous or nearly so, $5-10 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide, the lowest sometimes petioled, those of the branches gradually smaller; heads numerous, $16-25 \mathrm{~mm}$. broad; involucre broadly turbinate, its bracts linear-oblong, appressed, imbricated in 4 or 5 series, their green tips acute or obtusish; rays numerous, violet, or violet-purple, or sometimes white, $6-8 \mathrm{~mm}$. long; pappus white; achenes minutely pubescent. In moist soil, Me. and Ont. to Mass. and Fla., west to Mont., Mo. and Tex. Intergrades with $A$. paniculatus. Aug.-Oct.

Aster salicifolius subásper (Lindl.) A. Gray. Stem scabrous; leaves more or less so. Ind. to Mo. and Tex.

Aster salicifòlius stenophýllus (Lindl.) Burgess. Leaves narrowly linear-lanceolate, small, those of the branches numerous and minute; bracts of the involucre linear-subulate. Southern N. Y. and eastern Penn. to Va.
64. Aster paniculàtus Lam. Tall White or Panicled Aster. (I. F. f. 3793.) Stem glabrous or nearly so, paniculately much branched, 6-25 dm. high. Leaves lanceolate to oblong-lanceolate, acuminate at the apex, narrowed to a sessile or slightly clasping base, glabrous, usually thin, roughish-margined, those of the stem sparingly serrate in the middle, or sometimes very nearly entire, $7-15 \mathrm{~cm}$. long, $6-12 \mathrm{~mm}$. wide, the upper and those of the branches gradually smaller; heads numerous, $16-20 \mathrm{~mm}$. broad; involucre nearly hemispheric, $6-8 \mathrm{~mm}$. high, its bracts narrowly linear-lanceolate, acute or acuminate, appressed, green-tipped, imbricated in 4 or 5 series; rays numerous, white, or faintly tinged with violet, 6-8 mm . long; pappus white or nearly so; achenes minutely pubescent. In moist soil, N. B. to western Ont. and Mont., south to N. J., Va., Ky., La. and Kans. Aug.-Oct.

Aster paniculàtus bellidifiòrus (Willd.) Burgess. Leaves narrowly linear, acuminate at both ends, entire, or remotely appressed-serrate, chiefly 10 cm . long and 7 cm . wide, or less; heads numerous, rather densely clustered on the ascending branches of the large panicle. In moist or wet soil, in open situations, N. B. to western Ont., N. Car., Mo. and Kans.

Aster paniculàtus simplex (Willd.) Burgess. Leaves oblong-lanceolate or oblanceolate, thin, long-acuminate at both ends, the larger often 2 dm . long and 25 mm . wide, sparingly serrate with low teeth; inflorescence leafy, the heads less showy than in the preceding. In shaded moist places, Mass. to Ohio, Va. and Ky.

Aster paniculatus acùtidens Burgess. Leaves oblong-lanceolate, the larger often 15 cm . long by 3 cm . wide, very sharply serrate, at least above the middle; branches often very short, sometimes elongated. Along streams and ditches, Conn. to Va., Ohio and Kans.

Aster paniculàtus cineráscens Fernald. From Maine, is described as cinerous-hirsute, a character otherwise unknown in this species.
65. Aster Missouriénsis Britton. Missouri Aster. (I. F. f. 3794.) Stem densely puberulent or pubescent, at least above, much branched, 6 dm . high or more. Leaves thin, oblong-lanceolate to oblanceolate, acute or acuminate, sharply serrate above the middle, gradually tapering to an entire sessile or slightly clasping base, or the lower petioled, puberulent above, finely pubescent beneath, the larger $7-10 \mathrm{~cm}$. long, the upper much smaller, entire; heads $12-16 \mathrm{~mm}$. -broad, panicled, short-peduncled, or terminating short leafy branchlets, sometimes somewhat secund; involucre 4-6 mm. high, its linear acute bracts well imbricated, ciliate or pubescent; rays white. In moist soil, Kans. and Mo. Sept.-Oct.
66. Aster Tradescánti L. Tradescant's Aster. Michaelimas Daisy. (I. F. f. 3795.). Stem slender, paniculately branched, 6-15 dm. high, the branches usually ascending and often pubescent in lines. Stem-leaves linear-lanceolate or
lanceolate, acuminate, narrowed to a sessile base, 7-15 cm. long, 3-12 mm. wide, glabrous or nearly so on both sides, commonly thin, sharply serrate in the middle with low teeth, or sometimes entire; heads very numerous, racemose but not secund on the branches, $10-16 \mathrm{~mm}$. broad; involucre hemispheric to broadly turbinate, 4-6 mm . high, its bracts linear, acute, appressed, green-tipped, imbricated in 4 or 5 series; rays white or nearly so, numerous, 4-6 mm. long; pappus white; achenes minutely pubescent. In fields and swamps, Ont. to Va., west to the N. W. Terr., Ill. and Minn. Extends to Fla. Aug.-Oct.
67. Aster Fáxoni Porter. Faxon's Aster. (I. F. f. 3796.) Glabrous throughout; stem paniculately or corymbosely branched, rather stout, 6-15 dm. high. Stem-leaves lanceolate or linear-lanceolate, acute or acuminate, narrowed to a sessile base, or the lower into margined petioles, entire or nearly so, firm, 5-12 cm. long, 4-8 mm. wide, those of the branches gradually smaller; basal leaves oblong to spatulate, obtuse, dentate; heads not very numerous, $12-18 \mathrm{~mm}$. broad; involucre hemispheric, nearly 8 mm . high, its bracts linear-lanceolate, acute or subulate, green-tipped or green on the back, imbricated in about 3 series, the outer shorter; rays bright white, $6-8 \mathrm{~mm}$. long, numerous; pappus white; achenes minutely pubescent. On moist cliffs, Vt. and Mass. to Penn., west to Wis.(?), south to N. Car. Aug.-Sept.
68. Aster ericoìdes L. White Heath Aster. Frost-weed Aster. (I. F. f. 3797.) Stem glabrous or very nearly so, paniculately branched, usually bushy, 3-9 dm. high, the branches racemose, and the branchlets often somewhat secund. Leaves firm or rigid, the basal ones spatulate, obtuse, dentate, narrowed into margined petioles, glabrous or ciliate; stem-leaves narrowly linear, acute, entire, $2-7 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, those of the branches linear-subulate, numerous; heads usually very numerous, $8-12 \mathrm{nim}$. broad; involucre campanulate to hemispheric, its bracts coriaceous, lanceolate or linear-lanceolate, abruptly acute or acuminate, green-tipped, imbricated in about 3 series; rays $15-25$, white, or tinged with rose; pappus white; achenes finely pubescent. In dry soil, Me. and Ont. to Fla., west to Wis. and Ky. Sept.-Dec.

Aster ericoides pilosus (Willd.) Porter. Stem, branches and often the leaves villoushirsute or hispid; leaves linear-lanceolate. W. Ont. to Penn. and Ga., west to Minn. and Mo.

Aster ericoìdes platyphýllus T. \& G. Densely villous-hirsute: stem-leaves lanceolate or oblong-lanceolate, $2-5 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide. Ind. to N. Car. and Ga.

Aster ericoides depauperàtus Porter. Glabrous, very slender, $15-30 \mathrm{~cm}$. high; stemleaves and those of the branches linear or subulate. S. Penn. and W. Va.

Aster ericoìdes Rándi Britton. Low, stout, glabrous, seldom over 3 dm . high, corymbosely or somewhat racemosely branched above, often bushy; stem-leaves elongated, sometimes 6 mm . wide; basal leaves spatulate, petioled, entire; heads numerous, larger than in the type, sometimes over 25 mm . broad; rays white to violet; bracts of the involucre greener than in the type. Perhaps a distinct species. Mt. Desert Island, Me.

Aster ericoides parviceps Burgess. More or less pilose; stem strict, erect, about 3 dm. high, usually bushy, branched above, the branches mostly short; leaves narrowly linear, ascending, with short leafy branches in their axils; heads numerous, crowded, $6-8 \mathrm{~mm}$. broad, somewhat secund; involucre $\mathrm{r}-4 \mathrm{~mm}$. high ; leaves of the branches reduced to small scales. Prairies, Ill. and Mo.
69. Aster Prínglei (A. Gray.) Britton. Pringie's Astrk. (I. F. f. 3708 .) Stem very slender, glabrous, simple, or with few or numerous slender ascending branches, not busky, $1.5-6$ dm. high. Basal leaves lancoolate, ohbong or ohlameedlate, $5-15 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide, entire, or slightly toothed, ciliate and sometimes a little pubescent, at least on the stender petioles, which are often as long as the blades; stem-leaves marrowly linear, those of the branches small and subulate: heads as large as those of I. cricodes, or commonly smaller, ustally fewer, solitary at the ends of the branches and branchlets; bracts of the campanulate involucre with short green tips; rays white. On banks, especially in rocky places, Me. to Mass., Vt. and Wis. Aug.-Oct.
70. Aster lateriflòrus (L.) Brittom. Startin Astrr. Cumico Aster. (I. F. f. 3709.) Stem puberulent or nearly glabrous, slember, divergenty hranched. $\mathbf{3 - 1 5 d m}$. high. Basal leaves ovate, slender-petiold; stem-leaves broally hancenlate or oblong-lanceolate, mostly acuminate, serrate, 512 cm . long, $12-25 \mathrm{~mm}$. wide, those of the branches smaller, oblong or linear-oblong: heads $0-10 \mathrm{~mm}$. broad,
racemosely unilateral on the branches, short-peduncled or sessile, usually numerous and crowded; involucre turbinate, its bracts linear-oblong, obtuse or acutish, imbricated in about 4 series, their short green tips appressed or slightly spreading; rays numerous, short, white or pale purple; disk-flowers purple; pappus white; achenes minutely pubescent. In dry or moist soil, N. S. to western Ont., south to N. Car., La. and Tex. Called in Maryland Rosemary. Aug.-Oct.

Aster laterifiòus glomeréllus (T. \& G.) Burgess. Chiefly unbranched, with the habit of Solidago caesia; leaves hispidulous above, oblong-lanceolate, dull green, the teeth very sharp and straight; heads glomerate in the axils, often somewhat spicate toward the summit of the plant, sometimes also on short branches. In deep woods, N. Y. to Va.

Aster laterifiòrus thyrsòideus (A. Gray) Sheldon. Ashy-pubescent; leaves ovate to lanceolate ; branches ascending, rather stiff, mostly short; heads usually densely thyrsoidpaniculate, less markedly secund than in the type. Me. to N. Y., Ont. and Ill.

Aster lateriflòrus grándis Porter. Taller and larger-leaved than the type, the branches spreading; leaves lanceolate, sometimes 15 cm . long and nearly 25 mm . wide; heads mostly larger, rather loosely paniculate. In shaded places, southern N. Y, to Ky. and Ill.

Aster laterifiòrus péndulus (Ait.) Burgess. Leaves linear-elliptic, conspicuously drooping, remotely appressed-serrulate, often with narrowly margined petioles, roughish when dry; branches long, slender, often pendulous; heads long-peduncled; rays and bracts often purple-tinged. In thickets, N. Y. to Va.

Aster lateriflòrus horizontàlis (Desf.) Burgess. Branches long, slender, widely spreading; leaves firm, those of the branches very small, mostly entire; heads very numerous; rays rather large. Southern N. Y. to Va.
71. Aster hirsuticaùlis Lindl. Hairy-stemmed Aster. (I. F. f. 3800 .) Stem slender, erect, 4-9 dm. high, pubescent, nearly or quite to the base, the usually short branches spreading or ascending. Leaves thin, glabrous above, usually pubescent on the midvein beneath, serrate with a few appressed teeth, or entire, linearlanceolate to lanceolate, sometimes 15 cm . long, 4-14 mm. wide, sessile, or the basal ones spatulate and petioled; heads more or less secund on the branches, densely or loosely clustered, often also solitary or few in the lower axils; bracts of the involucre in 3 or 4 series, linear-lanceolate, acuminate or acute; rays white, about 4 mm . long. In woods and thickets, Me. to N. Y., Penn. and Ky.
72. Aster vimíneus Lam. Salle White Aster. (I. F. f. 380i.) Glabrous or nearly so; stem slender, divergently branched, 6-15 dm. high. Stemleaves linear-lanceolate, entire, or with a few low teeth, $7-12 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide, acuminate, narrowed to a sessile base, those of the branches much smaller; heads very numerous, $6-10 \mathrm{~mm}$. broad, $4-6 \mathrm{~mm}$. high, generally densely racemosesecund, short-peduncled; involucre broadly turbinate, its bracts linear, acute or acutish, green-tipped, appressed; rays numerous, about 4 mm . long, white; pappus white; achenes minutely pubescent. In moist soil, Ont. to Mass., Fla., Minn., Kans. and Ark. Aug.-Sept.

Aster vimíneus foliolòsus (Ait.) A. Gray. Branches ascending, very leafy; heads paniculate, scarcely secund, less densely clustered.. Mass. to Va., Ill. and Mo.

Aster vimíneus Columbiànus Britton. Minutely pubescent, $6-12 \mathrm{dm}$. high, the slender branches ascending; leaves linear to linear-lanceolate, those of the stem deflexed; heads about 25 mm . broad; rays red-purple. Perhaps a distinct species. D. C. to N. Y.

Aster vimineus saxatilis Fernald. Low, $1.5-6 \mathrm{dm}$. high, the leafy-bracteate branches bearing few or solitary heads, $I-1.5 \mathrm{~cm}$. broad; stem-leaves sometimes slightly clasping at the base. Shores and banks, Me., Vt. and Quebec. Perhaps not properly referred to this species.
73. Aster multiflòrus Ait. Dense-flowered Aster. White Wreath Aster. (I. F. f. 3802.) Stem strict, much branched and bushy, grayish-strigose, $3-20 \mathrm{dm}$. high, the branches ascending or spreading. Leaves rigid, linear or linear-oblong, entire, mostly obtuse, sessile or slightly clasping at the base, strigose or glabrate, those of the stem $\mathbf{I}-2.5 \mathrm{~cm}$. long, those of the branches very small and crowded; heads $6-8 \mathrm{~mm}$. broad, densely crowded, nearly sessile; involucre turbinate, $4-6 \mathrm{~mm}$. high, its bracts coriaceous, pubescent, in 3 or 4 series, their short green tips obtuse or mucronate, spreading; rays 10-20, white, $3-4 \mathrm{~mm}$. long; pappus brownish white; achenes puberulent. In dry open places, Me. and Ont. to S. Dak., Ga., Tex., Ariz. and Mex. Aug.-Nov.
74. Aster exíguus (Fernald) Rydb. Ciliate-leaved Aster. Stem much branched and bushy, $3-10 \mathrm{dm}$. high, rough-pubescent with short divaricate hairs;
branches spreading, often secund; leaves as in the preceding, but more pubescent, with spreading hairs, ciliate; heads as in the preceding, but usually on shorter branchlets; bracts broader with a thick, broad, oval or obovate green portion, hispid and ciliate. On prairies, plains and other open places, Vt. and Pa. to Wash., Tex. and Ariz. Rare in the East. Aug.-Nov. [A. ciliatus Muhl., not Walt.; A. multiflorus var. exiguus Fernald.]
75. Aster commutàtus Torr. \& Gray. White Prairie Aster. (I. F. f. 3803.) Similar to the two preceding species, except in the inflorescence, the stem rough-pubescent, or sometimes nearly glabrous, $4-7 \mathrm{dm}$. high, with ascending or divergent branches. Leaves linear or linear-oblong, obtuse, entire, sessile or slightly clasping at the base, those of the stem $2-7 \mathrm{~cm}$. long; heads larger than those of $A$. multiflorus, $\mathbf{1 2 - 1 6 ~ m m . ~ b r o a d ~ ; ~ i n v o l u c r e ~} 6-8 \mathrm{~mm}$. high, its bracts squarrose-tipped and sometimes foliaceous; rays $20-30$, about 6 mm . long. On prairies and along rivers, N. W. Terr. to western Neb., Tex., Ore., Utah and N. Mex. Aug.-Oct.
76. Aster tenuifòlius L. Perennial Salt-marsh Aster. (I. F. f. 38o4.) Perennial, glabrous and fleshy; stem flexuous, striate, at least when dry, sparingly and loosely branched, 3-6 dm. high. Stem-leaves linear, entire, acute, sessile or partly clasping at the base, the lowest lanceolate-linear, $5^{-15} \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. wide, those of the branches minute, bract-like, appressed; heads rather few, 1225 mm . broad, terminating the branches; involucre turbinate, about 8 mm . high, its bracts lanceolate, acuminate or mucronate, glabrous, green on the back or tip, appressed, imbricated in about 5 series, the outer shorter; rays numerous, longer than the pappus, pale purple or nearly white; pappus tawny; achenes hispid-pubescent, 5 -nerved. In salt marshes, coast of Mass. to Fla. Aug.-Oct.
77. Aster exilis Ell. Slim Aster. (I. F. f. 3805.) Annual, glabrous, fleshy; stem slender, usually much branched, the branches usually divergent. Leaves linear to linear-lanceolate, $2-10 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, entire, sessile, acute or acuminate, or the lowest narrowly oblong, $6-8 \mathrm{~mm}$. wide and petioled, those of the branches subulate; heads numerous, panicled, about 1 cm . broad; involucre campanulate, about 6 mm . high, its bracts linear-subulate, appressed, imbricated in 3 or 4 series; rays purplish, about 4 mm . long, mostly fewer than the disk-flowers, longer than the pappus; achenes somewhat pubescent. In moist or wet soil, especially in saline situations, Kans. to Tex., S. Car. and Fla. Aug.-Oct.
78. Aster subulàtus Michx. Annual Salt-marsh Aster. (I. F. f. 3 8o6.) Annual, glabrous and fleshy; stem paniculately branched, flexurus above, 3-18 dm. high, slightly angled, sometimes 25 mm . in diameter at the base, but usually smaller. Stem-leaves linear-lanceolate, acute, entire, sessile by a broad or slightly clasping base, $5-25 \mathrm{~cm}$. long, $2-16 \mathrm{~mm}$. wide, those of the branches very small and subulate; heads numerous, $6-10 \mathrm{~mm}$. broad; involucre campanulate, or at length hemispheric, 4-6 mm. high, its bracts linear-subulate, green, imbricated in 3 or 4 series, the outer shorter; rays $20-30$, purplish, scarcely excecding the nearly white pappus, more numerous than the disk flowers; achenes compressed, minutely pubescent. In salt marshes, coast of N. H. to Fla. Aug.-Nov.

## 32. LEUCELENE Greene.

Low perennial herbs, with much branched leafy stems, sessile, rather rigid, narrow entire leaves and small heads of both tubular and radiate white flowers, solitary at the ends of the numerous slender branchlets. Involucre turbinate. its bracts well imbricated. Disk-flowers perfect, their corollas white, tubular-tumel form, 5 -toothed. Ray-flowers numerous, white, or drying red to rose, pistillate. Style appendages acutish. Achenes elongated, flattened, hispidulous. Pappus a single series of slender rough white bristles. [Greck, reterring to the white disk.] One species, or more, native of the southwestern States and Mexico.

1. Leucelene ericoides (Torr.) Gmenc. Rosk: Hfarll Aster. (I. F. f. 3807.) Stems tufted from deep woody roots, comymbencly much branched, $7-30 \mathrm{~cm}$. high, hispid or scabrous, the branches erect or ditluse leaves hispitciliate, erect, or slightly spreading, ohtusish or mucromblate the lower and basal ones spatulate, $6-12 \mathrm{~mm}$. long, tapering into shont petioles, the upper sessibe, linear or linear-spatulate; heads terminating the branches, $10-16 \mathrm{~mm}$. broad; bracts hanceolate, appressed, scarious margined, imbricated in 3 or + series, rays $12-15$.
white to rose, $4-8 \mathrm{~mm}$. long. In dry soil, western Neb. to Kans., Tex. and Mex., west to Cal. May-Aug.

## 33. BRACHYÁCTIS Ledeb.

Annual, nearly glabrous, somewhat fleshy herbs, with narrow chiefly entire leaves, and small racemose or racemose-paniculate heads of tubular, or also radiate purplish flowers. Involucre campanulate. Central flowers of the head few, perfect, their narrow corollas $4-5$-toothed; outer flowers pistillate, usually in 2 series or more, and more numerous than the perfect ones; style-appendages lanceolate; rays very short, or none. Achenes 2-3-nerved, slender, appressed-pubescent. Pappus a single series of nearly white bristles. [Greek, short rays.] About 5 species, natives of western N. Am. and northern Asia.

1. Brachyactis angústus (Lindl.) Britton. Rayless Aster. (I. F. f. 3808.) Stem usually sparsely pubescent, at least above, I.5-6 dm. high, striate, at least when dry. Leaves linear, fleshy, ciliate on the margins, acutish, entire, sessile by a rather broad base, the basal (when present) spatulate; heads $8-\mathbf{1 2} \mathbf{~ m m}$. broad; involucre campanulate or nearly hemispheric, 4-6 mm . high, its bracts linear or linear-oblong, somewhat foliaceous, green, acute or obtuse, imbricated in 2 or 3 series, glabrous or slightly ciliate, nearly equal; rays none or rudimentary; pappus soft and copious. In wet saline soil, or sometimes in waste places, Minn. to the N. W. Terr., Utah and Colo. Found also about Chicago. July-Sept.

## 34. MACHAERANTHERA Nees.

Annual, biennial or perennial branched herbs, with leafy stems, alternate, mostly serrate or pinnatifid leaves, the teeth or lobes usually bristle-tipped, and large heads of both tubular and radiate flowers. Involucre of numerous series of imbricated canescent or glandular bracts with herbaceous or foliaceous spreading or appressed tips. Receptacle alveolate, the alveoii usually toothed or lacerate. Rayflowers numerous, violet to red or purple, pistillate. Disk-flowers perfect, their corollas tubular, 5 -lobed, yellow, changing to red or brown; anthers exserted, appendaged at the tip, rounded at the base; style-appendages subulate to lanceolate. Achenes turbinate, narrowed below, pubescent. Pappus of numerous stiff rough unequal bristles. [Greek, sickle-anther.] About 15 species, natives of western N. Am.

Annual or biennial; leaves pinnatifid.
Perennial or biennial; leaves sharply serrate.

1. M. tanacetifolia.
2. M. sessiliffora.
3. Machaeranthera tanacetifòlia (H. B. K.) Nees. Tansy Aster. Dag-GER-FLOWER. (I. F. f. 3809.) Annual or biennial; stem glandular-pubescent, often viscid, densely leafy, much branched and bushy, 3-6 dm. high. Leaves sessile or short petioled, pubescent, the lowest $2-7 \mathrm{~cm}$. long, $2-3$-pinnatifid, their lobes linear or oblong, acute or mucronate, the upper pinnatifid, those of the branches sometimes entire; heads numerous, corymbose-paniculate. $3-5 \mathrm{~cm}$. broad; involucre hemispheric, $8-12 \mathrm{~mm}$. high, its bracts linear, glandular. imbricated in 5-7 series; rays $15-25$, $10-16 \mathrm{~mm}$. long, achenes villous. In dry soil, Neb. to Tex. and Mex., west to Cal. June-Aug.
4. Machaeranthera sessiliflòra (Nutt.) Greene. Viscid Aster. (I. F. f. 38 Io.) Stem usually stout, finely rough-pubescent or canescent, branched, and viscid-glandular above, 3-6 dm. high. Leaves lanceolate, linear, or the lowest spatulate, sessile, sharply incised-dentate, the larger $2-7 \mathrm{~cm}$. long, the teeth bristletipped; heads numerous, racemose, or corymbose above, $25-37 \mathrm{~mm}$. broad, the lower often nearly sessile; involucre broadly turbinate or hemispheric, $8-12 \mathrm{~mm}$. high, its bracts acute, imbricated in $6-10$ series; rays $8-12 \mathrm{~mm}$. long; achenes narrow, appressed-pubescent. In dry soil, central and western Neb. July-Oct.

## 35. ERÍGERON L.

Branching or scapose herbs, with alternate or basal leaves, and corymbose, paniculate or solitary, peduncled heads, of both tubular and radiate (rarely all tubular) flowers. Involucre hemispheric or campanulate, its bracts narrow, nearly equal, imbricated in but $\mathbf{I}$ or $\mathbf{2}$ series in our species. Receptacle nearly flat, usually naked. Ray-flowers, in our species, white, violet or purple, pistillate. Disk-
flowers yellow, tubular, perfect, their corollas mostly 5 -lobed. Anthers obtuse and entire at the base. Style-branches more or less flattened, their appendages short, mostly rounded or obtuse. Achenes flattened, usually 2 -nerved. Pappus-bristles fragile, slender, scabrous or denticulate, in I series, or often an additional outer shorter series. [Greek, early-old, alluding to the early hoary pappus.] A genus of some 130 species, of wide distribution. In addition to the following, about 60 others occur in southern and western N. Am.

* Rays long, narrow, usually equalling or longer than the diameter of the disk.
+ Stem $2-25 \mathrm{~cm}$. high, simple, leafy; head solitary; involucre woolly.

1. E. uniflorus.
† + Stem I-9 dm. high, leafy, usually branched; involucre hirsute or glabrous. I. Roots perennial, thick and woody.

Heads 25-50 mm. broad; leaves lanceolate, ovate, oblong, or spatulate.
Rays violet or purple; stem-leaves ovate, lanceolate, or oblong.
Stem-leaves linear-lanceolate, the upper much smaller.
Stem-leaves ovate-lanceolate, the upper little smaller. 3. E. subtrinervis.
Rays mostly white; stem-leaves linear or linear-oblong. 4. E. caespitosus.
Heads $12-25 \mathrm{~mm}$. broad; leaves linear.
Plants hirsute or canescent; pappus double; western species.
Stem hirsute; achenes pubescent ; flowers white. 5. E. pumilus.
Stem appressed-canescent; achenes glabrous; flowers purple or white.
6. E. canus.

Plant nearly glabrous; pappus simple; northern.
7. E. hyssopifolius.
2. Perennial by decumbent rooting stems or stolons.
8. E. fagellaris.
3. Roots annual or biennial, fibrous; plants often perennial by offsets.

Heads $25-37 \mathrm{~mm}$. broad, few; stem simple ; eastern.
9. E. pulchellus.

Heads $12-25 \mathrm{~mm}$. broad, numerous; stem branched.
Rays 100-150, narrow, mostly purple or violet.
Pappus simple; plant erect, corymbosely branched. 1о. E. Philadelphicus.
Pappus double; plant diffusely branched, western. II. E. divergens.
Rays much less numerous, purplish or white.
Plants 1.5-3 dm. high, diffuse, western; pappus simple. 12. E. Bellidiastrum.
Plants $3^{-10} \mathrm{dm}$. high, erect, corymbosely branched; pappus double.
Stem-leaves lanceolate, nearly all sharply serrate. 13. E. annuzs.
Stem-leaves linear-lanceolate or oblong, nearly all entire.
14. E. ramosus.
$\dagger \dagger \dagger$ Stem leafless or nearly so; heads 12 mm . broad, corymbose.
15. E. vernus.
** Rays inconspicuous or short; a row of tubular pistillate flowers inside the row of rays.
16. E. acris.
I. Erigeron uniflòrus L. Arctic Erigeron. (I. F. f. 38if.) Perennial by short branching rootstocks; stems slender, single or tufted, more or less pubescent, simple, erect. Basal leaves petioled, spatulate, obtuse, entire, $2-5 \mathrm{~cm}$. long; stem-leaves sessile, lanceolate or linear-lanceolate, entire; head solitary, peduncled, $12-25 \mathrm{~mm}$. broad; rays about 100 , purple or purplish, $4-8 \mathrm{~mm}$. long; bracts linear-lanceolate, acute, copiously woolly; pappus simple. Lab. and arctic Am. to Alaska. Rocky Mts. specimens referred to this species belong to E. simplcir: Also in Europe. Summer.
2. Erigeron ásper Nutt. Rough Erigeron. (I. F. f. 3 Si2.) Stem simple, or branched above, more or less pubescent, sometimes hirsute. 1.5-6 dm. high. Leaves glabrous, pubescent or ciliate, entire, the basal ones spatulate, obtuse, 5-10 cm. long, $6-25 \mathrm{~mm}$. wide, narrowed into margined petiokes; stem-leaves oblong-lanceolate or linear-lanceolate, obtuse or acute, the upper smaller; heads several or solitary, slender-peduncled, $2-5 \mathrm{~cm}$. broad; bracts linear, acute, hirsute or pubescent; rays 100-150, very narrow, violet, purple, or nearly white, $\mathrm{S}-14 \mathrm{~mm}$. long; pappus double, the outer row of bristles much shorter than the inner. In dry soil, Minn. to Neb., west to the N. W. Terr., Utah and N. Mex. June-sept.
3. Erigeron subtrinérvis Rydberg. Three-nekved Fledbane. (1. F.f. 3813.) Similar to the preceding species, finely pubescent. Stems leafy to the inflorescence; leaves entire, thin, the basal and lower ones oblancoolate to oblong. obtuse or acute, petioled, the upper lanceolate or ovate-lanceolate, sessile or somewhat clasping, acute, rather distinctly 3 -nerved; heads $25-37 \mathrm{~mm}$. broad, corymbose, or rarely solitary; rays numerous, blue to pink; pappus double, the outer bristles very short. S. Dak. to Neb. and Utah.
4. Erigeron caespitòsus Nutt. Tufted Erigeron. (I. F. f. 3814.) Stems tufted, canescent, simple, or branched above, I.5-3 dm. high. Leaves canescent or pubescent, entire, the lower and basal ones petioled, narrowly oblanceolate or spatulate, 2-7 cm. long; heads solitary or several, short-peduncled, $25-37 \mathrm{~mm}$. broad; bracts lanceolate or linear-oblong, acute, canescent; rays $40-60,6-12 \mathrm{~mm}$. long, white or pinkish; pappus double, the outer series of bristles very short. In dry soil, Manitoba and the N. W. Terr. to Neb., N. Mex. and Cal. June-Aug.
5. Erigeron pùmilus Nutt. Low Erigeron. (I. F. f. 3815.) Stems tufted, slender, simple, or branched, $\mathbf{I}-2.5 \mathrm{dm}$. high. Leaves entire, hirsute, the lower and basal ones narrowly spatulate or linear, petioled, $2-10 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide; stem-leaves linear; heads $12-20 \mathrm{~mm}$. broad, short-peduncled; bracts linear, acute, hirsute: rays $50-80$, white, $6-8 \mathrm{~mm}$. long, at length deflexed; pappus double, the outer row of bristles short and more or less intermixed with the inner; achenes pubescent. Dry plains, S. Dak. to N. W. Terr., western Kans., Br. Col. and Utah. May-Sept.
6. Erigeron cànus A. Gray. Hoary Erigeron. (I. F. f. 38i6.) Stems slender, erect, tufted, $15-25 \mathrm{~cm}$. high, simple, or branched above. Leaves narrow, entire, canescent, the basal and lower ones narrowly spatulate, petioled, 5-10 cm . long, the upper linear, sessile, acute, gradually smaller; heads solitary, or 24, $\mathbf{I} 2-15 \mathrm{~mm}$. broad; bracts linear, acute, densely canescent; rays $40-50$, purple or white, 4-6 mm . long; pappus double, the outer row of bristles rather conspicuous. In dry soil, S. Dak. to western Neb., Wyo., Colo. and N. Mex. June-Aug.
7. Erigeron hyssopifòlius Michx. Hyssop-leaved Erigeron. (I. F. f. 3817 .) Perennial by slender rootstocks; stems tufted or single, very slender, simple or branched, glabrous or very nearly so, $10-35 \mathrm{~cm}$. high. Leaves narrow, thin, the basal and lower ones oblong or spatulate, short-petioled, $2-4 \mathrm{~cm}$. long, $3-4 \mathrm{~mm}$. wide, the upper linear or linear-oblong, acute, heads solitary or several, slenderpeduncled, $\mathbf{1 0}-\mathbf{I} 5 \mathrm{~mm}$. broad; bracts linear-lanceolate, sparingly pubescent; rays 20-30, white or purplish, 4-6 mm. long; pappus simple. On moist cliffs, Newf. to Vt., the N. W. Terr. and Lake Superior. July-Aug.
8. Erigeron Aagellàris A. Gray. Running Fleabane. (I. F. f. 3818.) Appressed-pubescent, sometimes densely so. Stem slender, branched, the branches elongated; leaves entire, the basal and lower ones spatulate or oblong, obtuse or acute, $2-5 \mathrm{~cm}$. long, narrowed into long petioles, the upper sessile, linear or linearspatulate, much smaller; peduncles solitary, elongated; heads about 25 mm . broad and 6 mm . high; rays very numerous, white to pink; pappus double, the outer series of subulate bristles. In moist soil, S. Dak. to Colo., Utah, Tex. and N. Mex. May-July.
9. Erigeron pulchéllus Michx. Robin's or Poor Robin's Plantain. (I. F. f. 3819.) Perennial by stolons and offsets, villous-pubescent; stems simple, slender, $2.5-6 \mathrm{dm}$. high. Basal leaves tufted, spatulate or obovate, somewhat cuneate at the base, narrowed into short margined petioles, obtuse at the apex, 27 cm long, $1-5 \mathrm{~cm}$. wide, dentate or serrate; stem-leaves sessile, partly clasping, oblong, lanceolate to ovate, mostly acute, entire, or sparingly serrate; heads I-6, slender-peduncled, bracts linear, acuminate, villous; rays numerous, violet or purplish, 8-14 mm. long; achenes nearly glabrous; pappus simple. On hills and banks, N. S. to Ont., S. Dak., Fla. and La. April-June.
10. Erigeron Philadélphicus L. Philadelphia Fleabane. Skevish. (I. F. f. 3820.) Perennial by stolons and offsets, soft-pubescent or sometimes nearly glabrous; stems slender, mostly branched above, 3-9 dm. high. Basal and lower leaves spatulate or obovate, obtuse, dentate, $2-7 \mathrm{~cm}$. long, narrowed into short petioles; upper stem-leaves clasping and often cordate at the base; heads several or numerous, corymbose-paniculate, $10-25 \mathrm{~mm}$. broad, slender-peduncled; bracts linear, usually scarious-margined; achenes puberulent. In fields and woods, throughout N. Am., except the extreme north, but locally rare. April-Aug.
II. Erigeron divérgens T. \& G. Spreading Fleabane. (I. F. f. 382I.) Annual or biennial, diffusely branched, $15-37 \mathrm{~cm}$. high, densely cinereouspubescent or hirsute. Basal and lower leaves spatulate or oblanceolate, acute or obtuse, mostly petioled, entire, dentate or lobed, $2-5 \mathrm{~cm}$. long, 4-10 mm . wide, the upper sessile, linear or narrowly spatulate, usually acute, gradually smaller; heads $16-25 \mathrm{~mm}$. broad; bracts linear, acute, hirsute or canescent; rays about 100,
purplish, violet or nearly white, 4-8 mm. long; pappus double, the short outer row of bristles subulate. In moist soil, Mont. to Neb., Tex., Mex., Wash. and Cal. April-Sept.
12. Erigeron Bellidiástrum Nutt. Western Daisy Fleabane. (I. F. f. 3822.) Annual, much branched, cinereous-pubescent throughout. Leaves entire, linear-spatulate, the lower and basal petioled, $2-4 \mathrm{~cm}$. long, the upper sessile and smaller; heads several, or numerous, $10-16 \mathrm{~mm}$. broad; involucre hemispheric, about 4 mm . high, its bracts linear, hirsute, acute; rays $30-65$, white or purplish, about 4 mm . long; pappus a single series of capillary bristles. In moist soil, Neb. and Kans. to Tex. May-July.
13. Erigeron ánnuus (L.) Pers. Sweet Scabious. Daisy Fleabane. (I. F. f. 3823.) Annual, sparingly pubescent, with spreading hairs; stem erect, corymbosely branched. Leaves thin, the lower and basal ones ovate or ovate-lanceolate, mostly obtuse, petioled, usually coarsely dentate, $5-15 \mathrm{~cm}$. long, $2-7 \mathrm{~cm}$. wide, the upper sessile or short-petioled, lanceolate, oblong, or linear-lanceolate; heads rather numerous, $10-14 \mathrm{~mm}$. broad; bracts somewhat hispid; rays $40-70$, linear, white, or commonly tinged with purple, $4-8 \mathrm{~mm}$. long; pappus double, the inner a series of slender fragile deciduous bristles, often wanting in the ray-flowers, the outer a persistent series of short, partly united, slender scales. In fields, N. S. to the N. W. Terr., south to Va., Ky., Kans. and Mo. Nat. in Europe. May-Nov.
14. Erigeron ramòsus (Walt.) B. S. P. Daisy Fleabane. (I. F. f. 3824.) Resembles the preceding species, but is usually lower and the pubescence more appressed. Stem-leaves linear-oblong, or linear-lanceolate, nearly all of them entire; basal and iowest spatulate or oblong, usually serrate; bracts of the involucre glabrous or nearly so; pappus similar to that of the preceding; rays white, or sometimes purplish, occasionally minute or wanting. In fields, N. S. to the N. W. Terr., south to Fla., La. and Tex. May-Nov.

Erigeron ramòsus Beyríchii (F. \& M.) Smith \& Pound. Stem more slender; leaves narrower ; heads smaller ; pubescence minute. Ga. to Neb. and Tex.
15. Erigeron vérnus (L.) T. \& G. Early Fleabane. (I. F. f. 3825.) Perennial by stolons and offsets; stem slender, simple or branched above, glabrous, or the branches pubescent, 3-5 dm. high. Leaves mainly in a basal rosette, glabrous, obovate, oval or spatulate, obtuse, repand-denticulate or entire, $5-10 \mathrm{~cm}$. long, narrowed into margined petioles; stem-leaves mostly reduced to subulatelanceolate scales; heads not numerous, corymbose, peduncled, about 1 cm . broad; rays $20-30$, white or pink, $4^{-6} \mathrm{~mm}$. long; pappus simple; achenes usually $4^{-}$ nerved. In marshes and moist soil, Va. to Fla. and La. April-May.
16. Erigeron àcris L. Blue or Bitter Fleabane. (I. F. f. 3826.) Biennial or perennial; stem hirsute-pubescent, slender, simple, or branched ahove, 1.54.5 dm . high. Leaves pubescent or glabrous, entire, the basal and lower ones spatulate, mostly obtuse, $2-7 \mathrm{~cm}$. long, petioled, those of the stem mostly oblong or oblanceolate, obtuse or acutish, sessile, shorter; heads several or numerous, racemose or paniculate, peduncled, $10-\mathbf{1 2} \mathbf{~ m m}$. broad; bracts linear, hirsute; rays numerous, purple, equalling or slightly exceeding the brownish pappus; tubular pistillate flowers numerous; pappus simple or nearly so, copions. Lab, to Br . Col., south in the Rocky Mts. to Colo. and Utah. Also in Europe and Asia. July-Aug.

Erigeron àcris Droebachiànus (O. F. Mueller) Blytt. Usually taller and less pubescent, or glabrate; involucre nearly glabrous. N. B. to western Ont., Alaska, Br. Col. and Colo. Also in Europe.

Erigeron àris débilis A. Gray. Slightly pilose-pubescent, very slender; heads few. Range of the last.
36. LÉPTILON Raf.

Annual or biennial herbs, with small racemose thyrsod or panicled heads of white flowers, the rays small, usually shorter than the diameter of the disk or mone. Involucre mostly campanulate, its narrow bracts in 2 or 3 serics. Recoptacle naked. Ray-flowers pistillate; disk-flowers perfect, their comollas usually f-hobed or 4 -toothed, the anthers obtuse at the base: sty-branches somewhat thattemed, their appendages short. Achenes flattencd. lappus of mumerous simple fragile bristles in 1 series. [Greek, referring to the small heads.] About 20 species,
natives of America and Asia. Besides the following, 2 or 3 others occur in the southwestern U. S. and one is nat. from Asia on the southern Atlantic and Pacific coasts.

Lower leaves spatulate, toothed; rays white.
Leaves all linear or subulate, entire; rays purplish.

1. L. Canadense.
2. L. divaricatum.
I. Leptilon Canadénse (L.) Britton. Horse-weed. Canada Fleabane. (I. F. f. 3827.) Stem hispid-pubescent, or glabrate, $7-30 \mathrm{dm}$. high, the larger plants paniculately much branched. Leares usually pubescent or ciliate, the basal and lower spatulate, petioled. incised, dentate or entire. $2-10 \mathrm{~cm}$. long, obtuse or acutish, those of the stem linear and mainly entire; heads usually very numerous; about 4 mm . broad: involucre. $2-3 \mathrm{~mm}$. high, its bracts linear, acute. glabrate; rays numerous, white, shorter than the pappus and mostiy shorter than their tubes. In fields and waste places, a common weed throughout N. Am., except the extreme north. Widely distributed as a weed in the Old World and in S. Am. June-Nor.
3. Leptilon divaricatum (Michx.) Raf. Low Horse-weed. Purpie Horse-weed. (I. F.f. 3 §28.) Stem diffusely much branched. $7-30 \mathrm{~cm}$. high, pubescent or hirsute. Leaves all linear or subulate, entire. $\delta-25 \mathrm{~mm}$. long, about I mm. wide, the uppermost minute: heads numerous. about +mm . broad; involucre 2 mm . high, its bracts linear, acute, pubescent; rays purplish, shorter than their tubes. In sandy soil. especially along rivers. Ind. to Minn.. S. Dak., Tenn.. La., Neb. and Tex. June-Oct.

## 37. DOELLINGERIA Nees.

Perennial leafy herbs, the lower leaves reduced to scales or sheaths, the upper large. mostly entire. acute or acuminate in our species. Basal leaves none. Heads corymbose: involucre campanulate to hemispheric. its bracts imbricated in several series, appressed. thin, sometimes scarious-margined. their tips not herbaceous nor foliaceous. Receptacle foveolate. Ray-flowers white. pistillate, not very numerous. Dish-flowers perfect, the corolla with a slender tube abruptly exparded into a campanulate 5 -lobed limb. white to greenish in our species. Anthers obtuse at the base; strle-appendages ovate to subulate (rarely obtuse). Achenes obovoid. Pappus double, the outer series of numerous short bristles or scales, the inner of long capillary bristles. some or all of which have thichened tips. [In honor of Th. Doilinger, botanical explorer.] About 4 species, natives of eastern N. Am.
Leaves lanceolate to ovate; heads mostly numerous.

Leaves lanceolate to oblong-lanceolate, acuminate.
Leaves ovate to ovate-lanceolate, acute.
Leaves, at least the lower, obovate ; heads commonly few.

1. D. umbellata.
2. D. humilis.
3. D. infirma.
I. Doellingeria umbellàta (Mill.) Nees. Tall Flat-top White Aster. (I. F. f. $3 \$ 29$.) Stem glabrous or pubescent above, striate, corymbosely branched at the summit. $6-25 \mathrm{dm}$. high. Leaves glabrous above. usually pubescent on the reins beneath. membranous. narrowed at the base into short petioles, or the uppermost sessile. hispid-margined, those of the stem $12-15 \mathrm{~cm}$. long. $1-2.5 \mathrm{~cm}$. Wide; heads $12-25 \mathrm{~mm}$. broad. in terminal compound corymbs; involucre $3-4 \mathrm{~mm}$. high. its bracts lanceolate, usually pubescent or ciliate, acutish or cbtuse: rays io-15. White; style-appendages orate, acute: achenes rerred. slightly pubescent. In moist soil. Newf. to Ga.. west to the N. W. Terr., Mich. and Ark. July-Oct.

Doellingeria umbellàta pùbens (A. Gray) Britton. Under leaf-surfaces pubescent. Mich, to the N. W. Terr.
2. Doellingeria hùmilis TTilld.) Britton. Broad-IEated Flat-top White Aster. (I. F. f. 3 Sjo.) Similar to the preceding species, usually lower, seldom wer 12 dm . high. Stem striate, corymbrisely branched above. glabrous, or somewhat pubescent. Leaves rather firm. sessile. or the lower very short-petioled. narzowed, or sometimes rounded at the base, rough-margined. those of the stem 2-7 cm . long. $12-50 \mathrm{~mm}$. wide. inflorescence as in D. umbellata; achenes somewhat pubescent. In moist soil, southern N. I. and Penn. to Fla. and Tex. July-Sept.
3. Doellingeria infíma Michx.) Greene. Cornel-LEAVED Aster. (I. F. f. $3^{8} 3 \mathrm{I}$. Stem slender, glabrous, or roughish above. sparingly branched at the summit, terete, $4 \rightarrow 9 \mathrm{dm}$. high. Leaves entire. hispid-margined. glabrous above,
sparingly hispid on the veins beneath, the lower usually sessile, the upper larger, oblong-lanceolate, acute, $5-12 \mathrm{~cm}$. long, $2-4 \mathrm{~cm}$. wide; heads few, about 25 mm . broad, in a divergently branched terminal corymbose cluster; involucre 4-6 mm. high, its bracts oblong-lanceolate, obtuse, sparingly pubescent; rays $8-15$, white; style appendages subulate; achenes nerved, glabrous. In dry, usually rocky soil Mass. to N. Y., Penn. and Tenn. Aug.-Sept.

## 38. IONÁCTIS Greene.

Low, mostly branching, perennial herbs with numerous narrow entire $\mathbf{I}$-nerved leaves, and rather large and showy heads of tubular and radiate flowers terminating the stem and branches. Basal leaves none. Involucral bracts coriaceous, imbricated in several series, appressed, their tips not herbaceous. Ray-flowers normally violet, pistillate. Disk-flowers perfect, the corolla with a campanulate limb. Achenes villous. Pappus double, the inner series of long capillary bristles, the outer much shorter. [Greek, violet rays.] Three known species, of N. Am.

1. Ionactis linariifòlius (L.) Greene. Stiff or Savory-leaved Aster. (I. F. f. 3832 .) Stems tufted, stiff, puberulent or scabrous, very leafy, corymbosely branched above, I.5-6 dm. high. Leaves linear or spatulate, spreading, I-nerved, rigid, entire, rough, usually ciliolate on the margins, mucronulate, 18 - 35 mm . long, $2-4 \mathrm{~mm}$. wide, sessile, those of the branches much smaller and somewhat appressed; heads several, terminating the branchlets, about 25 mm . broad; involucre broadly turbinate, its bracts linear-lanceolate, keeled, green on the back, the inner obtuse, the outer usually acute; rays $10-\mathrm{I}_{5} 5$, violet, rarely white, 8-10 mm . long; pappus tawny; achenes silky. In dry or rocky soil, Newf. to Quebec and Fla., west to Minn., Mo. and Tex. July-Oct.

## 39. BÁCCHARIS L.

Diœcious shrubs, with alternate leaves, and small paniculate or corymbose heads of tubular flowers. Involucre campanulate in our species, its bracts imbricated in several series, the outer shorter. Receptacle flat, naked, commonly foveolate. Corolla of the pistillate flowers slender, that of the staminate tubular, 5 -lobed. Anthers obtuse and entire at the base. Style-branches narrow or subulate, those of the fertile flowers smooth, exserted, those of the sterile flowers rudimentary, tipped with an ovate pubescent appendage. Achenes more or less compressed, ribbed. Pappus of the fertile flowers copious, capillary, that of the sterile flowers short. [Named for Bacchus; originally applied to some different shrubs.] About 275 species, all American, most abundant in S. Am. Besides the following, some 18 others occur in the southern and western U. S.
Shrubs; pappus of fertile flowers in 1 or 2 series.
Leaves oblong, or lance-oblong, mostly obtuse, sparingly dentate.
Leaves deltoid-obovate, cuneate, spatulate, or oblong, the lower coarsely dentate. $\begin{array}{ll}\text { Heads in numerous terminal clusters. } & \text { 2. } B \text {. halimifolia. }\end{array}$
Heads clustered in the axils of the leaves.
3. B. slomervithora.

Leaves linear or linear-lanceolate, mostly acute, sparingly dentate.
4. B. neglecta. Herbaceous from a woody base ; pappus of fertile flowers in several series.
5. B. Wrightii.
I. Baccharis salícina T. \& G. Willow Baccharts. (T. F. f. S $_{3} 3.1$ A glabrous glutinous much-branched shrub), I-2 m . high, the branches iscemding. Leaves firm, more or less conspicuously 3 -nerved, narrowed into a cuncate subses. sile base, $2-4 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide; heads in peduncled clusters of $1-7$. the involucre of both sterile and fertile ones campanulate. $5-6 \mathrm{~mm}$. hich, its bracts ovate or ovate-lanceolate, acute or subacute: pappus usually but a single series of nearly white capillary bristles. Western Kans, and Colo. to Tex. Mav-Tuly.
2. Baccharis halimifolia L. Groundsel-tref or -mish. PEcit trfe (I. F. f. 3834.) A branching glabrous shrub, I-3 dm. high, the branchlets angled. sometimes minutely scurfv. Leaves thick, those of the stem and larger bramehes $2-7 \mathrm{~cm}$. long, $1-5 \mathrm{~cm}$. wide. those of the branchlets ohlancenlate. shert-petioled or sessile, entire, or few toothed toward the aper: heads in terminal peduncled dusters of $1-5$, those of the sterile plant nearly globose when young, the bracts of the
involucre oblong-ovate, obtuse, glutinous, appressed, the inner ones of the pistillate heads lanceolate, acute or acutish, fertile pappus bright white, $6-8 \mathrm{~mm}$. long, of I-2 series of capillary bristles, much exceeding the involucre. Along salt marshes and tidal rivers, extending beyond saline influence, Mass. to Fla. and Tex. The white pappus is very conspicuous in autumn. Sept.-Nov.
3. Baccharis glomeruliflòra Pers. Axillary-flowfred Baccharis. Similar to the preceding species but brighter green, the leaves often spatulate; heads in small sessile or short-peduncled clusters in the upper axils; involucral bracts obtuse. In swamps, Va. to Fla., near the coast. Sept.-Dec.
4. Baccharis neglécta Britton. Linear-leaved Baccharis. (I. F. f. 3835.) A much-branched, glabrous or slightly glutinous shrub, I m. high or more, the branches paniculate, slender, ascending. Leaves faintly 3 -nerved, gradually attenuate into a nearly sessile base, $2-7 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide; heads in short-peduncled clusters; involucre of both kinds of heads campanulate, 4 mm . high, its outer bracts ovate, acute or somewhat obtuse, the inner lanceolate, acuminate; pappus of the fertile flowers a single series of capillary dull-white bristles. Neb. to Tex. and northern Mex. July-Sept.
5. Baccharis Wrightii A. Gray. Wright's Baccharis. (I. F. f. 3836.) Much branched, glabrous, not glutinous, 3-9 dm. high, the branches straight, nearly erect, slender, striate. Leaves linear, sessile, I-nerved, entire, 6-25 mm. long, I-2 mm. wide; heads solitary at the ends of the branches, $10-12 \mathrm{~mm}$. broad; involucre of the sterile heads hemispheric, about 6 mm . high, that of the fertile ones somewhat campanulate and longer; bracts of both involucres lanceolate, acuminate, with scarious margins and a green back; pappus tawny or purplish, copious. W. Kans. and Colo. to Tex., Ariz. and Chihuahua. April-July.

## 40. FILÀGO L.

White-woolly annual herbs, with alternate entire leaves, and small discoid clustered heads, usually subtended by leafy bracts. Bracts of the involucre few and scarious. Receptacle convex or elongated, chaffy, each chaffy scale subtending an achene. Outer flowers of the heads in several series, pistillate, fertile, their corollas filiform, minutely 2-4-dentate. Central flowers few, perfect, mainly sterile, their corollas tubular, 4-5-toothed. Anthers sagittate at the base, the auricles acuminate. Achenes compressed or terete. Pappus none. [Latin, filum, a thread.] About 12 species, natives of both the New World and the Old. In addition to the following, 3 others occur in the western U. S.
I. Filago prolífera (Nutt.) Britton. Filago. (I. F. f. 3837.) Stem simple, or branched at the base, very leafy, $5^{-15} 5 \mathrm{~cm}$. high. Leaves spatulate, obtuse, sessile, ascending or appressed, $8-16 \mathrm{~mm}$. long, $2-5 \mathrm{~mm}$. wide; heads in a sessile leafy-bracted cluster, usually subtended by 1 or several slender, nearly leafless branches, each terminated by a similar cluster, or these again proliferous; heads oblong or fusiform; receptacle convex; chaff of the central sterile flowers woollytipped, that of the fertile flowers scarious, mnstly glabrous. In dry soil, Tex. to Kans. and S. Dak., west to Colo. and N. Mex. April-July.

## 41. GÍFOLA Cass.

White-wonlly herbs, closely resembling those of the preceding genus, with alternate entire leaves, and small discoid glomerate heads, often subtended by leafy bracts, the clusters proliferous in our species. Involucre small, its bracts scarious, imbricated in several series, the outer usually tomentose. Receptacle subulate, cylindric or obconic, chaffy, each chaffy scale near its base enclosing an achene. Outermost flowers pistillate, fertile, with filiform corollas and no pappus, or the pappus a few rudimentary' bristles: inner flowers also pistillate and fertile, but with a pappus of capillary scabrous bristles; central (uppermost) flowers few, perfect, their corollas tubular, their pappus capillary and scabrous. Anthers sagittate at the base. Achenes terete or slightly compressed. [Anagram of Filago.] About io species, natives of warm and temperate regions.
I. Gifola Germánica (L.) Dumort. Cudweed. Cotton Rose. Herba Impia. (I. F. f. 3838.) Annual, erect, cottony, I-4.5 dm. high, simple, or branched at the base, very leafy. Leaves sessile, lanceolate, linear, or slightly
spatulate, erect or ascending, obtuse or acutish, $6-25 \mathrm{~mm}$. long; stem terminated by a sessile dense cluster of heads, usually subtended by several leafy branches terminated by similar clusters and these often again proliferous; heads $10-30$ in each cluster, many-flowered; involucre ovoid, light yellow, its bracts mainly acute. In dry fields, southern N. Y. to Penn. and N. Car. May-Sept.

## 42. PLÙCHEA Cass.

Pubescent or glabrous herbs, or some tropical species shrubby, with alternate dentate leaves, and small heads of tubular flowers in terminal corymbose cymes. Involucre ovoid, campanulate, or nearly hemispheric, its bracts appressed, herbaceous, imbricated in several series. Receptacle flat, naked. Outer flowers of the head pistillate, their corollas filiform, 3 -cleft or dentate at the apex. Central flowers perfect, but mainly sterile, their corollas 5 -cleft. Anthers sagittate at the base, the auricles caudate. Style of the perfect flowers 2 -cleft or undivided. Achenes $4-5$-angled. Pappus a single series of capillary scabrous bristles. [Named for the Abbé N. A. Pluche, of Paris.] About 30 species, widely distributed in warm and temperate regions.
Perennial; leaves sessile, cordate, or clasping at the base.

1. P. foetida.

Annual; leaves, at least those of the stem, petioled.
Leaves short-petioled; heads about 6 mm . high ; involucral bracts densely puberulent.
2. P. camphorata.

Leaves long-petioled; heads $4-5 \mathrm{~mm}$. high; involucral bracts granulose, ciliate.

1. Pluchea foètida (L.) B.S.P. Viscid Marsh Fleabane. (I. F. f. 3839.) Stem simple or sparingly branched at the summit, puberulent and slightly viscid, 4-9 dm. high. Leaves oblong, ovate or ovate-lanceolate, sharply denticulate, pubescent or puberulent, $5-10 \mathrm{~cm}$. long, $\mathbf{I}-4 \mathrm{~cm}$. wide, reticulate-veiny; clusters of heads compact, leafy-bracted; involucre $5-6 \mathrm{~mm}$. high, its bracts lanceolate, acute, viscid-puberulent. In swamps, southern N. J. to Fla. and Tex., mainly near the coast. Also in the W. Ind. July-Sept.
2. Pluchea camphoràta (L.) DC. Spicy or Salt-marsh Fleabane. (I F. f. 3840.) Stem usually branched, finely viscid-puberulent, or nearly glabrous, 6-9 dm . high, somewhat channeled. Leaves ovate, oblong or lanceolate, puberulent or glabrous, acute or acuminate at the apex, narrowed at the base, the upper sessile but not clasping, $7-20 \mathrm{~cm}$. long, $3-7 \mathrm{~cm}$. wide, serrate or denticulate, not conspicuously reticulate-veined; bracts of the involucre ovate-lanceolate, or lanceolate. acute; flowers purplish; achenes pubescent. In salt marshes, coast of N. H. to Fla., Tex. and Mex. Also in the W. Ind. Aug.-Oct.
3. Pluchea petiolàta Cass. Inland Marsh Fleabane. (I. F. f. $3 \mathbb{S}_{4}$ I.) Similar to the preceding species, but glabrate, usually taller, 7-12 dm. high, the stem stout, rather strongly channeled. Leaves ovate-lanceolate to oval, thin, ro-25 cm . long, 4-7 cm. wide, mostly acuminate at the apex, cuneate-narrowed at the base, irregularly serrate; petioles of the larger leaves $15-25 \mathrm{~mm}$. long; achenes short-pubescent. In moist soil, often in woods, Via. to Fla., Ill., Mo, and the lnd. Terr. Aug.-Oct.

## 43. ANTENNÀRIA Gaertn.

Perennial woolly diocious or polygamo-diocious herbs, with alternate and basal leaves, and small discoid many flewered hede, ghomerate, moemose, solitary. or corymbose. Involucre oblong, ovoid or campanulate, its hracte scarinus, imbricatal in several series, the outer shorter, usually woolly. Receptacke convex or nearly flat, foveolate, not chaffy. Staminate flowers with a truncate or minutely dentate corolla, usually undivided style and scanty pappus of club-shaped smonth of minutely barbed bristles. I'istillate or perfect flowers with tubular mostly 5 -thethed corollas, 2 -cleft style, and copious pappus of capillary naked bristles, slightly united at the base. Achenes oblong, terete, or slightly compressed. [1.atin, in allusion to the fancied resemblance of the sterike pappus to insect antemare. I . bout 50 species, natives of the morth temperate zome and southern $\therefore$. Am. la addition to the following, about a dozen others occur in the western parts of N. Am., and one or more in the Southern States.

Several species and subspecies additional to those here recognized have been recently described, but I am unable at present to characterize them so that they may be distinguished from the following.

## * Pappus-bristles of sterile flowers with club-shaped or dilated tips. † Plant not stoloniferous ; basal leaves oblanceolate.

1. A. Carpathica.
$\dagger \dagger$ Plants stoloniferous; growing in patches.
$\ddagger$ Involucral bracts white, greenish brown, or yellowish; plants not arctic.
Basal leaves small, $0.7-2 \mathrm{~cm}$. long, 1 -nerved, or indistinctly 3 -nerved.
Basal leaves bright green and glabrous above from the first, or slightly woolly when

> unfolding.

Basal leaves dull and more or less persistently woolly on the upper surface.
Basal leaves spatulate, usually abruptly mucronulate.
Inner involucral bracts of the fertile heads obtuse or acutish; western.
3. A. aprica.

Inner involucral bracts of the fertile heads acuminate; eastern.
4. A. neodioica.

Basal leaves obovate to oblanceolate, acute or obtuse.
Stem of fertile plant slender, $2-3 \mathrm{dm}$. high ; basal leaves mostly oblanceolate.
5. A. neglecta.

Stems stout, $0.5-\mathrm{I} .5 \mathrm{dm}$. high; basal leaves obovate. 6. A. campestris.
Basal leaves persistently appressed silvery-pubescent on both surfaces, very small.
7. A. microphylla.

Basal leaves large, $2-12 \mathrm{~cm}$. long, distinctly 3 -nerved, sometimes 5 -nerved, the lateral nerves also often prominent.

Plants not glandular; leaves dull and woolly on the upper surface, at least when young.

Involucre of the fertile plants 6-8 mm. high.
Basal leaf-blades obovate to spatulate-obovate. 8. A. plantaginifolia. Basal leaves with nearly orbicular or rhombic-obovate large blades.
9. A. calophylla.

Involucre $8-10.5 \mathrm{~mm}$. high.
Bracts of the fertile involucre linear to linear-lanceolate, the inner long-acuminate.
10. A. fallax.

Bracts of the fertile involucre oblong to lanceolate, the inner merely acute.
11. A. Farwellii.

Plants glandular, at least above.
Basal leaves and those of the ends of stolons glabrous and bright green on the upper surface from the first, or slightly woolly when unfolding.
12. A. Parlinii.

Leaves all dull and more or less persistently woolly on the upper surface.
13. A. ambigens.

$$
\ddagger \ddagger \text { Involucral bracts dark greenish brown, acute. }
$$

** Pappus-bristles of sterile flowers not dilated, barbellate; plant $2-3 \mathrm{~cm}$. high, tufted; head solitary.

I5. A. dimorpha.

## I. Antennaria Carpáthica (Wahl.) Hook. Carpathian Everlasting.

(I. F. f. 3842.) Plant floccose-woolly throughout, not stoloniferous; stem $5-25 \mathrm{~cm}$. high, simple. Basal leaves oblanceolate or oblong, obtuse or acutish at the apex, narrowed at the base into short petioles, $3-5 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide; stem-leaves linear, acute or acutish, erect, the upper gradually smaller; heads in a terminal subcapitate cluster, or rarely solitary, 5-6 mm . broad; involucre $4-6 \mathrm{~mm}$. high, woolly at the base, its bracts brownish purple, the inner ones of the fertile heads mostly acutish, those of the sterile heads mainly obtuse. In dry soil, Lab. and Anticosti to Hudson Bay. Also in Europe and northern Asia. May-Sept.
2. Antennaria Canadénsis Greene. Canadian Cat's-foot. Scape 2-3.5 dm . high, slender. Basal leaves and those of the ends of stolons spatulate to oblanceolate, obtuse or apiculate, $2.5-3.5 \mathrm{~cm}$. long, I cm . wide or less, gradually tapering from above the middle to a long narrow base, I-nerved or with two faint lateral nerves, bright green and glabrous above, lanate beneath; stolons short, leafy, assurgent; stem-leaves linear-lanceolate, distant, $1.5-\mathbf{2 . 5} \mathrm{mm}$. wide; inflorescence capitate to racemose-corymbose; fertile involucre about 9 mm . high, its outer bracts oblong, obtuse, the inner lanceolate, acute to attenuate. Quebec and N. B. to Vt. and Mass. May-June.
3. Antennaria áprica Greene. Rocky Mountain Cudweed. (I. F. f. 3844 as $A$. dioica.) Floccose-woolly or canescent, surculose, forming broad patches. Flowering stems $6-20 \mathrm{~cm}$. high; basal leaves spatulate, obtuse, rather abruptly narrowed from above the middle, white-canescent on both sides, or sometimes green above, $8-30 \mathrm{~mm}$. long, 4-8 mm. wide; stem-leaves linear to spatulate, sessile; heads $6-8 \mathrm{~mm}$. broad in a terminal capitate or corymbose cluster; involucre 8-10 mm . high, the bracts of the fertile heads oblong, white or pink, all obtuse, or the inner ones acute; those of the sterile heads oval or elliptical, obtuse; achenes glabrous, or minutely glandular. Manitoba to Br. Col., Neb. and Ariz. May-Aug. Plants previously referred to the European $A$. dioica are now divided among several species.
4. Antennaria neodioìca Greene. Smaller Cat's-Foot. (I. F. f. 3845.) Floccose-woolly, with numerous stolons which are leafy throughout. Stem of fertile plants slender, about 3 dm . high; stolons mostly short; basal leaves about 2.5 cm . long, 6-10 mm. wide, narrowly to broadly spatulate, I-nerved, or indistinctly 3 -nerved, white-tomentose beneath, dull and often glabrate above, abruptly narrowed from above the middle, distinctly apiculate; stem-leaves linear, acute; heads loosely corymbose, $6-8 \mathrm{~mm}$. broad; outermost bracts of the involucre obtuse, the rest lanceolate, acute or acuminate, greenish yellow or brownish below, with white tips; achenes obtusely 4-angled, granular-papillose; staminate plant lower, $7-20 \mathrm{~cm}$. high; heads more densely clustered; bracts of the involucre oblong, obtuse. In dry shaded places, Quebec to Vt., Va. and S. Dak. April-July.
5. Antennaria neglécta Greene. Field Cat’s-foot. (I. F. f. 3846.) Stoloniferous, the stolons mostly long and slender. Basal leaves oblanceolate to obovate oblanceolate, obtuse or acutish, gradually tapering to a sessile base, whitetomentose beneath, dull and glabrate above, I-nerved, or with two faint additional lateral nerves; stem-leaves linear; fertile plant 2-4 dm. high; heads $6-8 \mathrm{~mm}$. broad, capitate, corymbose, or racemose; bracts brownish, with white tips, lanceolate, acute, acuminate, or the outer blunt; sterile plant I-2 dm. high, the heads densely clustered, the bracts oblong, obtuse. In fields and pastures, Me. to N. Y., Va. and Wis. April-June.
6. Antennaria campéstris Rydb. Prairie Cat’s-foot. (I. F. f. 3847 .) Stolons short, leafy; flowering stems of both fertile and sterile plants $5-15 \mathrm{~cm}$. high; basal leaves obovate-cuneate, white-tomentose beneath, glabrate above, I-nerved, or indistinctly 3 -nerved; stem-leaves small, linear; heads $6-8 \mathrm{~mm}$. broad, in subcapitate clusters; bracts of the fertile heads lanceolate, greenish below, brownish at the middle, the apex white, acute or acuminate; bracts of sterile heads elliptic, obtuse. On dry prairies, Neb., Kans. and S. Dak. to Saskatchewan. May-June.
7. Antennaria microphỳlla Rydb. Small-leaytd Cat's foot. Stem slender, 2-3 dm. high. Stolons short, not over 5 cm . long; basal leaves and those of the ends of the stolons spatulate, obtuse, or apiculate, $0.5-1.5 \mathrm{~cm}$. long. $2+\mathrm{mm}$. wide, narrowed from above the middle; stem-laves linear-oblong, or the leaves linear-spatulate, often longer than the basal ones; heads corymbese, rather numerous; involucre 5-7 mm. high; bracts of the fertile heads linearoblong, acute or acutish, those of the sterile oltuse. In dry soil, Alberta and Saskatchewan to Mont., Neb. and Colo. July-Aug.
8. Antennaria plantaginifòlia (L.) Richards. Piantain-maf Eferlasting. Mouse-ear Everlasting. (I. F. I. 38 \&8.) Flociose-woolly, stomiternus. forming hroad patches. Flowering stems of fertile plant $1.5-3.5 \mathrm{dm}$. high; hasal leaves obovate to broadly oval, obtuse, sometimes apiculate, distinctly 3 -ribbed. petioled, becoming glabrate and dull green above, silvery beneath, +7 cim. hong. I-3 cm. wide; stem-leaves sessile. oblong or lancolate; hede in corymbese or subcapitate clusters, 8-10 mm. broad; involucre o 8 mm . high, its hracts greenish white, lanceolate, acute or acutish; achenes minutely shomdular; sterile plant smaller, 7-20 cm. high; basal leaves somewhat smaller; stem-leaves mostly linear; heads smaller, $6-8$ mm. broad; bracts oblong, whtusc. In dry mil, cepecially in open woods, Lab. (?), Ont. to Fla., Ill., Kans, and Tex. April-June.
 stout. sometimes I dm. long, their leaves mestly in a tuft at the emb. hrodly owate to obovate, $8-10 \mathrm{~cm}$. long, $4-5 \mathrm{~cm}$. wide, obtuse, apiculate, narmwal abruptly into
the long, very narrow base which is about as long as the expanded portion, strongly 3 -nerved, and usually with an, additional pair of lateral nerves, densely tomentose beneath, dull green and loosely floccose above: pistillate heads rather numerous, corymbose; involucre about 7 mm . high, its bracts linear to linearlanceolate, brown below, the inner acuminate; stem of staminate plant $\mathbf{1} \mathbf{- 1 . 5} \mathrm{dm}$. high, the heads small, glomerate. Ill. and Mo. to La. The basal leaves of a plant evidently closely related to this were collected by Mr. Bicknell at New York and by Mr. Pollard at Washington.
io. Antennaria fallax Greene. Tall Cat's-Foot. Stolons rather stout, often I dm. long, leafy. Scape of fertile plant 3.5-4.5 dm. tall, stoutish; basal leaves oval to obovate, $6-10 \mathrm{~cm}$. long, $2-4 \mathrm{~cm}$. wide, acute or obtuse, contracted gradually into a narrow base about as long as the expanded portion, dull green and loosely floccose, or at length glabrous above, densely white-tomentose beneath; stem-leaves lanceolate, rather distant, acuminate, $2.5-5 \mathrm{~cm}$. long; heads capitate to corymbose; involucre $8-10 \mathrm{~mm}$. high, its inner bracts attenuate-acuminate, the outer oblong, obtuse; staminate plant very much smaller. In dry soil, Me. to D. C., Wis. and Kans. April-May.

I I. Antennaria Fàrwellii Greene. Farwell's Cat's-Foot. Closely resembling the preceding species, sometimes lower. Stolons rather stout, leafy; basal leaves spatulate to obovate-spatulate, obtuse, the expanded portion usually larger than the gradually narrowed base, dull green and floccose or becoming glabrous above, strongly 3 -nerved, $4-8 \mathrm{~cm}$. long, 2.5 cm . wide or less; heads capitate to subcorymbose; involucre $8-10.5 \mathrm{~mm}$. high, its inner bracts acute, obtusish, or a few of them acuminate. Me. to Mich. May-June.
12. Antennaria Pàrlinii Fernald. Parlin's Cat's-foot. More or less glandular-pubescent; stems of fertile plant 3-4.5 dm. tall. Leaves bright green and devoid of tomentum on the upper surface from the time of unfolding, or very slightly floccose when very young, the basal ones obovate or spatulate to elliptic, obtuse or acutish, gradually contracted into a narrow base about as long as the expanded part, $5-8.5 \mathrm{~cm}$. long, $2-3.5 \mathrm{~cm}$. wide; stem-leaves lanceolate or the lower narrowly oblong; heads corymbose; involucre about 8 mm . high, its bracts all lanceolate-acuminate or the outer ones linear-oblong and obtusish. Me. and Vt. to N. J. and D. C. May-June.
13. Antennaria ambigens (Greene) Fernald. Intermediate Cat's-foot. Similar to A. fallax, and perhaps only a glandular form of that plant. Stem not so tall, its leaves rather closer together, usually glandular only above; basal leaves sometimes not over 2.5 cm . long; inner involucral bracts of the fertile heads acuminate. Me. to D. C.
14. Antennaria alpìna (L.) Gaertn. Alpine Everlasting. (I. F. f. 3843.) Surculose by short stolons; stems floccose woolly, $3-10 \mathrm{~cm}$. high. Basal leaves usually numerous, spatulate or linear-oblong, obtuse, silvery-woolly on both sides, or glabrate and green above, $8-25 \mathrm{~mm}$. long; stem-leaves linear and small, few; heads in a terminal capitate, or seldom somewhat corymbose cluster, rarely solitary, 4-5 mm . broad; involucre about 5 mm . high, the bracts of the fertile heads dark brownish green, the inner ones acute or acuminate; those of the sterile heads lighter, brownish, broader and obtuse; achenes glandular. Lab. and arctic Am. to Alaska. The Rocky Mountain plant referred to this species is A. media Greene.
15. Antennaria dimórpha (Nutt.) T. \& G. Loẃ Everlasting. (I. F. f, 3849.) Tufted from a thick woody often branched caudex, $3-4 \mathrm{~cm}$. high. Leaves all in a basal cluster, spatulate, white-canescent or tomentose on both sides, obtuse or acutish, $\mathbf{I}-2.5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, narrowed into short petioles; heads of staminate flowers about 6 mm . broad and high, solitary and sessile among the leaves, or raised on a very short sparingly leafy stem, with obtuse or obtusish brownish involucral bracts, those of pistillate flowers longer, their inner bracts lin-ear-lanceolate, acuminate; pappus of the staminate flowers slender. scarcely thickened, but barbellate at the tips, that of the pistillate flowers of fine and smooth bristles. Dry soil, Neb. to Utah and Cal., north to Mont. and Br. Col. April-June.
44. ANÁPHALIS DC.

Perennial white-tomentose or woolly herbs, with leafy erect stems, in our species, alternate entire leaves, and small corymbose discoid heads of diœcious flowo
ers. Involucre oblong to campanulate, its bracts scarious, imbricated in several series, mostly white, the outer shorter. Receptacle mostly convex, not chaffy. Staminate flowers with a slender or filiform corolla, an undivided style, and a pappus of slender bristles, not thickened at the summit, or scarcely so; anthers tailed at the base. Pistillate flowers with a tubular 5 -toothed corolla, 2 -cleft style, and a copious pappus of capillary separate bristles. Achenes oblong. [Greek name of some similar plant.] About 30 species, natives of the north temperate zone. Only the following and one other in N. Am.
I. Anaphalis margaritàcea (L.) Benth. \& Hook. Pearly or Largeflowered Everlasting. (I. F. f. 3850.) Stem floccose-woolly, corymbosely branched at the summit, leafy, 3-9 dm. high. Leaves linear-lanceolate, narrowed to a sessile base, revolute, green, but more or less pubescent above, woolly beneath $7-12 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide, the lowest shorter, spatulate, usually obtuse; corymb compound, $5-20 \mathrm{~cm}$. broad; heads very numerous, short-peduncled or sessile, about 6 mm . high, 8 mm . broad when expanded; involucre campanulate, its bracts ovate-lanceolate, obtuse, finely striate, pearly white, mostly glabrous; pappusbristles of the fertile flowers distinct and falling away separately. Dry soil, Newf. to Alaska, N. Car., Kans. and Cal. Also in northern Asia.

## 45. GNAPHALLIUM L.

Woolly branched herbs, with alternate leaves, and discoid heads of pistillate and perfect flowers arranged in corymbs, spikes, racemes, or heads. Receptacle flat, convex or conic, not chaffy, usually foveolate. Pistillate flowers in several series, their corollas filiform, minutely dentate or 3 -4-lobed. Central flowers perfect, tubular, few, their corollas 5 -toothed or 5 -lobed. Anthers sagittate at the base, the auricles tailed. Achenes oblong or obovate, terete or slightly compressed, not ribbed. Pappus a single series of capillary bristles, sometimes thickened above, cohering at the base, or separately deciduous. [Greek, referring to the wool.] About 120 species, widely distributed.
Tall, erect ; inflorescence corymbose, or paniculate; pappus-bristles distinct.

Leaves sessile; plant not viscid.
Leaves sessile; plant glandular-viscid.
Leaves decurrent; plant glandular-viscid.

1. G. obtusifolium.
2. G. Helleri.
3. G. decurrens.

Low, diffuse; inflorescence mostly capitate; pappus-bristles distinct.
Floccose-woolly; involucral bracts yellowish, or white.
4. G. palustre.

Appressed-woolly ; involucral bracts becoming dark brown.
5. G. uliginosum.

Tufted low mountain herbs; heads few; bracts brown; pappus-bristles distinct.
6. G. supinum.

Slender, simple ; heads spicate; pappus-bristles united at base, falling away in a ring.
Leaves linear or lanceolate-spatulate, acute; heads about 6 mm , high; northeastern. Bracts dark brown ; stem-leaves lanceolate-spatulate. 7. G. Norvegicum. Bracts brownish tipped; stem-leaves linear.
8. G. sylvaticum.

Leaves spatulate, obtuse or obtusish ; heads $4-5 \mathrm{~mm}$. high; eastern and southeru.
9. G. purpureum.

1. Gnaphalium obtusifòlium L. Sweet or White Balsam. Sweet or Fragrant Life Everlasting. (I. F. f. 385 i.) Annual or winter-annual, fragrant; stem erect, simple, or branched above, tomentose. 3-9 dm. high. Leaves lanceolate or linear-lanceolate, sessile, acute or acutish, or the lower obtuse at the apex, narrowed at the base, densely white-woolly beneath, glabrate and commonly dark green above, $2-7 \mathrm{~cm}$. long, $4^{-8} \mathrm{~mm}$. wide, the margins undulate; heads numerous, about 6 mm . high; bracts of the involucre white, or tinged with brown. oblong, thin and scarious, ohtuse, the outer woolly at the base; achenes slabrous. In dry, mostly open places, N. S. to Fla., Manitoba, Kins. and Tex. Leaves of winter rosettes oblong. Aug.-Sept.
2. Gnaphalium Hélleri Britton. Heller's Evfrlasminc. (I. F. f. 3 §52.) Similar to the preceding species, 4-6 dm. high, the stem and branches densely glandular-pubescent, not tomentose. Leaves oblong lanceolate, sessile, wuminate at both ends, green and hispidulous above, white-tomentose beneath. the larser about 5 cm . long and $\mathbf{I c m}$. wide, the uppermost much smaller and natrower; heads very numerous, about 5 mm . broad; involucre ohlong, or becoming campanulate, 6 mm . high, its bracts bright white, tomentose the outer whong, the inner linearoblong, all obtuse ; achenes glabrous. In fields, Va, to Ky. and Ga. Scpt.-Uct.
3. Gnaphalium decúrrens Ives. Clammy Everlasting. Winged Cudweed. (I. F. f. 3853.) Annual or biennial, similar to the two preceding species, fragrant; stem very leafy, glandular-viscid, 6-9 dm. high. Leaves lanceolate or broadly linear, acutish at the apex, densely white-woolly beneath, glabrate or loosely woolly above, sessile and decurrent on the stem at the base, $3-7 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. wide, or the lowest shorter and slightly spatulate; heads about 6 mm . high; bracts of the involucre white or brownish, ovate, acutish or the inner lanceolate and acute, the outer woolly at the base; achenes glabrous. In open, moist or dry places, N. S. to Penn., west to western Ont., Mich. and Br. Col., south in the Rocky Mts. to Ariz. July-Sept.
4. Gnaphalium palúustre Nutt. Western Marsh Cudweed. (I. F. f. 3854.) Annual; diffusely branched from the base, densely but loosely floccose-woolly all over, 5-20 cm. high. Leaves sessile, oblong, linear-oblong, or the lower spatulate, obtuse or acutish, $12-25 \mathrm{~mm}$. long, 3-6 mm. wide; heads about 4 mm . high, several together in leafy-bracted glomerules; involucre more or less woolly, its bracts linear or lanceolate, acute, white or pale yellow. In moist wet soil, N. W. Terr. to western Neb. and N. Mex., west to Br. Col. and Cal. May-Aug.
5. Gnaphalium uliginòsum L. Low or Marsh Cudweed. Wartwort. Mouse-ear. (I. F. f. 3855.) Annual; diffusely branched from the base, or the stems sometimes erect or ascending, $5-20 \mathrm{~cm}$. high. Leaves sessile, spatulatelinear, linear, or the lower oblanceolate or spatulate and narrowed into petioles, all obtuse or obtusish, generally mucronulate, $2-4 \mathrm{~cm}$. long; heads about 4 mm . high, numerous in dense leafy-bracted terminal glomerules; bracts of the involucre oblong or oblong-lanceolate, the outer obtuse or obtusish and more or less woolly, the inner acute. In damp soil, Newf. to Va. west to western Ont., Minn. and Ind. Apparently nat. from Europe, where it is common. Occurs.also in the far Northwest, where it is probably indigenous. July-Sept.
6. Gnaphalium supinum L. Dwarf Cudweed. (I. F. f. 3856.) Perennial, white-woolly, much tufted; stems simple, $2-8 \mathrm{~cm}$. high. Leaves mainly basal, linear, acute, narrowed at the base, sessile, $\mathbf{1} 2-25 \mathrm{~mm}$. long, $2-4 \mathrm{~mm}$. wide; heads few or several, capitate or short-spicate, about 6 mm . high; flowers yellowish; bracts of the involucre brown, glabrous, lanceolate or oblong-lanceolate, acute. Alpine summits of the mountains of Me. and N. H.; Lab. and Greenland, and in Europe and Asia. July-Aug.
7. Gnaphalium Norvégicum Gunner. Norwegian Cudweed. (I. F. f. 3857.) Perennial; stem simple, I.5-4.5 dm. high. Leaves lanceolate to spatulate, elongated, acute, narrowed at the base, woolly on both sides, or green and glabrate above, $7-15 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide, the lower and basal ones petioled; heads about 6 mm . high, the lowest often distant, solitary or glomerate in the upper axils; bracts of the involucre ovate-oblong, dark brown, or brown-tipped, glabrous or slightly woolly, obtuse; achenes hispidulous. Mt. Albert, Gaspé, Quebec, north to Greenland and arctic Am. Also in Europe. July-Aug.
8. Gnaphalium sylváticum L. Wood Cudweed. Chafeweed. Owl's Crown. Golden Motherwort. (I. F. f. 3858.) Perennial; stem slender, simple, $1.5-4.5 \mathrm{dm}$. high. Leaves linear, acute, $3-5 \mathrm{~cm}$. long, about 2 mm . wide, or the lowest linear-spatulate, woolly beneath, glabrous or glabrate above; heads about 6 mm . high; bracts of the involucre linear-oblong, obtuse, mostly glabrous, yellowish or greenish with a brown spot at or just below the apex; achenes hispidulous. N. H., N. B. and Cape Breton Island, perhaps introduced from Europe. Widely distributed in Europe and northern Asia. June-Aug.
9. Gnaphalium purpùreum L. Purplish Cudweed. (I. F. f. 3859.) Annual or biennial, simple and erect, or branched from the base and the branches ascending, 5-6 dm. high. Leaves spatulate, or the uppermost linear, mostly obtuse, mucronulate, woolly beneath, usually green and glabrous or nearly so above when old, sessile, or the lowest narrowed into petioles, $3-5 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. wide: heads $4-5 \mathrm{~mm}$. high; bracts of the involucre yellowish brown or purplish, lance-olate-oblong, acute or acutish, the outer woolly at the base; achenes roughish. In dry sandy soil, eastern Me. to Fla., west to Penn., W. Va., Ky., Kans., Tex. and Mex. Also on the Pacific Coast and in S. Am. May-Sept.

## 46. ADENOCAÛLON Hook.

Perennial herbs, with broad alternate slender-petioled leaves, woolly beneath, and panicled small heads of tubular flowers. Involucre campanulate, composed of a few herbaceous bracts. Receptacle nearly flat, naked. Corollas all tubular, 4-5-lobed. Marginal flowers pistillate, fertile. Central flowers perfect, sterile, the style undivided; anthers slightly sagittate at the base. Pappus none. Achenes obovoid or clavate, very obtuse, faintly nerved, glandular above, longer than the bracts of the involucre. [Greek, gland-stem.] About 3 species, natives of N. Am., Japan, the Himalayas and Chile. Only the following in N. Am.
I. Adenocaulon bícolor Hook. Adenocaulon. (I. F. f. 3860.) Stem floccose-woolly, or at length glabrous, 3-9 dm. high, leafless and mostly paniculately branched above. Leaves all basal or nearly so, deltoid-ovate, obtuse or acute at the apex, deeply cordate at the base, coarsely repand-toothed or lobed, thin, green and glabrous above, densely and persistently white-woolly beneath, 5$\mathbf{1 5} \mathrm{cm}$. long and broad, with slender narrowly margined petioles; heads numerous, very slender-peduncled, small; bracts of the involucre 4 or 5 , ovate to lanceolate, reflexed in fruit, at length deciduous; achenes $6-8 \mathrm{~mm}$. long, $\mathbf{r} \mathrm{mm}$. thick, the upper part beset with nail-shaped glands. In moist woods, northern Mich. and Lake Superior to Br. Col. and Cal. May-July.

## 47. ÍNULA L.

Perennial, mostly tomentose or woolly herbs, with alternate and basal leaves, and large heads of both tubular and radiate yellow flowers. Involucre hemispheric or campanulate, its bracts imbricated in several series, the outer often foliaceous. Receptacle flat or convex, areolate or foveolate, not chaffy. Ray-flowers pistillate, their ligules 3 -toothed. Disk-flowers perfect, their corollas tubular, 5 -toothed. Anthers sagittate at the base, the auricles caudate. Style-branches of the disk-flowers linear, obtuse. Achenes 4-5-ribbed; pappus of capillary rough bristles in our species. [The ancient Latin name.] About 90 species, natives of Europe, Asia and Africa.
i. Inula Helènium L. Elecampane. Horseheal. (I. F. f. 386i.) Stems tufted from large thick roots, simple or rarely somewhat branched, 6-18 dm. high, densely pubescent above. Leaves large, broadly oblong, rough above, densely pubescent beneath, denticulate, the basal ones acute at each end, long-petioled, 2.5-5 dm. long, $\mathbf{I}-2 \mathrm{dm}$. wide; stem-leaves sessile, or cordate-clasping at the base, acute at the apex, smaller; heads solitary, or few, terminal, stout-peduncled, 5-10 cm . broad; involucre hemispheric, nearly 25 mm . high, its outer bracts ovate, foliaceous, pubescent; rays numerous, linear; achenes glabrous, 4 -sided. Along roadsides and in fields, N. S. to Ont. and Minn., south to N. Car. and Mo. Nat. from Europe.

## 48. POLÝMNIA L.

Perennial herbs (some tropical species woody), with opposite membranous lobed or angled leaves, or the lower alternate, and mostly large corymbose-paniculate heads of both tubular and radiate yellow or whitish flowers, or rays sometimes obsolete. Involucre hemispheric or broader, of about 5 large outer bracts, and more numerous smaller inner ones. Receptacle chaffy. Raly-flowers pistillate, fertile, subtended by the imer involucral bracts, the ligules elongated, minute or none. Disk-flowers subtended by the chaffy scales of the receptacle, perfect, sterile, their corollas tubular, 5 -toothed. Anthers 2 -toothed at the base. Pappus none. Achenes thick, short, turgid, glabrous. [From the Muse Polhymni..] About io species, natives of America. Only the following and one other species are known in N. Am.

Rays commonly $12-25 \mathrm{~mm}$. long, yellow; achenes strongly striate. Rays commonly minute and whitish, or none ; achenes 3 -ribbed.

1. P. Č:
2. Polymnia Uvedàlia L. Yeldow or Larce-ftowered Leaf.clp. (I. F. f. 3862.) Rough-pubescent, stout. branched, i \& m. high. Lesves hroadly wate or deltoid, 3 -nerved, abruptly contracted above the base, minutely cilizte, imore or less pubescent on both sides, angulate-lobed, the lower often 3 dm, long and broad,
petioled, the upper sessile, somewhat clasping; heads few, $4-7 \mathrm{~cm}$. broad; rays 1o-15, linear-oblong, bright yellow; exterior bracts of the cup-like involucre ovateoblong, obtuse, ciliate, $8-20 \mathrm{~mm}$. long; achenes slightly oblique and laterally compressed, nearly 6 mm . long. In rich woods, N. Y. to Ind. and Mich., Fla., Mo. and Tex. July-Aug.
3. Polymnia Canadénsis L. Small-flowered Leaf-Cup. (I. F. f. 3863.) Rather slender, viscid-pubescent, at least above, 6-15 dm. high. Leaves deltoidovate to hastate, usually very thin, all petioled, deeply angulate-lobed and the lobes dentate, or the lower lyrate-pinnatifid, $\mathbf{I}-2.5 \mathrm{dm}$. long, the upper ones sometimes ovate and entire or merely denticulate; heads few, $8-12 \mathrm{~mm}$. broad; outer bracts of the involucre ovate to lanceolate, obtuse or acutish, $4-6 \mathrm{~mm}$. long; achenes 3 -angled, obovoid, obcompressed, 3 -ribbed. In damp, rich shaded places, western Ont. to Minn., Ga., Mo. and Ark. June-Sept.

Polymnia Canadénsis radiàta A. Gray. Ligules larger, sometimes 12 mm . long, 3 -lobed, nearly white. Occasional in the range of the type.

## 49. MELAMPÒDIUM L.

Herbs, some species woody, with opposite entire or dentate leaves, and terminal peduncled heads of both tubular and radiate, white or yellow flowers in our species. Involucre hemispheric, its bracts in 2 series, the 4 or 5 outer ones broad, often connate at the base, the inner hooded, embracing or permanently surrounding the pistillate fertile ray-flowers. Receptacle convex or conic, chaffy. Ray-flowers in I series, the rays spreading, 2 -3-lobed or entire. Disk-flowers perfect, sterile, their corollas with a narrowly campanulate 5 -toothed limb, the anthers entire at the base, the style undivided. Achenes obovoid, more or less incurved. Pappus none. [Greek, black-foot, without significance.] About 25 species, natives of the warmer parts of America. Besides the following, some 4 others occur in the southwestern U. S.
I. Melampodium leucànthum T. \& G. Pale Melampodium. (I. F. f. 3864 as M. cinercum.) Perennial, canescent, $\mathrm{I}-3 \mathrm{~cm}$. high, the branches slender. Leaves linear, lanceolate, or the lower spatulate, sessile, entire, undulate or sinuate, $3-5 \mathrm{~cm}$. long, $3-9 \mathrm{~mm}$. wide, obtuse or obtusish at the apex; heads $16-28 \mathrm{~mm}$. broad; peduncles slender, $2-7 \mathrm{~cm}$. long; outer bracts of the involucre ovate or oval, obtuse, united below; rays 5-9, cuneate-oblong, white; inner bracts turbinate or terete, hooded, muricate, the hood wider than the body. In dry soil, Kans. to Colo., Ariz., Tex. and Mex. June-Oct.

## 50. SÍLPHIUM L.

Tall perennial herbs, with resinous juice, and large corymbose or paniculate (rarely solitary) peduncled heads of both tubular and radiate yellow flowers. Involucre hemispheric or campanulate, its bracts imbricated in few series. Receptacle flat or nearly so, chaffy, the chaff subtending the disk-flowers. Ray-flowers in 2 or 3 series, pistillate, fertile, the ligules numerous, linear. Disk-flowers perfect but sterile, their corollas tubular, 5 -toothed, the style undivided. Anthers minutely 2 -toothed or entire at the base. Achenes broad, dorsally flattened, 2 -winged, notched at the apex. Pappus none, or of 2 awns confluent with the wings of the achene. [Greek, from the resinous juice.] About 25 species, of N. Am.
Stem leafy, the leaves opposite, alternate, or verticillate.
Leaves, or their petiole-bases, connate-perfoliate; stem square.

## 1. S. perfoliatum.

Leaves not connate-perfoliate, sessile or petioled
Leaves opposite, or the uppermost alternate; cauline sessile.
2. S. integrifolium

Leaves, or some of them, verticillate in 3 's or 4's, petioled.
3. S. trifoliatum.

Most or all of the leaves alternate, entire or dentate.
Involucral bracts ovate to orbicular, mostly obtuse, glabrous or puberulent. 4. S. Asteriscus.

Involucral bracts triangular to lanceolate, acute, hirsute or pubescent.
5. S. Gatesii.

Leaves all alternate, pinnatifid or bipinnatifid, large. Stem leafless or nearly so, scaly above; leaves basal, large.
6. S. laciniatum.
7. S, terebinthinaceum.
r. Silphium perfoliàtum L. Cup-plant. Indian-cup. (I. F. f. 3865.) Stem square, glabrous, or rarely somewhat hispid, branched above, or sometimes simple, $1-2.4 \mathrm{~m}$. high. Leaves ovate or deltoid-ovate, opposite, the lower abruptly contracted into margined petioles, all thin, usually scabrous on both sides, or pubescent beneath, coarsely angulate-dentate, or the upper entire, the larger 1225 mm . long, $8-16 \mathrm{~mm}$. wide ; heads commonly numerous, $5-7 \mathrm{~cm}$. broad; rays $20-30$, about 25 mm . long and 4 mm . wide; involucre depressed-hemispheric, its outer bracts broad, ovate, ciliolate, spreading or erect; achenes obovate, emarginate, sometimes 2-toothed. In moist soil, southern Ont. to S. Dak., south to Ga., Neb. and La. Naturalized near N. Y. City. July-Sept.
2. Silphium integrifòlium Michx. Entire-leaved Rosin-weed. (I. F. f. 3866.) Stem glabrous, rough or sometimes hirsute, corymbosely branched above, $0.6-1.5 \mathrm{~m}$. high. Leaves ovate to ovate-lanceolate, acute or acuminate, entire, denticulate or remotely dentate, rough above, pubescent or glabrous beneath, $7-12 \mathrm{~cm}$. long, $3-5 \mathrm{~cm}$. wide ; heads usually numerous, $2-5 \mathrm{~cm}$. broad; involucre nearly hemispheric, its outer bracts ovate or ovate-lanceolate, acute, spreading, ciliolate or pubescent; rays $15-25$; achenes oval or obovate, $8-10 \mathrm{~mm}$. long, deeply emarginate. On prairies, Ohio to Minn., La., Neb., Ark. and Tex. Aug.-Sept.
3. Silphium trifoliàtum L. Whorled Rosin-weed. (I. F. f. 3867.) Stem glabrous, sometimes glaucous, corymbosely branched at the summit, $1-2 \mathrm{~m}$. high. Leaves lanceolate or oblong-lanceolate, acuminate at the apex, narrowed at the base, rough or roughish above, pubescent or nearly glabrous beneath, entire or denticulate, $7-17 \mathrm{~cm}$. long, $\mathbf{1}-4 \mathrm{~cm}$. wide; heads several or numerous, $4-5 \mathrm{~cm}$. broad; involucre hemispheric, its outer bracts ovate or oval, acute or obtuse, glabrous, or slightly pubescent, ciliolate; rays $15-20$; achenes oval or obovate, narrowly winged, emarginate, sharply 2 -toothed. In woods, Penn. to Ohio, Va. and Ala. JulyOct.
4. Silphium Asteríscus L. Starry Rosin-weed. (I. F. f. 3868.) Stem $0.6-\mathbf{I} .2 \mathrm{~m}$. high, usually purple. Leaves ovate, ovate-oblong, or lanceolate, acute or obtusish, sessile, somewhat clasping, or the lower narrowed into short petioles, dentate, or the upper entire, $5-\mathbf{1 2} \mathrm{cm}$. long, $\mathbf{I - 2 . 5} \mathrm{cm}$. wide; heads commonly few, $3-5 \mathrm{~cm}$. broad; rays $12-15$; involucre hemispheric, its bracts mostly hispid, orbicular, ovate or oblong, obtuse; achenes oval or obovate, narrowly winged, 2 -toothed. In dry soil, Md. to Tenn. and Mo., south to Fla. and La. June-Sept.
5. Silphium Gátesii Mohr. Gates' Rosin-weed. Stems $0.6-1.5 \mathrm{~m}$. tall. hispid, simple or sparingly branched above. Leaves alternate, broadly linear to oblong-lanceolate or lanceolate, 5-14 cm. long, acute, remotely serrate, roughpubescent, the lower ones short-petioled; heads showy; involucre campanulate. barely $\mathbf{I c m}$. high, the bracts mainly triangular to lanceolate, hirsute or pubescent. the outer acute or short-acuminate; ray-flowers several, the ligules yellow, 12-20 mm . long; achenes suborbicular or broader than high, the teeth when present separated by a broad sinus. In dry soil, Mo. to Tenn. and Ala. May-Aug.
6. Silphium laciniàtum L. Compass-plant. Phot-werid. (I. F. f. 3 S60.) Rough or hispid, very resinous; stem $2-5 \mathrm{~m}$. high; hasal leaves pinnatifid or bipinnatifid, long-petioled, 3 dm . long or more, the lobes oblong or lanceolate ; stemleaves alternate, vertical, their edges tending to point north and south, sessile, or the lower short-petioled, the upper cordate-clasping at the base; heads $5-12 \mathrm{~cm}$. broad. the peduncles bracted at the base ; rays $20-30,25-35 \mathrm{~mm}$. lons; ; involucre nearly hemispheric, its bracts large, rigid, lanceolate or ovate, very squarrose : achenes oval, about 12 mm . long, the wing broader above than below, noteded at the apex. awnless. On prairies, Ohio to S. Dak., Ma., Ia., Kans. and Tex. July-Scpt.
7. Silphium terebinthinàceum Jacq. Pratraf Dock. (I. F. f. 35フo.) Sitem glabrous or nearly so, branched and scaly above, $1-3 \mathrm{~m}$. high. Lowes coriacons. ovate, mostly long-petioled, acute at the apex. condate at the base, rough on both sides, often 3 dm . long and 15 cm . wide, shapply dentate: heads numerons. $4-7 \mathrm{~cm}$. broad; involucre hemispheric, its bracts whowate-oblons, ewect, glabrous or minutely pubescent; rays $12-20$; achenes whowte, matowly winsed, slighty 2 -toothed and emarginate at the apex. ()n prairie's and in dry wonds, southern Ont. and Ohio to Minn., Iowa and La. July-Sept.

Silphium terebinthinaceum pinnatifidum (kll.) . (iray. Leaves laciniate or pinnatifid. Ohio to Tenn. and Ga.

## 51. CHRYSÓGONUM L.

Pubescent perennial herbs, with opposite and basal petioled leaves, and slenderpeduncled axillary and terminal, rather large heads of both tubular and radiate yellow flowers. Involucre hemispheric, its bracts in 2 series of 5 , the outer large, obovate or spatulate, foliaceous, the inner oval, firm, each subtending a pistillate ray-flower. Receptacle chaffy, each scale subtending and partly enclosing a perfect but sterile tubular flower with a 5 -toothed corolla. Anthers nearly entire at the base. Achenes obovate, compressed, their margins acute, not winged, I-nerved on the back, $\mathbf{r}-2$-ribbed on the inner side. Pappus a short half-cup-shaped crown. [Greek, golden-knee.] A monotypic genus.
I. Chrysogonum Virginiànum L. Chrysogonum. (I. F.f. 387 I.) Perennial by rootstocks or runners, pubescent or hirsute throughout, branched from the base, or at first acaulescent, $7-30 \mathrm{~cm}$. high. Leaves ovate or oblong, obtuse or acutish at the apex, the upper sometimes subcordate at the base, crenate-dentate, rather thin, $3-7 \mathrm{~cm}$. long, $1-2.5 \mathrm{~cm}$. wide, peduncles $3-10 \mathrm{~cm}$. long ; heads $2.5-4$ cm . broad; outer bracts of the involucre obtuse ; rays about $5,8-14 \mathrm{~mm}$. long. In dry soil, southern Penn. to Fla. April-July.

Chrysogonum Virginiànum dentàtum $A$. Gray. Leaves dentate, the teeth and acutish apex mucronulate; outer bracts of the involucre acute. High Island, Potomac River, near Washington.

## 52. BERLANDIÈRA DC.

Perennial canescent or pubescent herbs, with alternate leaves and rather large, peduncled heads of both tubular and radiate yellow flowers. Involucre depressedhemispheric, its bracts imbricated in about 3 series, the outermost small, mostly oblong, the second series broader, oval or obovate. the inner membranous, similar, reticulated when mature, subtending the ray flowers and exceeding the disk. Receptacle nearly flat, chaffy, the chaff subtending the disk-flowers. Ray-flowers 5-12, pistillate, fertile. Disk-flowers perfect, tubular, sterile, their corollas 5toothed. Anthers entire, or minutely 2 -toothed at the base. Style of the tubular flowers undivided, hirsute. Achenes obovate, compressed, not winged, r-ribbed on the inner side, the pappus obsolete, early deciduous or of 2 caducous awns. [Named after J. L. Berlandier, a Swiss botanical collector in Texas and Mexico.] About 5 species, natives of the southern U. S. and Mex.

Stem leafy ; leaves ovate to oblong, crenate.
Plant acaulescent, or nearly so ; leaves lyrate-pinnatifid.
I. Berlandiera Texàna DC. Texan Berlandiera. (I. F, f. 3872.) Hirsute-pubescent throughout ; stem erect, branched above, or simple, 6-9 dm. high, leafy. Leaves acutish or obtuse at the apex, rounded or cordate at the base, $5-10 \mathrm{~cm}$. long, $3-5 \mathrm{~cm}$. wide, the upper sessile, the lower petioled; heads few or several, $3-4 \mathrm{~cm}$. broad, in a terminal corymbose-cymose cluster ; inner bracts of the involucre twice as large as the outer. In dry soil, Mo. and Kans. to Ark. and La. July-Aug.
2. Berlandiera lyràta Benth. Lyre-Leayed Berlandiera. (I. F. f. 3873.) Finely whitish-canescent; scapes or peduncles slender, $7-20 \mathrm{~cm}$. long, bearing a solitary head, or rarely 2. Leaves lyrate-pinnatifid, obtuse, petioled, the terminal segment usually larger than the lateral ones. the lower ones very small. all obtuse, mostly crenate, sometimes becoming green and glabrate above; head about 25 mm . broad; inner bracts of the involucre much broader than the outer, orbicular, or wider than long. In dry soil, Kans. to Tex., Ariz. and Mex.

## 53. ENGELMANNIA T. \& G.

Perennial hirsute herbs, with alternate pinnatifid leaves, and corymbose slenderpeduncled rather large heads of both tubular and radiate yellow flowers. Involucre hemispheric, its bracts imbricated in 2 or 3 series. the outer linear, loose, hirsute, ciliate, the inner oval or obovate, concave, appressed. subtending the rayflowers. Receptacle flat, chaffy, the chaff subtending and partly enclosing the diskflowers. Rays 8 -Io. pistillate, fertile. Disk-flowers about as many, tubular. perfect, sterile, the corolla 5 -toothed. Anthers minutely 2 -dentate at the base. Style
of the tubular flowers undivided. Achenes obovate, compressed, not winged, I-ribbed on each face. Pappus a persistent irregularly cleft crown. [Named for Dr. Geo. Engelmann, botanist, of St. Louis.] A monotypic genus.
I. Engelmannia pinnatífida T. \& G. Engelmannia. (I. F. f. 3874.) Stem usually branched above, 3-9 dm. high. Basal leaves slender-petioled, I-2 dm. long, their lobes lanceolate or oblong, dentate or entire, obtuse or acutish; upper leaves smaller, sessile, less divided, the uppermost sometimes entire, or with a pair of basal lobes; heads usually numerous, about 25 mm . broad; outer bracts of the involucre somewhat in 2 series, the first linear, the second broadened at the base. In dry soil, Kans. to La., Ariz. and N. Mex. May-Aug.

## 54. PARTHENIUML.

Perennial, mostly pubescent or canescent herbs, or shrubs, with alternate leaves, and small corymbose or paniculate heads of both tubular and radiate white or yellow flowers. Involucre broadly campanulate or hemispheric, its bracts imbricated in 2 or 3 series, obtuse, appressed, nearly equal. Receptacle convex or conic, chaffy, the chaff membranous, surrounding the disk-flowers. Ray-flowers about 5, pistillate, fertile, their ligules short, broad, 2 -toothed or obcordate. Diskflowers perfect, sterile, their corollas 5-toothed, the style undivided. Anthers entire at the base. Achenes compressed, keeled on the inner face, margined, bearing the persistent rays on the summit. Pappus of $2-3$ scales or awns. [Greek, virgin.] About Io species, natives of N. Am., Mex., the W. Ind. and northern S. Am. Besides the following, some 5 others occur in the southern and southwestern U. S.

Leaf-bases not auricled.
Stem minutely pubescent, or glabrous below ; rootstocks thickened.

1. $P$. integrifolium.

Stem pilose or hispid; rootstocks slender, creeping, forming runners.
2. P. repens.
3. $P$. auriculatum.

Upper leaves with sessile auricled bases.
I. Parthenium integrifolium L. American Fever-few. Prairie Dock. (I. F. f. 3875.) Stem stout, striate, corymbosely branched above, 3-12 dm. high. Rootstocks tuberous-thickened; leaves firm, ovate or ovate-oblong, acute or acuminate, crenate-dentate or somewhat lyrate at the base, hispidulous and roughish on both sides, the lower and basal ones petioled, often 3 dm . long and 12 cm . wide, the upper smaller, sessile and partly clasping; involucre nearly hemispheric, about 6 mm . high, its bracts firm, the outer oblong, densely appressed-pubescent, the inner broader, glabrous, or ciliate on the margins; rays white or whitish. In dry soil, Md. to Minn., Ga., Mo. and Tex. May-Sept.
2. Parthenium rèpens Eggert. Creeping or Hairy Parthenium. (I. F. f. 3876.) Similar to P. integrifolium, but lower, seldom over 6 dm. high. Rootstocks slender, forming runners; stem pilose or hispid with spreading hairs; leaves hispid on both sides, irregularly crenate, sometimes lyrate at the basc, the teeth rounded and obtuse ; heads fewer, slightly larger, in a smaller looser corymb; outer bracts of the involucre proportionately broader. Mo. and Kans. April-July:
3. Parthenium auriculatum Britton. Auricled Parthenilm. (I.F.f. 3 $\$ 75.2$.) Rootstock an oval erect tuber twice as long as thick; stem villous-pubescent. 4-7 dm . high. Leaves rough above, villous, especially on the veins beneath, oval, ovate or oblong, irregularly crenate-dentate, some or all of them laciniate or pimatifid at the base, the basal and lower slender-petioled with petiole as long as the blade, or longer, the upper with a sessile clasping auricled base, or with margined clasping petioles; inflorescence densely corymbose, its branches villous-tomentose; bracts of the involucre densely canescent. Near Clarksville, Va.; Alleghany Mts.

## 55. CRASSİNA Scepin.

Annual or perennial herbs, some species shrubby, with opposite entire, or sparingly serrate, mostly narrow and sessile leaves, and large or middle sized heads of both tubular and radiate flowers. Ray-flowers pistillate, vellow or variegated, persistent on the achene. Disk-flowers perfect. fertile; corolla cylimitricous. its lobes villous. Involucre campanulate to nearly cylindric, its bracts obtuse, dry,
firm, appressed, imbricated in 3 series or more, the outer gradually shorter. Receptacle conic or cylindric, chaffy, the chaff subtending and enwrapping the diskflowers. Style-branches elongated, not appendaged. Achenes of the ray-flowers somewhat 3 -angled, those of the disk flattened. Pappus of few awns or teeth. [In honor of Paul Crassus, an Italian botanist of the 16th century.] About 12 species, natives of the U. S. and Mex.
I. Crassina grandifiòra (Nutt.) Kuntze. Prairie Zinnia. (I. F. f. 3877.) Perennial, woody at the base, tufted, much branched, rough, I-I. 5 dm . high. Leaves rather rigid, linear to linear-lanceolate, entire, $1-3 \mathrm{~cm}$. long, 3 mm . wide or less, connate at the base, acute or acutish, crowded; heads numerous, peduncled, terminating the branches, $20-35 \mathrm{~mm}$. broad; rays 4 or 5, broad, yellow rounded or emarginate, their achenes with a pappus of 2 or 4 awns; involucre campanulate-cylindric, $6-8 \mathrm{~mm}$. high ; style-branches of the disk-flowers subulate. In dry soil, Kans. and Colo. to Tex., Mex. and Ariz. June-Sept.

## 56. HELIOPSIS Pers.

Perennial herbs (a tropical species annual), with opposite petioled 3-ribbed leaves, and large peduncled terminal and axillary heads of tubular and radiate yellow flowers. Involucre hemispheric or broadly campanulate, its bracts oblong or lanceolate, imbricated in 2 or 3 series. Receptacle convex or conic, chaffy, the chaff enveloping the disk-flowers. Ray-flowers pistillate, fertile, the rays spreading, the tube very short, commonly persistent on the achene. Disk-flowers perfect, the tube short, the limb elongated, 5 -toothed. Anthers entire, or minutely 2 -toothed at the base. Style-branches tipped with small hirsute appendages. Achenes thick, obtusely 3-4-angled, the summit truncate. Pappus none, or of 2-4 teeth, or a coroniform border. [Greek, sun-like.] About 6 species, natives of America. Besides the following, two others occur in the southern and southwestern U. S.
Leaves smooth, or nearly so; pappus none, or of 2-4 short teeth. I. H. helianthoides. Leaves rough; pappus crown-like, or of I-3 sharp teeth.
2. H. scabra.
I. Heliopsis helianthòides (L.) B.S.P. Ox-eye. False Sunflower. (I. F. f. 3878.) Stem glabrous, branched above, 9-15 dm. high. Leaves opposite, or rarely in 3's, ovate or ovate-lanceolate, rather thin, acuminate at the apex, usually abruptly narrowed at the base, sharply and nearly equally dentate, $7-15 \mathrm{~cm}$. long, $2.5-6 \mathrm{~cm}$. wide ; heads long-peduncled, somewhat corymbose, $3.5-6 \mathrm{~cm}$. broad; rays $18-25 \mathrm{~mm}$. long; bracts of the involucre oblong or linear-oblong, obtuse or acutish; achenes glabrous, the summit truncate. In open places, Ont. to Fla., west to IIl. and Ky. July-Sept.
2. Heliopsís scàbra Dunal. Rough Ox-Eye. (I. F. f. 3879.) Similar to the preceding species, but stem rough, at least above, simple or branched, 6-12 dm. high. Leaves ovate or ovate-lanceolate, acute or acuminate, sharply dentate, firm, $5-12 \mathrm{~cm}$. long, $4-5 \mathrm{~cm}$. wide, abruptly narrowed at the base, short-petioled; heads few, or solitary, long-peduncled, $5-6 \mathrm{~cm}$. broad ; rays usually 25 mm . long, or more ; bracts of the involucre canescent, oblong or linear-oblong ; achenes pubescent on the margins when young. Usually in dry soil, Me. to N. Y., N. J., Ill., Br. Col., Kans. and Ark. June-Sept.

## 57. ECLÍPTA L.

Erect or diffuse branching pubescent or hirsute herbs, with opposite leaves, and small peduncled terminal and axillary heads of tubular and radiate whitish flowers. Involucre hemispheric or broadly campanulate, its bracts imbricated in about 2 series, nearly equal, or the outer longer. Receptacle flat or convex, chaffy, the chaff awn-like, subtending the achenes. Ray-flowers pistillate, fertile. Diskflowers perfect, mostly fertile, their corollas tubular, 4 -toothed or rarely 5 -toothed. Anthers entire or minutely 2 -toothed at the base. Style-branches of the diskflowers with obtuse or triangular tips. Achenes thick, those of the rays 3 -sided, those of the disk compressed. Pappus none, or of a few short teeth. [Greek, wanting, referring to the absence of pappus.] About 4 species, mostly of tropical distribution.
I. Eclipta álba (L.) Hassk. Eclipta. (I. F. f. 3880.) Annual, rough with appressed pubescence, erect or diffuse, 1.5-9 dm. high. Leaves lanceolate,
oblong-lanceolate or linear-lanceolate, acute or acuminate, denticulate or entire, narrowed to a sessile base, or the lower petioled, $2-12 \mathrm{~cm}$. long, $4-20 \mathrm{~mm}$. wide ; heads commonly numerous, $6-12 \mathrm{~mm}$. broad, nearly sessile, or slender-peduncled; rays short, nearly white ; anthers brown ; achenes 4 -toothed, or at length truncate. Along streams, and in waste places, southern N. Y. to Ill. and Neb., south to Fla., Tex. and Mex. Naturalized from tropical Am. and widely distributed in warm regions as a weed. July-Oct.

## 58. TETRAGONOTHECA L.

Erect perennial mostly branched herbs, with opposite sessile or connate-perfoliate, broad dentate leaves, and large peduncled heads of tubular and radiate yellow flowers. Involucre depressed-hemispheric, its principal bracts 4, large and foliaceous, inserted in I series; inner bracts $6-15$, small, subtending the pistillate ray-flowers. Receptacle conic, chaffy, the chaff concave, enwrapping the perfect fertile disk-flowers, the corollas of which are slender and 5 -toothed. Anthers entire or minutely 2 -toothed at the base. Style-branches of the disk-flowers hispid, tipped with elongated appendages. Achenes thick, 4 -sided, truncate at the summit. Pappus none, or of several short scales. [Greek, 4 -angled case, referring to the involucre.] Three known species, of the southern U. S. and northern Mex.
I. Tetragonotheca helianthoides L. Tetragonotheca. (I. F. f. 3881.) Viscidly pubescent; stem branched or simple, 3-7 dm. high. Leaves ovate, ovateoblong, or somewhat rhomboid, thin, coarsely and unequally dentate, acute at the apex, narrowed at the base, sessile, or connate-perfoliate, $5-15 \mathrm{~cm}$. long, $2-7 \mathrm{~cm}$. wide; heads usually few, $3-7.5 \mathrm{~cm}$. broad; principal bracts broadly ovate, acute; rays 6 -1o, strongly nerved, $2-3$-toothed; achenes 4 -sided, or nearly terete; pappus none. In dry soil, Va. to Fla. and Ala. May-June. Sometimes flowering again in the autumn.

## 59. SPILÁNTHES Jacq.

Annual branching herbs, or some species perennial, with opposite, usually toothed leaves and rather small, long-peduncled discoid and radiate heads, terminal, or in the upper axils, or rays wanting in some species. Involucre campanulate, its bracts in about 2 series, herbaceous, loosely appressed. Receptacle convex or elongated, chaffy, its chaff embracing the disk-achenes and at length falling away with them. Ray-flowers yellow, or white, pistillate. Disk-flowers yellow, perfect, their corollas tubular with an expanded $4-5$-cleft limb. Anthers truncate at the base. Style-branches of the disk-flowers long, sometimes penicillate at the summit. Ray-achenes 3 -sided, or compressed, those of the disk-flowers compressed, margined. Pappus of I-3 awns, or more. [Greek, spot- or stain-flower, not significant.] About 30 species, of warm and tropical regions.

1. Spilanthes rèpens (Walt.) Michx. Spilanthes. (I. F. f. 38Sz.) Perennial, usually rooting at the lower nodes; stem slender, spreading or ascending. z-6 dm. long. Leaves ovate to lanceolate, petioled, acute, acuminate, or the lower obtuse, coarsely toothed, or nearly entire, $3-7 \mathrm{~cm}$. long; heads solitary at the ends of the stem and branches, $12-20 \mathrm{~mm}$. broad; bracts of the involucre oblong to oblenglanceolate; rays $8-\mathbf{1 2}$, yellow; receptacle narrowly conic; achenes oblong, most of them roughened when mature and hispidulous. In moist or wet soil, Mo. to Tex., east to S. Car. and Fla. June-Sept.

## 60. RUDBÉCKIA L.

Perennial or biennial (rarely amual), mostly rigid, usually rough or hispid herbs, with alternate undivided lobed or pinnatifid leaves, and large long-peduncled heads of tubular (mostly purple) and radiate (yellow) flowers. Inwoluce hemispheric, its bracts imbricated in $2-+$ serics. Receptacle conic or convex, with chafficoncave scales subtending or enveloping the disk-flowers. Ray-flowers nentrat, the rays entire or toothed. Disk-flowers perfect. fertile, their comellas 5 -howed. Anthers entire or minutely 2 -mucronate at the hase. Style-hranches tipped with hirsute appendages. Achenes $q$-angled, obtuse or truncate at the apes. Pappus coroniform, sometimes of $2-4$ short teeth, or none. [In homor of Claus Rudheck. 1630-1702, Swedish anatomist and botanist.] About 27 species, of N. Am, and

Mex. In addition to the following, some 25 others occur in the southern and western U. S.

* Stem-leaves not cordate-clasping ; achenes 4-angled.

Disk globose or ovoid and purple or dark brown in fruit; lower leaves entire or lobed.
Lower leaves deeply 3 -lobed or 3 -divided.
Plant more or less hirsute ; leaves thin; chaff awned. I. R. triloba.
Plant scabrous; leaves thick; chaff blunt, pubescent at apex.
2. R. subtomentosa.

Leaves neither 3 -lobed nor 3 -divided.
Plants hispid; chaff acute or acutish, hirsute at summit; style-tips subulate. Stem-leaves lanceolate, ovate to oblong; involucre shorter than the rays. Upper stem-leaves narrowly lanceolate, entire or nearly so.
3. R. hirta.

Upper stem-leaves ovate to ovate-lanceolate, mostly toothed.
4. R. monticola.

Stem-leaves oval to obovate ; involucral bracts foliaceous, nearly as long as the rays. 5. R. Brittoniz.
Plants pubescent, hirsute or glabrate; style-tips obtuse.
Leaves denticulate or entire; rays $1.8-2.5 \mathrm{~cm}$. long.
Stem-leaves oblong, ovate or oblong-lanceolate ; disk $10-16 \mathrm{~mm}$. broad, subglobose.

Basal leaves oval, acute or acutish, sparingly pubescent.
6. R. fulgida.

Basal leaves narrowly oblong, obtuse, hirsute.
7. R. Missouriensis.

Basal leaves broadly ovate to orbicular, cordate, obtuse, slightly pubescent.
8. R. palustris.

Stem-leaves obovate or spatulate ; disk $8-10 \mathrm{~mm}$. broad, depressed.
9. R. spathulata.

Leaves dentate or laciniate ; rays about 3.5 cm . long.
Stem-leaves elongated-lanceolate. Io. R. speciosa.
Stem-leaves ovate-lanceolate. II. R. Sullivantii.
Disk elongated or cylindric in fruit, yellowish or gray; lower leaves pinnately divided or pinnatifid.
12. R. laciniata.
** Stem-leaves cordate-clasping; achenes nearly terete, striate. 13. R. amplexicaulis.
I. Rudbeckia tríloba L. Thin-Leaved Cone-flower. (I. F. f. 3883.) Stem somewhat pubescent and rough, rarely glabrate, branched, 6-I5 dm. high. Leaves rough on both sides, bright green, the basal and lower ones petioled, the lobes lanceolate or oblong, acuminate, sharply serrate; upper leaves ovate, ovatelanceolate, or lanceolate, acuminate or acute, narrowed to a sessile base or into short margined petioles, serrate or entire, $5-10 \mathrm{~cm}$. long, $\mathbf{I}-2.5 \mathrm{~cm}$. wide; heads nearly 5 cm . broad, corymbed; bracts of the involucre linear. acute, pubescent, soon reflexed; rays 8-12, yellow, or the base orange or brownish purple; disk dark purple, ovoid, about 12 mm . broad; pappus a minute crown. In moist soil, N. J. to Ga., west to Mich., Kans. and La. June-Oct.
2. Rudbeckia subtomentòsa Pursh. Sweet Cone-flower. (I. F. f. 3884.) Densely and finely cinereous-pubescent and scabrous; stem branched above, 6-18 dm . high. Leaves thick, the lower ones petioled, 7-12 cm . long, the lobes oblong or lanceolate, acute or acuminate, dentate; upper leaves, or some of them, lanceolate or ovate, acuminate, sessile or nearly so; heads numerous, $5-7 \mathrm{~cm}$. broad; rays 15-20, yellow, or with a darker base; disk subglobose, rounded, purple, 12-16 mm. broad; bracts of the involucre linear-lanceolate, acuminate, squarrose, sweetscented; pappus a short crenate crown. On prairies and along rivers, Ill. to La., Kans. and Tex. July-Sept.
3. Rudbeckia hírta L. Black-eyed Susan. Yellow Daisy. (I. F. f. 3885.) Biennial or sometimes annual; stems simple or sparingly branched, often tufted, 3-9 dm. high. Leaves thick, sparingly serrate with low teeth, or entire, the lower and basal ones petioled, mostly obtuse, $3-5$-nerved, $5-17 \mathrm{~cm}$. long, $1-5 \mathrm{~cm}$. wide, the upper sessile, narrower, acute or acutish; heads commonly few or solitary, $5-10 \mathrm{~cm}$. broad; rays $10-20$, orange, rarely darker at the base; bracts of the involucre very hirsute, spreading or reflexed: disk globose-ovoid, purple-brown; pappus none. In fields, Quebec to western Ont. and the N. W. Terr., south to Fla., Colo. and Tex. Widely distributed in the east as a weed. May-Sept.
4. Rudbeckia montícola Small. Mountain Cone-flower. Perennial by a woody root; stem hirsute, simple or with long, slender branches, 4-7 dm. high. Leaves thin, rough-pubescent on both sides, the basal and lower ones with oval to oblong, obtuse or obtusish blades tapering into margined petioles, the upper ovate to ovate-lanceolate, serrate, acute to acuminate, $6-12 \mathrm{~cm}$. long, sessile and partly clasping, or narrowed into broad clasping petioles; heads very long-peduncled, $8-10 \mathrm{~cm}$. broad; involucral bracts narrowly lanceolate to linear, half as long as the rays, or less. Mountainous regions, W. Va. to Tenn., N. Car., Ala. and Ga. June-Aug.
5. Rudbeckia Brittònii Small. Britton's Cone-flower. (I. F. f. 3886.) Stem stout, erect, 4-7 dm. high, simple, grooved, leafy, at least below. Leaves serrate or crenate-serrate, strigose-pubescent, the basal ones ovate to ovate-lanceolate, $7-10 \mathrm{~cm}$. long, obtuse, long-petioled; stem-leaves often with a lateral lobe, the petioles wing-margined; uppermost leaves often ovate-lanceolate, sessile, cordate; bracts of the involucre often 25 mm . long or more; head $5-7 \mathrm{~cm}$. broad; rays about 12, 2-lobed; style-tips slender, acute. In woods, mountains of Penn. to Va. and Tenn. May-July.
6. Rudbeckia fúlgida Ait. Orange Cone-flower. (I. F. f. 3887.) Perennial; stem hirsute or strigose-pubescent, slender, sparingly branched or simple, 3-9 dm. high. Leaves firm, more or less hirsute or pubescent on both sides, the basal and lower ones oblong or spatulate, obtuse, $5-10 \mathrm{~cm}$. long, 3-nerved, narrowed into margined petioles, the upper sessile, or slightly clasping at the base; heads few, $2-4 \mathrm{~cm}$. broad; bracts of the involucre oblong or lanceolate, $6-16 \mathrm{~mm}$. long; rays 10-15, linear, bright yellow, or with an orange base; disk brownpurple; chaff of the receptacle linear-oblong, obtuse, glabrous, or nearly so at the summit; pappus a minute crown. In dry soil, N. J. and Penn, to Ga., west to Mo. and Tex. Aug.-Oct.
7. Rudbeckia Missouriensis Engelm. Missouri Cone-flower. Stem more or less hirsute, 4-7 dm. high, simple or branched. Leaves firm, entire, or with an occasional minute callous tooth, the basal ones narrowly oblong, acutish or obtuse, $6-20 \mathrm{~cm}$. long, $8-12 \mathrm{~mm}$. wide, 3 -nerved, hirsute, narrowed into petioles, those of the stem sessile or the lower petioled, linear-lanceolate to linear, acute or obtusish; heads $7-9 \mathrm{~cm}$. broad; rays mostly 12-14, 2-3-toothed; involucral bracts oblong to lanceolate, obtuse to acute, much shorter than the rays ; disk hemispheric, purple-brown; chaff pointed; style-tips obtuse; pappus a very short crown. Missouri and Arkansas.
8. Rudbeckia palústris Eggert. Swamp Cone-flower. Perennial; stem grooved, smooth and glabrous, or nearly so, branched, 4-9 dm. high, the branches slender, erect. Leaves rather thin, the basal ones with broadly ovate to orbicular blades $5-8 \mathrm{~cm}$. long, palmately veined, remotely denticulate, cordate or obtuse at the base, their slender pubescent petioles $10-15 \mathrm{~cm}$. long; stem-leaves ovate to ovate-lanceolate, sparingly serrate, acute or acuminate at the apex, narrowed at the base, 3 - 5 -nerved, the lower petioled, the upper sessile; peduncles long, slender, pubescent; heads 3 cm . wide or more; involucral bracts oblong. obtuse, appressedpubescent, half the length of the rays or less. In wet soil, Ky. to Temn. and Mo.
9. Rudbeckia spathulata Michx. Spatulate-leated or Flat-heaned Cone-flower. (I. F. f. 3888.) Perennial; stem slender, simple, or little branched, finely strigose-pubescent, $3-9 \mathrm{dm}$. high. Leaves appressed-pubescent on both sides, the lower $5-10 \mathrm{~cm}$. long. $2-4 \mathrm{~cm}$. wide, the basal ones sometimes nearly orbicular, obtuse or obtusish, denticulate, narrowed into margined petioles; heads few, or solitary, $2.5-4 \mathrm{~cm}$. broad; bracts of the involucre short, at length reflexed; disk depressed-globose or ovoid, about 1 cm . broad; rays $\mathcal{S}-12$, oblong, yellow, mostly orange at the base; chaff of the receptacle obtusc; pappus a short-toothed crown. In dry woods, Va. to Tenn. and Fla. Aug.-Sopt.
10. Rudbeckia speciòsa Wenderoth. Shoily Coxp-fiowfr. (I. F. f. 3889.) Perennial, more or less hirsute or hispid; stem branched ahove, 3-12 dm. high. Leaves firm, slender-petioled, $5-12 \mathrm{~cm}$. long. 35 cm . wide, dentate with low teeth, acute or sometimes acuminate, $3-5$-ncrved; stem-leaves sessile or partly clasping, or narrowed into broad margined petioles, laciniate or sharply serrate, lanceolate, acuminate, often 15 cm . long, the uppermost smallor and sometimes entire; heads several, $5-7 \mathrm{~cm}$. broad; bracts of the involucre linear-lanceolate,
acute; rays $\mathbf{1 2 - 2 0}$, bright yellow, usually orange at the base; disk depressedglobose, IO-16 mm . broad, brown-purple; chaff of the receptacle acute, ciliate or naked; florets $5.5-6.5 \mathrm{~mm}$. long; achenes $2.5-3 \mathrm{~mm}$. high; pappus a short crown. In moist soil, N. J. to Mich., south to Ala. and Ark. Aug.-Oct.
i i. Rudbeckia Sullivàntii Boynton \& Beadle. Sullivant's Cone-flower. Perennial, 5-12 dm. high. Stem-leaves ovate to ovate-lanceolate, the lower 15-20 cm . long, $4-8 \mathrm{~cm}$. wide, their petioles $3-7 \mathrm{~cm}$. long, the blade coarsely and irregularly serrate, more or less pubescent; heads several, 5-9 cm. broad; rays $\mathbf{1 0}-\mathbf{1 5}$; chaff acute, smooth or nearly so; florets $6.5-7.5 \mathrm{~mm}$. long; achenes $3-4 \mathrm{~mm}$. high. Ohio and Michigan.
12. Rudbeckia laciniàta L. Tall or Green-headed Cone-flower. (I. F. f. 3890.) Perennial; much branched, glabrous, or nearly so, $\mathbf{I}-3.5 \mathrm{~mm}$. high. Leaves rather thin, minutely pubescent on the margins and upper surface, broad, the basal and lower ones long-petioled, often 3 dm . wide, the segments variously toothed and lobed; stem-leaves shorter-petioled, $3-5$-parted or divided, the upper ones much smaller, 3 -lobed, dentate or entire; heads several or numerous, $6-10 \mathrm{~cm}$. broad; rays $6-10$, bright yellow, drooping; bracts of the involucre unequal; chaff of the receptacle truncate and canescent at the apex; pappus a short crown. In moist thickets, Quebec to Manitoba and Mont., south to Fla., Kans. and N. Mex. July-Sept.

Rudbeckia laciniàta hùmilis A. Gray. Simple or branched, glabrous or nearly so, 3-6 dm. high, some or all of the basal leaves orbicular and undivided; heads $4-6 \mathrm{~cm}$. broad; disk globose or ovoid. Va. and N. C. to Tenn. and Ga., mostly in the mountains.

## 13. Rudbeckia amplexicaùlis Vahl. Clasping-leaved Cone-flower.

 (I. F.f. 389I.) Annual; glabrous throughout, somewhat glaucous; stem branched, grooved, 3-6 dm. high, the branches ascending. Leaves entire, or sparingly toothed, I-ribbed, reticulate-veined, the lower oblong to spatulate, sessile, the upper ovate, ovate-oblong, or lanceolate, acute ; heads solitary at the ends of the branches, long-peduncled, about 5 cm . broad; bracts of the involucre few, lanceolate, acuminate; rays yellow, or sometimes brown at the base; disk ovoid-oblong, often becoming 25 mm . high; achenes striate and transversely wrinkled, obliquely attached to the elongated receptacle; chaff at length deciduous; pappus none. In wet soil, Kans. and Mo. to La. and Tex. June-Aug.
## 61. RATIBIDA Raf.

Mostly perennial herbs, with alternate pinnately divided or parted leaves, and long-peduncled terminal heads of tubular and radiate flowers, the disk-flowers gray or yellow, becoming brown, the rays yellow, or with brown bases, drooping or spreading. Involucral bracts in 2 or 3 series. Disk globose, oblong, or cylindric. Receptacle columnar to subulate, the concave chaff subtending or enveloping the disk-flowers, truncate, the tips inflexed, canescent. Ray-flowers neutral. Diskflowers perfect, fertile, their corollas with scarcely any tube. Achenes short, flattened, sharp-margined, or winged, at length deciduous with the chaff. Pappus with I or 2 teeth, or none. [Name unexplained.] About 4 species, of N. Am.

Style-tips lanceolate-subulate; leaf-segments lanceolate; rays $25-75 \mathrm{~mm}$. long.
I. R. pinnata.

Style-tips short, blunt ; leaf-segments linear; rays $6-30 \mathrm{~mm}$. long.
Disk cylindric, at length 2.5 cm . long or more; rays mostly equalling it, or longer.
2. R. columnaris. Disk globose to short-oval, about I cm . high; rays mostly short. 3. R. Tagetes.
r. Ratibida pinnàta (Vent.) Barnhart. Gray-headed Cone-flower. (I. F.f. 3892.) Perennial; rough and strigose-pubescent throughout; stem branched or simple, $9-15 \mathrm{dm}$. high. Leaves pinnately 3-7-divided, the basal ones sometimes 2.5 dm . long, petioled, the segments cleft or entire, acute or acuminate; upper leaves sessile or nearly so, the uppermost commonly small and entire; bracts of the involucre linear or linear-oblong, short, reflexed; rays 4-10, bright yellow, drooping; disk oblong, gray or becoming brown, rounded, at length twice as long as thick; the inner margin of achenes produced into a short tooth. On dry prairies, western N. Y. to Fla., west to S. Dak., Neb. and La. June-Sept.
2. Ratibida columnàris (Sims) D. Don. Long-headed or Prairie Coneflower. (I. F. f. 3893.) Perennial, strigose-pubescent and scabrous; stem slender, usually branched, 3-7 dm. high. Leaves pinnately divided into acute or obtuse, entire dentate or cleft segments, the cauline short-petioled or sessile, 5-10 cm . long, the basal ones sometimes oblong, obtuse and undivided, slender-petioled; bracts of the involucre short, linear-lanceolate or subulate, reflexed, rays 4-10, yellow, brown at the base, or brown all over, drooping; pappus of $\mathbf{I}$ or 2 subulate teeth usually with several short intermediate scales. On dry prairies, N. W. Terr. to Minn., Tenn., Neb., Tex. and Ariz. May-Aug.
3. Ratibida Tagètes (James) Barnhart. Short-Rayed Cone-flower. (I. F. f. 3894.) Perennial, rough-canescent; stem 3-4 cm. high, usually much branched, leafy. Leaves firm, pinnately divided into 3-7 mostly entire segments; peduncles terminal, $1-5 \mathrm{~cm}$. long; heads 25 mm . broad, or less; bracts of the receptacle narrow, deflexed; rays few, mostly shorter than the globose to short-oval disk; pappus of $\mathbf{I}$ or 2 subulate deciduous teeth, with no short intermediate teeth. On dry plains and rocky hills, Kans. to Tex., Chihuahua, N. Mex. and Ariz. July-Sept.

## 62. BRAUNERIA Neck.

Perennial erect branched or simple herbs, with thick black roots, thick rough alternate or opposite 3-5-nerved entire or dentate undivided leaves, and large longpeduncled heads of tubular and radiate flowers, the rays purple, purplish red or white, the disk green or purple, at length ovoidthor conic. Involucre depressed-hemispheric, its bracts lanceolate, spreading or appressed, imbricated in 2-4 series. Receptacle conic, chaffy, the chaff carinate and cuspidate. Ray-flowers neutral, or with a rudimentary pistil. Disk-flowers perfect, the corolla cylindric, 5-toothed. Achenes 4 -sided, obpyramidal, thick. Pappus a short dentate crown. [Named for Jacob Brauner, a German botanist of the 18th century.] Five known species, natives of N. Am.
Rays purple to white.

Leaves ovate or ovate-lanceolate, mostly dentate.
Leaves lanceolate, oblong-lanceolate, or linear, entire. Rays purplish to white, $2-3 \mathrm{~cm}$. long, spreading. Rays rose-purple, 3-7 cm. long, narrow, drooping.
Rays yellow to red.

1. B. purpurea.
2. B. angustifolia.
3. $B$. pallida.
4. B. atrorubens.
I. Brauneria purpùrea (L.) Britton. Purple Cone-flower. Black Sampson. Red Sunflower. (I. F. f. 3895.) Stem glabrous or sparingly hispid. usually stout, $6-15 \mathrm{dm}$. high. Lower and basal leaves slender-petioled, ovate mostly 5 -nerved, acute or acuminate at the apex, abruptly narrowed or rarely cordate at the base, commonly sharply dentate, $7-20 \mathrm{~cm}$. long, $4-7 \mathrm{~cm}$. wide ; petioles mostly winged at the summit ; uppermost leaves lanceolate or ovate-lanceolate, 3 -nerved, sessile or nearly so, often entire; rays 12-20, purple, crimson, or rarely pale, $4-7 \mathrm{~cm}$. long, spreading or drooping. In moist, rich soil, Va. to Ala., west to Ill., Ky. and La. July-Oct.
5. Brauneria angustifòlia (DC.) Heller. Narrow-leaved Purple Coneflower. (I. F. f. 3896 as B. pallida.) Stem hispid, slender, often simple, 3-6 dm. high. Leaves lanceolate, oblong-lanceolate or linear-lanceolate, acute and about equally narrowed at each end, strongly 3 -nerved and sometimes with an additional pair of marginal less distinct nerves, entire, $7-20 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide, the lower and basal ones slender-petioled, the upper short-petioled or sessile; rays short, $2-3 \mathrm{~cm}$., spreading, or rarely deflexed, often pale. In dry soil. especially on prairies, Minn. to the N. W. Terr., Wyo. and Tex. June-Oct.
6. Brauneria pállida (Nutt.) Britton. Pale Purple Cone-flower. Similar to the preceding species, but usually taller, sometimes i m. high. Stem-leaves elongated-lanceolate, entire; rays narrow and elongated, drooping, $4-7 \mathrm{~cm}$. long. 3-6 mm. wide, rose-purple or sometimes nearly white. In dry soil, Ill. to Mich., Ark., Ala., La. and Tex. May-July.
7. Brauneria atrorubens (Nutt.) Boynton \& Beadle. Red Cone-flower. Glabrous, or with a few scattered stiff hairs; stem stout, simple, $6-7.5$ dm. tall. Leaves elongated-lanceolate, entire, strongly 3 -nerved, the lower $1.5-2 \mathrm{dm}$. long, the petioles often as long as the blades, $1.2-2 \mathrm{~cm}$. wide, the upper sessile, all
rough-ciliate on the margins and with some appressed hairs on both surfaces; peduncle long, stout; rays $3-5 \mathrm{~cm}$. long, $6-8 \mathrm{~mm}$. wide, narrowed below, drooping, "very dark red" according to Nuttall, apparently yellow in Missouri specimens. Ark. and Mo.

## 63. BORRÍCHIA Adans.

Fleshy, more or less canescent, branching shrubs of the seacoast, with opposite entire or denticulate, cuneate, oblong, spatulate or obovate, 1-3-nerved leaves, and terminal large long-peduncled heads of both tubular and radiate yellow flowers. Involucre hemispheric, its bracts slightly unequal, imbricated in 2 or 3 series, the inner ones coriaceous. Receptacle convex, chaffy, the chaff rigid, concave, subtending or enwrapping the disk-flowers. Ray-flowers pistillate, fertile. Diskflowers perfect, the corolla tubular, 5-toothed, the style-branches elongated, hispid. Anthers dark colored, entire at the base, or minutely sagittate. Achenes of the ray-flowers 3 -sided, those of the disk-flowers 4 -sided. Pappus a short dentate crown. [Named for Olaf Borrick, a Danish botanist.] About 5 species, natives of America. In addition to the following, another occurs in South Fla.

1. Borrichia frutéscens (L.) DC. Sea Ox-eye. (I. F. f. 3897.) Finely canescent, even when old; stems terete, sparingly branched, 3-12 dm. high. Leaves mostly erect or ascending, spatulate or obovate, fleshy, tapering to the sessile base, somewhat connate, $3-7 \mathrm{~cm}$. long, $4-14 \mathrm{~mm}$. wide ; heads solitary or few, about 25 mm . broad; rays $15-25$, rather short ; exterior bracts of the involucre ovate and somewhat spreading, the inner ones and the chaff of the receptacle cuspidate. Seacoast, Va. to Fla. and Tex. Also on the coasts of Mex. and W. Ind. April-Oct.

## 64. HELIÁNTHUS L.

Erect, annual or perennial, mostly branched herbs, with opposite or alternate simple leaves, and large peduncled corymbose or solitary heads of both tubular and radiate flowers, the rays yellow, the disk yellow, brown or purple. Involucre hemispheric or depressed, its bracts imbricated in several series. Receptacle flat, convex or conic, chaffy, the chaff subtending the disk-flowers. Ray-flowers neutral (in our species), the rays spreading, mostly entire. Disk flowers perfect, fertile, the corolla tubular, the tube short, the limb 5-lobed. Anthers entire, or minutely 2 -toothed at the base. Style-branches tipped with hirsute appendages. Achenes thick, oblong or obovate, compressed, or somewhat 4 -angled. Pappus of 2 scales or awns, or sometimes with 2-4 additional shorter ones, deciduous. [Greek, sunflower.] About 60 species, natives of the New World. Besides the following, about 25 others occur in the southern and western parts of N. Am.

$$
\begin{array}{ll}
\text { * Disk purple, purplish or brown; receptacle flat or convex. } \\
\text { I. Leaves mostly alternate, the lower opposite. } \\
\text { Leaves narrow, linear or lanceolate; perennials. } \\
\text { Stem rough; leaves linear or linear-lanceolate; eastern. } & \text { 1. H. angustifolius. } \\
\text { Stem glabrous; leaves elongated-linear; western. } & \text { 2. H. orgyalis. } \\
\text { Leaves broad, ovate; annuals. } & \\
\text { Leaves dentate; bracts ovate, acuminate, ciliate, hispid. } & \text { 3. H. annuus. } \\
\text { Leaves entire or nearly so; bracts lanceolate, canescent. } & \text { 4. H. petiolaris. }
\end{array}
$$

2. Leaves mostly opposite, the upper alternate.

Leaves hispid, abruptly contracted into winged petioles. 5. H. atrorubens.
Leaves gradually narrowed into petioles.
Stem-leaves lanceolate ; involucral bracts acuminate. 6. H. scaberrimus.
Stem-leaves rhombic-ovate to lanceolate; involucral bracts acute.
7. H. subrhomboideus.

*     * Disk yellow or yellowish; receptacle convex or conic.
+ Leaves nearly all basal or near the base of the stem; upper bract-like.

8. H. occidentalis.
$+\dagger$ Stems leafy; leaves alternate or opposite.
9. Leaves prevailingly lanceolate and $3-8$ times as long as wide.
a. Leaves glabrous on both sides; heads $2.5-4 \mathrm{~cm}$. broad.
10. H. laevigatus.
b. Leaves scabrous, at least on the upper surface.

Heads $\mathrm{I}-3.5 \mathrm{~cm}$. broad, leaves thin, stem glabrous,
io, $H$, microcephalus.

Heads $3.5-8 \mathrm{~cm}$. broad; leaves firm, many of them often alternate.
Stem scabrous, scabrate or hispid, at least above; leaves sessile or nearly so. Leaves lanceolate, scabrous above, hirsute beneath, flat,

Leaves mostly alternate, narrowed at the base. 11. H. giganteus.
Leaves all but the uppermost opposite, obtuse at base.
12. H. ambiguus.

Leaves very scabrous on both sides.
Leaves elongated-lanceolate, conduplicate, pinnately veined.
Plant $\mathrm{r}-4 \mathrm{~m}$. high ; heads numerous ; leaves mostly alternate.
13. H. Maximiliani.

Plant 4-7 dm. high; heads 1 or 2 ; leaves all but the upper opposite.
14. H. Dalyi.

Leaves lanceolate to ovate-lanceolate, flat, 3 -nerved.
Leaves narrowly lanceolate, gradually narrowed at the base.
15. H. subtuberosus.

Leaves ovate-lanceolate, abruptly narrowed at the base.
16. H. Rydbergi.

Stem glabrous; leaves sessile by a truncate base.
19. H. divaricatus.

Stem glabrous; leaves petioled.
Stem glaucous; leaves lanceolate, firm. 17. H. grosseserratus.
Stem not glaucous ; leaves elongated, linear-lanceolate, thin.
18. H. Kellermani.
2. Leaves prevailingly ovate, ovate-lanceolate, or oblong.
a. Leaves sessile, or very nearly so.

Stem glabrous; leaves divaricate.
Stem hirsute or hispid; leaves ascending.
Leaves cordate-clasping at the base.
Leaves narrowed from below the middle.
b. Leaves manifestly petioled.
19. H. divaricatus.
20. H. mollis.
21. H. doronicoides.

Stem puberulent or glabrous.
Leaves membranous, slender-petioled, sharply serrate. Leaves regularly serrate.
Leaves irregularly serrate-laciniate.
Leaves firmer, shorter-petioled, less serrate or entire. Bracts of the involucre much longer than the disk. Bracts of the involucre about equalling the disk.
Stem hirsute, hispid, or scabrous.
Leaves rounded or truncate at the base, short-petioled.
Leaves, at least the upper, narrowed at the base.
Bracts of the involucre ovate-lanceolate, appressed. 27. H. laetiflorus
Bracts of the involucre lanceolate-acuminate, spreading.
Leaves villous-pubescent beneath.
28. H. tomentosus.

Leaves scabrous or puberulent beneath.
29. H. tuberosus.

## r. Helianthus angustifòlius L. Narrow-leaved or Swamp Sunflower.

 (I. F. f. 3898.) Perennial by slender rootstocks: stem branched above, or simple, slender, often hirsute below, 6-20 dm. high. Leaves firm, entire, sessile, slightly scabrous, rarely somewhat canescent beneath, $5-17 \mathrm{~cm}$. long, 4-6 mm . wide, the margins revolute when dry; heads usually few, sometimes solitary, $5-7 \mathrm{~cm}$. broad; involucre hemispheric, its bracts linear-lanceolate, acute or acuminate, scarcely squarrose, pubescent; receptacle slightly convex; chaff entire or 3 -toothed; rays 12-20; achenes truncate, glabrous; pappus usually of 2 short awns. In swamps, Long Island, N. Y., to Fla., Ky. and Tex., mainly near the coast. Aug.-Oct.2. Helianthus orgyàlis DC. Linear-leaved Sunflower. (I. F. f. 3809 .) Perennial by slender rootstocks; stem branched near the summit, very leafy to the top, $2-3 \mathrm{~m}$. high. Leaves sessile, entire, remotely dentate and short-petioled, rough with mucronate-tipped papillae, especially on the lower surface, acuminate. I-4 dm. long, $2-8 \mathrm{~mm}$. wide; heads usually numerous, about 5 cm . broad, terminating slender branches; involucre nearly hemispheric, its bracts linear-subulate to lanceolate, acuminate, squarrose, ciliate; receptacle convex, its chaff entire, or toothed, slightly ciliate; rays 10-20; achenes oblong-obovate, glabrous, $2-4$-a wned. On dry plains, Neb. and Colo. to Tex. Sept.-Oct.
3. Helianthus ánnuus L. Common Sunflower. (I. F. f. 3900.) Stem hispid or scabrous, stout, branched above, $\mathbf{I - 2} \mathrm{m}$. high, or in cultivated forms sometimes 4.5 m . high. Leaves broadly ovate, petioled, 3 -nerved, dentate or denticulate, acute at the apex, rough on both sides, sometimes pubescent beneath, the lower cordate at the base, $7-30 \mathrm{~cm}$. long; heads in the wild plant $7-15 \mathrm{~cm}$. broad; invo-
lucre depressed, its bracts ovate or oblong, usually long-acuminate or aristate; chaff of the receptacle 3-cleft; achenes obovate-oblong, appressed-pubescent, or nearly glabrous. On prairies, etc., Minn. to the N. W. Terr., Mo. and Tex. Much larger in cultivation; an occasional escape in the east. July-Sept.
4. Helianthus petiolàris Nutt. Prairie Sunflower. (I. F. f. 3901.) Annual, similar to the preceding species, but smaller and with smaller heads; stem strigose-hispid or hirsute, 3-10 dm. high. Leaves petioled, oblong, ovate, or ovatelanceolate, rough on both sides, usually paler beneath than above, $3-7 \mathrm{~cm}$. long, entire, or denticulate, obtuse or acutish at the apex, mostly narrowed at the base; heads $4-7 \mathrm{~cm}$. broad; involucre depressed-hemispheric, its bracts not hispid-ciliate, acute, or short-acuminate; achenes villous-pubescent, at least when young. On dry prairies, Minn. to the N. W. Terr. and Ore., south to Mo., Tex. and Ariz. Found rarely in waste places farther east. June-Sept.

Helianthus petiolàris cànus Britton. Leaves ovate, white-canescent beneath. Neb. to Tex. and N. Mex.

Helianthus petioiàris pàtens (Lehm.) Rydb. Heads larger, long-peduncled, the peduncles fleshy toward the top; leaves large, long-petioled. Neb. and Mo.
5. Helianthus atrórubens L. Hairy Wood Sunflower. Purple-disk Sunflower. (I. F. f. 3902.) Perennial; stems hirsute below, often minutely pubescent above, branched at the summit, 6-I 5 dm . high. Leaves hirsute on both sides, or canescent beneath, mostly thin, ovate or ovate-lanceolate, acutish, dentate or crenate-dentate, $10-25 \mathrm{~cm}$. long, $3-10 \mathrm{~cm}$. wide; heads not numerous, slenderpeduncled, about 5 cm . broad; involucre hemispheric, its bracts oblong to obovate, obtuse, ciliolate, appressed; receptacle convex, its chaff acute, entire, or 3-toothed; rays 10-20; achenes obovate, truncate, finely pubescent, about 4 mm . long; pappus usually of 2 lanceolate awns. In dry woods, Va. to Fla., west to Ohio, Minn., Mo., Ark. and La. Aug.-Oct.
6. Helianthus scabérrimus Ell. Stiff Sunflower. (I. F. f. 3903.) Perennial; stems simple or little branched, hispid or scabrate, 5-25 dm. high. Leaves thick, coriaceous, serrate or serrulate, very scabrous on both sides, $\mathbf{I}-5 \mathrm{~cm}$. long, 5-17 cm . wide, acute at the apex, narrowed at the base, the lower ovate or ovateoblong, petioled, the upper lanceolate or oblong-lanceolate, sessile or short-petioled; heads solitary or few, $5-7 \mathrm{~cm}$. broad; involucre hemispheric, its bracts ovate, acute, ciliate; receptacle convex, its chaff obtuse; rays $15-25$, light yellow; achenes more or less pubescent, oblong-obovate; pappus of 2 broad scales or of $2-4$ stout awns. Prairies, Minn. to Ill., Ga. and Tex. Aug. -Sept.
7. Helianthus subrhomboìdeus Rydb. Rhombic-Leaved Sunflower. Stem simple, sparingly hirsute, usually tinged with red. Leaves opposite, firm, very scabrous, 3 -nerved, slightly serrate, the basal ones broadly ovate to obovatespatulate, those of the stem rhomboid-ovate to rhomboid-lanceolate, short-petioled, $5-10 \mathrm{~cm}$. long, the uppermost very small; head. $\mathrm{I}-3,2.5-4 \mathrm{~cm}$. in diameter; bracts of the involucre oblong, acutish, densely white-ciliate. Plains, S. Dak. to Saskatch., Neb. and Mont. July-Sept.
8. Helianthus occidentàlis Riddell. Few-leaved Sunflower. (I. F. f. 3904.) Perennial; stems appressed-pubescent or sometimes nearly glabrous, slender, mostly simple, 6-9 dm. high. Leaves mainly basal, firm, ovate or oblonglanceolate, obtuse or obtusish at the apex, narrowed at the base, 3-5-nerved, serrulate or entire, mostly scabrous above, pubescent beneath, with slender petioles; heads several or solitary, $4-6 \mathrm{~cm}$. broad; involucre hemispheric, its bracts lanceolate or ovate-lanceolate, acute or acuminate, generally ciliate, appressed; receptacle convex, its chaff acute; rays $12-15$; achenes truncate and pubescent at the summit; pappus of 2 lanceolate-subulate awns. In dry soil, Ohio to Minn., south to Fla. and Mo. Aug.-Sept.

Helianthus occidentalis Dowelliànus (Curtis) T. \& G. Leaves broader and more numerous, smooth or nearly so on both sides. D. C. to N. Car. and Ga.

## 9. Helianthus laevigàtus T. \& G. Smooth Sunflower. (I. F. f. 3905.)

 Stems slender, from a perennial root, simple or little branched, glabrous, or somewhat glaucous, $6-12 \mathrm{dm}$. high. Leaves nearly all opposite, firm, glabrous, lanceolate, short-petioled, or the upper sessile, serrulate or entire, pale beneath, acuminate, narrowed at the base, $7-15 \mathrm{~cm}$. long, $\mathbf{I}-4 \mathrm{~cm}$, wide, the margins sometimesroughish; heads few or solitary; involucre campanulate, its bracts lanceolate or ovate-lanceolate, firm, ciliolate, the tips of the outer ones spreading; rays 5-10; chaff linear; achenes slightly pubescent at the summit; pappus of 2 lanceolate or ovate awns, with or without 2 intermediate scales. In dry soil, mountains of Va. and N. Car. Aug.-Oct.
ro. Helianthus microcéphalus T. \& G. Small Wood Sunflower. (I. F. f. 3906.) Stems slender, glabrous, branched above, or rarely simple, I-2 m. high. Leaves thin or thinnish, petioled, most of them opposite, lanceolate, or the lower ovate-lanceolate, rough above, canescent or puberulent beneath, long-acuminate at the apex, narrowed at the base, serrulate, or the lower serrate, $7-17 \mathrm{~cm}$. long, $1-4$ cm . wide; heads commonly several or numerous, borne on slender, sometimes roughish peduncles; involucre campanulate, its bracts lanceolate or ovate, acute or acuminate, ciliolate, the tips of the outer ones spreading; chaff of the receptacle oblong, entire, or 3 -toothed; rays $5-10$; disk yellow; achenes nearly glabrous; pappus usually of 2 subulate awns. In moist woods and along streams, Penn. to Ga., west to Ohio, Mo. and La. July-Sept.
iI. Helianthus gigantèus L. Tall or Giant Sunflower. (I. F. f. 3907.) Perennial by fleshy roots and creeping rootstocks; stems hispid or scabrous, at least above, $1-3.5 \mathrm{~m}$. high. Leaves sessile or short-petioled, firm, serrate or denticulate, acuminate at the apex, narrowed at the base, $5-15 \mathrm{~cm}$. long, $1-2.5 \mathrm{~cm}$. wide; heads usually several, mostly long-peduncled, $4-6 \mathrm{~cm}$. broad; involucre hemispheric, its bracts squarrose, lanceolate-subulate, hirsute or ciliate, commonly as long as the diameter of the disk; chaff of the receptacle oblong-linear, acute; achenes oblong, glabrous; rays 10-20; pappus of 2 subulate awns. In swamps and wet meadows, Me. and Ont. to the N. W. Terr., south to Fla., Neb. and La. Stem commonly purple. Aug.-Oct.
12. Helianthus ambíguus (T. \& G.) Britton. Ambiguous Sunflower. Stem slender, rough-hispid above, 5-8 dm. high, simple or little branched. Leaves thin, lanceolate, sharply serrate, long-acuminate, $6-10 \mathrm{~cm}$. long, finely roughpubescent on both sides, broadest justabove the obtuse or subacute base, the upper sessile, the lower short-petioled; heads few, $7-8 \mathrm{~cm}$. broad; bracts of the involucre lanceolate, acuminate, densely ciliate. In moist soil, L. I. and Ga. July-Sept. [H. giganteus ambiguus T. \&' G.]
13. Helianthus Maximiliàni Schrad. Maximilian's Sunflower. (I. F. f. 3908.) Perennial by fleshy roots and thickened rootstocks; stems stout, scabrous or hispid below, $\mathbf{I}-4 \mathrm{~m}$. high. Leaves folding in drying, rigid, acuminate or acute at both ends, denticulate or entire, $7-17 \mathrm{~cm}$. long, $\mathrm{r}-4 \mathrm{~cm}$. wide; heads few or numerous, $5-7 \mathrm{~cm}$. broad, on stout densely rough-pubescent peduncles; involucre hemispheric, its bracts lanceolate, acuminate, squarrose, densely strigose-pubescent, often 18 mm . long; rays $15-30$; chaff linear, acute, pubescent above; achenes linear-oblong, glabrous or nearly so; pappus commonly of 2 lanceolate awns. On dry prairies, Minn. and Manitoba to the N. W. Terr., Neb. and Tex. Aug.-Oct.
14. Helianthus Dàlyi Britton. Judge Daly's Sunflower. Perennial by a fusiform tuber, $3-4 \mathrm{~cm}$. long. Stem slender, simple, roughish, appressed-pubescent, about 6 dm . high; leaves firm, conduplicate, drooping, finely rough-pubescent on both sides, narrowly lanceolate, acuminate at both ends, distantly serrate with low teeth, the larger about I dm. long and 1.4 cm . wide, all opposite or the uppermost alternate; heads usually solitary and long-peduncled, rarely 2 , about 8 cm . broad; involucral bracts narrowly lanceolate with long subulate tips; rays acute; pappus 2 subulate awns; chaff of the receptacle pubescent at the acute apex. Sag Harbor, N. Y.
15. Helianthus subtuberòsus Bourgeau. Indian Potato. Fleshy roots thick and edible. Leaves thick, more or less scrrate, all or all but the upper distinctly petioled, sometimes all opposite, $6-12 \mathrm{~cm}$. long, acuminate at the apex, mostly narrowed at the base, the petioles ciliate; heads not very numerous; bracts of the involucre lanceolate, acuminate, densely pubescent and white-ciliate, about 1.5 cm . long; rays $3-4 \mathrm{~cm}$. long. Mich. and Minn. to the N. W. Terr., Wyo. and Mont. Aug.-Sept. [H. giganteus subtuberosus Britton.]
16. Helianthus Rỳdbergi Britton, n. sp. Rynberg's Sunflower. Perennial by a narrowly fusiform tuberous root with several stout branches. Stem 0.7$\mathbf{1 . 5} \mathrm{m}$. high, somewhat branched near the summit; leaves ovate-lanceolate or the
upper ones lanceolate, thick, pale green, scabrous on both sides, 3-nerved, sparingly serrate, acuminate at the apex, abruptly narrowed at the base into short petioles, the larger about I dm. long and 3 cm . wide; heads several, stout-peduncled, 8-9 cm . broad; bracts of the involucre lanceolate, acuminate, long-ciliate. Sand hill region of central Neb.; type, Rydberg No. 1767, from Middle Loup River, Hooker Co.
17. Helianthus grosseserràtus Martens. Saw-Tooth Sunflower. (I. F. t. 3909.) Perennial by fleshy roots and slender rootstocks; stems glabrous, glaucous, branched above, $2-3 \mathrm{~m}$. high, the branches usually strigose-pubescent; leaves long-lanceolate, slender-petioled, long-acuminate, narrowed at the base, sharply serrate, or merely denticulate, the uppermost entire, rough above, densely puberulent or canescent beneath, $\mathbf{I - 2} \mathrm{dm}$. long, $\mathbf{1}-2.5 \mathrm{~cm}$. wide; heads several or numerous, $4-7 \mathrm{~cm}$. broad; involucre hemispheric, its bracts squarrose, narrowly lanceolate, acuminate, hirsute; chaff linear-oblong, pubescent at the summit, acute. often 3 -toothed; disk yellowish; rays 10-20, deep yellow; achenes nearly glabrous; pappus of 2 lanceolate awns. In open places, eastern L. I. to Penn., S. Dak., Mu. and Tex. May contain more than one species as here characterized.
18. Helianthus Kéllermani Britton, n. sp. Kellerman's Sunflower. Stem $2-3 \mathrm{~m}$. high, very smooth, much branched above, the branches slender. Leaves narrowly elongated-lanceolate to linear-lanceolate, drooping, rather thin, distantly serrate with very small teeth, long-acuminate at the apex, attenuate at the base into short petioles or the upper sessile, scabrate and sparingly pubescent on both surfaces, pinnately veined, the lower about 2 dm . long and $\mathbf{r} .5 \mathrm{~cm}$. wide; branches of the inflorescence pubescent; bracts of the involucre linear-lanceolate, about $\mathbf{I} .5$
 yellow, 3-4 cm. long; chaff of the receptacle linear. Columbus, Ohio. W. A. Kellerman, Sept. 5, 1898.
19. Helianthus divaricàtus L. Rough or Woodland Sunflower. (I. F. f. 3910.) Perennial by slender rootstocks; stem glabrous throughout, or pubescent at the summit, slender, 6-20 dm. high. Leaves usually all opposite, divaricate, lanceolate or ovate-lanceolate, firm, dentate or denticulate, 3 -nerved, rough above, pubescent beneath, gradually long-acuminate, $7-20 \mathrm{~cm}$. long, $6-36 \mathrm{~mm}$. wide ; heads few or solitary, about 25 mm . broad, borne on strigose-pubescent peduncles; involucre hemispheric, its bracts lanceolate or ovate-lanceolate, strigose or hirsute, the outer ones spreading; rays $8 \mathbf{- 1 5}$; chaff of the receptacle apiculate; achenes glabrous; pappus of 2 short subulate awns. In dry woodlands, Me. and Ont. to the N. W. Terr., south to Fla., Neb. and La. July-Sept.
20. Helianthus móllis Lam. Hairy Sunflower. (I. F. f. 39ir.) Perennial, stem stout, simple, or sparingly branched above, 6-12 dm. high. Leaves pinnately veined, 3 -nerved above the base, all opposite, or the upper alternate, acute or acuminate, scabrous or cinereous-pubescent above, densely and finely pubescent beneath, serrulate, $5-12 \mathrm{~cm}$. long, 2-6 cm. wide; heads solitary or few, $5-7 \mathrm{~cm}$. broad; involucre hemispheric, its bracts lanceolate, acuminate, densely villouscanescent, somewhat spreading; rays $\mathbf{1 5 - 2 5}$; chaff canescent at the summit; mature achenes nearly glabrous; pappus of 2 lanceolate scales. In dry barren soil, Ohio to Ga., west to Iowa, Kans., and Tex.; also on L. I. Aug.-Sept.
21. Helianthus doronicoìdes Lam. Oblong-leaved Sunflower. (I. F. f. 3912.) Perennial by slender rootstocks; stems stout, rough, or finely roughpubescent, branched above, $\mathbf{I - 2} \mathrm{m}$. high. Leaves oblong, ovate-oblong, or ovate, thick, ascending, serrate or serrulate, acute or acuminate at the apex, rough on both sides, or finely pubescent beneath, somewhat 3 -nerved, 1-2 dm. long, 2-6 cm . wide; heads commonly numerous, $6-10 \mathrm{~cm}$. broad; involucre hemispheric, its bracts lanceolate, acuminate, pubescent or hirsute, somewhat spreading; rays $\mathbf{1 2 - 2 0}, 8-\mathbf{1 2} \mathrm{mm}$. wide; achenes glabrous; pappus of 2 subulate awns. In dry soil, Ohio to Mich., Mo. and Ark. Aug.-Sept.
22. Helianthus decapétalus L. Thin-leaved or Wild Sunflower. (I. F. f. 3913.) Perennial by branched, sometimes thickened rootstocks; stem slender, glabrous or nearly so, branched above, 3-15 dm. high; branches puberulent. Leaves $7-20 \mathrm{~cm}$. long, $4-7 \mathrm{~cm}$. wide, ovate or ovate-lanceolate, the upper commonly alternate, roughish above, finely but often sparingly pubescent beneath, acuminate, the rounded or truncate base decurrent on the petiole; heads numer-
ous, $5-7 \mathrm{~cm}$. broad; involucre hemispheric; its bracts linear-lanceolate, acuminate, hirsute, ciliate, spreading, often longer than the disk; rays $8-\mathbf{1} 5$, light yellow; chaff entire or 3 -toothed, pubescent at the apex; achenes glabrous; pappus of 2 subulate awns. In moist woods and along streams, Quebec to Mich., Ga. and Ky. Aug.Sept.
23. Helianthus scrophulariifolius Britton, n. sp. Figwort Sunflower. Root 3 dm . long, or more, slender. Stem simple, glabrous, and smooth, striate, about 1 m . high. Leaves rather thin, ovate to ovate-lanceolate, $7-12 \mathrm{~cm}$. long, roughish on both sides, 3 -nerved, sharply, deeply, and very irregularly toothed, the apex long-acuminate, the base rather gradually narrowed into a ciliate margined petiole $2-4 \mathrm{~cm}$. long, or the uppermost leaves nearly sessile; heads few, on slender scabrous peduncles, $6-8 \mathrm{~cm}$. broad; involucral bracts linear to linear-lanceolate, acute, about equalling the disk, not conspicuously ciliate. Hillside thicket northwest of Woodlawn, N. Y. City, E. P. Bicknell.
24. Helianthus tracheliifòlius Mill. Throatwort Sunflower. (I. F. f. 3914.) Similar to the following species, but the stem usually roughish-pubescent. Leaves short-petioled, ovate-lanceolate, 3-nerved near the base, green both sides, but darker above, generally rougher on the upper surface, the lower ones sharply serrate; branches and peduncles scabrous; heads several, $6-8 \mathrm{~cm}$. broad; bracts of the hemispheric involucre linear-lanceolate, long-acuminate, ciliate and puberulent, sometimes foliaceous, and 3 times the length of the disk. In dry soil, Penn. and Ohio to Wis. Aug.-Sept.
25. Helianthus strumòsus L. Pale-leaved Wood Sunflower. (I. F. f. 3915.) Perennial by branched, sometimes tuberous-thickened rootstocks; stem glaıbous below, sometimes glaucous, I-2 m . high, branched above, the branches usually pubescent. Leaves ovate or ovate-lanceolate, not membranous, rough above, pale and somewhat puberulent or canescent beneath, acuminate, contracted much below the middle and decurrent on the petiole, 3-nerved above the base, 7-20 cm . long, $2-4 \mathrm{~cm}$. wide, mostly opposite, the upper often alternate; heads commonly several, $6-10 \mathrm{~cm}$. broad; involucre hemispheric, its bracts lanceolate or ovate-lanceolate, acuminate, ciliate; rays $5-\mathbf{1} 5$; chaff pubescent; achenes nearly glabrous. In dry woods and on banks, Me. and Ont. to Minn., Ga. and Ark. July-Sept.

Helianthus strumòsus macrophýllus (Willd.) Britton. Leaves finely and densely canescent beneath. Mass. to Penn., Iowa and Miss.
26. Helianthus hirsùtus Raf. Stiff-haired Sunflower. (I. F. f. 3916.) Perennial; stem usually branched, stout, rigid, 6-12 cm. high. Leaves ovatelanceolate or the upper lanceolate, acuminate at the apex, thick, very rough above, rough-pubescent beneath, 3-nerved, serrate or serrulate, $7-15 \mathrm{~cm}$. long, $\mathbf{1}-2.5 \mathrm{~cm}$. wide, nearly all opposite; heads usually several, $5-7 \mathrm{~cm}$. broad; involucre hemispheric, its bracts lanceolate, or ovate-lanceolate, acuminate, ciliate, mostly puberulent, erect or but slightly spreading, equalling or shorter than the disk; rays 12-15; chaff obtusish, pubescent at the summit; achenes oval, rounded at the summit, glabrous; pappus of 1 or 2 subulate awns. In dry soil, Penn. and Ohio to Wis., south to W. Va., Ga., Kans. and Tex. July-Oct.

Helianthus hirsùtus trachyphýllus T. \& G. Leaves thick, very rough on both sides; heads larger; involucral bracts more spreading. Neb. to Ark.
27. Helianthus laetiflòrus Pers. Showy Sunflower. (I. F. f. 3917.) Perennial; stem scabrous or hispid, leafy, $\mathbf{r}-2.8 \mathrm{~m}$. high. Leaves oval-lanceolate or ovate-lanceolate, short-petioled, 3 -nerved, rough on both sides, long-acuminate at the apex, serrate or serrulate, $10-25 \mathrm{~cm}$. long, $\mathrm{I}-6 \mathrm{~cm}$. wide, the upper often alternate; heads usually several, $5-10 \mathrm{~cm}$. broad, mostly short-peduncled; bracts of the hemispheric involucre ovate-lanceolate, or oblong-lanceolate, imbricated in only 2 or 3 series, ciliate, otherwise nearly glabrous, appressed or but little spreading, shorter than or equalling the disk; rays 15-25, showy; chaff of the receptacle entire, or sometimes 3 -toothed. On prairies and barrens, Penn. and Ohio to Minn. Aug.-Sept.
28. Helianthus tomentòsus Michx. Woolly Sunflower. (I. F. f. 30 IS.) Perennial ; stem stout, hirsute or hispid, especially above, branched. 1 - j . . high. Leaves rather thin, ovate, or the lower oblong, mostly alternate, 3 -ribbed
above the base, gradually or abruptly contracted into margined petioles, rough above, sparingly serrate, the lower often 3 dm . long and I dm. wide; heads commonly several or numerous, $7-10 \mathrm{~cm}$. broad; involucre hemispheric, its bracts imbricated in many series, densely hirsute and ciliate, usually longer than the disk; chaff of the receptacle and lobes of the disk-corollas pubescent; pappus of 2 subulate awns. In dry soil, Va. to Ga. and Ala. Reported from Ill. Aug.-Oct.
29. Helianthus tuberòsus L. Jerusalem Artichoke. Earth Apple. (I. F. f. 39I9.) Perennial by fleshy thickened rootstocks bearing tubers; stems branched above, $2-3.5 \mathrm{~m}$. high. Leaves ovate or ovate oblong, firm, 3-nerved near the base, narrowed, or the lower rounded, truncate or subcordate at the base, acuminate at the apex, rather long-petioled, serrate, $1-2 \mathrm{dm}$. long, $4-7 \mathrm{~cm}$. wide, the upper alternate, the lower opposite; heads several or numerous, $5-8 \mathrm{~cm}$. broad; involucre hemispheric; rays $12-20$; chaff of the receptacle acute and pubescent at the summit; achenes pubescent. In moist soil, N. B. and Ont. to the N. W. Terr., south to Ga., Kans. and Ark. Often occurs along roadsides in the east, a relic of cultivation by the aborigines. Now extensively grown for its edible tubers. Sept.Oct.

Helianthus tuberòsus subcanéscens A. Gray. Lower; leaves densely white canescent beneath. Prairies, Minn. to the N. W. Terr., south to Mo.

## 65. VERBESİNA L.

Pubescent or scabrous herbs (some tropical species shrubby), with leaves often decurrent on the stem and branches, and corymbose or solitary heads of both tubular and radiaic yellow or white flowers, or the rays sometimes wanting. Involucre campanulate or hemispheric, its bracts imbricated in few series. Receptacle chaffy, the chaff embracing the disk-flowers. Ray-flowers pistillate or neutral. Diskflowers perfect, mostly fertile, their corollas with an expanded 5 -lobed limb, usually longer than the tube. Style-branches of the disk-flowers with acute papillose appendages. Achenes flattened, or those of the ray-flowers 3 -sided, their margins winged or wingless. Pappus of 2 (I-3) subulate awns, sometimes with 2 or 3 intermediate scales. [Name altered from Verbena.] A large genus, variously restricted by authors, mainly natives of the New World. Besides the following, about 6 others occur in the southern and southwestern U. S.
Involucre campanulate, 4-6 mm. broad; heads small, numerous.

Leaves alternate; rays white.
Leaves opposite; rays yellow.
Involucre hemispheric, $12-20 \mathrm{~mm}$. broad; heads few, large.
Leaves ovate, sessile, serrate.
Leaves deltoid, petioled, coarsely dentate.
Involucre of a few, at length deflexed bracts; disk globose.

1. V. Virginica.
2. V. occidentalis.
3. V. helianthoides.
4. $V$. encelioides.
5. V. alternifolia.
I. Verbesina Virgínica L. Small White or Virginia Crownbeard. (I. F. f. 3920.) Perennial; stem densely puberulent, terete or winged, I-2 m. high. Leaves usually thin, ovate, roughish above, puberulent, canescent or glabrate beneath, acute or acuminate, $10-25 \mathrm{~cm}$. long, $2-7 \mathrm{~cm}$. wide, contracted at the base into winged petioles, the uppermost sessile, lanceolate, smaller, often entire; heads corymbose-paniculate, $12-20 \mathrm{~mm}$. broad; bracts narrowly lanceolate, erect, obtuse, pubescent; rays $3-5$, obovate, white, pistillate; achenes minutely pubescent, winged or wingless. In dry soil, Penn. to Va., Ill. and Kans., south to Fla. and Tex. Aug.-Sept.
6. Verbesina occidentàlis (L.) Walt. Small Yellow Crownbeard. (I. F. f. 3921 .) Perennial; stem glabrous, or puberulent above, usually much branched, narrowly 4 -winged, I-2 dm. high, the branches also winged and pubescent. Leaves thin, ovate, or the upper oblong, minutely rough-pubescent on both sides, or glabrate, acuminate at the apex, narrowed or contracted below into slender petioles, serrate, $10-25 \mathrm{~cm}$. long, $2-8 \mathrm{~cm}$. wide; heads $12-25 \mathrm{~mm}$. broad, corymbose; bracts lanceolate, obtuse, erect, or the tips slightly spreading, pubescent; rays I-5, usually pistillate, rarely none; achenes wingless. In dry thickets and on hillsides, Md. and southern Penn. to Ill., Fla. and Ga. Aug.-Oct.
7. Verbesina helianthoides Michx. Sunflower Crownbeard. (I. F. f. 3922.) Perennial; stem hispid or hirsute, 4 -winged, usually simple, 6-12 dm.
high. Leaves acute, acuminate or obtuse at the apex, narrowed at the base, rough or appressed-hispid above, densely pubescent or canescent beneath, $5-10 \mathrm{~cm}$. long, $2-4 \mathrm{~cm}$. wide, all alternate, or the lower opposite; heads solitary or few, $5-7 \mathrm{~cm}$. broad; bracts lanceolate, acutish, canescent, appressed; rays $8-15$, pistillate or neutral, linear-oblong, yellow; achenes scabrous or pubescent, broadly winged. On dry prairies and in thickets, Ohio to Ga., Iowa, Kans. and Tex. June-July.
8. Verbesina encelioides (Cav.) A. Gray. Golden Crownbeard. (I. F. f. 3923.) Annual; stem densely puberulent, much branched, 3-6 dm. high. Leaves thin, $5-10 \mathrm{~cm}$. long, acuminate; acute or blunt at the apex, green and minutely pubescent above, pale and densely canescent beneath, all alternate, or the lowest opposite, narrowed at the base into naked or wing-margined petioles, which are often provided with dilated appendages at the base; heads $3-5 \mathrm{~cm}$. broad; involucre hemispheric, about 12 mm . high, its bracts lanceolate, canescent; rays $12-15$, bright golden yellow, 3-toothed; achenes of the disk-flowers obovate, winged, pubescent; those of the ray-flowers rugose, thickened, often wingless. In moist soil, Kans. to Tex., Ariz. and Mex. Also in Fla., and widely distributed in warm regions as a weed. Summer.
9. Verbesina alternifolia (L.) Britton. Actinomeris. (I. F. f. 3924.) Perennial; stem puberulent or glabrous, narrowly winged, or wingless, simple or branched near the summit, leafy, r.2-3 m. high. Leaves oblong-lanceolate or lanceolate, acuminate, serrate, serrulate or entire, rough or roughish on both sides, gradually narrowed to the sessile base, or the lower short-petioled, $\mathbf{1}-3 \mathrm{dm}$. long, I-7 cm. wide, sessile, short-petioled, alternate, or the lower opposite and slenderpetioled; heads numerous, $3-5 \mathrm{~cm}$. broad, corymbose-paniculate; rays $2-10$, yellow; achenes broadly winged or nearly wingless, sparingly pubescent. In rich soil, N. J. to western N. Y., Iowa, Fla., Kans. and La. Aug.-Sept.

## 66. COREÓPSIS L.

Herbs, with opposite leaves, or the upper alternate, and large long-peduncled heads of both tubular and radiate flowers, the rays yellow, or brown at the base, or brown throughout, or pink. Involucre usually hemispheric, its bracts in 2 distinct series, all united at the base, those of the outer series commonly narrower and shorter than the inner. Receptacle flat or slightly convex, chaffy, the chaff flat or concave. Ray-flowers neutral. Disk-flowers perfect, fertile, their corollas with slender tube and broader 5 -toothed limb. Anthers mostly entire at the base. Achenes flat, orbicular to oblong. Pappus of 2 short teeth; or a mere coroniform border, or none. [Greek, bug-like, referring to the achenes.] About 50 species, natives of America, S. Africa and Australasia. In addition to the following, some Io others occur in the southern and western U. S.

* Rays pink, or occasionally white; leaves linear, entire.

*     *         * Rays yellow throughout.
I. Leaves sessile, rigid, palmately 3 -lobed below the middle.

4. C. palmata.
5. Leaves sessile, some or all 3 -divided to the base, appearing verticillate.
Leaf-segments oblong or lanceolate, entire.
6. C. major.

Leaf-segments r-2-pinnately parted.
Divisions of the segments linear-lanceolate. 6. C. delphinifolia.
Divisions of the segments very narrowly linear.
7. C. verlicillata.
3. Stem-leaves sessile or petioled, entire, or the lower 3-5-lobed; achenes often with a callus at each end on the inner side.
Glabrous or nearly so ; stem-leaves lanceolate; achenes winged.
8. C. lanceolata.

Plants hirsute, hispid or pubescent, at least below.
Plant leafy, 6-12 dm. high; stem-leaves oblong to ovate, acutish.
9. C. pubescens.

Leaves few ; plants 3-6 dm. high ; stem-leaves mostly obtuse.
Achenes broadly winged; basal leaves oblong. Io. C. crassifolia.
Achenes narrowly winged; basal leaves nearly orbicular.
11. C. auriculata.
4. Leaves, or most of them, r-2-parted into linear segments; rays lobed. 12. C. grandiflora.
5. Leaves petioled, all but the upper pinnately 3 -5-divided; rays entire. 13. C. tripteris.

1. Coreopsis ròsea Nutt. Small Rose or Pink Tickseed. (I. F. f. 3925.) Perennial by slender rootstocks; stems at length much branched, slender, strict, glabrous, $\mathbf{I}$. 5- $^{-6} \mathrm{dm}$. high. Leaves opposite, glabrous, obscurely I-nerved, $3-6 \mathrm{~cm}$. long, $\mathbf{I}-3 \mathrm{~cm}$. wide, sessile, or the lower petioled; heads slender-peduncled, several or numerous, $12-25 \mathrm{~mm}$. broad; disk yellow; rays $4-8$, oblong to obovate, slightly 3 -toothed or sometimes entire; inner bracts of the hemispheric involucre ovateoblong, glabrous, much longer than the lanceolate outer ones; style-tips truncate; achenes oblong or linear-oblong, thin, not winged, slightly ribbed on the inner face; pappus a very short truncate crown. In open swamps, eastern Mass. to Ga., near the coast. July-Aug.
2. Coreopsis cardaminefòlia (DC.) T. \& G. Cress-leaved Tickseed. (I. F. f. 3926.) Annual; stem glabrous, branched, 3-8 dm. high. Basal leaves petioled, $5-10 \mathrm{~cm}$. long; stem-leaves distant, sessile or nearly so, pinnately parted into linear segments, or the uppermost entire; heads $16-25 \mathrm{~mm}$. broad, slenderpeduncled; involucre hemispheric, its inner bracts brown, ovate or ovate-lanceolate, obtuse or obtusish, scarious-margined, much longer than the lanceolate obtusish outer ones; rays $4-8$, 3 -toothed; achenes oval, $2-3 \mathrm{~mm}$. long, winged, smooth, or slightly papillose; pappus of 2 minute awns, or none. In moist soil, Kans. to N. Mex., La. and northern Mex. May-Oct.
3. Coreopsis tinctòria Nutt. Garden Tickseed. (I. F. f. 3927.) Annual; stem glabrous, branched, 3-10 dm. high; heads slender-peduncled, $20-25 \mathrm{~mm}$. broad, or in cultivation much broader; involucre hemispheric, its inner bracts brown, ovate or oblong, obtuse or acute, scarious-margined, 3-5 times as long as the obtuse outer ones; rays 6-10, cuneate, yellow with a brown base or brown all over; style-tips truncate; achenes linear or linear-oblong, about 2 m . long; pappus a mere border, or none. In moist soil, Minn. to the N. W. Terr., south to Neb., La. and Ariz. Escaped from gardens to roadsides and waste places eastward. May-Sept.
4. Coreopsis palmàta Nutt. Stiff Tickseed. (I. F. f. 3928.) Perennial, stems rigid, glabrous, simple or little branched, very leafy, 3-9 dm. high. Leaves sessile, 5-7 cm. long, the uppermost entire, thick, rigid, the lobes linear-oblong, obtusish, entire, or with I-3 lateral lobes, their margins rough; heads few or solitary, short-peduncled, $3-5 \mathrm{~cm}$. broad; involucre hemispheric, its bracts somewhat united at the base, those of the outer series narrower and nearly as long as the inner ones; rays 6-10, bright yellow, oblong or obovate, mostly 3 -toothed; achenes oblong, narrowly winged, slightly incurved; pappus of 2 short tips, or none. On dry prairies and in thickets, Ill. to La., west to Minn., Manitoba, Neb. and Tex. June-July.
5. Coreopsis major Walt. Wood, or Greater Tickseed. (I. F. f. 3929.) Perennial; stem pubescent, branched above, 6-9 dm. high. Leaves more or less pubescent, or glabrous, divided into 3 , segments $5-10 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide, which appear as if in verticils of 6 ; the upper and lower leaves (rarely all of them) undivided and entire; heads several or numerous, slender-peduncled, $3-5 \mathrm{~cm}$. broad; bracts of the hemispheric involucre all united at the base, the outer ones linear-oblong, obtuse, equalling or shorter than the broader inner ones, all pubescent; rays 6-10, oblong, entire; disk yellow; achenes oblong to elliptic, winged, I-4 cm. long ; pappus of 2 short deciduous teeth. In dry sandy woods, Va. and N. Car. to Fla. and Miss. July-Aug.

Coreopsis màjor Oèmleri (Fill.) Britton. Plant glabrous throughout; leaf-segments often narrower. Va. and W. Va. to Ga.
6. Coreopsis delphinifòlia Lam. Larkspur Tickseed. (I. F. f. 3930.) Perennial, stem glabrous, branched above, rather slender, 3-9 dm. high. Segments $3-5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide; heads several or numerous, $4-6 \mathrm{~cm}$. broad; involucre hemispheric, its bracts glabrous, the outer linear-oblong, obtuse, shorter than or equalling the ovate-oblong inner ones; rays $6-10$, entire; disk brown; achenes
oblong to oval, narrowed at the base, narrowly winged; pappus of 2 short teeth. In dry woods, Va., N. Car. to Ga. and Ala. Aug.-Sept.
7. Coreopsis verticillàta L. Whorled Tickseed. (I. F. f. 393I.) Perennial; stem stiff, much branched, slender, leafy, 3-6 dm. high. Heads numerous, $3-4 \mathrm{~cm}$. broad; involucre hemispheric, or short-cylindric in fruit, glabrous, its outer bracts linear, obtuse, commonly somewhat shorter and much narrower than the ovate-oblong inner ones; rays 6-10, spatulate-oblong, obtuse; disk dull yellow; achenes oblong, narrowly winged, 4 mm . long; pappus of 2 short teeth. In dry soil, western Ont. to northern Mich., Md., N. Car., Ky., Neb. and Ark. JuneSept.
8. Coreopsis lanceolàta L. Lance-Leaved Tickseed. (I. F. f. 3932.) Perennial; stem slender, 3-6 dm. high. Leaves glabrous, the lower and basal ones slender-petioled, spatulate or narrowly oblong, very obtuse, $5-15 \mathrm{~cm}$. long, entire, or with I-3 lateral obtuse entire lobes; heads few or solitary on elongated slender peduncles, 4-6 cm. broad, showy; peduncles often 3 dm . long; involucre depressed-hemispheric, its bracts glabrous or ciliate, lanceolate or ovate-lanceolate, the outer narrower than the inner, but nearly as long; rays 6-10, cuneate, 3-7lobed; achenes oblong, about 2 mm . long; pappus of 2 short teeth. In dry or moist soil, western Ont. to Va., Fla., La. and Mo. May-Aug.
9. Coreopsis pubéscens Ell. Star Tickseed. (I. F. f. 3933.) Perennial; stem leafy, little branched, or simple, erect. Leaves pubescent or glabrous, entire, or some of them 3 - 5 -lobed or divided, the basal and lower ones slenderpetioled, obovate-oval, obtuse, the upper short-petioled or sessile, $5-7 \mathrm{~cm}$. long; heads few, $2.5-3.5 \mathrm{~cm}$. broad, long-peduncled; involucre depressed-hemispheric, glabrous, star-like, its lanceolate obtuse or acute outer bracts nearly as long as but much narrower than the ovate inner ones; rays 8 -10, cuneate, lobed at the apex; achenes similar to those of the preceding species or broader. In dry woods, Va. to Ill. and Mo., south to Fla. and La. June-Aug.
io. Coreopsis crassifòlia Ait. Thick-leaved or Hairy Tickseed. (I. F. f. 3934.) Perennial; stem ascending, little branched, 2-5 dm. high. Leaves rather thick, hirsute or pubescent, all entire, the lower and basal ones petioled, 4-7 cm . long, $8-20 \mathrm{~mm}$. wide; stem-leaves few, short-petioled or sessile, obtuse or acutish, narrower; heads few, 3-5 cm. broad, borne on slender, puberulent peduncles of ten 3 dm . long, similar to those of $C$. lanceolata, as are the rays, involucral bracts and achenes. Dry soil, Ill. to La., east to S. Car. and Fla. May-Aug.
iI. Coreopsis auriculàta L. Running or Lobed Tickseed. (I. F. f. 3935.) Perennial; stoloniferous; stems weak, very slender, decumbent or ascending, I.5-4 dm. long, little branched, or simple. Leaves thin, entire or pinnately 3 -5-lobed or 3-5-divided, the terminal segment entire and much larger than the lateral ones, the lower and basal more or less pubescent, with slender pubescent petioles; stem-leaves few, petioled or sessile, mostly obtuse; heads $2-4 \mathrm{~cm}$. broad, slender-peduncled; outer bracts of the involucre oblong, narrower than the mostly ovate and acute inner ones; rays 6 -10, cuneate, about 4 -toothed, yellow; achenes oval, the wings involute and thick. In woods, Va. to Ky., south to Fla. and La. May-Aug.
12. Coreopsis grandiflòra Hogg. Large-flowered Tickseed. (I. F. f. 3936.) Perennial (or sometimes annual ?); stem glabrous, usually branched above, 3-9 dm. high. Leaves, or most of them, 1-2-pinnately parted, or the lower entire and slender-petioled; segments of the lower stem-leaves oblong, obtuse, the terminal one larger than the lateral; segments of most of the stem-leaves linear or even filiform; petioles ciliate; heads commonly several, $3-5 \mathrm{~cm}$. broad, long-peduncled; outer bracts of the involucre lanceolate, narrower and mostly shorter than the oval or ovate-lanceolate inner ones; rays $6-10$, achenes oblong, broadly winged when mature, the projections on the inner face usually large; pappus of 2 short scales. In moist soil, Kans. and Mo. to Tex., east to Ga. May-Aug.
13. Coreopsis trapteris L. Tall Tickseed. (I. F. f. 3937.) Perennial; stem glabrous, much branched above, $12-25 \mathrm{dm}$. high. Leaves petioled. glahrous, or very nearly so, firm, the lower all divided into lanceolate entire acute rough-margined segments, which are $5-12 \mathrm{~cm}$. long, $6-25 \mathrm{~mm}$. wide and pinnately veined; uppermost leaves lanceolate, entire; heads numerous, slender-peduncled, $3-4 \mathrm{~cm}$.
broad; outer bracts of the invoucre linear, obtusish, much narrower than the ovateoval or ovate-lanceolate, acute inner ones; rays 6 -Io, yellow, obtuse, achenes oblong to obovate, narrowly winged, emarginate; pappus none. In moist woods and thickets, Penn. to Wis., Kans., Va., Fla. and La. July-Oct.

## 67. BİDENS L.

Annual or perennial herbs, with opposite, serrate, lobed, divided or dissected leaves, or the uppermost alternate, and mostly large heads of both tubular and radiate flowers, or the rays none, or rudimentary. Involucre campanulate or hemispheric, its bracts in 2 series, distinct or slightly united at the base; the outer often foliaceous and much larger than the inner. Receptacle flat or nearly so, chaffy, the chaff subtending the disk-flowers. Rays, when present, neutral, mostly entire, yellow in our species. Disk-flowers perfect, fertile, their corollas tubular, 5 -toothed. Anthers entire, or minutely sagittate at the base. Style-branches with short or subulate tips. Achenes flat, quadrangular or nearly terete, cuneate, oblong, or linear. Pappus of 2-6 teeth or subulate awns, upwardly or downwardly barbed or hispid. [Latin, two-toothed, referring to the achenes.] About 75 species of wide geographic distribution. Besides the following, several others occur in the southern and western U. S.
Plants terrestrial, erect; leaves simple, or divided.
Leaves lanceolate, serrate, undivided, rarely lobed (pinnately divided in B. connata pinnata.

Rays present, large and conspicuous, twice as long as the disk or longer.
Heads usually erect; rays oval; leaves lanceolate, many-toothed.
I. B. laevis.

Heads nodding ; rays linear-oblong; leaves narrowly lanceolate, fine toothed.
2. B. elegans.

Rays"small, not more than twice as long as the disk, sometimes very short or wanting.

Heads nodding after flowering. 3. B. cernua.
Heads persistently erect.
Pappus-awns downwardly barbed.
Involucral bracts not foliaceous; stem purple ;
flowers orange. 4. B. connata.
Involucral bracts foliaceous; stem straw-color ; flowers greenish yellow.

Outer involucral bracts erect or nearly so ; lower leaves petioled. 5. B. comosa.

Outer involucral bracts spreading; leaves sessile.

> 6. B. acuta.
> 7. B. bidentoides.

Pappus-awns upwardly barbed.
Leaves, some or all of them, pinnately 1 -3-parted or dissected.
Rays rudimentary, none, or very short.
Achenes flat ; leaves, some or all of them, 1 - 3 -divided.
Outer involucral bracts, $4^{-8}$; achenes nearly black.
Achenes $4-4.5 \mathrm{~mm}$. long ; awns very short ; outer bracts 4 .
8. B. discoidea.

Achenes 6 mm . long; awns half as long as the achene; outer bracts 6-8. 9. B. frondosa.
Outer involucral bracts io-16; achenes brown.
10. $B$. vulgata.

Achenes linear; leaves dissected.
Rays large and conspicuous.
Achenes sparingly pubescent, not ciliate; pappus of 2 short teeth.
12. B. coronata.

Achenes ciliate ; pappus 2-4 subulate teeth or awns.
Achenes cuneate, or linear-cuneate.
13. B. trichosperma.

Achenes obovate, very flat.
Bracts of the involucre glabrous or ciliate, short.
14. B. aristosa.

Outer bracts densely hispid, much longer than the inner.
15. $B$. involucrata.

Plant aquatic ; submersed leaves filiformly dissected.
16. B. Beckiz.
I. Bidens laèvis (L.) B.S.P. Larger or Smooth Bur-Marigold. Brook Sunflower. (I. F. f. 3938.) Annual; glabrous throughout; stems branched, erect or ascending, $3-6 \mathrm{dm}$. high. Leaves sessile, acuminate at the apex, narrowed to the sometimes connate-perfoliate base, $7-20 \mathrm{~cm}$. long, $6-25 \mathrm{~mm}$. wide; heads
numerous, short-peduncled, erect, $4-6 \mathrm{~cm}$. broad; rays very showy, golden yellow; involucre hemispheric, its outer bracts linear-oblong or spatulate, equalling or exceeding the broader, ovate-or oblong, membranous inner ones; rays $8-\mathrm{ro}$, oval to oblong, obtuse; achenes cuneate, truncate, 2 mm . long, retrorsely hispid on the margins; pappus of 2-5 (usually 2), rigid downwardly barbed awns. In swamps and wet meadows, Mass. to N. Car. and western N. Y. Aug.-Oct.
2. Bidens élegans Greene. Narrow-rayed Bur-Marigold. Glabrous; stem slender, sparingly branched, terete, red-purple. Leaves narrowly lanceolate, $6-8 \mathrm{~cm}$. long, with few short salient teeth ; heads nodding, on long slender peduncles; outer bracts of the involucre shorter than the inner; rays 6-8, about 3 times as long as the involucre; outer achenes 4 -awned, the inner 3 -awned; awns and margins of the achenes retrorsely barbed. Southeastern Va.
3. Bidens cérnua L. Smaller or Nodding Bur-Marigold. (I. F. f. 3939.) Annual; stems glabrous, or hispid, usually erect, branched, 5-9 dm. high. Leaves sessile and commonly somewhat connate-perfoliate at the base, glabrous, acuminate, $7-15 \mathrm{~cm}$. long, $6-25 \mathrm{~mm}$. wide; heads numerous, globose, short-peduncled, $\mathbf{1 - 2 . 5} \mathrm{cm}$. broad, nodding after or during flowering; rays $6-\mathbf{1 0}$, short (6-12 mm .), or none; involucre depressed-hemispheric, its outer bracts commonly ciliate, often large, foliaceous and much exceeding the broad, yellowish-margined membranous inner ones; achenes cuneate, about 4 mm . long, retrorsely hispid on the margins; pappus of 2-4 (usually 4) downwardly barbed awns. In wet soil, N. S. to Hudson Bay and Br. Col., south to N. Car., Mo. and Cal. Also in Europe and Asia. July-Oct. It has recently been proposed by Professor E. L. Greene to separate this into several species, and Mr. Wiegand has suggested two subspecies.
4. Bidens connàta Muhl. Purple-stemmed Swamp Beggar-ticks. (I. F. f. 3940.) Annual; glabrous throughout; stem erect, usually much branched, i.525 dm . high. Leaves petioled, thin. apex acuminate, base tapering, blade $5-12 \mathrm{~cm}$. long, 6-25 mm. wide, decurrent on the petiole, the lower sometimes with a pair of lateral basal lobes; heads several or numerous, peduncled, $1-4 \mathrm{~cm}$. broad; involucre campanulate or hemispheric, its outer bracts ciliate or naked, somewhat exceeding the ovate-oblong inner ones; rays none, or $\mathbf{1}-5$ and inconspicuous; stamens often exserted; achenes cuneate or obovate, hairy and tubercled, or nearly glabrous, often keeled, the margins with either erect or retrorse hairs, or both; pappus-awns 3 or 4; corolla 5 -toothed. In swamps or moist soil, N. S. to the N. W. Terr., south to Del., Ga., Ky. and Mo. Aug.-Oct.

Bidens connàta pinnàta $S$. Wats. Leaves pinnately divided into 4-6 pairs of acute, entire to incised segments. Minn.
5. Bidens comòsa (A. Gray) Wiegand. Leafy-bracted Tickseed. (I. F. f. 3941.) Annual, glabrous; stem erect, branched, I.5-10 dm. high. Leaves shortpetioled, with mostly smaller teeth than in $B$. connata, tapering to each end, the petioles broadly margined; heads several or numerous, $\mathbf{I} \mathrm{cm}$. broad or more; outer bracts of the involucre spatulate or lanceolate, foliaceous, often toothed, 2-4 times as long as the head; corollas mostly 4 -lobed, stamens and style included; achenes larger, $7-\mathrm{Ir} \mathrm{mm}$. long, evenly cuneate, very flat, retrorsely hairy; pappus-awns commonly 3, downwardly barbed. In wet soil, southern N. Y. and Mass. to Ill. Aug.-Oct.
6. Bidens acuta (Wiegand) Britton. Prairie Beggar-ticks. Similar to B. comosa. Leaves lanceolate to oblong-lanceolate, sessile by a narrowed base, $4-8 \mathrm{~cm}$. long, sharply serrate, the margins sparingly ciliate ; involucre broader than high, $\mathbf{I} .5-3 \mathrm{~cm}$. broad; outer bracts foliaceous, ciliate, acutish, longer than the achenes, spreading; inner bracts narrowly triangular-lanceolate, acute; achenes cuneate, sparingly retrorsely hairy; awns 3 , retrorsely barbed, the longer more than half as long as the achene. In wet soil, Kans. and Mo. Aug.-Scpt. [ $B$. comosa acuta Wiegand; B. riparia Greene.]
7. Bidens bidentoides (Nutt.) Britton. Swamp Beggar-ticks. (I. F. f. 3942.) Closely resembles B. connata, glabrous throughout; stem branched. 3-12 dm . high. Leaves petioled, or the upper sessile and entire, acuminate at the apex, narrowed at the base; involucre narrowly or becoming somewhat broadly campanulate, its outer bracts linear, foliaceous, not ciliate, usually much exceeding the oblong inner ones; rays none, or rarely present and very short; achenes linear-
cuneate, 8 -10 mm . long, their sides and the 2 slender pappus-awns (rarely with a short intiermediate awns) upwardly barbed or hispid. Muddy shores, Penn., N. J., Del. and Md. Aug.-Oct.
8. Bidens discoìdea (T. \& G.) Britton. Small Beggar-ticks. (I. F. f. 3943.) Annual, glabrous, slender, branching, erect. 5-18 dm. high. Leaves membranous, very slender-petioled, all the lower ones divided into 3 lanceolate or oblong-lanceolate, dentate, acuminate segments which are $2-7 \mathrm{~cm}$. long; uppermost leaves commonly rhombic-lanceolate and undivided; heads usually numerous, slenderpeduncled, $5-10 \mathrm{~mm}$. broad; involucre broadly campanulate or hemispheric, its outer bracts mostly foliaceous and obtuse, usually much surpassing the inner ones; rays apparently always wanting ; achenes flat, narrowly cuneate, upwardly strigose, abcut 4 mm . long; pappus of 2 short, upwardly hispid, rarely downwardly barbed awns. In swamps and wet places, Conn. to Va., Ohio, Mich., La. and Tex. July-Sept.
9. Bidens frondòsa L. Black Beggar-ticks. Annual ; stem erect, branched, sparingly pubescent or glabrous, 5-10 dm. high. Leaves slenderpetioled, pinnately $3-5$-divided or the uppermost undivided, the segments lanceolate or oblong-lanceolate, sharply serrate, acuminate at the apex, narrowed at the base, usually slightly pubescent beneath, stalked, $5-10 \mathrm{~cm}$. long, $\mathrm{I}-2 \mathrm{~cm}$. wide; heads usually numerous, slender-peduncled, $9-15 \mathrm{~mm}$. broad; involucre campanulate, becoming hemispheric, its outer bracts foliaceous, often exceeding the oblong inner ones; achenes flat, cuneate, nearly black, the margins upwardly hairy; the two slender awns downwardly barbed, or sometimes upwardly hispid. In moist soil, often a weed in fields, N. B. to Fla., Neb. and Tex. July-Oct.
ro. Bidens vulgàta Greene. Tall Beggar-ticks. (I. F. f. 3944, as B. frondosa.) Taller, sometimes 3 m . high, glabrous or nearly so. Leaves pinnately 3-5divided, the veins straight and prominent; heads larger, $1.5-2.5 \mathrm{~cm}$. broad, stoutpeduncled; outer involucral bracts linear to linear-spatulate, ciliate, the inner mostly ovate or narrowly triangular, pubescent at the apex; ray-flowers usually present, pale yellow; achenes very flat, $7-9 \mathrm{~mm}$. long, $4-5 \mathrm{~mm}$. wide, brown or greenish brown; the margins downwardly barbed above, upwardly hairy below; awns 2, half as long as the achene or more, downwardly barbed. In moist soil, Ont. to N. Car., Br. Col., Mo. and Cal.

Bidens vulgàta pubérula (Wiegand) Greene. Crisp-pubescent above, especially on the involucre; inner bracts pubescent on the back. Wis. to Saskatch., Iowa, Neb. and Mo.

I I. Bidens bipinnàta L. Spanish Needles. (I. F. f. 3945.) Annual; stem quadrangular, erect, freely branched, rather slender, $3^{-15} \mathrm{dm}$. high. Leaves thin, acuminate, petioled, 1-3-pinnately dissected into ovate or oblong, toothed or lobed segments; lower leaves often 2 cm . long; heads usually numerous, long-peduncled, 4-8 mm . broad; involucre narrow, its outer bracts linear, ascending, nearly as long as the broader erect inner ones; rays 3-4, yellow, short, sometimes none; achenes linear, 4 -angled, slightly pubescent, narrowed upward into a beak, 10-18 mm . long, the outer ones commonly shorter and thicker than the inner; pappus of 2-4 (usually 4), downwardly barbed, slightly spreading awns, much shorter than the achene. In various situations, often a weed in cultivated fields, R. I. to Fla., west to Ohio, Neb. and Ariz. Also in Mex. and tropical Am., and introduced as a weed into southern Europe and Asia. July-Oct.
12. Bidens coronàta (L.) Fisch. Southern Tickseed-Sunflower. (I. F. f. 3946.) Annual, glabrous or nearly so throughout; stem branched, 3-9 dm. high. Lower leaves petioled, $7-\mathbf{1 2} \mathrm{cm}$. long, 3 -divided, the terminal segment lanceolate, acute or acuminate, serrate, much larger than the serrate or entire lateral ones; upper leaves much smaller, 3 -parted, 3 -lobed or undivided, sessile or short-petioled, entire or serrate; heads numerous, slender-peduncled, $3-5 \mathrm{~cm}$. broad: involucre hemispheric, its outer bracts linear-oblong, obtuse, equalling or slightly exceeding the broader inner ones; rays $6-10$, obtuse; achenes broadly cuneate, $2-4 \mathrm{~mm}$. long; pappus of 2 chaffy, divergent, somewhat laciniate teeth, rarely with 2 shorter intermediate ones. In wet places, Va. to Fla. and Ala. July-Sept.
13. Bidens trichospérma (Michx.) Britton. Tall Tickseed-Sunflower. (I. F. f. 3947.) Annual or biennial, glabrous; stem tall, obscurely quadrangular, much branched, $6-15 \mathrm{dm}$. high. Lower leaves petioled, $\mathbf{1}-2 \mathrm{~cm}$. long, pinnately
divided into 5-7 lanceolate, acuminate, sharply serrate, incised or nearly entire, sessile or short-stalked segments; upper leaves sessile or nearly so, 3-lobed, 3divided, or entire and linear-lanceolate; heads numerous, 4-6 cm. broad, longpeduncled; involucre hemispheric, its outer bracts linear or spatulate, sometimes ciliate, about the length of the broader inner ones; rays 6-19, obtuse, golden yellow, 14-25 mm. long; achenes $6-8 \mathrm{~mm}$. long; pappus of 2 upwardly hispid teeth or short awns. In swamps and wet meadows, Mass. to Ga., Ill. and Ky. Aug.-Oct.

Bidens trichospérma tenuiloba (A. Gray) Britton. Segments of the leaves linearlanceolate, serrate or entire; achenes sometimes smaller. In bogs, Ill., Ind., Minn., Iowa and southern Ont. A similar form occurs in southern N. J.
14. Bidens aristòsa (Michx.) Britton. Western Tickseed-Sunflower• (I. F. f. 3948.) Annual or biennial; stem much branched, 3-9 dm. high. Leaves thin, slender-petioled, pubescent beneath, the lower ones pinnately 5 - 7 -divided, $7-15 \mathrm{~cm}$. long, the segments lanceolate, serrate, incised or pinnatifid, acuminate, narrowed at the base; upper leaves less divided, lanceolate, or merely lobed, sessile or short-petioled; heads numerous, slender-peduncled, $2-5 \mathrm{~cm}$. broad; outer bracts of the hemispheric involucre linear or spatulate; rays 6-9, obtuse; achenes upwardly ciliate and strigose-pubescent; pappus of 2 slender upwardly or downwardly barbed awns, nearly as long as the achene, rarely wanting. In swamps and wet prairies, Del. to Mich., La. and Mo. Aug.-Oct.
15. Bidens involucràta (Nutt.) Britton. Long-bracted Tickseed-SunFLower. (I. F. f. 3949.) Similar to the two preceding species, minutely pubescent, 3-9 dm. high, much branched. Segments of the leaves narrower, linearlanceolate, incised or pinnatifid, long-acuminate; heads numerous, $3-5 \mathrm{~cm}$. broad, on slender, usually hispid peduncles; outer bracts of the hemispheric involucre linearlanceolate, acuminate; rays orange at the base; achenes flat, ciliate and strigose; pappus of 2 short teeth. In swamps, Ill. to Kans., Ark. and Tex. July-Sept.
16. Bidens Béckii Torr. Water Marigold. (I. F. f. 3950.) Perennial, aquatic; stems simple, or little branched, 6-25 dm. long. Submersed leaves sessile, $3-5 \mathrm{~cm}$. long; emersed leaves few, sessile, opposite, or sometimes in 3's, lanceolate or oblong, acute, serrate or laciniate, $\mathbf{1}-4 \mathrm{~cm}$. long; heads solitary or few, shortpeduncled, $2.5-3.5 \mathrm{~cm}$. broad; involucre hemispheric, its bracts oval or oblong, obtusish, glabrous, the outer somewhat shorter than the inner; rays 6-10, obovate, or oblong, obtuse, golden yellow; achenes nearly terete, each end truncate; pappus of 3-6 slender awns, downwardly barbed above, smooth below, divergent, 12-25 mm . long. In ponds and streams, Quebec to N. J., west to Manitoba and Mo. Aug-Sept. Emersed leaves sometimes wanting. This and a northwestern species constitute the recently-described genus Megalodonta Greene.

## 68. THELESPERMA Less.

Glabrous herbs, with opposite linear and undivided, or finely dissected leaves, and long-peduncled heads of both tubular and radiate flowers, or the rays wanting. Involucre of 2 distinct series of bracts, the outer short, narrow and somewhat spreading, the inner united into a cup, their tips scarious-margined. Receptacle flat, chaffy, the 2 -nerved broad white scarious chaff subtending the disk-flowers and achenes. Ray-flowers, when present, neutral, the rays yellow, entire or toothed. Disk-flowers perfect, fertile, their corolla with a slender tube and 5 -toothed limb. Anthers obtuse and entire at the base. Style-tips acute. Achenes, some or all of them, papillose on the back, oblong or linear, slightly compressed or terete, wingless. Pappus of 2 retrorsely hispid awns or scales, or sometimes none. [Greck, nipple-seed.] About 7 species, natives of the south central U. S., Mex. and southern S. Am.
Rays large; pappus-awns shorter than the width of the achene.
Leaves not rigid, their segments filiform-linear ; annual or biennial.

Leaves rigid, their segments linear; perennial.

1. T. triffdum.
2. T'. intermedium.

Rays inconspicuous, or none; awns longer than the width of the achene.
3. T. gracile.

1. Thelesperma trífidum (Poir.) Britton. (I. F. f. 395 I.) Stem branched, $3^{-9} \mathrm{dm}$. high. Leaves numerous, $4-5 \mathrm{~cm}$. long,
bipinnately divided; heads $2.5-3 \mathrm{~cm}$. broad; outer bracts of the involucre about 8, subulate-linear, equalling or more than half as long as the inner, which are united not higher than the middle; rays 6-10, somewhat spatulate, 3 -lobed; disk purple or brown; achenes linear-oblong, straight, or slightly curved, the outer ones strongly papillose. In dry soil, Neb. to Tex. June-Aug.
2. Thelesperma intermèdium Rydb. Intermediate Thelesperma. (I. F. f. 3952.) Perennial from a deep woody root; stem rigid, usually much branched, 3-4 dm. high. Leaves usually numerous, 4-5 dm. long, less compound than those of the preceding species; outer bracts of the involucre lanceolate-subulate, usually much shorter than the inner ones, which are united to about the middle; rays and achenes similar to those of the preceding. In dry soil, Wyo., Colo. and Neb. June-Aug. It has been confused with the southwestern T. ambiguum, which is less leafy and has a slender rootstock.
3. Thelesperma grácile (Torr.) A. Gray. Rayless Thelesperma. (I. F. f. 3953.) Perennial from a deep root; stem rigid, 3-9 dm. high, the branches nearly erect. Leaves rigid, erect or ascending, $5-7 \mathrm{~cm}$. long, pinnately or bipinnately divided into linear segments, or the upper linear and entire; heads $1.2-2 \mathrm{~cm}$. broad; rays usually none, sometimes present and $4-6 \mathrm{~mm}$. long; outer bracts of the involucre 4-6, oblong or ovate, mostly obtuse, very much shorter than the inner ones which are united to the middle or beyond; disk yellow, or brownish; outer achenes slightly papillose. On dry plains, Neb. and Wyo. to Tex., northern Mex. and Ariz. May-Aug.

## 69. GALINSÒGA R. \& P.

Annual branching herbs, with opposite, mostly petioled leaves, and small peduncled heads of both tubular and radiate flowers, terminal and in the upper axils. Involucre hemispheric or broadly campanulate, its bracts in 2 series, ovate, obtuse, membranous, striate, nearly equal, or the outer shorter. Receptacle conic or elongated, its thin chaff subtending the disk-flowers. Ray-flowers white, pistillate, fertile, the rays 4 or 5 , short. Disk-flowers yellow, perfect, the corolla 5 -toothed. Anthers minutely sagittate at the base. Style-branches tipped with acute appendages. Achenes angled, or the outer ones flat. Pappus of the diskflowers of several short laciniate or fimbriate scales, that of the ray-flowers of several or few short slender bristles, or none. [Named in honor of M. M. Galinsoga, superintendent of the Botanic Gardens at Madrid.] About 5 species, natives of tropical and warm temperate America.
I. Galinsoga parviflòra Cav. Galinsoga. (I. F. f. 3954.) Slightly appressed-pubescent, 3-9 dm. high. Leaves thin, ovate or deltoid-ovate, 3-nerved, $2-8 \mathrm{~cm}$. long, acute at the apex, mostly obtuse at the base, dentate, the lower slender-petioled, the upper short-petioled or sessile, and sometimes nearly or quite entire; heads usually numerous, 4-6 mm. broad, slender-peduncled; bracts of the involucre glabrous or nearly so, the outer shorter; pappus of the disk-flowers 4-16, oblong to spatulate, fimbriate obtusish scales, shorter than the finely pubescent obpyramidal achene. In door-yards and waste places, eastern Mass. to Ore., N. Car., Kans. and Mex. Nat. from tropical Am. June-Nov.

Galınsoga parvıfiòra hispida DC. Pubescence more abundant, especially above, spreading ; pappus of the disk-flowers attenuate, bristle-tipped. In waste places, R. I. to Penn., N. Car. and Wis.

## 70. ACTINOSPÉRMUM Ell.

Erect herbs, with alternate entire narrow punctate leaves, and large terminal heads of both tubular and radiate yellow flowers, or those of the disk purplish. Involucre hemispheric, its small bracts imbricated in several series, appressed, or with spreading tips, the outer shorter. Receptacle convex, deeply honey-combed, chaffy, the persistent chaff coriaceous or cartilaginous, laterally united, subtending the disk-flowers. Rays large, neutral, toothed. Disk-flowers perfect, fertile, the corolla 5 -toothed. Anthers sagittate at the base. Style-branches with truncate subulate tips. Achenes turbinate, silky-villous. Pappus of 7-12 scarious nearly equal scales. [Greek ray-seed.] Two known species, natives of the southeastern U. S.
I. Actinospermum unifiòrum (Nutt.) Barnhart. One-headed ActinoSPERMUM. (I. F. f. 3955.) Stem stout, puberulent, simple, or with a few erect branches, 3-9 dm. high. Leaves thick, spatulate-linear or the upper linear, sessile, erect or ascending, $2-5 \mathrm{~cm}$. long, the lower 4-6 mm. wide; heads longpeduncled, solitary, $5-6 \mathrm{~cm}$. broad; bracts of the involucre ovate, acuminate, thick, their tips at length spreading; rays $20-30$, cuneate, $3-4$-toothed at the truncate apex; disk $16-25 \mathrm{~mm}$. broad; chaff of the receptacle cuneate, truncate, very cartilaginous, more or less united laterally, the summit eroded; achenes obconic; pappus of $7-9$ oblong scales about as long as the achene. In wet pinebarrens, Va. to Fla. and La. July-Sept.

## 71. MARSHÁLLIA Schreb.

Perennial, often tufted, nearly glabrous herbs, with basal or alternate, entire leaves, and large long-peduncled discoid heads of purple, pink or white, glandularpubescent flowers. Involucre hemispheric or broadly campanulate, its bracts in I or 2 series, herbaceous, narrow, nearly equal. Receptacle convex or at length conic, chaffy, the scales narrow, rigid, distinct. Rays none. Flowers all perfect and fertile, their corollas with a deeply 5 -lobed or 5 -parted campanulate limb and a slender tube. Anthers minutely sagittate at the base. Style-branches long, truncate. Achenes turbinate, 5 -ribbed and 5 -angled. Pappus of 5 or 6 acute or acuminate, ovate or lanceolate-deltoid, nearly entire scales. [Named for Humphrey Marshall, of Pennsylvania, botanical author.] About 8 species, of the southern and central U. S.
Leaves ovate or oval, or oval-lanceolate, 3-5-nerved ; corolla-tube swollen at the throat.
Stem-leaves ovate to ovate-lanceolate, acuminate. 1. M. trinervia.
Stem-leaves lanceolate to oblong-lanceolate, acute or obtuse. 2. M. grandiflora. Leaves linear, or the basal spatulate, thick; corolla-tube not swollen at the throat.
3. M. caespitosa.
I. Marshallia trinérvia (Walt.) Porter. Broad-leaved Marshallia. (I. F. f. 3956.) Stem simple, or little branched, leafy to or beyond the middle, 3-6 dm. high. Leaves acute or acuminate at the apex, narrowed to a sessile base, $5-7 \mathrm{~cm}$. long, $18-35 \mathrm{~mm}$. wide; heads $\mathrm{I}-2 \mathrm{~cm}$. broad; corolla purplish; bracts of the involucre linear-lanceolate, acute, rigid; chaff of the receptacle subulatefiliform; pappus-scales lanceolate-acuminate from a triangular base; achenes glabrous when mature. In dry soil, Va. to Ala. and Miss. May-June.
2. Marshallia grandiflòra Beadle \& Boynton. Large-flowered MarShallia. Similar to the preceding species, leafy to above the middle. Lower and basal leaves oblong to oblong-lanceolate, tapering into petioles often as long as the blade, obtuse or obtusish; upper leaves lanceolate, sessile; florets slightly larger than those of $M$. trineriva, $1.5-2 \mathrm{~cm}$. long; achenes larger, $4-5 \mathrm{~mm}$. long, pubescent. In moist soil, Penn. to W. Va. and N. Car. July-Aug.
3. Marshallia caespitòsa Nutt. Narrow-leaved Marshallia. (I. F. f. 3957.) Stems usually tufted and simple, sometimes sparingly branched, leafy either only near the base or to beyond the middle, $2-4 \mathrm{dm}$. high. Leaves near the base usually much longer and linear, sometimes $I \mathrm{dm}$. long and 6 mm . wide, the upper ones linear, acutish, shorter; head about 25 mm . broad, borne on a peduncle often 2.5 dm . long; corollas pale rose or white; bracts of the involucre linear. lanceolate, acute or acutish; chaff of the receptacle linear, or slightly dilated above; achenes villous on the angles; scales of the pappus ovate, acutish, equalling or longer than the achene. In dry soil, Kans. to Tex. May-June.

## 72. PSILÓSTROPHE DC.

Branched woolly herbs, often nearly glabrous when old, with alternate leaves, and middle-sized heads of both tubular and radiate yellow flowers, corymbose, or clustered at the ends of the branches. Involucre cylindraceous, its 4 -1o bracts in I series, narrow, equal, densely white-woolly, separate. but erect and comivant. commonly with $1-4$ scarious ones within, and occasionally a narrow outer one. Rays broad, becoming papery and whitish. persistent, $5-7$-nerved, $2-3$-tonthed. pistillate. Receptacle small, naked. I)isk-flowers perfect, fertile, their corollas with a short proper tube and elongated cylindraccous limb, 5 -toothed, the teeth
glandular-bearded. Anthers obtuse and entire at the base. Style-branches of the disk-Howers capitellate. Achenes linear, striate. Pappus of 4-6 nerveless acute scales, glabrous or villous. Four species, natives of the southwestern U. S. and northern Mex.

1. Psilostrophe villòsa Rydb. n. sp. Northern Psilostrophe. (I. F. f. 3958.) Perennial, branched, I.5-6 dm. high, loosely white-woolly. Basal and lower leaves oblanceolate, entire, dentate or rarely pinnatifid, mostly obtuse, 5-10 cm . long; upper leaves sessile, or nearly so, smaller, oblanceolate or spatulate, entire; heads several together in the clusters, $8-10 \mathrm{~mm}$. broad, short-peduncled, or subsessile; rays few, lemon yellow, 4 mm . long, commonly wider, with 2 or 3 broad teeth or lobes at the summit; achenes glabrous, or sparingly pubescent; pap-pus-scales linear-lanceolate, glabrous, shorter than the disk-corollas. In dry sandy soil, Kans. to Tex. and Ariz. June-Sept. It has been confused with P. Tagetinae with orange persistent rays $5-10 \mathrm{~mm}$. long.

## 73. FLAVERIA Juss.

Glabrous or minutely puberulent, light green, mostly annual herbs, with opposite sessile leaves, and small, $\mathbf{r}$-several-flowered, usually sessile, oblong and densely cymose-capitate heads of tubular, or both tubular and radiate, yellow or yellowish flowers. Involucre of 2-5 narrow, nearly equal, appressed bracts, sometimes with $\mathbf{I}$ or 2 additional small exterior ones. Receptacle small, naked. Ray-flower commonly one, pistillate, fertile, sometimes wanting. Disk-flowers 1-15, perfect, fertile, their corollas 5 -toothed. Anthers entire at the base. Style-branches of the disk-flowers truncate. Achenes oblong or linear-oblong, 8-10-ribbed. Pappus none. [Latin, flavus, yellow, from its dyeing properties.] About 7 species, natives of America. In addition to the following, 3 others occur in the southern U. S.
I. Flaveria angustifòlia (Cav.) Pers. Narrow-leaved Flaveria. (I. F. f. 3959.$)$ Annual, glabrous or very nearly so, erect, 3-6 dm. high, little branched. Leaves linear or lanceolate, serrulate or entire, 3 -nerved, acuminate or acute at the apex, sessile by a broad and somewhat clasping base, $3-6 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide; heads about 6 mm . high, closely sessile in terminal glomerules or these pedunculate from the upper axils; involucre usually of 3 oblong-lanceolate bracts, $2-5$-flowered; ray equalling or longer than the breadth of the disk; achenes linear, glabrous, about 3 mm . long. In alkaline soil, Kans. and Colo. to Tex., Mex. and N. Mex. Aug.-Oct.

## 74. HYMENOPÁPPUS L'Her.

Perennial or biennial, erect herbs, with angled stems, alternate or basal, mostly pinnatifid or dissected leaves, and small or rather large discoid heads of white or yellow flowers. Involucre hemispheric or broadly campanulate, its bracts 6-12, in 1 or 2 series, nearly equal, mostly appressed, colored, petal-like, the margins and apices scarious. Receptacle small, naked. Rays none. Disk-flowers all perfect and fertile, their corollas with slender tubes and reflexed or spreading cam panulate 5-lobed limbs, the lobes ovate. Anthers entire at the base. Stylebranches with short conic appendages. Achenes obovoid or obpyramidal, 4-5angled, the faces usually prominently I-3-nerved. Pappus of $10-20$ thin obtuse scales, sometimes very short or none. [Greek, membrane-pappus.] About 8 species, natives of N. Am. and Mex.
Bracts of the involucre broadly ovate or oval, bright white.

1. H. Carolinensis. Bracts of the involucre obovate or oblong, green with whitish or yellow tips.

Achenes puberulent or sparingly pubescent on the angles.
Colored portion of the bracts broad, whitish to sulphur-yellow; corolla whitish. Segments of the leaves, at least of the lower, oblong or broadly linear.
2. H. sulphureus.

Segments of all the leaves narrowly linear.
3. H. corymbosus.

Colored portion of the bracts narrow, yellow; corolla yellow.
4. H. favescens.

Achenes densely villous or hirsute.
Pappus over 1 mm . long, equalling the corolla-tube or nearly so, not hidden by the hairs of the achenes; heads numerous. 5. H. tenuifolius.
Pappus less then 1 mm . long, shorter than the corolla-tube and hidden by the hairs of the achenes; heads few.
6. H. filifolius.

1. Hymenopappus Carolinénsis (Lam.) Porter. White-bracted Hymenopappus. (I. F. f. 3960.) Biennial ; stem leafy below, corymbosely branched and nearly naked above, $6-9 \mathrm{dm}$. high. Basal and lower leaves petioled, I-1.5 dm. long, I-2-pinnately parted or deeply pinnatifid into linear or oblong, obtuse or obtusish lobes, more or less white-tomentose beneath; heads commonly numerous, corymbose, $12-20 \mathrm{~mm}$. broad; bracts of involucre broadly ovate or oval, thin, bright white; corolla lobes about as long as the throat, white; achenes puberulent or pubescent; pappus of very small nerveless scales, shorter than the width of the top of the achene. In dry sandy soil, Ill. to Tex., S. Car. and Fla. March-June.
2. Hymenopappus sulphureus Rydb. Sulphur-bracted Hymenopappus. Biennial; stem more or less permanently white-tomentose, branched above, 3-6 dm . high. Lower leaves pinnately divided into oblong or linear toothed often obtuse lobes, white-tomentose beneath, glabrate above; upper leaves twice pinnate with narrower lobes; heads corymbose, about $\mathbf{I} \mathrm{cm}$. broad; bracts obovate, their tips light sulphur or almost white; corolla whitish; its lobes as long as the throat; achenes puberulent, short-hairy on the angles; pappus-scales obovate, shorter than the width of the achene. Prairies, Kans. to Tex. Apr.-July. [Type from Riley Co., Kans., J. B. Norton, No. 285.]
3. Hymenopappus corymbòsus T. \& G. Corymbed, or Smooth White Hymenopappus. (1. F. f. 3961.) Biennial; stem glabrous or nearly so, corymbosely branched and nearly naked above, 3-6 dm. high. Lower and basal leaves petioled, I-2-pinnately parted into linear or nearly filiform, acute or acutish glabrous lobes, or somewhat tomentose beneath; upper leaves few, much smaller and less divided; heads corymbose, numerous, $8-12 \mathrm{dm}$. broad; bracts of the involucre obovate to oblong, puberulent, their tips greenish white; corolla white, its lobes about as long as the throat; achenes puberulent; pappus-scales small, nerveless, shorter than the width of the achene. On dry prairies, Neb. to Tex. Summer.
4. Hymenopappus flavéscens A. Gray. Woolly Yellow Hymenopap. pus. (I. F. f. 3963.) Biennial; stem densely white-woolly, at least when young, 3-7 dm. high, leafy, branched above. Leaves I-3-pinnately parted or divided into linear segments; heads numerous, usually larger than those of the following species; involucral bracts obovate to ovate with greenish-white margins; corolla yellow or yellowish, the lobes about equalling the throat; achenes sparingly shortvillous; pappus-scales spatulate, shorter than the slender corolla-tube. In sandy soil, Kans. to Tex., Ariz. and northern Mex.
5. Hymenopappus tenuifolius Pursh. Woolly White Hymenopappus. (I. F. f. 3962.) Biennial; stem lightly tomentose, or at length glabrate, 3-6 dm. high, slender, leafy below, corymbosely branched and nearly naked above. Lower and basal leaves petioled, 1-3-pinnately parted into linear or filiform lobes, woollypubescent beneath, at least when young; heads numerous, corymbose, $8-12 \mathrm{~mm}$. broad; bracts of the involucre obovate-oblong, usually densely tomentose; corolla white, its lobes slightly shorter than the throat; achenes densely villous-pubescent; pappus of several oblong to ovate ribbed or nerved scales, which are about as long as the width of the top of the achene. On dry prairies, S. Dak. to Tex. June-Sept.
6. Hymenopappus filifòlius Hook. Low Tufted Hymenopappus. (I. F. f. 3964.) Perennial from a deep woody root; stems usually tufted, woolly when young, sometimes glabrate when old, densely leafy toward the base, usually naked or nearly so above, r.5-4.5 dm. high. Leaves tomentose when young, the lower and basal ones petioled, 1 - 3 -pinnately parted or pinnatifid into narrowly linear, somewhat rigid lobes; heads commonly few, $\mathbf{1 2 - 2 5} \mathrm{mm}$. broad; bracts of the involucre obovate-oblong, usually densely woolly, their tips whitish; corolla yellow or yellowish, its lobes much shorter than the throat; achenes densely villous; pap-pus-scales costate, short. On prairies and in dry rocky soil, N. W. Terr. to S. Dak., Neb. and Ariz. June-Sept.

## 75. POLỲPTERIS Nutt.

Erect rough, glandular or cinereous herbs, with alternate. mostly entire leaves, or the lower opposite, and corymbose heads of tubular or both tubular and radiate pink or purple flowers. Involucre campanulate or obconic, its bracts in 1 or 2 series, narrow, herbaccous, nearly equal, or with a few exterior shorter ones. appresssd, usually colored. Receptacle small, flat, naked. Ray-flowers, when
present, pistillate, fertile, the rays 3 -cleft. Disk-flowers perfect, fertile, their corollas with slender tubes and deeply 5 -parted campanulate limbs. Style- branches filiform, acutish, glandular-pubescent throughout. Achenes linear or obpyramidal, quadrangular. Pappus of 8-12 lanceolate strongly costate scales, that of the outer achenes often much shorter than that of the inner. [Greek, many-winged.] About 6 species, natives of the southern and south-central U. S. and Mex.
Rays purple, deeply 3-lobed: leaves lanceolate.

1. P. Hookeriana.

Rays none; leaves linear or linear-lanceolate.
2. P. callosa.
I. Polypteris Hookeriàna (T. \& G.) A. Gray. Hooker's Polypteris. (I. F. f. 3965.) Annual; stem rather stout, glandular-pubescent and viscid above, 3-9 dm. high. Leaves lanceolate, entire, acute or acuminate, narrowed at the base, rough on both sides, the upper alternate, the lower opposite and slender-petioled, $5-10 \mathrm{~cm}$. long, $6-10 \mathrm{~mm}$. wide; bracts of the involucre $10-16$, linear-lanceolate or spatulate, glandular-hispid, the inner with purplish tips; ray-flowers $8-10$; achenes about 8 mm . long and I mm. thick; pappus-scales of the disk-flowers 6-8, lanceolate, awned, those of the ray-flowers as many, spatulate, obtuse, shorter. In dry soil, Neb. to Tex. and Mex. July-Sept.
2. Polypteris callòsa (Nutt.) A. Gray. Rayless Polypteris. (I. F. f. 3966.) Annual; glanduiar, at least above; stem slender, paniculately branched, $3^{-6} \mathrm{dm}$. high. Leaves $3-6 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, entire, short-petioled, mostly alternate; bracts of the top-shaped involucre 8-10, lincar or narrowly oblong, herbaceous, pubescent, about 6 mm . long; corollas purple, deeply 5 -parted; achenes narrowly obpyramidal, pubescent or glabrous, nearly as long as the involucre; pappus-scales obovate or nearly orbicular, rounded or retuse, or sometimes minute, or none. In dry soil, Mo. to Tex. and N. Mex. June-Oct.

## 76. PICRADENIÒPSIS Rydb.

## [Bahia Nutt., not Lag.]

Herbs or shrubs, more or less woolly, with opposite or alternate leaves, and small or rather large corymbose or solitary heads, of both tubular and radiate yellow flowers. Involucre campanulate or hemispheric, its bracts in I or 2 series herbaceous, obtuse, appressed, nearly equal. Receptacle small, nearly flat, naked, foveolate. Ray-flowers in I series, pistillate, fertile. Disk-flowers perfect, fertile, their corollas with campanulate or cylindric 5 -cleft limb. Anthers entire or emarginate at the base. Style-tips mostly truncate and obtuse. Achenes quadrangular: linear or oblong. Pappus of several nerveless or costate scales, rarely none. [Name referring to resemblance of this genus to Picradenia.]
I. Picradeniopsis oppositifòlia (Nutt.) Rydb. False Bahia. (I. F. f. 3967.) Perennial, herbaceous; stem densely cinereous, much branched, I-3 dm. high, very leafy. Leaves opposite, or the uppermost alternate, $1-4 \mathrm{~cm}$. long, palmately $2-5$ parted into linear, obtuse or obtusish, entire segments, finely cinereous on both sides; heads short-peduncled, $12-18 \mathrm{~mm}$. broad; involucre campanulate, or becoming hemispheric, its bracts oblong, obtuse, densely tomentose; rays $5-7$, short; achenes linear-oblong, glandular-pubescent; pappus of $4-8$ spatulate to lanceolate scales with thickened bases. On plains, S. Dak., Neb. and Mont. to Kans. and N. Mex. June-Sept. [Bahia oppositifolia Nutt.]

## 77. TETRANEURRIS Greene.

Branched or scapose, villous-pubescent or glabrous, bitter and aromatic herbs, with alternate or basal, often punctate entire leaves, and small or rather large, peduncled heads of both tubular and radiate yellow flowers, or rays rarely wanting. Involucre hemispheric, campanulate or depressed, its bracts imbricated in $2-3$ series, appressed. Receptacle convex or conic, naked. Ray-flowers pistillate and fertile, the rays 3 -toothed, 3 -lobed. Disk-flowers perfect, fertile, their corollas with $4-5$-toothed limbs. Anthers entire or minutely sagittate at the base. Stylebranches truncate and penicillate at the summit. Achenes turbinate, 5-10-ribbed or angled, villous or pubescent. Pappus of 5-12 thin aristate acuminate or truncate scales. [Greek, four-nerved.] About 20 species, natives of western N. Am. and Mex. Besides the following, some 10 others occur in the western U. S.

Branches of the caudex comparatively slender and elongated; leaves narrowly linear, the blade much narrower than the dilated base. Bases of the leaves and involucre sparingly silky-villous. 2. T. stenophylla. Bases of the leaves conspicuously arachnoid hairy; involucre densely villous.
3. T. fastigiata.

Branches of the caudex very short and thick; leaves from linear to spatulate, but the blade not much narrower than the base if at all.

Bracts of the involucre acutish, densely silky; leaves decidedly silky. Leaves linear or narrowly oblanceolate, $4-7 \mathrm{~cm}$. long. 4. T. simplex.
Leaves oblanceolate or spatulate, $2-4 \mathrm{~cm}$. long. 5. T. acaulis.
Bracts of the involucre rounded, obtuse, sparingly silky; leaves nearly glabrous.
6. T. herbacea.
r. Tetraneuris linearifòlia (Hook.) Greene. Fine-leaved Tetraneuris* (I. F. f. 3968.) Annual or perhaps biennial; stem usually diffusely branched, finely hirsute, or glabrous, or woolly at the base, slender, $15-35 \mathrm{~cm}$. high. Stemleaves narrowly linear, sessile, $\mathbf{r}-4 \mathrm{~cm}$. long, $\mathrm{I}-2 \mathrm{~mm}$. wide; basal leaves spatulate, often villous, much broader, obtuse, narrowed into margined petioles; heads numerous, slender-peduncled, $\mathbf{1 2 - 1 6} \mathrm{mm}$. broad; involucre broadly campanulate, its bracts oblong, obtuse, pubescent, imbricated in about 2 series; receptacle conic; rays 6 -10, oblong; achenes pubescent; pappus of 5 or 6 ovate awned scales. In dry soil, Kans. to La., Tex. and N. Mex. May-Sept. [Picradenia linearifolia (Hook.) Britton.
2. Tetraneuris stenophỳlla Rydb. Narrow-leaved Tetraneuris. Perennial with a branched caudex; branches often $5-8 \mathrm{~cm}$. long, upper portion covered with the scarious bases of old leaves; bases of the leaves dilated, sparingly silkyvillous; blades narrowly linear, $3-4 \mathrm{~cm}$. long, $\mathrm{I}-2 \mathrm{~mm}$. wide, glabrous, conspicuously punctate; scape $6-10 \mathrm{~cm}$. high, minutely strigose; involucre $10-13 \mathrm{~mm}$. wide; bracts oval or oblong-acutish; rays about 10 mm . long and 4 mm . wide. In dry soil, Kans. to Colo. and Mex. [Actinella glabra T. \& G., not Nutt.; Picradenia scaposa Britton, Ill., Fl., in part.]
3. Tetraneuris fastigiàta Greene. Fastigiate Tetraneuris. Like the preceding, but leaves still narrower, about I mm . wide, the bases conspicuously arachnoid villous; involucre about 8 mm . wide; bracts ovate, densely villous. Only known from the imperfect type material from dry hills near Coolidge, Kans.
4. Tetraneuris símplex A. Nelson. Simple Tetraneuris. Cespitose perennial; caudex with very short thick erect branches; scapes few, 1-2 dm. high, silkystrigose; leaves linear or linear-oblanceolate, silky but less so than in the next, 4-7 cm . long, $2-5 \mathrm{~mm}$. wide; involucre $\mathbf{1}^{5}-18 \mathrm{~mm}$. wide, its bracts oblong-lanceolate, acute, densely silky-villous; rays about 1 cm . long. On dry hills, Black Hills of S. Dak., western Neb., Wyo. and Mont. June-July.
5. Tetraneuris acaùlis (Nutt.) Greene. Stemless Tetraneuris. (I. F. f. 3970.) Similar to the preceding species, perennial by thick roots and a stout branched caudex; scapes tufted, densely silky or tomentose, $5-15 \mathrm{~cm}$. high. Leaves all borne on the ends of the branches of the caudex, spatulate, entire, obtuse or obtusish, 3-5 cm. long, 3-6 mm. wide, densely silky or villous; heads $18-35 \mathrm{~mm}$. broad; involucre hemispheric, its bracts densely villous; rays 10-15; pappus of 5 or 6 ovate or oblong awned scales. In dry or rocky soil, N. W. Terr. to Mont., Neb., Ariz. and N. Mex. May-Aug. [Picradenia acaulis (Nutt.) Britton.]
6. Tetraneuris herbàcea Greene. Green Tetraneuris. Perennial, with a rather simple caudex; scape stout, $10-15 \mathrm{~cm}$. high, strigose-silky; leaves narrowly oblanceolate, $5-8 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide, at first sparingly long-silky, soon glabrous and green; involucre about 16 mm . wide, its bracts oblong, rounded, obtuse, sparingly silky; rays 15 mm . or more long, $20-25$ in number. Hills, Ohio and Ill. May-June.

## 78. PICRADENIA Hook.

Branched, more or less pubescent plants with alternate, pinnately divided leaves with linear segments and peduncled radiate heads with yellow flowers. Involucre hemispheric, its bracts in 2 scries, the outer ones united at the base. Receptacle convex or conic, naked. Ray-flowers pistillate and fertile, usually 3 -toothed.

Disk-flowers perfect, fertile. Style-branches truncate and penicillate at the summit. Achenes turbinate, pubescent. Pappus scales acuminate or awned. [Greek, bitter glands.]
I. Picradenia odoràta (DC.) Britton. Fragrant Picradenia. Limonillo. (I. F. f. 397I.) Annual; stem much branched, puberulent, sparingly hirsute or glabrous, $3^{-6} \mathrm{dm}$. high, leafy. Leaves $3-5 \mathrm{~cm}$. long, $\mathrm{I}-3$ - parted into filiform entire somewhat pubescent segments about I mm . wide; heads commonly numerous, $\mathbf{1 2 - 2 0} \mathrm{mm}$. broad. Involucre campanulate, puberulent, its outer bracts 6-9, lanceolate, keeled, acute, united at the base; rays $7-10$, cuneate; pappus-scales lanceolate, acuminate. In dry soil, Kans. to Tex., Mex. and Cal. April-July.

## 79. HELENIUM L.

Erect, mostly branching herbs, with alternate, mainly decurrent, punctate bitter entire or dentate leaves, and large peduncled heads of both tubular and radiate, yellow or brownish-yellow flowers, or rays sometimes wanting. Involucre broad and short, its bracts in $\mathbf{I}$ or 2 series, linear or subulate, reflexed or spreading. Receptacle convex, sub-globose or oblong, naked. Ray-flowers pistillate and fertile, or neutral, the rays cuneate, 3 - 5 -lobed. Disk-flowers perfect, fertile, their corollas 4-5-toothed, the teeth glandular-pubescent. Anthers 2-toothed or sagittate at the base. Style-branches of the disk-flowers dilated and truncate at the apex. Achenes turbinate, ribbed. Pappus of 5-8 entire, dentate or incised, acuminate or aristate scales. [The Greek name of some plant, from Helenus or Helena.] About 24 species, natives of North and Central America. In addition to the following, some 18 others occur in the southern and southwestern U.S.
Stem-leaves oblong-lanceolate or ovate-lanceolate, dentate rays fertile, disk yellow.

Leaves glabrous or nearly so.
Leaves grayish, scabrous, puberulent.

1. H. autumnale.
2. H. montanum.

Stem-leaves lanceolate or linear-lanceolate, mainly entire; rays neutral; disk purple.
3. H. nudiflorum.

Leaves all linear-filiform, entire; rays fertile.
4. H. tenuifolium.

1. Helenium autumnàle L. False or Swamp Sunflower. Sneezeweed. Yellow-star. Ox-eye. (I. F. f. 3972.) Perennial; stem puberulent or glabrous, rather stout, narrowly winged by the decurrent bases of the leaves, corymbosely branched above, $6-18 \mathrm{dm}$. higin. Leaves firm, acuminate or acute at apex, narrowed to the sessile base, pinnately few-veined, $5-12 \mathrm{~cm}$. long, $.5-5 \mathrm{~cm}$. wide, bright green; heads numerous, $3-5 \mathrm{~cm}$. broad, borne on long puberulent pedunclcs; bracts of the flattish involucre densely canescent, linear-lanceolate; rays $10-18$, drooping, bright yellow, 3-cleft; achenes pubescent on the angles; pappus-scales ovate, acuminate or aristate, often lacerate or toothed. In swamps and wet meadows, Que. to Conn., Fla., S. Dak., Kans. and Ala. Aug.-Oct.
2. Helenium montánum Nutt. Western Sneezeweed. Like the last but lower, 3-8 dm. high. Leaves narrower with smaller and closer teeth, grayish, scabrous on both sides, especially beneath; stem also very scabrous; rays short, about 8 mm . long, reflexed; bracts lanceolate. Meadows, Manitoba to Br. Col., south to Miss. and Ariz. July-Sept. [H. autumnale pubescens Britton.]
3. Helenium nudiflòrum Nutt. Purple-head Sneezeweed. (I. F. f. 3973.) Perennial; stem mostly slender, puberulent at least above, corymbosely branched, 3-9 dm. high, narrowly winged by the decurrent leaf-bases. Stem-leaves 4-7 cm. long, $4-12 \mathrm{~mm}$. wide, sessile; basal and lower leaves spatulate, obtuse, dentate, tapering into margined petioles; heads $3-4 \mathrm{~cm}$. broad, on slender or short-puberulent peduncles; rays 10-15 (sometimes wanting), drooping, yellow, yellow with a brown base, or brown throughout, 3 -toothed; pappus-scales ovate, aristate. In moist soil, Kans. to Ill., Tex., east to N. Car. and Fla. Also near Philadelphia. June-Oct.
4. Helenium tenuifòlium Nutt. Fine-Leaved Sneezeweed. (I. F. f. 3974.) Annual; glabrous or minutely pubescent above; stem slender, very leafy and usually much branched, $2-6 \mathrm{dm}$. high. Leaves sessile, often fascicled, $\mathrm{I}-4 \mathrm{~cm}$. long, I mm . or less wide; heads several or numerous, corymbose, $18-30 \mathrm{~mm}$. broad, borne on slender or filiform peduncles; bracts of the involucre few, linear or subulate, sometimes pubescent, soon reflexed; rays $4-8$, at length drooping; achenes villous; pappus-scales ovate, tipped with slender awns. In moist soil, S. E. Va. to Fla., Mo., Kans., Ark, and Tex. Aug.-Oct,

## 80. GAILLÀRDIA Foug.

Branching or scapose, pubescent herbs, with alternate or basal leaves, and large peduncled heads of both tubular and radiate flowers, or rays wanting. Involucre depressed-hemispheric, or flatter, its bracts imbricated in 2 or 3 series, their tips spreading or reflexed. Receptacle convex or globose, bristly, fimbrillate or nearly naked. Rays cuneate, yellow, purple, or parti-colored, neutral or rarely pistillate, 3 -toothed or 3-lobed. Disk-flowers perfect, fertile, their corollas with slender tubes and 5 -toothed limbs, the teeth pubescent with jointed hairs. Anthers minutely sagittate or auricled at the base. Style-branches tipped with filiform or short appendages. Achenes turbinate, 5 -ribbed, densely villous, at least at the base. Pappus of 6-12 I-nerved awned scales, longer than the achene. [Named for M. Gaillard de Marentonneau, a French botanist.] About 12 species, natives of the U. S. and Mex., I in southern S. Am.

Stem leafy; style-tips with filiform hispid appendages.
Fimbrillæ of the receptacle obsolete, or short ; southern.
I. G. lanceolata.

Fimbrillæ subulate or bristle-like, mostly longer than the achenes. Rays yellow; fimbrillæ exceeding the achenes.
2. G. aristata.

Rays purple, or red at base; fimbrillæ about equalling the achenes.
3. G. pulchella.

Leaves basal; style-tips with short naked appendages; rays none, or few.
4. G. suavis.

1. Gaillardia lanceolàta Michx. Sweet Gaillardia. (I. F. f. 3975.) Annual, or perhaps perennial; stem puberulent with jointed hairs, or cinereous, usually branched, 4-9 dm. high, the branches straight, nearly erect. Stem-leaves sessile, spatulate or linear, entire or sparingly serrate, puberulent, ciliolate, acute or obtusish and mucronulate at the apex, narrowed to the base, 3-7 cm. long, 4-8 mm . wide; basal leaves broader, very obtuse, sometimes short-petioled; heads 3-5 cm . broad, long-peduncled; flowers sweet-scented; bracts of the involucre about equalling the violet disk; rays $8 \mathbf{- 1 2}$, yellow or reddish with darker veins, rarely none; achenes villous at the base, or to beyond the middle; awns of the pappus slender. In dry woods, Kans. to Tex., east to S. Car. and Fla. May-Sept.
2. Gaillardia aristàta Pursh. Great-flowered Gaillardia. (I. F. f. 3976.) Perennial; stem simple, or little branched, hirsute, or densely pubescent with jointed hairs, 3-9 dm. high. Leaves firm, densely and finely pubescent, the lower and basal ones petioled, oblong or spatulate, laciniate, pinnatifid or entire, mostly obtuse, $5-\mathrm{I} 2 \mathrm{~cm}$. long; upper leaves sessile, lanceolate or oblong, or slightly spatulate, smaller, entire or dentate, rarely pinnatifid; heads $4-10 \mathrm{~cm}$. broad, long-pedurcled; bracts of the involucre lanceolate, acuminate, hirsute; achenes villous, at least at the base. On plains and prairies, Minn. to the N. W. Terr., Br. Col., Kans., Colo. and N. Mex. Leaves sometimes all basal. May-Sept.
3. Gaillardia pulchélla Foug. Showy Gaillardia. (I. F. f. 3977.) Annual; diffusely branched at the base, the branches ascending, $15-35 \mathrm{~cm}$. high, or larger in cultivation, more or less hirsute or pubescent with jointed hairs. Leaves lanceolate, oblong, or the lower spatulate, $3-7 \mathrm{~cm}$. long, entire, dentate or sinuatepinnatifid, all but the lowest sessile; heads 3-7 cm. broad, long-peduncled, bracts of the involucre lanceolate, acuminate, hirsute or pubescent; achenes more or less villous, or glabrous. In dry soil, Neb. and Kans. to La., Mex. and Ariz. MaySept.
4. Gaillardia suàvis (A. Gray) Britt. \& Rusby. Rayless Gaillardia. (I. F. f. 3978.) Annual or biennial. Leaves in a basal tuft, or a few near the base of the slender pubescent scape, spatulate or obovate in outline, $5^{-15} \mathbf{c m}$. long, pinnatifid, dentate, or some of them entire; scape $3^{-6} \mathrm{dm}$. high, monocephalous; head about 25 mm . broad, with the odor of heliotrope, globose in fruit: rays none, or short and pistillate, or a few of them longer and neutral; bracts of the involucre oblong or lanceolate, sparingly pubescent; fimbrillae of the receptacle obsolete; achenes densely villous; pappus-scales broad, their awns very slender. In dry rocky soil, Kans. to Tex. April-June.

## 81. BOEBĖRA Willd.

[Dysòdia Lag., not Cav.]
Erect or diffuse, branching, mostly annual, strong-scented more or less glandu. lar herbs, with opposite or alternate, mostly finely dissected leaves, and small peduncled heads of both tubular and radiate yellow flowers. Involucre cylindric, campanulate or nearly hemispheric, its bracts in I series, united into a cup, usually with a few small additional outer ones. Receptacle flat, pubescent, or covered with short bristles. Ray-flowers pistillate, the rays short. Disk-flowers perfect, their corollas 5 -toothed. Anthers entire or minutely 2 -toothed at the base. Stylebranches of the disk-flowers elongated, hirsute, sometimes apiculate. Achenes narrowly obpyramidal, 3-5-angled, striate. Pappus of about 10 scales, parted to beyond the middle into numerous capillary, rather stiff, bristle-like segments. [Named for J. von Boeber, a Russian botanist.]
I. Boebera pappòsa (Vent.) Rydb. Fetid Marigold. False DogFennel. (I. F. f. 3979.) Annual, very leafy, glabrous or finely pubescent, glanddotted, much branched, $15-45 \mathrm{~cm}$. high, the branches diffuse or erect. Leaves opposite, sessile, or short-petioled, I-4 cm. long, pinnately parted into linear or slightly spatulate, sharply serrate or incised segments; heads numerous, shortpeduncled, $6-10 \mathrm{~mm}$. broad; involucre campanulate, of 8-10 appressed, oblong, obtuse, green or purplish, glabrous or ciliate bracts, with several narrow shorter outer ones; rays few, not longer than the width of the disk; receptacle and achenes pubescent. Along streams and roadsides, Ohio to Minn. and Neb., south to La., Mex. and Ariz. Occasionally found as a weed in waste places in the Eastern and Middle States, and in Ont. July-Oct. [Dysodia papposa (Vent.) A. S. Hitchc.

## 82. THYMOPHÝLLA Lag.

Annual or perennial herbs, some species low undershrubs, with gland-dotted foliage and involucre, alternate or opposite leaves, and small heads of both tubular and radiate, mostly yellow flowers. Involucre campanulate, its principal bracts united into a cup, sometimes with smaller outer ones. Receptacle naked, or fimbrillate, not chaffy. Ray-flowers pistillate, fertile, Disk-flowers perfect, fertile. Style-branches truncate or blunt. Achenes striate. Pappus of several or numerous scales or bristles. [Greek, thyme-leaf, not applicable to the following species.] About 15 species, natives of America. Besides the following, some 4 others occur in the western parts of the U.S.
I. Thymophylla àurea (A. Gray) Greene. Thyme-Leaf. (I. F. f. 3980.) Annual, glabrous, I-3 dm. high, much branched; the leaves and involucre with large oval oil-glands. Leaves alternate, or the lower opposite sessile or nearly so, very deeply parted into 5-9 linear-filiform, mostly entire, blunt segments; heads numerous, corymbose, $\mathbf{I 2 - 2 0} \mathrm{mm}$. broad, terminating the branches; involucre about 6 mm . high, its bracts acute; rays about 12, 5-6 mm. long; pappus of 6-8 erose truncate scales, somewhat longer than the thickness of the achene. Kans. and Colo. to Tex. June-Sept.

## 83. PÉCTISL.

Annual or perennial, diffuse prostrate or erect, mostly glabrous herbs, glanddotted and strong-scented, with opposite narrow sometimes ciliate leaves, and small usually cymose heads of both tubular and radiate yellow flowers. Involucre cylindric, oblong or campanulate, its bracts in I series, narrow, keeled, distinct. Receptacle small, naked. Ray-flowers pistiliate, the rays small, entire or 3-lobed. Disk-flowers perfect, their corollas with expanded, somewhat irregularly 5 -cleft limbs. Anthers entire at the base. Style-branches of the disk-flowers very short, obtuse. Achenes linear, slightly angled, striate. Pappus of several or numerous scales, slender bristles or awns, sometimes with a few outer smaller additional ones. [Latin, pecten, comb, referring to the pappus.] About 50 species, natives of the warmer parts of America. Besides the following, about 10 others occur in the southern and western U. S.
I. Pectis angustifòlia Torr. Lemon-scented Pectis. (I. F. f. 398i.) Annual, much branched, I-3 dm. high, the branches diffuse or ascending. Leaves
narrowly linear, sessile, obtusish, $\mathrm{r}-5 \mathrm{~cm}$. long, 2 mm . wide or less, often ciliate with a few bristles near the base; heads several or numerous, short-peduncled, about 6 mm . broad; involucre short-cylindric or narrowly campanulate, its bracts about 8 , linear, acutish, partly enclosing the outer achenes; rays few, 3 -toothed, or entire; pappus a crown of 4-6 somewhat united short scales, with or without 2 slender short awns. In dry soil, Neb. and Colo. to Mex. and Ariz. Plant with the odor of lemons. May-Oct.

## 84. ACHILLEAA L.

Herbs, mostly perennial, with erect, leafy stems, finely dissected, pinnatifid or serrate alternate leaves, and small heads of both tubular and radiate flowers, corymbose at the ends of the stem and branches. Involucre obovoid, or campanulate, its bracts appressed, imbricated in few series, the outer shorter. Receptacle nearly flat, or convex, chaffy, the membranous chaff subtending the disk-flowers. Rayflowers pistillate, fertile, the rays white or pink. Disk-flowers perfect, fertile, their corollas yellow, 5-lobed. Anthers obtuse and entire at the base. Stylebranches of the disk-flowers truncate. Achenes oblong or obovate, slightly compressed. Pappus none. [Named for Achilles.] About 75 species, natives of the northern hemisphere, mostly of the Old World. Besides the following, several others occur in northwestern N. Am.
Leaves serrate.

1. A. Ptarmica.
Leaves finely dissected.
Involucre broadly campanulate; bracts fuscous-margined; rays 10-20.
2. A. borealis.

Involucre oblong; bracts scarcely fuscous-margined; rays 5-10.
Rays $3^{-6} \mathrm{~mm}$. broad ; plant villous; achenes broadly margined.
3. A. lanulosa.

Rays $2-3 \mathrm{~mm}$. broad ; plant sparsely villous or glabrate ; achenes scarcely margined.
4. A. Millefolium.

1. Achillea Ptàrmica L. Sneezewort. White Tansy. (I. F. f. 3982.) Perennial by horizontal or creeping rootstocks ; stem glabrous, or slightly pubescent, nearly or quite simple, $3-6 \mathrm{dm}$. high. Leaves linear or linear-lanceolate, sessile and slightly clasping at the base, acute at the apex, regularly and closely serrate, sometimes pubescent on the veins beneath, $3-6 \mathrm{~cm}$. long, $3-6 \mathrm{~mm}$. wide; heads not very numerous, $10-18 \mathrm{~mm}$. broad; peduncles puberulent; bracts ovate-oblong, obtuse or obtusish, slightly tomentose; rays $5 \mathbf{- 1 5}$, white, rather large. In moist soil, Newf. to Quebec, Mass. and Mich. Nat. from Europe. July-Sept.
2. Achillea borealis Bong. Northern Yarrow. Perennial, 2-4 dm. high; stem more or less lanate. Leaves bipinnate, with numerous crowded segments, sparingly lanate; corymb dense; heads $4-8 \mathrm{~mm}$. high; involucral bracts sonfewhat scarious with broad fuscous margins; rays large, white or pink, $3-5 \mathrm{~mm}$. broad; achenes prominently winged. Lab. to Alaska, south in the mountains of the Pacific Coast to Mex. June-Sept.
3. Achillea lanulòsa Nutt. Western Yarrow. Perennial, 3-5 dm. high; stem lanate. Leaves finely bipinnatifid, with approximate segments; cyme rather dense in age, becoming flat-topped; involucral bracts stramineous, with greenish keel and brown margins; achenes elliptical, broadly margined. Plains and mountains, S. Dak. to Br. Col., south to Mex. and Kans. Also introduced further east. June-Sept.
4. Achillea Millefòlium L. Yarrow. Milfoil. (I. F. f. 3983.) Perennial from horizontal rootstocks; flowering stems sparsely pubescent, or nearly glabrous, simple, or corymbosely branched above, 3-6 dm. high. Basal leaves and those of the numerous short sterile shoots, mostly petioled, sometimes 25 cm . long and 1 cm . wide, those of the stem sessile, all somewhat pubescent or nearly glabrous; heads numerous, 4-6 mm . broad, in terminal compound dense, somewhat convex corymbs; involucre ovoid, its bracts oblong, stramineous with greenish keel, obtusish, pubescent; rays $4-6$, white, or often pink or purple. In various situations in the east occurring as a naturalized weed. Native of Europe and Asia. June-Nov.

Achillea ligustica All., a native of Europe, has been collected in N. V. and Mass. It differs from $A$. Millefolium in the open loose panicle and broad and short leaf-segments.

## 85. ÁNTHEMIS L.

Annual or perennial herbs, with pinnatifid or dissected, alternate leaves, and usually large peduncled heads of both tubular and radiate flowers, terminating the branches. Involucre hemispheric, its bracts imbricated in several series, scariousmargined, appressed, the outer shorter. Receptacle convex, conic or oblong, chaffy at least toward the summit, the chaff subtending the disk-flowers. Rayflowers pistillate and fertile, or neutral, the tube terete or 2 -winged, the ray white or yellow, entire or $2-3$-toothed. Disk-flowers perfect, fertile, yellow, their corollas with 5 -cleft limbs. Anthers obtuse and entire at the base. Style-branches of the disk-flowers truncate. Achenes oblong, angled, ribbed or striate. Pappus none, or a short coroniform border. [Greek name of Camomile.] About 60 species, natives of Europe, Asia and Africa.
Rays white.

Rays neutral; plant glabrous, or nearly so, fetid.
Rays pistillate; plants pubescent.
Annual; chaff of the receptacle acute.
Perennial; chaff of the receptacle obtuse.
Rays yellow ; plant pubescent, or tomentose.

1. A. Cotula.
2. A. arvensis.
3. A. nobilis.
4. A. tinctoria.
I. Anthemis Cótula L. Mayweed. Dog's, or Fetid Camomile. Dillweed. (I. F. f. 3984.) Annual, glandular and with a fetid odor and acrid taste, much branched, 3-6 dm. high. Leaves mostly sessile, $3-5 \mathrm{~cm}$. long, finely $1-3-$ pinnately dissected into narrow, or almost filiform, acute lobes; heads commonly numerous, about 25 mm . broad; bracts of the involucre oblong, obtuse or obtusish, usually somewhat tomentose; rays 1o-18, mostly 3 -toothed; receptacle convex, becoming oblong, its chaff bristly, subtending the central flowers; achenes roribbed, rugose or glandular-tuberculate; pappus none. In fields, waste places and along roadsides, all over N. Am., except the extreme north. Nat. from Europe. June-Nov.
5. Anthemis arvénsis L. Corn or Field Camomile. (I. F. f. 3985.) Annual or sometimes biennial, not fetid; stem finely pubescent, usually much branched, about 3 dm . high, the branches decumbent or ascending. Leaves sessile, $3-9 \mathrm{~cm}$. long, $\mathrm{I}-2$ pinnately parted into linear or lanceolate acute lobes, less divided than those of the preceding species and with broader segments; heads commonly numerous, $3-4 \mathrm{~cm}$. broad; bracts of the involucre oblong, obtuse, usually somewhat pubescent, with broad scarious margins; rays 10-18, mostly 2 -toothed; chaff of the obtuse receptacle lanceolate; achenes oblong, obtusely 4 angled; pappus a mere border. In fields and waste places, N. S. to Va., west to Mich., Mo., and on the Pacific coast. Nat. from Europe. May-Aug.
6. Anthemis nóbilis L. Garden, Scotch, White or Low Camomile. (I. F. f. 3986.) Perennial, pubescent, aromatic, much branched, I.5-4.5 dm. high, the branches procumbent. Leaves numerous, $3-5 \mathrm{~cm}$. long, finely and compactly dissected into nearly filiform lobes and segments; heads about 25 mm . broad; bracts of the involucre obtuse, pubescent, their scarious margins broad; rays 12-18, 2 -3-toothed; chaff of the conic receptacle broad, membranous; achenes oblong, obtusely 3 -angled; pappus none. Sparingly escaped from gardens, R. I. to Del. and Mich. Adventive from Europe. June-Aug.
7. Anthemis tinctoria L. Yellow or Ox-eye Camomile. (I. F. f. 3987.) Perennial; stem erect, branched, 3-9 dm. high, with nearly erect branches. Leaves sessile, $3-7 \mathrm{~cm}$. long, pinnately divided, the oblong segments pinnatifid into narrow acute lobes; heads few or several, 3-4 cm. broad; bracts of the involucre oblong, obtuse, densely tomentose; rays $20-30$, pistillate, usually 2 .toothed; chaff of the nearly hemispheric receptacle lanceolate, acuminate, rather rigid; achenes 4 -angled, somewhat compressed; pappus a crown-like border. In fields and waste places, Me. to N. J., and locally escaped from gardens. Adventive from Europe. JuneSept.

## 86. CHRYSÁNTHEMUM L.

Perennial or annual, mostly erect and branching herbs, with alternate dentate incised or dissected leaves, and large, usually long-peduncled heads of both tubular and radiate flowers, or rays rarely wanting. Involucre hemispheric or depressed,
its bracts appressed, imbricated in several series, the outer shorter. Receptacle flat, convex or hemispheric, naked. Ray-flowers pistillate, fertile, the rays white, yellow or rose-colored, entire or toothed. Disk-flowers perfect, fertile, their corollas with terete or 2 -winged tubes and 4 - 5 -cleft limbs. Anthers obtuse and entire at the base. Style-branches of the disk-flowers truncate, penicillate. Achenes angled or terete, 5-10 ribbed, those of the ray-flowers commonly 3-angled. Pappus none or a scaly cup. [Greek, goiden-flower.] About 100 species, of wide distribution in the northern hemisphere. Besides the following, 2 others occur in northwestern arctic America. Our species have white ray-flowers.

> Heads large, few or solitary at the ends of the stem or branches. Stem-leaves linear-spatulate, pinnately incised; weed. Stem-leaves cuneate-spatulate, toothed or lobed above; arctic. I. C. Leucanthemum. C. arcticum.

Heads numerous, small, corymbose; plants escaped from gardens.
Leaves pinnatifid, segments incised.
Leaves oblong, serrate.
I. Chrysanthemum Leucánthemum L. White-weed. White or Ox-eye Daisy. (I. F. f. 3988.) Perennial; stem glabrous, or sparingly puberulent, simple or little branched, 3-9 dm. high, often tufted, the branches nearly erect. Basal leaves obovate, oblong, or spatulate, coarsely dentate or incised, narrowed into long slender petioles; stem-leaves mostly sessile and partly clasping, $3-7 \mathrm{~cm}$. long, the uppermost very small and nearly entire; heads $3-5 \mathrm{~cm}$. broad, on long naked peduncles; rays $20-30$, white, spreading, slightly $2-3$-toothed; bracts of the involucre oblong-lanceolate, obtuse, mostly glabrous, with scarious margins and a brown line within the margins; pappus none. In pastures, meadows and waste places, common as a weed. Nat. from Europe. Rays rarely short and tubular. Disk bright yellow. May-Nov.
2. Chrysanthemum àrcticum L. Arctic Daisy. (I. F. f. 3989.) Similar to the preceding species, but somewhat fleshy, lower, seldom over 3 dm . high. Leaves cuneate-spatulate, $3 \cdot 5-7.5 \mathrm{~cm}$. long, crenate or cleft at the apex, narrowed into a long tapering entire base, or the lower into slender petioles, slightly clasping at the base, the uppermost few, small, linear and nearly entire; heads solitary or few, long-peduncled, $3-4 \mathrm{~cm}$. broad; rays $20-30$, white; bracts of the involucre oblong, obtuse, brown or with broad brown scarious margins, usually pubescent; pappus none. Coast of Hudson Bay to Alaska. Also in arctic Europe and Asia. Summer.
3. Chrysanthemum Parthènium (L.) Pers. Common Feverfew. FeathERFEW. (I. F. f. 3990.) Perennial; stem puberulent or glabrate, much branched, $3-7 \mathrm{dm}$. high. Leaves thin, the lower often 15 cm . long, petioled, or the upper sessile, pinnately parted into ovate or oblong, pinnatifid or incised segments; heads numerous, corymbose, slender-peduncled, $12-20 \mathrm{~mm}$. broad; bracts of the depressed involucre lanceolate, rather rigid, keeled, pubescent, acute or acutish; rays 10-20, white, oval or obovate, spreading, mostly toothed, long-persistent; pappus a short toothed crown. In waste places, N. B. and Ont. to N. J., and locally in the interior, mostly escaped from gardens. Nat. or adventive from Europe. Summer.
4. Chrysanthemum Balsámita L. Costmary. Cost. Alecost. Alecoast. (I. F. f. 399I.) Perennial, puberulent or canescent; stem much branched, 6-12 dm . high. Leaves $3-5 \mathrm{~cm}$. long, those of the stem mostly sessile, and often with a pair of lateral lobes at the base; heads numerous, corymbose, slender-peduncled, 10-15 5 mm . broad, or when rayless only 6 mm . broad; bracts of the involucre narrow, obtuse, pubescent; rays $10-15$, white, spreading; pappus a short crown. Sparingly escaped from gardens, Ohio to Ont. and N. S. Native of the Old World. Summer.

## 87. MATRICÀRIA L.

Mostly erect herbs, similar to some species of the preceding genus, with alternate leaves, dissected into filiform or narrowly linear segments and lobes, and peduncled heads of both tubular and radiate flowers, or rays wanting in some species. Involucre hemispheric, its bracts appressed, imbricated in few series, the outer shorter. Receptacle conic, elongated or hemispheric, naked. Rays, when present, white, pistillate and fertile. Disk-flowers yollow, perfect, fertile, their corollas $4-5$-toothed. Anthers obtuse and entire at the base. Style-branches of the disk-
flowers truncate, penicillate. Achenes $3-5$-ribbed. Pappus none, or a coroniform border. [Latin, matrix, from its medicinal virtues.] About 20 species, natives of the northern hemisphere and South Africa.
Rays present, white.
Achenes obpyramidal, strongly 3 -ribbed.
Plant tall, much branched; bracts of the involucre green. 1. M. inodora. Plant low, nearly simple, arctic; bracts dark brown or black.

Achenes nearly terete, oblong, faintly 3 - 5 -ribbed. Rays none; achenes oblong, faintly nerved.
2. M. grandiflora.
3. M. Chamomilla.
4. M. matricarioides.
I. Matricaria inodòra L. Scentless Camomile. Corn Mayweed. (I. F. f. 3992.) Annual; stem glabrous, or very nearly so throughout, 3-6 dm. high. Leaves numerous, sessile, 2-3-pinnately dissected into filiform lobes, the rachis somewhat dilated at the base. Heads several or numerous, terminating the branches, $1.5-4 \mathrm{~cm}$. broad; bracts of the involucre lanceolate-oblong, obtuse, green with brown scarious margins; receptacle hemispheric or ovoid; pappus a short entire or 4 -toothed crown. In fields and waste places, Newf. to N. J., and locally in the interior. Nat. or adventive from Europe. June-Sept.
2. Matricaria grandiflòra (Hook.) Britton. Arctic Camomile. (I. F. f. 3993.) Perennial; stem usually simple and monocephalous, glabrous, I-3 dm. high. Leaves sessile, or the lowest short-petioled, $1-2$-pinnately disseted, $3-7 \mathrm{~cm}$. long. Head not very long-peduncled, $3-5 \mathrm{~cm}$. broad; bracts of the involucre ovate or ovate-oblong, obtuse, glabrous, brown or nearly black, or with broad, brown, scarious margins; receptacle hemispheric when mature. Coast of Hudson Bay to Alaska. Reported from Lake Huron. Summer.
3. Matricaria Chamomílla L. Wild or German Camomile. (I. F. f. 3994.) Annual, glabrous, much branched, 3-6 dm. high. Leaves aromatic, finely 2-3-pinnately dissected into numerous linear lobes; heads numerous, $16-25 \mathrm{~mm}$. broad, slender-peduncled at the ends of the branches; bracts of the involucre oblong, obtuse, green, or with brownish margins; receptacle ovoid. becoming conic and hollow: pappus none. In waste places and on ballast, southern N. Y. to Penn. Adventive or fugitive from Europe. Summer.
4. Matricaria matricarioìdes (Less.) Porter. Rayless Camomile. (I. F. f. 3995.) Annual, glabrous; stem very leafy, at length much branched, 15-45 cm . high. Leaves $2-3$-pinnately dissected into linèar acute lobes; heads numerous, $6-8 \mathrm{~mm}$. broad, peduncled; bracts of the involucre oval or oblong, green with broad white scarious margins, much shorter than the ovoid yellow disk; receptacle conic; pappus an obscure crown, sometimes produced into 2 coriaceous oblique auricles. In waste places, in ballast and along railroads, Mont. to Mo., Me. and Mass. Adventive from the Pacific coast. May-Aug.

## 88. TANACÈTUM L.

Erect, strongly aromatic herbs, our species perennials, with alternate, I-3-pinnately dissected or divided leaves, and numerous small corymbose heads of tubular flowers, or with rays sometimes present and imperfectly developed. Involucre hemispheric, depressed, or campanulate, its bracts appressed, imbricated in several series. Receptacle flat or convex, naked. Marginal flowers pistillate, fertile, their corollas $2-5$-toothed or lobed, sometimes produced into short rays. Disk-flowers perfect, fertile, the corollas 5 -toothed. Anthers obtuse and entire at the base, their tips broad. Style-branches truncate and penicillate at the summit. Achenes 5 -angled or 5 -ribbed, truncate or obtuse. Pappus none, or a short crown. [From tanasie, old French for tansy; Greek, athanasia, immortality.] About 35 species, natives of the northern hemisphere. Besides the following, 6 others occur in western and northwestern N. Am.

Glabrous, or nearly so; heads numerous, 6-10 mm. broad. Villous-pubescent; heads few, $12-16 \mathrm{~mm}$. broad.
. Tanaceur valgare I. . Stem sout asull
I. Tanacetum vulgàre L. Tansy. (I. F. f. 3996.) Stem stout, usually simple up to the inflorescence, $4-9 \mathrm{dm}$. high. Leaves pinnately divided into linearoblong, pinnatifid or incised segments, the lobes acute, usually serrate; lower segments of the leaves oftens maller than the others; basal leaves often 3 dm . long; heads
rather short-peduncled; involucre depressed-hemispheric, its bracts oblong-lanceolate, obtuse, or the outer acute, slightly pubescent or ciliate; receptacle flat; flowers yellow; marginal corollas with short oblique 3 -toothed limbs; pappus a short crown. Along roadsides, mostly escaped from gardens, N. S. and Ont. to S. Dak., south to N. Car., Mo. and Kans. Nat. from Europe. July-Sept.

Tanacetum vulgàre crispum DC. Leaf-segments more incised and crisped. Occasional, in similar situations; in some places more plentiful than the type.
2. Tanacetum Huronénse Nutt. Lake Huron Tansy. (I. F. f. 3997.) Villous-pubescent throughout, at least when young, less so when mature, $3-6 \mathrm{dm}$. high. Leaves 2-pinnately divided, the lobes dentate or incised, acute, the lower segments commonly smaller than the others; heads $1-8$, on very stout pubescent peduncles; involucre depressed-hemispheric; marginal flowers with 3 -5-lobed limbs, often expanded into short rays; pappus a short crown. In moist soil, N. B. to Hudson Bay, Me., Lake Superior, Alaska and Ore. July-Sept.

## 89. ARTEMÍSIA L.

Odorous herbs or shrubs, with alternate leaves, and small discoid, racemose, spicate, glomerate or paniculate heads of greenish or yellowish flowers. Involucre ovoid, oblong, or broadly hemispheric, its bracts imbricated in few series, the outer gradually shorter. Receptacle naked or pubescent, not chaffy. Central flowers perfect, sometimes sterile, with abortive ovaries and undivided styles, sometimes perfect and fertile, with truncate style-branches; marginal flowers usually pistillate and fertile, their corollas $2-3$-toothed; or flowers all perfect and fertile in some species. Anthers obtuse and entire at the base, often tipped with subulate appendages. Achenes obovoid or oblong, 2-ribbed or striate, rounded at the summit, usually bearing a large epigynous disk. Pappus none. [Named for Artemisia, wife of Mausolus.] About 200 species, natives of the northern hemisphere and southern S. Am. Besides the following, some 30 others occur in western N. Am.

> * Marginal flowers pistillate; central flowers perfect, sterile.
> a. Biennial or perennial herbs.

Leaves pinnately dissected into narrowly linear lobes.
Heads very numerous, 2 mm . broad; leaves mostly glabrous.

1. A. caudata.

Heads 4 mm , broad. in narrow panicles; leaves silky-pubescent.
Heads few; involucre brown, mostly pubescent. 2. A. borealis.
Heads numerous; involucre green, mostly glabrous. 3. A. Canadensis.
Leaves linear, the lower sometimes 3 -cleft or pinnately divided.
Leaves glabrous.
Leaves finely and densely pubescent.
4. A. dracunculoides.
b. Shrubby, silvery-canescent; heads small and numerous.
6. A. filifolia.
** Marginal flowers pistillate; central flowers perfect, fertile.
a. Receptacle villous-pubescent.

Leaf-segments linear-filiform, short.
Leaf-segments oblong, or linear-oblong; introduced.
7. A. frigida.
b. Receptacle glabrous, or sparingly pubescent.

Leaves dissected, glabrous or pubescent, green, not tomentose.
Heads about 4 mm . broad, numerous in panicled racemes; perennial.

$$
\begin{aligned}
& \text { Heads about } 2 \mathrm{~mm} \text {. broad, paniculate or spicate; annuals. } \\
& \text { Leaves finely } 2-3 \text { - }- \text {-pinnately divided; heads paniculate. } \\
& \text { Io. A. annum. } \\
& \text { Leaves pinnately divided; segments pinnatifid; heads in leafy spikes. } \\
& \text { II. A. biennis. }
\end{aligned}
$$

Leaves densely white-canescent or tomentose, at least beneath.
Leaves pinnatifid or dissected.
Heads 6-8 mm. broad; racemose-glomerate ; sea-beach plant.
Heads $2-4 \mathrm{~mm}$. broad, spicate-paniculate or racemose.
Leaves deeply pinnatifid, the segments mostly incised.
13. A. vulgaris.

Leaves finely dissected into short linear lobes. I4. A. Pontica.
Leaves pinnately parted into 5-7 narrow entire segments.
15. A. Kansana.

Leaves lanceolate, oblanceolate, or linear, serrate, somewhat lobed, or entire, not pinnatifid.
Leaves lanceolate, sharply serrate, glabrous above. 16. A. serrata.
Leaves linear, oblong or lanceolate, entire or lobed.
Leaves elongated, at length glabrous above. 17. A. longifolia.
Leaves shorter, oblanceolate, oblong, or lanceolate, tomentose both sides. Heads 4 mm . high, $2.5-3 \mathrm{~mm}$. broad; leaves entire or some of the lower toothed, white-tomentose on both sides.
18. A. gnaphalodes.

Heads 3 mm . high, $2-2.5 \mathrm{~mm}$. broad; leaves, except the upper ones, deeply 3-7 lobed, greener above.
19. A. Ludoviciana. Leaves cuneate, I cm . long, 3 -toothed at the apex. 20. A. Brgelovii.
*** Flowers all perfect and fertile; far western species.

Leaves cuneate, 3 -toothed or 3 -lobed.
Leaves linear, entire.
21. A. tridentata.
22. A. cana.
I. Artemisia caudàta Michx. Tall or Wild Wormwood. (I. F. f. 3998.) Root biennial (sometimes perennial?); stems slender, glabrous, tufted, strict, very leafy, o.6-2 m. high, at length paniculately branched; branches glabrous, or rarely slightly pubescent, nearly erect. Lower and basal leaves and those of sterile shoots slender-petioled, sometimes a little pubescent, $7-15 \mathrm{~cm}$. long, 2-3-pinnately divided into lobes about 1 mm . wide; the uppermost entire and short; heads shortpeduncled, mostly nodding; bracts of the ovoid-campanulate involucre ovate, or the inner elliptic, glabrous; receptacle hemispheric, naked; central flowers sterile. In dry sandy soil, abundant on sea-beaches, Quebec to Fla., Manitoba, Neb. and Tex. July-Sept.
2. Artemisia borealis Pall. Northern Wormwood. (I. F f. 3999.) Perennial, $\mathbf{1 2}-35 \mathrm{~cm}$. high, densely silky-pubescent all over. Leaves less divided, the basal and lower ones petioled, $2-6 \mathrm{~cm}$. long, the upper sessile, linear and entire or 3 -parted; heads about 4 mm . wide in a dense, terminal, rarely branched thyrsus; involucre nearly hemispheric, its bracts brown or brownish, pilose-pubescent or nearly glabrous; receptacle convex, naked; disk-flowers sterile. Me. (according to Fernald); Quebec to Greenland, west through arctic Am. to Alaska, south to Colo. Also in northern Asia. July-Aug.
3. Artemisia Canadénsis Michx. Canada Wormwood. (I. F. f. 4000 .) Root perennial (or sometimes biennial); stem pubescent or glabrous, strict, 3-6 dm. high, the branches appressed and erect. Leaves usually pubescent, but sometimes sparingly so, the basal and lower ones petioled, $5-8 \mathrm{~cm}$. long, 2 -pinnately divided into lobes which are shorter and broader than those of Artemisia caudata; upper leaves sessile, less divided; heads short-peduncled, mostly spreading or erect, in small forms the panicle reduced to a nearly or quite simple terminal raceme; involucre ovoid, its bracts ovate or oval; receptacle hemispheric; central flowers sterile. In rocky soil, Hudson Bay to northern Me. and Vt., west to Minn., Manitoba, the Canadian Pacific Coast, south to Ariz. and Neb. July-Aug.
4. Artemisia dracunculoìdes Pursh. Linear-Leaved Wormwood. (I. F. f. 4001.) Perennial, glabrous; stem somewhat woody, usually much branched, 6-12 dm . high, the branches nearly erect. Leaves $3-9 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, acute, entire, or the lower and basal ones sometimes 3 -cleft or even more divided; heads very numerous, $2-3 \mathrm{~mm}$. broad, nodding, very short-peduncled, racemose-paniculate; involucre nearly hemispheric, its bracts ovate or oblong, green, scariousmargined; receptacle hemispheric, naked. Dry plains and prairies, Manitoba to the N. W. Terr., Br. Col., Neb., Tex. and Cal. July-Nov.
5. Artemisia glaùca Pall. Silky Wormwood. (I. F. f. 4002.) Perennial, similar to the preceding species; stems strict, leafy, usually simple or little branched, 3-6 dm. high, pubescent, tomentose or canescent, or glabrous below. Leaves linear, $\mathrm{r}-6 \mathrm{~cm}$. long, about 2 mm . wide, entire, obtuse or obtusish, or the lower or sometimes nearly all of them 3-cleft into linear lobes $2-4 \mathrm{~cm}$. long; panicle narrow, branched, its branches nearly erect; heads drooping, sessile, very numerous, scarcely more than 3 mm . long; involucre hemispheric, its bracts scari-ous-margined, obtuse; receptacle naked. Minn. and Manitoba to the N. W. Terr.
6. Artemisia filifolia Torr. Silvery Wormwood. (I. F. f. 4003.) Stem branched. 3-6 dm. high, the rigid branches nearly erect. Leaves $2-5 \mathrm{~cm}$. long, nearly all 3 -parted into filiform entire segments less than I mm . wide, or the uppermost undivided; heads exceedingly numerous, about I mm. broad, racemose,
paniculate, very short-peduncled, 3-5-flowered; involucre oblong, its bracts densely canescent; receptacle small, naked or slightly fimbrillate; central $\mathbf{1}-3$ flowers sterile. On dry plains, S. Dak. to Utah, south to Tex., Mex. and N. Mex. JulyOct.
7. Artemisia frígida Willd. Pasture Sage-Brush. Wormwood Sage. (I. F. f. 4004.) Perennial, woody at the base, densely silky-canescent all over; stem $2.5-5 \mathrm{dm}$. high. Leaves $1-4 \mathrm{~cm}$. long, ternately or 5 -nately divided into numerous short, acutish, mostly entire lobes less than I mm. wide, the lower and basal ones petioled, and often with a pair of entire or 3-cleft divisions near the base of the petiole, the upper sessile and less divided; heads rather numerous, racemose or racemose-paniculate, short-peduncled, nodding, about 4 mm . broad; involucre hemispheric, its bracts oblong, canescent or tomentose. On dry plains and in rocky soil, Minn. to the Yukon, Idaho, Neb., Tex. and N. Mex. July-Oct.
8. Artemisia Absínthium L. Common Wormwood. Absinth. (I. F. f. 4005.) Shrubby, finely canescent; stem much branched, 6-12 dm. high. Leaves $5-12 \mathrm{~cm}$. long, I-3-pinnately divided, the lower long-petioled, the upper shortpetioled or sessile, the uppermost commonly linear and entire; heads numerous, yellow, racemose-paniculate, drooping, short-peduncled, $4-5 \mathrm{~mm}$. broad; involucre hemispheric, its outer bracts linear, the inner much broader, scarious-margined; receptacle pilose-pubescent; central flowers fertile, the marginal ones fertile or sterile. In waste places, Newf. and Hudson Bay to Mass., western Ont., Mont. and N. C. Nat. or adventive from Europe. July-Oct.
9. Artemisia Abrótanum L. Southernwood. (I. F. f. 4006.) Perennial, somewhat shrubby; stem puberulent or glabrous, much branched, 6-12 dm. high, the branches short, erect or ascending. Leaves glabrous or somewhat pubescent, $\mathbf{I}-\mathbf{7 c m}$. long, $\mathbf{I}-3$-pinnately parted into linear, obtuse, entire lobes about $\mathbf{I m m}$. wide, or the uppermost linear and entire, the lowest petioled; heads severalflowered, yellow, very numerous, nodding, $4-5 \mathrm{~mm}$. broad; involucre nearly hemispheric, pubescent, its outer bracts lanceolate, acute, the inner ones obovate. In waste places, Mass. to N. C., Ont., and Neb. Adventive from Europe.

Artemisia prócera Willd., a similar species, but with glabrous involucre, is stated by Dr. Gray to have escaped from gardens at Buffalo, N. Y.
10. Artemisia ánnua L. Annual Wormwood. (I. F. f. 4007.) Annual, glabrous throughout, much branched, 6-15 dm. high. Leaves $5-15 \mathrm{~cm}$. long; lobes very narrow, short, obtuse; lower and basal leaves slender-petioled, the upper sessile and less divided, but none of them entire; heads very numerous, drooping, borne on very slender peduncles of about their own length or less; involucre hemispheric, glabrous, its bracts few, ovate to oblong. In waste places Ont. to D. C., Tenn., Ark. and Kans.; a bad weed in some places. Adyentive or nat. from Asia. Summer.
II. Artemisia biénnis Willd. Biennial Wormwood. (I. F. f. 4008.) Annual or biennial, glabrous throughout; stem very leafy, usually branched, 3-12 dm . high, the branches nearly erect. Leaves $2-8 \mathrm{~cm}$. long; lobes linear or linearoblong, acutish, serrate or incised; lowest leaves petioled, the uppermost less divided or rarely quite entire; heads not drooping, sessile and exceedingly numerous ir axillary crowded glomerules; involucre nearly hemispheric, its bracts green, scariousmargined. Native in the N. W. Terr. and the northwestern U. S., now widely distributed as a weed from Manitoba to N. S., south to Kans., Ky. and Penn. Aug.-Oct.
12. Artemisia Stelleriàna Bess. Beach Wormwood. (I. F. f. 4000.) Perennial, densely white-tomentose; stem branched, 3-5 dm. high, bushy, the branches ascending. Leaves obovate to spatulate, $3-10 \mathrm{~cm}$. long, pinnatifid into oblong obtuse entire or few-toothed lobes, the lower petioled, the upper sessile, all densely tomentose beneath, but becoming green and glabrous above when old; heads not drooping; involucre oblong-campanulate, its bracts tomentose, lanceolate or oblong-lanceolate. Sandy sea-beaches, Me. and Mass. to N. J. Cultivated in gardens along the coast. Native of northeastern Asia. Occurs also on the coast of Sweden. July-Aug.
13. Artemisia vulgàris L. Common Mugwort. (I. F. f. 4oio.) Perennial: stem glabrous or nearly so, much branched, $3^{-10} \mathrm{dm}$. high. Leaves $3^{-12} \mathrm{~cm}$.
long, deeply pinnatifid, into linear, oblong or somewhat spatulate, pinnatifid, toothed or entire lobes, densely white-tomentose beneath, dark green and glabrous above, the lower petioled, the upper sessile, the uppermost sometimes linear and entire; heads numerous, erect, about 4 mm . broad, in panicled simple or compound spikes; involucre oblong-campanulate, its bracts oblong, obtusish, scarious-margined; tomentose or glabrous. In waste places, N. S. to Ont., Mich., N. C. and Penn. Nat. from Europe. Native also of Asia. July-Oct.
14. Artemisia Póntica L. Roman or Hungarian Wormwood. (I. F. f. 4011.) Perennial; stem branched, glabrous or canescent, 3-10 dm. high. Leaves 3-6 cm. long, 2-3 pinnately dissected into short narrow lobes less than 2 mm . wide, canescent on both sides, or tomentose beneath, the lower petioled and the petioles somewhat clasping or auricled at the base, the upper mostly linear and entire; heads numerous, $2-4 \mathrm{~mm}$. broad, drooping, slender-peduncled; involucre hemispheric, canescent, its bracts oblong or obovate, obtuse, the outer short, lanceolate. Railway embankment near Tumble Station, Hunterdon Co., N. J,; mountain-side near Lily Lake, Luzerne Co., Pa. Fugitive or adventive from central Europe. July-Aug.
15. Artemisia Kansäna Britton. Kansas Mugwort. (I. F. f. 4012.) Densely white-woolly all over; stem erect, much branched, the branches strict, bearing very numerous small heads forming a narrow dense panicle. Leaves numerous, crowded, the lower pinnately divided into 3-7 narrowly linear revolutemargined segments I mm . wide or less, greenish above; upper leaves mostly narrowly linear and entire; heads oblong-oval, sessile, or very short-peduncled, erect, or somewhat spreading, 3 mm . long; involucre very woolly, its bracts ovatelanceolate to oblong-lanceolate, acute. Plains, western Kans.
16. Artemisia serràta Nutt. Saw-leaf Mugwort. (I. F. f. 4013.) Perennial; stem stout, tomentose or becoming glabrous, much branched, I.5-3 m. high. Leaves lanceolate, $5-15 \mathrm{~cm}$. long, $6-25 \mathrm{~mm}$. wide, densely white-tomentose beneath, acuminate at the apex, narrowed to a sessile base, or the lowest petioled; heads very numerous, greenish, erect, about 3 mm . broad, sessile or short-peduncled in panicled spikes or racemes; involucre canescent, its bracts oblong, obtuse, or the outer ones lanceolate. Prairies, Ill. to Minn. and S. Dak. Introduced on the Mohawk River, near Schenectady, N. Y. Aug.-Oct.
17. Artemisia longifolia Nutt. Long-leaved Mugwort. (I. F. f. 4014.) Perennial; stem densely white-tomentose, branched, 6-15 dm. high. Leaves linear or linear-lanceolate, $5-12 \mathrm{~cm}$. long, $2-10 \mathrm{~mm}$. wide, acuminate, tapering to a sessile base, or the lower petioled, densely white-tomentose on both sides, or becoming green and glabrate above; heads numerous, erect, spicate-paniculate, about 4 mm . broad; involucre tomentose, its bracts oblong, obtuse. In dry rocky soil, western Neb. to Minn., Mont. and the N. W. Terr. Aug.-Sept.
18. Artemisia gnaphalòdes Nutt. Prairie, Western or Cud-weed MuGwort. (I. F. f. 40I5.) Perennial, similar to the preceding species; stem white-tomentose, usually much branched, 3-12 dm. high. Leaves lanceolate or oblong, $3-7 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide, entire, or the lower somewhat toothed, white-tomentose on both sides, acute or acuminate, sessile or the lower narrowed into short petioles; heads numerous, erect, spicate-paniculate, above 3 mm . broad, involucre oblong, tomentose. On prairies and dry banks, western Ont. and Ill. to Br. Col., south to Mo., Tex., Ariz., Mex. and Cal. Aug.-Oct.
19. Artemisia Ludoviciàna Nutt. Lobed Cud-weed. Perennial, ascending or erect, lower than the preceding, 3-5 dm. high, branched; stem somewhat tomentose. Leaves oblanceolate or somewhat cuneate in outline, $2-5 \mathrm{~cm}$. long, densely white-tomentose beneath, floccose but greener above, deeply 3-7-lobed with lanceolate lobes, or the upper entire; heads very small and numerous, somewhat noduing; involucre oblong-campanulate, tomentose, but less so than in the preceding. Prairies and mountain-sides, Mo. to Col. Aug.-Oct.
20. Artemisia Bigelòvii A. Gray. Bigelow's Sage-buSh. (I. F. f. 4016.) Perennial, shrubby, silvery-canescent throughout, 2-4 dm. high, much branched, the branches erect. Leaves narrowly cuneate, or oblong, obtuse, truncate, or 3-5toothed at the apex, $10-18 \mathrm{~mm}$. long, about 2 mm . wide; heads very numerous, about 2 mm . broad, densely glomerate-spicate in a narrow virgate panicle, 2-5flowered, 1 or 2 of the marginal ones pistillate, the others perfect and fertile; invo-
lucre short-oblong, canescent or tomentose, its bracts oblong, obtuse. Kans. (according to Smyth), and Colo. to Ariz. Aug.-Oct.

2I. Artemisia tridentàta Nutt. Common Sage-bush. Sage-brush. Sage-wood. Mountain Sage. (I. F. f. 40i7.) Shrubby, silvery-canescent; stem much branched, 3-35 dm. high. Leaves narrowly cuneate, $\mathrm{I}-4 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, sessile, $3-7$-toothed at the truncate apex; heads very numerous, $5-8$-flowered, about 3 mm . broad, sessile, or very nearly so, in large dense panicles; involucre oblong, tomentose, its inner bracts oblong, the outer short, ovate, all obtuse or obtusish. On dry plains and in rocky soil, western Neb. to Colo., Utah and Cal., north to Mont. and Br. Col. July-Sept.
22. Artemisia càna Pursh. Hoary Sage-bush. (I. F. f. 4018.) Shrubby, densely white-canescent; stem much branched, 3-7 dm. high. Leaves linear, linear-oblong or narrowly lanceolate, sessile, acute at both ends, $3-5 \mathrm{~cm}$. long, $3-6 \mathrm{~mm}$. wide, usually quite entire, rarely with 2 or 3 acute teeth or lobes; heads numerous, about 3 mm . broad, glomerate or sometimes solitary in the axils of the leaves, or crowded into a naked thyrsus at the summit, 5-9 flowered; involucre oblong, canescent, its inner bracts oblong or lanceolate, obtuse, usually with r-3 shorter outer ones. Plains, Neb. and Colo. to N. Dak. and the N. W. Terr. JulySept.

## 89. TUSSILAGO L.

An acaulescent herb, more or less white-tomentose, with slender perennial rootstocks, broad basal cordate, dentate or lobed, long-petioled leaves, and large solitary, monœcious heads of both tubular and radiate yellow flowers at the summit of a scaly scape, appearing before the leaves of the season. Involucre campanulate to cylindric, its principal bracts in a single series, equal, with or without a few shorter outer ones. Receptacle flat, naked. Ray-flowers in several series, pistillate, fertile. Disk-flowers perfect, sterile, the corolla 5 -cleft, the style undivided and obtuse. Achenes of the ray-flowers linear, 5-10-ribbed. Pappus copious, of numerous slender roughish bristles, that of the sterile flowers shorter than that of the fertile. [Latin, tussis, cough, for which the plant was a reputed remedy.] A monotypic genus.

1. Tussilago Fàrfara L. Coltsfoot. Coughwort. (I. F. f. 4org.) Scape slender, 7-45 cm. high, bearing a solitary large head at the summit. Leaves nearly orbicular, or broadly ovate-reniform, angulately lobed and dentate, 7-16 cm . broad, green and glabrous above, persistently white-tomentose beneath; head about 25 mm . broad; involucre campanulate: rays bright yellow, numerous, linear, pistillate, fertile. In moist soil, along roadsides, etc., N. S. and N. B. to Mass., N. Y. and Minn. Nat. from Europe. April-June.

## go. PETASITES Gaertn.

Herbs with perennial thick horizontal rootstocks, broad basal petioled leaves, and scaly scapes bearing racemose or corymbose heads of tubular or both tubular and radiate, white or purplish, often diœcious or subdiœcious flowers. Involucre campanulate to cylindric, its bracts in I series, equal. Receptacle flat, or nearly so, not chaffy. Corolla of pistillate flowers very slender, 2 - 5 -toothed, truncate or sometimes with a ray, marginal, or composing most of the head; perfect but sterile flowers with a tubular 5 -cleft corolla, the style undivided. Anthers entire or minutely sagittate at the base. Fertile achenes linear, the pappus of numerous capillary rough or barbellate bristles. [Greek, a broad-rimmed hat, referring to the broad leaves of these plants.] About 12 species, natives of the north temperate and subarctic zones.

Flowers whitish, the pistillate radiate ; natives ; northern.
Leaves orbicular, 7 -11-cleft nearly to the base.

1. P. palmata.

Leaves hastate-reniform, sinuate-lobed or toothed.
Leaves deltoid-ovate, repand-denticulate.
Flowers all rayless, purple; introduced.
2. P. frigida.
3. P. sagittata.
4. P. Petasites.
I. Petasites palmàta (Ait.) A. Gray. Palmate-leaf Sweet Coltsfoot. (I. F. f. 4020.) Scape very scaly, stout, I.5-6 dm. high. Leaves 7-30 cm. broad. green and glabrous above, densely white-tomentose beneath, at least when young,
sometimes becoming glabrate, the lobes oblong or obovate, acute, often somewhat cuneate, sharply dentate or incised; heads mostly diocious, corymbose or racemosecorymbose, numerous, $7-12 \mathrm{~mm}$. broad; flowers nearly white, fragrant. In swamps and along streams, Newf. to Alaska and Br. Col., south to Mass., N. Y., Wis. and Cal. April-June.
2. Petasites frígida (L.) Fries. Arctic Sweet Coltsfoot. (I. F. f. 402 I.) Scape very scaly, 7-30 cm. high. Leaves $3-10 \mathrm{~cm}$. long, irregularly and angulately lobed and incised, green and glabrous above, persistently white-tomentose beneath, the lobes entire or few-toothed ; heads usually fewer and larger than those of the preceding species; involucre short-campanulate; flowers nearly white, fragrant. Lake Winnipeg to the Arctic Sea, west to Alaska and the mountains of Br . Col. Also in northern Europe and Asia. June-Aug.
3. Petasites sagittàta (Pursh) A. Gray. Arrow-leaf Sweet Coltsfoot. (I. F. f. 4022.) Scape and racemose-corymbose inflorescence similar to those of the two preceding species. Leaves deltoid-ovate or reniform-ovate, persistently whitetomentose beneath, glabrous or nearly so above, $\mathbf{I}-3 \mathrm{dm}$. long, their margins sinuatedenticulate, neither cleft nor lobed; involucre campanulate; flowers nearly white. In wet ground, Hudson Bay to Manitoba and Minn., Br. Col., S. Dak. and Colo. May-June.
4. Petasites Petasites (L.) Karst. Butter-bur. Butterfly-dock. (I. F. f. 4023.). Scape very scaly, $15-45 \mathrm{~cm}$. high. Leaves orbicular or hastate-reniform, often 3 dm . broad when mature, rounded or pointed at the apex, repanddenticulate all around, persistently white-tomentose beneath, green and mostly glabrous above; heads $8-\mathbf{1 2} \mathbf{~ m m}$. broad, mostly diæccious, in a dense raceme, the staminate ones smaller than the pistillate. In cultivated and waste ground, Pa. Nat. from Europe. Native also of northern Asia. April.

## 92. ÁRNICA L.

Erect, simple or little branched herbs, with opposite leaves, or the upper rarely alternate, and large, long-peduncled heads of both tubular and radiate yellow flowers, or rays wanting in some species. Involucre turbinate or campanulate, its bracts in I or 2 series, narrow, nearly equal. Receptacle flat, naked, fimbrillate or villous. Ray-flowers pistillate, fertile, the rays spreading, entire, or 2-3toothed. Disk-flowers perfect, fertile, the corolla 5 -lobed, the style with slender branches. Anthers entire or minutely 2-auriculate at the base. Achenes linear, 5-10-ribbed, more or less pubescent. Pappus a single series of rough or barbellate rigid slender bristles. [Derivation uncertain, perhaps from Ptarmica.] About 30 species, natives of the northern hemisphere. Besides the following, some 20 others occur in the western parts of North America.

| Basal leaves ovate or oval, sessile; southern. | 1. A. acaulis. |
| :--- | :--- |
| Basal leaves oblong, lanceolate, or cordate-ovate, petioled. | 2. A. cordifolia. |
| Basal leaves cordate-ovate. |  |
| Basal leaves not cordate, tapering to the petiole. | 3. . lanceolata. |
| Stem-leaves 3-5 pairs, the upper somewhat smaller. | 4. A. alpina. |

1. Arnica acaùlis (Walt.) B.S.P. Leopard's-bane. (I. F. f. 4024.) Gland-ular-hirsute; stem 3-9 dm. high, bearing several slender-peduncled heads at the summit. Basal leaves tufted, ovate or oval, obtuse, narrowed to a sessile base, denticulate or entire, $5-12 \mathrm{~cm}$. long, $4-7 \mathrm{~cm}$. wide; stem-leaves $\mathbf{I}-3$ pairs, and some alternate, very small ones above; heads $25-35 \mathrm{~mm}$. broad; bracts of the involucre linear-lanceolate, acute or acutish; rays $12-15$, commonly 3 toothed at the truncate apex; achenes pubescent when young, glabrous or nearly so when mature. In low woods, Del. and southern Penn. to Fla. April-May.
2. Arnica cordifòlia Hook. Heart-leaf Arnica. (I. F. f. 4025.) Hirsute, or prbescent; stem simple, or sparingly branched, 3-9 dm. high. Basal and lower leaves ovate to nearly orbicular, obtuse or acute, deeply cordate at the base, dentate, 3-7 cm. long, with slender sometimes margined petioles; stem-leaves $1-3$ pairs, ovate to oblong, sessile or short-petioled, much smaller; heads $1-8,5-7 \mathrm{~cm}$. broad; bracts of the involucre acute or acuminate, $\mathbf{1 2 - 2 0} \mathrm{mm}$. long; rays $\mathbf{1 2 - 1 6 ,}$
toothed at the apex; achenes hirsute-pubescent, or glabrous at the base. Western Neb. to S. Dak., the N. W. Terr., Nev. and Br. Col. May-July.
3. Arnica lanceolata Nutt. Northern Arnica. (I. F. f. 4026.) Sparingly villous-pubescent; stem simple, or little branched, 3-7 dm. high, bearing I-6 heads at the summit. Leaves oblong or oblong-lanceolate, dentate or entire, acute or obtuse, $5-12 \mathrm{~cm}$. long, $6-18 \mathrm{~mm}$. wide, the lower and basal ones narrowed into petioles, the upper sessile, and usually somewhat connate by a broad or narrowed base, those of the stem 3-5 pairs, usually with some alternate small ones on the branches; heads $2-5 \mathrm{~cm}$. broad; bracts of the involucre acute; rays $10-15,3$-toothed; achenes hirsute-pubescent. Mountains of northern N. Y., N. H. and Me. to N. B., west to Lake Superior. June-Aug. It has been confused with the grayish pubescent $A$. Chamissonis of the west.
4. Arnica alpìna (L.) Olin. Mountain Tobacco. Arctic Arnica. (I. F. f. 4027.) Similar to the preceding species, but smailer and more slender, 15-35 cm . high, villous or pubescent. Stem simple, usually bearing but a single head; leaves lanceolate, linear-oblong, or the lowest spatulate, thickish, entire or dentic ulate, 3-nerved, the basal ones petioled, those of the stem 1-3 pairs, sessile or short-petioled, scarcely connate, the upper pair usually much smaller than the lower ones; heads about 5 cm . broad; rays 10-15, toothed; achenes hirsute or glabrate. Labrador to Greenland and the Arctic Sea. Also in northern Europe. May-Sept.

## 93. ERECHTÌTES Raf.

Erect, usually branching herbs, with alternate leaves, and (in our species) rather large discoid many-flowered heads of whitish flowers, corymbose-paniculate at the ends of the stem and branches. Involucre cylindric, swollen at the base, its principal bracts in I series, linear, with or without some much smaller outer ones. Receptacle concave, naked. Marginal flowers in 2 -several series, pistillate, fertile, their corollas filiform, the limb 2-4-toothed. Central flowers perfect, fertile; corolla narrowly tubular, the limb 4-5-toothed, the style-branches elongated, truncate or obtuse at the summit. Anthers obtuse and entire at the base. Achenes linearoblong, angled or striate. Pappus of copious caspillary soft smooth white bristles. [Ancient name of some groundsel.] About 12 species, natives of America and Australasia. The following is the only one known to occur in North America.

1. Erechtites hieracifòlia (L.) Raf. Fire-weed. Pilewort. (I. F. f. 4028.) Annual, glabrous, or somewhat hirsute; stem striate, succulent, usually branched, 3-25 dm. high. Leaves thin, lanceolate or ovate-lanceolate, dentate and often deeply incised, $5-20 \mathrm{~cm}$. long, the upper sessile or auriculate-clasping, mostly acuminate, the lower usually narrowed into petioles; heads $\mathbf{1 2 - 2 0} \mathrm{mm}$. long, about 6 mm . in diameter, the involucre conspicuously swollen at the base before flowering, its bracts numerous, striate, green, with narrow scarious margins; pappus bright white. In woodlands, thickets and waste places, Newf. to Fla., west to the N. W. Terr., Neb., Kans. and La. Also in Mex. and S. Am. July-Sept.

## 94. MESADÈNIA Raf.

Tall perennial mostly glabrous herbs, with alternate petioled leaves and numerous, rather small, corymbose, discoid heads of white, yellowish or pinkish flowers, all tubular and perfect. Sap milky (at least in some species). Involucre cylindric or nearly so, its principal bracts 5 , in I series, equal, usually with a few short outer ones. Receptacle flat, not chaffy, with a fleshy projection in the center. Corollas with somewhat spreading 5 -cleft limbs, the lobes usually with a mid-nerve. Style-branches conic or obtuse at the apex. Achenes oblong, glabrous. Pappus of copious white scabrous bristles. [Greek, referring to the central projection of the receptacle.] About 12 species, natives of North and Central America. Besides the following, 4 others occur in the southern and southwestern U.S.
Leaves thin, reniform or fan-shaped, lobed, or angulate-dentate.

Leaves green both sides, angulate-dentate.
Leaves glaucous beneath, green above, angulate-lobed.
Leaves thick, green both sides, ovate or oval, entire, or repand.
I. M. reniformis.
2. 1/. atrictiofolia.
3. M. tuberosa.

1. Mesadenia renifórmis (Muhl.) Raf. Great Indian Plantain. Wild Collard. (I. F. f. 4029.) Glabrous; stem angled and grooved, $1-3 \mathrm{~m}$. high. Leaves green both sides, the basal and lower reniform, long-petioled, sometimes 6 dm . wide, the upper ovate or fan-shaped, mostly cuneate at the base, the uppermost small and oblong; heads numerous, mostly 5 -flowered, about 5 mm . broad, in large compound corymbs; involucre $6-8 \mathrm{~mm}$. high. In woods, N. J. and Penn. to Minn., south to N. C. and Tenn. July-Sept.
2. Mesadenia atriplicifòlia (L.) Raf. Pale Indian Plantain. (I. F. f. 4030.) Stem terete, glabrous, glaucous, 9-18 dm. high. Leaves thin, the lower and basal ones slender-petioled, sometimes 15 cm . wide, the upper reniform, fan-shaped, or triangular with a nearly truncate base, the uppermost commonly small, lanceolate or oblong and entire; heads very numerous, about 3 mm . broad, in large loose compound corymbs; involucre $6-8 \mathrm{~mm}$. high. In woods, W. Ont. to Minn., south to Fla., Mo. and Kans. July-Sept.
3. Mesadenia tuberòsa (Nutt.) Britton. Tuberous Indian Plantain. (I. F. f. 4031.) Glabrous and green throughout; stem angled, stout, 6-18 dm. high. Leaves strongly 5-9-nerved, the lower and basal ones oval, ovate, or ovatelanceolate, obtuse or acutish, usually quite entire, but sometimes rapand, long-petioled, narrowed at the base, or rarely subcordate, $1-2 \mathrm{dm}$. long, $2-7 \mathrm{~cm}$. wide; upper leaves ovate to oblong or cuneate-obovate, sessile or short-petioled, much smaller; heads very numerous in a compound corymb, mostly 5 -flowered, about 4 mm . broad; involucre $6-8 \mathrm{~mm}$. high. On wet prairies and in marshes, Ohio and W. Ont. to Minn., south to Ala., La., Ark. and Kans. June-Aug.

## 95. SYNÓSMA Raf.

A perennial leafy herb, glabrous or very nearly so, with triangular or hastate, alternate leaves, the lower petioled, the upper sessile, and several or numerous, corymbose or corymbose-paniculate, discoid heads of white or pinkish flowers. Involucre nearly cylindric, its principal bracts $12-15$, linear, acute, usually with some subulate outer ones. Receptacle flat, naked. Flowers perfect; corolla 5lobed. Style-branches not appendaged. Pappus of very numerous white soft capillary bristles. [Greek, perhaps signifying a fragrant composite.] A monotypic genus of eastern North America.
I. Synosma suavèolens (L.) Raf. Sweet-scented Indian Plantain. (I. F. f. 4032.) Glabrous or very nearly so throughout; stem striate, $\mathbf{I} \mathbf{- 1 . 5} \mathbf{~ m}$. high, leafy to the inflorescence. Leaves triangular-lanceolate or hastate, sharply and irregularly serrate, acuminate, $\mathbf{1}-2.5 \mathrm{dm}$. long, $5-15 \mathrm{~cm}$. wide at the base, the auricles sometimes with 1 or 2 lobes on the lower side; petioles margined, or those of the basal leaves naked and slender; uppermost leaves sometimes merely lanceolate and sessile; heads $4^{-6} \mathrm{~mm}$. broad in a usually large and compound corymb; involucre $8-\mathbf{1 2} \mathrm{mm}$. high, its principal bracts linear, acute; heads 20-30flowered. In woods, Conn. and N. J. to Ill. and Minn., south to Fla., W. Va. and Ky. Aug.-Oct.

## 96. SENELCIO L.

Annual or perennial herbs (some tropical species shrubby or even arborescent), with alternate or basal leaves, and solitary corymbose or paniculate many-flowered heads, of both tubular and radiate, or only tubular flowers, in our species yellow. Involucre cylindric or campanulate, its principal bracts in I series, distinct, or united at the base, usually with some shorter outer ones. Receptacle flat or slightly convex, mostly naked, often honeycombed. Rays, when present, pistillate, fertile. Disk-flowers perfect, fertile, their corollas tubular, the limb 5-toothed or 5lobed. Anthers obtuse and entire at the base; or rarely slightly sagittate. Stylebranches of the disk-flowers usually recurving or spreading. Achenes terete, or those of the marginal flowers somewhat compressed, 5-IO-ribbed, papillose, or canescent, at least after wetting, and then usually emitting a pair of spiral threads. Pappus of numerous slender or capillary, smooth or rough, mostly white bristles. [Latin, senex, an old man, referring to the hoary character of some species; or to the white pappus.] An immense genus of probably at least 1000 species, of very wide geographic distribution, In addition to the following, some 7 o others occur
in the southern and western parts of North America. Our species known as Groundsel, Ragwort, or Squaw-weed.

* Heads conspicuously radiate (except in forms of Nos. 9, ro and 16 ).
(a) Heads solitary or few, $12-25 \mathrm{~mm}$. high ; northern species.

Stout; leaves $1-2 \mathrm{dm}$. long; heads $4-5 \mathrm{~cm}$. broad. I. S. Pseudo-Arnica. Low; leaves $3-5 \mathrm{~cm}$. long; heads $2-3 \mathrm{~cm}$. broad.
2. S. frigidus.
(b) Heads several or numerous, corymbose, mostly smaller.
$\dagger$ At least the lowest leaves entire or dentate, not pinnatifid (or sometimes pinnatifid in Nos. 7 and 14).
$\ddagger$ None of the leaves cordate.
Heads $10-14 \mathrm{~mm}$. high; plants $3-15 \mathrm{dm}$. tall; northwestern species.
Involucral bracts acuminate; leaves mostly entire. 3. S. integerrimus.
Bracts acute or obtuse, mostly black-tipped; leaves denticulate.
4. S. atriapiculatus.

Heads 6 -10 mm. high; plants 1.5-7 dm. tall.
Leaves and stems persistently more or less tomentose or woolly.
Achenes glabrous.
5. S. Purshianus.

Achenes hispidulous or glandular.
Basal leaves long-petioled, crenate-dentate or sometimes pinnatifid; plants tall.

> Basal leaves crenate-dentate; eastern.
> Stem-leaves, and often also the basal, pinnatifid; western.
7. S. Plattensis.

Basal leaves'short-petioled, much tufted, oval, few-toothed or entire; plant
low.
Leaves glabrous or nearly so; stem often woolly, especially below.
Basal leaves obovate, spatulate, or oval; achenes glabrous.
Basal leaves obovate or suborbicular, crenate or dentate; involucral bracts 4-5 mm, long. 9. S. obovatus.
Basal leaves ovate to oval; involucral bracts $6-10 \mathrm{~mm}$. long.
Rays usually wanting, northern species. $\quad$ 10. $S$. discoideus.
Rays large and conspicuous.
Basal leaves oblong; achenes glabrous or hispidulous.
Heads few or several, $6-8 \mathrm{~mm}$. high; basal leaves $2-7 \mathrm{~cm}$. long.
12. S. Balsamitae.

Heads numerous, $4-5 \mathrm{~mm}$. high; basal leaves $7-15 \mathrm{~cm}$. long.
13. S. Smallii.

Basal leaves linear-cuneate, entire or 3 -toothed at apex.
14. S. compactus.
$\ddagger \ddagger$ Basal leaves cordate or subcordate; plants mostly glabrous.

Basal leaves lanceolate or oblong-lanceolate.
Basal leaves orbicular or ovate-oval.
$\dagger \dagger$ Leaves narrowly linear, entire.
17. S. spartioides.
$\dagger \dagger \dagger$ Leaves all pinnatifid or coarsely sinuate-dentate; plants glabrous, or somewhat woolly when young.
Leaves sinuate-dentate, lanceolate; heads 8 -10 mm. high.
Leaves pinnatifid.
Segments narrowly linear, entire. 18. S. Fremontii.
Segments not linear.
Leaves pinnately divided; segments dentate; heads $4^{-6} \mathrm{~mm}$. high.
20. S. lobatus.

Leaves 2 -pinnatifid; heads 6 mm . high ; introduced species.
21. S. Jacobrea.
** Heads discoid, the rays none, or minute: introduced species
Leaves pinnatifid; plants glabrous or puberulent; achenes canescent.
Heads 6-8 mm. high; involucre naked, or nearly so at the base.
22. S. sylvaticus.

Heads 8-12 mm. high; involucre with several short outer bracts.
23. S. viulgaris.
24. S. viscisis.

Leaves pinnatifid ; plant viscid-pubescent; achenes glabrous.
Nos. 9, 10 and 16.

1. Senecio Pseùdo-Árnica Less. Sea-beachi Senecio. (I. F. f. qo33.) Perennial, somewhat fleshy: stem stout mostly simple, very leafy, r.5-0 dm. high. Leaves oblong-obovate, or the lower spatulate, acute or obtuse at the apex, densoly tomentose beneath, at least when young, repand-dentate or denticulate, marrowed to a sessile and partly clasping base, or the lowest into margined petioles; honds stout-peduncled, nearly 25 mm . high; molucre broadly campanulate, its bracts
lanceolate, acuminate, mostly tomentose, commonly with several subulate spreading ones at the base; rays $\mathbf{1 2 - 1 5}$, linear, conspicuous; disk-corollas 5 lobed; achenes glabrous; pappus dull. On sea-beaches and rocks near the sea, Me., N. B. and the lower St. Lawrence to Lab. and the Arctic Sea. Also in Alaska and northern Asia. July-Aug.
2. Senecio frígidus Less. Arctic Senecio. (I. F. f. 4034.) Perennial, more or less tomentose, or becoming glabrous when old; stem slender, I.5-3 dm. high, bearing a solitary head (rarely 2 or 3). Basal and lower leaves spatulate or obovate, petioled, obtuse, repand-dentate or entire; stem-leaves oblong to linearlanceolate, obtuse or acute, sessile, mostly entire, smaller; involucre broadly campanulate, its bracts lanceolate, acute, with no exterior smaller ones; rays 10-16, 12-20 mm. long, 3 -toothed, linear-oblong, or cuneate at the base; achenes glabrous or sparingly pubescent. Lab. and arctic Am. to Alaska. Also in northeastern Asia. Summer.
3. Senecio integérrimus Nutt. Entire-leaved Groundsel. (I. F. f. 4035.) Perennial, more or less woolly when young, glabrous or nearly so when old. Leaves entire, or sparingly denticulate, somewhat fleshy, the lower and basal ones oval or oblong, obtuse or obtusish at the apex, 7-15 cm. long, 2-4 cm . wide, petioled, the upper linear or lanceolate, acute, the uppermost very small; heads numerous, corymbose, long-peduncled, $\mathbf{1 2 - 2 0} \mathrm{mm}$. broad; involucre nearly cylindric, its principal bracts linear, green, usually with a few subulate outer ones; rays 8-12, linear-oblong; achenes nearly glabrous. Minn. and Manitoba to Wyo. and Br. Col. June-July.
4. Senecio atriapiculàtus Rydb. Black-tipped Groundsel. (I. F. f. 4036 as $S$. lugens.) Similar to the preceding species, more or less woolly when young, soon glabrous; stem stout, 3-9 dm. high. Basal and lower leaves oblong, oval, or slightly spatulate, obtuse or acute, denticulate or dentate, 5-12 cm . long, 3-4 cm . wide, narrowed into margined petioles; upper leaves few, sessile, small and bract-like; heads several or numerous, corymbose, often short-peduncled, 12-20 mm . broad; involucre campanulate, its bracts lanceolate or oblong-lanceolate; rays 10-12, oblong-linear; achenes glabrous. In moist soil, the N. W. Terr. to Minn., Iowa and Neb., west to Br. Col. and Cal. June-Aug. This has been confused with the smaller arctic S. lugens Richardson.
5. Senecio Purshianus Nutt. Pursh's Groundsel. (I. F. f. 4037 as S. canus.) Perennial, densely and persistently white-tomentose to the inflorescence; stems slender, usually tufted, 1-2 dm. high. Basal and lower leaves spatulate or oval, entire, very obtuse, 3-6 cm. long, narrowed into petioles; upper leaves oblong or spatulate, obtuse or acute, mostly sessile, smaller, entire; heads several or numerous, $10-15 \mathrm{~mm}$. broad, usually slender-peduncled; involucre campanulate, or at first short-cylindric, about 8 mm . high, its bracts linear-lanceolate, acute sparingly tomentose, or glabrate, usually with no exterior smaller ones; rays 8-12; achenes glabrous, at least below. In dry soil, Manitoba to Minn. and Neb., west to Br. Col. and Utah. May-Aug. It has been confused with the larger S. canus of the Rockies.
6. Senecio tomentòsus Michx. Woolly Ragweed. Ashwort. (I. F. f. 4038.) Perennial, more or less densely and persistently tomentose or woolly-canescent; stems rather stout, solitary, or sometimes tufted, 3-7 dm. high. Basal and lower leaves ovate-lanceolate, oblong or rarely spatulate, erect, very obtuse, 5-15 cm . long, $\mathbf{I}-5 \mathrm{~cm}$. wide, narrowed or truncate at the base; stem-leaves few and distant, small, linear-lanceolate or spatulate, crenate or rarely laciniate; heads mostly long-peduncled, $16-20 \mathrm{~mm}$. broad; involucre cylindric, or narrowly campanulate, its bracts linear-lanceolate, acute or acuminate, at length glabrate; rays 10-15; achenes hispidulous, at least on the angles. In moist soil, southern N. J. to Fla., west to La. April-June.
7. Senecio Platténsis Nutt. Prairie Ragwort. (I. F. f. 4039.) Perennial; similar to the preceding species, usually smaller-leaved, lower and less tomentose, or becoming glabrate in age, seldom over 4 dm . high. Basal leaves oval, ovate or oblong, some or all of them more or less pinnatifid, with the terminal segment much larger than the lateral ones, crenulate or dentate, long-petioled; heads several or numerous, compactly or loosely corymbose, conspicuously radiate. Ill. to S. Dak., Wyo., Colo. and Ind. Terr. April-June.
8. Senecio antennariifòlius Britton. Cat's-paw Ragwort. (I. F. f. 4040.) Perennial, tufted in mostly large clumps; stems slender, 2-4.5 dm. high, loosely white-woolly. Leaves nearly all basal, commonly numerous, oval to spatulate, angulately few-toothed or entire, mostly obtuse, narrowed into a petiole as long as the blade or longer, densely white-tomentose beneath, green and finally glabrous above, $2-4 \mathrm{~cm}$. long; stem-leaves small, spatulate, laciniate, or the upper narrowly linear and entire; heads slender-peduncled, rather less than 25 mm . broad; rays golden yellow, showy; involucre 6 mm . high, white-woolly; achenes glandu-lar-pubescent. White Sulphur Springs, W. Va., on a loose slate hillside; Blue Ridge, Va.
9. Senecio obovàtus Muhl. Round-leaf Squaw-weed. (I. F. f. 4041.) Perennial; stems commonly several from the same root, glabrous, or a little woolly at the base, 2-6 dm. high. Leaves rather thick, the basal ones very obtuse and rounded at the apex, $2-7 \mathrm{~cm}$. long, $\mathbf{I}-2.5 \mathrm{~mm}$. wide, often purplish, usually with short, margined petioles, or the earliest sessile; stem-leaves commonly few and sessile, spatulate to oblong, often incised or pinnatifid; heads several, corymbose, $12-16 \mathrm{~mm}$. broad, about 6 mm . high, slender-peduncled; involucre nearly cylindric, its principal bracts linear-lanceolate, 4-6 mm. long, acute; rays $8-12$, usually conspicuous. In moist soil and on banks, N. S. to Fla., west to Ont., Mich., Ky. and Mo. April-June.

Senecio obovàtus elongàtus (Pursh) Britton. Stem slender, weak; leaves, or some of them, with tufts of wool in their axils; heads few, rayless or short-rayed, often longpeduncled. On moist shaded banks, eastern Penn.

Senecio obovàtus rotúndus Britton. Basal leaves orbicular, broadly oval, or ovateorbicular, rather abruptly narrowed into the petiole, the larger $6-7 \mathrm{~cm}$. broad. On wet banks, or rocks, Ky. to Mo. and the Ind. Terr,
10. Senecio discòideus (Hook) Britton. Northern Squaw-weed. (I. F. f. 4042.) Perennial, glabrous except for smail tufts of wool in the axils of the lower leaves; stem rather stout, 3-6 dm. tall; basal leaves oval to ovate, obtuse, thin, sharply dentate, abruptly narrowed into petioles longer than the blade; stemleaves few, small, more or less laciniate; heads few or several, slender-peduncled, corymbose; bracts of the involucre narrowly linear, $6-10 \mathrm{~mm}$. long; rays usually very short, or none. In moist places, Mich. to the N. W. Terr. and Alaska. June-Aug.
ir. Senecio Cráwfordii Britton. Crawford's Squaw-weed. Perennial, with slender thread-like roots, glabrous, or with sparse woolly pubescence below. Stem slender, about 4 dm . high; leaves thick, firm, the basal ones erect, the larger $\mathbf{2 - 2 . 5 d m}$. long, the blades oval, oblong, or some of them narrowly obovate, mostly not more than one-half as long as the slender petioles, sharply and nearly equally serrate from the apex to the entire cuneate base, or the lower teeth somewhat larger than the upper; stem-leaves lanceolate or narrower, mostly acuminate, incised-serrate, clasping, the upper sessile, the lower petioled, the uppermost very small; heads $3-7$; peduncles $\mathbf{1 . 5 - 1 0 ~ c m . ~ l o n g , ~ s l e n d e r , ~ b r a c t e d , ~ r a r e l y ~ f o r k e d ; ~}$ involucre 7-9 mm. high, its bracts linear-lanceolate, acuminate, $\mathbf{I}-\mathrm{I} .5 \mathrm{~mm}$. wide. shorter than the white barbellate pappus; rays $8-10 \mathrm{~mm}$. long; achenes linear, striate, 2.5 mm . long, 0.5 mm . thick. Tullytown, Pa.
12. Senecio Balsámitae Muhl. Balsam Groundsel. (I. F. f. 4043.) Perennial, often tufted; stems slender, $2.5-5 \mathrm{dm}$. high, woolly at the base and in the axils of the lower leaves. Basal leaves slender-petioled, very obtuse, narrowed at the base, mostly thick, crenate, often purplish, $3-7 \mathrm{~cm}$. long, $6-12 \mathrm{~mm}$. wide, their petioles and sometimes their lower surfaces persistently tomentose or woolly, or glabrous throughout; lower stem-leaves petioled, laciniate or pinnatifid, the upper sessile, very small; heads few or several, slender-peduncled, $12-20 \mathrm{~mm}$. broad; rays 8-12. In dry or rocky soil, N. S. to N. Car., west to Wash., Br. Col., Tex. and Neb. May-July.

Senecio Balsamitae paupérculus (Michx.) Fernald. Lower; heads few, sometimes only one. Me. to Lab. Apparently merely a reduced form of the type.

Senecio Balsamitae praelòngus Greenman. Tall; lower leaves long-petioled, r.5-6 cm . long, ro-12 mm. broad; stem-leaves large, sometimes 2 cm . wide, deeply pinnatificl with usually rounded lobes; achenes hispidulous. Vt. and Mont. to N. Y. and Penn.
13. Senecio Smàllii Britton. Small's Squaw-weed. (I. F. f. 4044.) Similar to the preceding species but taller, growing in large clumps. Stem 4-7 dm. high, slender, densely and persistently floccose-woolly at the base and in the lower axils, or finally glabrate; basal leaves elongated-oblong or linear-oblong, obtuse or acute, long-petioled, crenate-dentate, at first tomentose, at length nearly glabrous; stem-leaves several, deeply pinnatifid, or the lower lyrate; heads very numerous, $8-10 \mathrm{~mm}$. broad, slender-peduncled, forming large corymbs; rays 8-10. In meadows and thickets, Va. andN. Car. to Ga. and Ala. May-June.
14. Senecio compáctus (A. Gray) Rydb. Western Squaw-weed. (I. F. f. 4045.) Perennial; stem usually tufted, low, rather stout, $15-30 \mathrm{~cm}$. high, woolly at the base and in the lower axils, or glabrous. Basal leaves linearcuneate, entire, or 3 -toothed at the apex, $2-7 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. wide, thick, slender-petioled, the petioles comrionly woolly-margined; lower stem-leaves often much larger and broader, usually laciniate or pinnatifid, but sometimes similar to the basal, the uppermost very small and sessile; heads several, $16-20 \mathrm{~mm}$. broad, short-peduncled in a compact corymb; rays $10-15$; achenes hispidulous. On dry plains, Neb. and Colo. to Tex. May-June.
15. Senecio Robbínsii Oakes. Robbins' Squaw-weed. (I. F. f. 4046.) Perennial, glabrous or very nearly so throughout; stems slender, 3-7 dm. high. Basal leaves long-petioled, lanceolate, obtuse or acute at the apex, cordate, subcordate or truncate at the base, usually thin, $5-10 \mathrm{~cm}$. long, $\mathbf{I}-4 \mathrm{~cm}$. wide, sharply dentate; heads several or numerous, slender-peduncled in an open corymb, 16-20 mm. broad; rays 6-12; achenes glabrous. In swamps and mountain meadows. northern N. H., Me., Vt. and N. Y., and on the summit of Roan Mountain, N. Car. June-Sept.
16. Senecio aùreus L. Golden Ragwort. Life-root. Swamp Squawweed. (I. F. f. 4047.) Perennial, glabrous or very nearly so throughout; stems rather slender, solitary or tufted, 3-7 dm. high. Basal leaves cordate-ovate, cordate-orbicular or reniform, crenate-dentate, very obtuse and rounded, often purplish, $2-15 \mathrm{~cm}$. long, with long slender petioles; lower stem-leaves lanceolate or oblong, usually laciniate, pinnatifid or lyrate, somewhat auriculate and clasping; heads several, $16-20 \mathrm{~mm}$. broad, 8 -10 mm . high, slender-peduncled in an open corymb; rays $8-\mathbf{I 2}$, golden yellow; achenes glabrous. In swamps and wet meadows, Newf. to Fla., west to Ont., Mo. and Tex. May-July.

Senecio aùreus paucifòrus (Pursh) Britton. Glabrous or with a little wool in the axils of the lower leaves; stem rather stout, $15-30 \mathrm{~cm}$. high; basal leaves ovate to orbicular, about 1 cm . broad, cordate or subcordate at the base, crenate; stem-leaves few, pinnatifid; heads i-ro, short-peduncled, rather large, apparently always rayless; bracts very narrow, acuminate, tinged with purple. Newf. to the Canadian Rocky Mts. and Wyo.

Senecio aùreus grácilis (Pursh) Britton. Stem slender, 3-6 dm. high, the lowest axils sometimes woolly. Basal leaves smaller than those of the type, cordate or subcordate; heads numerous, rather small; rays conspicuous. In wet soil, R. I. to Mich., S. Dak., Va. and Mo.
17. Senecio spartioìdes Torr. \& Gray. Linear-leaved Senecio. Like the next in habit, but slender from a woody base, glabrous; leaves entire, narrowly linear, $5-10 \mathrm{~cm}$. long, $\mathbf{1}-3 \mathrm{~mm}$. wide; heads numerous; involucre about I cm . high, 6-8 mm. broad, almost cylindraceous; rays about 7, golden yellow. Dry plains, Neb. to Wyo., south to Tex. and Ariz. July-Sept. [S. Douglasii A. Gray in part.]
18. Senecio Fremòntii (T. \& G.) Rydb. Narrow-lobed Senecio. (I. F. f. 4048 as S. Douglasii.) Woody at the base, usuaily branched, sometimes shrubby, glabrous or nearly so, leafy, $3-18 \mathrm{dm}$. high. Leaves sessile, or the lowest petioled, thick, 3-7 cm. long, pinnately parted into 3-9 linear or filiform entire segments, or the upper entire; heads corymbuse at the ends of the branches, $\mathbf{I}-2 \mathrm{~cm}$. broad, slender-peduncled; involucre cylindric or becoming campanulate, $10-15 \mathrm{~mm}$. high, its bracts linear, acute or acuminate, usually with some subulate exterior ones; rays $8-15$, achenes canescent. Piains, in dry soil, Neb. to Tex. and Mex. JuneSept. [S. filifolius var. Fremontii, T. \& G.; S. Riddellii T. \& G.; S. Douglasii A. Gray, in part.]
19. Senecio palístris (L.) Hook. Marsh Fleawort. Pale Ragwort. Marsh Groundsel. (I. F. f. 4049.) Annual or biennial, pubescent or glabrate;
stem hollow, $15-60 \mathrm{~cm}$. high. Leaves lanceolate, oblong or spatulate, entire, dentate, or laciniate, acute or obtuse, $5-18 \mathrm{~cm}$. long, $6-30 \mathrm{~mm}$. wide, or the upper linear-lanceolate and small, those of the stem sessile and somewhat auriculateclasping, the basal petioled; heads numerous, $12-25 \mathrm{~mm}$. broad, mostly shortpeduncled in a large, rather dense, terminal corymb; involucre cylindric, becoming campanulate, $6-8 \mathrm{~mm}$. high, its bracts linear, acute, more or less pubescent, with no shorter outer ones; rays $15-20$, pale yellow; achenes glabrous; pappus white, elongated, at length twice the length of the involucre. In swamps, Iowa and Wis. to Manitoba and arctic Am., west to Alaska. Reported from Lab. Also in Greenland, northern Europe and Asia. June-Aug.
20. Senecio lobàtus Pers. Butterweed. Cress-leaved Groundsel. (I. F. f. 4050.) Annual, glabrous throughout, or slightly woolly when young, fleshy and tender; stem hollow, simple or branched, 3-9 dm. high. Leaves 5-25 cm. long, the segments orbicular, oblong, obovate or cuneate, obtuse, sinuate-dentate, entire or lobed, the terminal segment usually larger than the others; lower and basal leaves slender-petioled; heads numerous, $14-20 \mathrm{~mm}$. broad, slender-peduncled in terminal corymbs; involucre nearly cylindric, 5 mm . high, its bracts linear, acute, usually with no smaller outer ones; rays 6-12; achenes minutely hispidulous on some of the angles. In swamps, Mo. and southern Ill. to N. Car., N. Mex., Mex. and Fla. April-Sept.
21. Senecio Jacobaèa L. Tansy Ragwort. Staggerwort. (I. F. f. 405 I.) Perennial by short thick rootstocks, somewhat woolly, or glabrous; stems stout, simple, or branched above, 6-12 dm. high, very leafy. Leaves 5-20 cm . long, the lower petioled, the upper sessile, the lobes oblong-cuneate, dentate or incised; heads very numerous, $12-16 \mathrm{~mm}$. broad, short-peduncled in large compact corymbs; involucre narrowly campanulate, about 5 mm . high, its bracts linearlanceolate, acute, green, or tipped with black; rays $\mathbf{1 2 - 1 5}$; achenes of the diskflowers pubescent, those of the rays glabrous. In waste places, N. S., N. B. and Ont., and in ballast about N. Y. and Philadelphia. Adventive from Europe. July-Sept.
22. Senecio sylváticus L. Wood Groundsel. (I. F. f. 4052.) Annual; stem usually much branched, 3-7 dm. high, leafy. Leaves oblong or lanceolate in outline, the segments oblong or spatulate, obtuse, dentate, lobed or entire, or the uppermost leaves linear and merely dentate; heads several or numerous in the corymbs, slender-peduncled, about 4 mm . broad; involucre usually swollen at the base; rays none, or very short and recurved; achenes canescent. In waste places, N. S. and Pr. Edw. Isl. to Me. Also on the coasts of Cal. and Br. Col. Nat. or adventive from Europe. April-Sept.
23. Senecio vulgàris L. Common Groundsel. (I. F. f. 4053.) Annual; stem hollow, usually much branched, $1.5-3.5 \mathrm{dm}$. high. Leaves $5-15 \mathrm{~cm}$. long, the lower spatulate in outline, petioled, obtuse, the upper sessile or clasping at the base, more deeply lobed or incised, their segments oblong, dentate; heads several or numerous in the corymbs, nearly 6 mm . broad; bracts of the involucre linear, often blackish-tipped; rays none; achenes slightly canescent. In cultivated ground and waste places, Newf. and Hudson Bay to Va., west to Mich. and S. Dak. Also on the Pacific Coast. Nat. from Europe. April-Oct.
24. Senecio viscòsus L. Fetid or Viscous Groundsel. (I. F. f. 4054.) Annual, strong-scented; stem usually much branched, 3-6 dm. high. Leaves 1-2pinnatifid, $4-7 \mathrm{~cm}$. long, oblong or somewhat spatulate in outline, the segments oblong or cuneate, dentate or incised; lower leaves petioled; heads few in the corymbs, 6-8 mm . broad, mostly slender-peduncled; involucre nearly cylindric. S-10 mm . high, its bracts linear, acute, usually with $\mathrm{I}-3$ shorter outer ones; rays commonly about 20, very short, recurved and inconspicuous; pappus about one-third longer than the involucre. In waste places and on ballast near the coast, N. B. to N. Car. July-Sept.

## 97. ÀrCTIUM L.

Large coarse branching, rough or canescent, mostly biennial herbs, with broad alternate petioled leaves, and rather large heads of purple or white perfect tubular flowers, racemose, corymbose or paniculate at the ends of the branches. Involucre subglobose, its bracts rigid, lanceolate, tipped with spreading or erect hooked bristles,
imbricated in many series. Receptacle flat, densely bristly. Corollas tubular with 5 -cleft limbs. Filaments glabrous. Anthers sagittate at the base. Achenes oblong, somewhat compressed and 3 -angled, ribbed, truncate. Pappus of numerous short serrulate scales. [Greek, bear, from the rough involucre.] About 6 species, natives of Europe and Asia.
Bracts densely cottony ; heads corymbose.

1. A. tomentosum.

Bracts of the involucre glabrous, or slightly woolly.
Involucre 25 mm . broad or more; inner bracts equalling or exceeding the flowers.

> 2. A. Lappa.

Involucre $12-20 \mathrm{~mm}$. broad; inner bracts not exceeding the flowers.
3. A. minus.
I. Arctium tomentòsum (Lam.) Schk. Woolly or Cottony Burdock. (I. F. f. 4055.) Similar to the following species. Heads $\mathbf{1} 6-20 \mathrm{~mm}$. broad, corymbose at the ends of the branches, mostly long-peduncled; bracts of the involucre densely cottony, the inner ones erect and somewhat shorter than the flowers. In waste places, N. B. to Mass. and southern N. Y. Adventive from Europe. JulyAug.
2. Arctium Láppa L. Great Bur, Burdock, or Clotbur. (I. F. f. 4056.) Stem much branched, $12-27 \mathrm{dm}$. high. Leaves thin, broadly ovate, pale and tomentose-canescent beneath, obtuse, entire, repand or dentate, mostly cordate, the lower often 4.5 dm . long; petioles solid, deeply furrowed; heads clustered or subcorymbose, sometimes long-peduncled, $3-4 \mathrm{~cm}$. broad; bracts of the involucre glabrous or nearly so, their spines all spreading; corolla-tube longer than the limb. In waste places, N. B. and Ont. to southern N. Y., and locally in the interior. Nat. from Europe. July-Oct.
3. Arctium minus Schk. Common Burdock. (I. F. f. 4057.) Smaller than the preceding species, seldom over 15 dm . high. Leaves similar, the lower deeply cordate; petioles hollow, not deeply furrowed; heads numerous, racemose on the branches, short-peduncled or sessile; bracts of the involucre glabrous or slightly cottony, the spines of the outer ones spreading, those of the inner erect and shorter than the flowers; corolla-tube about as long as the limb. In waste places, common throughout our area. Nat. from Europe. July-Nov.

## 98. CÀRDUUS L.

Erect, branched or simple, prickly herbs, some species acaulescent, with alternate or basal, sinuate-dentate lobed or pinnatifid, usually very spiny leaves, sometimes decurrent, and large many-flowered, solitary or clustered, discoid heads of purple, yellow or white, tubular, perfect and fertile, or rarely diocious flowers. Involucre ovoid or globose, its bracts prickle-tipped or unarmed, imbricated in many series. Receptacle flat or convex, bristly. Corolla-tube slender, the limb deeply 5-cleft. Filaments pilose, or rarely glabrous. Anthers sagittate at the base. Style-branches short or elongated, obtuse. Achenes obovate or oblong, compressed or obtusely 4 -angled, glabrous, smooth or ribbed. Pappus of several series of slender, plumose, minutely serrulate, or simple bristles, connate at the base. [The ancient Latin namo of these plants.] About 250 species, widely distributed in the northern hemisphere. Besides the following, some 35 others occur in the southern and western parts of N. Am.

* Pappus-bristles, at least those of the inner flowers, plumose. (Plumed Thistles.)
† Outer involucral bracts, or all of them, strongly prickly-pointed.

1. Leaves glabrous or hispid above, tomentose beneath (tomentose on both sides in No. 3).
All the bracts of the involucre tipped with prickles; naturalized weed.
I. C. lanceolatus.

Outer bracts prickle-tipped, the inner merely acuminate; native species.
Branches leafy up to the heads; involucral bracts firm or rigid.
Leaves undivided, lobed or dentate, rarely pinnatifid.
2. C. altissimus.

Leaves deeply pinnatifid into lanceolate or linear segments.
Leaves tomentose on both sides, strongly spiny ; stem white-tomentose.
3. C. Flodmaniz.

Leaves glabrate above, weakly spiny; stem green, glabrous.
Heads naked-peduncled, 25 mm . high; involucral bracts thin.
4. C. discolor.
5. C. Virginianus.
2. Leaves tomentose on oth sides, or becoming glabrous above; western.

Leaves pinnately parted; segments linear, entire or lobed.
6. C. Pitcheri.

Leaves pinnatifid into triangular or lanceolate dentate segments.
Outer bracts with spines less than one-half their length.
Leaf-lobes triangular; flowers pink or purple. 7. C. undulatus.
Leaf-lobes linear-lanceolate to oblong; flowers cream-color.
8. C. Plattensis.

Outer bracts with spines of nearly or quite their length.
9. C. ochrocentrus.

Leaves entire or undulate; outer pappus-bristles barbellate.
10. C. Nebraskensis.
3. Leaves green both sides, somewhat pubescent beneath.

Leaf-lobes acute; bracts of the involucre faintly nerved. II. C. odoratus.
Leaf-lobes blunt; bracts with a prominent glutinous midnerve. 12. C. Hillii.
$\dagger \dagger$ Bracts of the involucre not at all prickly-pointed, or scarcely so.
Heads large, few, $3-10 \mathrm{~cm}$. broad; flowers all perfect and fertile.
Heads involucrate by the upper very spiny leaves; flowers usually yellow.
13. C. spinosissimus.

Heads peduncled, naked, or with I or 2 bracts at the base; flowers purple.
14. C. muticus.

Heads small, numerous, 2.5 cm . broad or less; flowers imperfect, diœcious.
15. C. arvensis.

*     * Pappus-bristles simple, or minutely serrulate.

Head solitary, nodding; bracts of the involucre lanceolate. Heads clustered, erect or ascending; bracts linear
es.)
17. C. crispus.
I. Carduus lanceolàtus L. Common Bur or Spear Thistle. (I. F. f. 4058.) Biennial; stem stout, branched, more or less tomentose, $\mathbf{I}-\mathbf{I} .5 \mathrm{~m}$. high, leafy to the heads. Leaves dark green, lanceolate, acuminate, deeply pinnatifid, $7-15 \mathrm{~cm}$. long, or the lowest larger, decurrent on the stem and branches, the lobes triangular-lanceolate, tipped with stout prickles, the margins and decurrent bases bristly, the lower surface brown-tomentose and midnerve pilose especially when young; heads mostly solitary at the ends of the branches, $4-5 \mathrm{~cm}$. broad, $4-5 \mathrm{~cm}$. high; bracts of the involucre cottony, narrowly lanceolate, acuminate; flowers dark purple. In fields and waste places, Newf. to Ga., west to Minn., Neb. and Kans. Nat. from Europe. Natíve also of Asia.
2. Carduus altissimus L. Tall or Roadside Thistle. (I. F. f. 4059.) Biennial or perennial; roots often thickened; stem pubescent, or tomentose, stout, branched, leafy to the heads, $1-3 \mathrm{~m}$. high. Leaves ovate-oblong or oblong-lanceolate, sessile, or slightly clasping, sparingly pubescent above, densely white-tomentose beneath, scarcely or not at all decurrent, acute, spinulose-margined, entire, dentate with bristle-pointed teeth or lobed, sometimes pinnatifid, the lowest sometimes 2 dm . long, narrowed into margined petioles, the uppermost linear or lanceolate, much smaller; heads about 5 cm . broad, $4-5 \mathrm{~cm}$. high, mostly solitary at the ends of the branches; outer bracts of the involucre ovate or ovate-lanceolate, firm, with a dark, slightly glandular spot at the apex, tipped with short prickles; flowers light purple. In fields and thickets, Mass. to S. Dak., Fla., Neb. and Tex. Aug.-Sept.
3. Carduus Flódmanii Rydb. Flodman’s Thistle. Stem rather slender, -5-1 m. high, more or less white cottony. Leaves deeply divided intolinear-oblong or lanceolate, acute segments, floccose but green above, white-tomentose beneath: head campanulate, $3-4 \mathrm{~cm}$. broad; bracts like those of the preceding but narrower; flowers rose or reddish purple. In river-bottoms and meadows, Neb. to Mont. and Wyo. July-Sept.
4. Carduus discolor (Muhl.) Nutt. Field Thistle. (I. F. f. 4060.) Similar to Carduus altissimus, but lower and more leafy, seldom over 2 m . high. Leaves deeply pinnatifid into linear, linear-lanceolate, or falcate, prickly-tonthed segments, white-tomentose beneath, sessile, the basal ones sometimes 3 dm . long; heads $4-5 \mathrm{~cm}$. broad, about 4 cm . high, usually involucrate by the upper leaves, mostly solitary at the ends of the branches; outer bracts of the involucre coriaceous. ovate, slightly woolly, tipped with slender bristles, which are longer than those of C. altissimus ; flowers light purple or pink, rarely white. In fields and along roadsides, Quebec and Ont. to Ga., S. Dak., Neb. and Mo. July-Nov.
5. Carduus Virginiànus L. Virginia Thistle. (I. F. f. qo6i.) Biennial; stem slender, naked or scaly above, pubescent or somewhat tomentose, simple or branched, 6-12 dm. high. Leaves oblong, oblong-lanceolate, or the lowest slightly
spatulate, sessile, or somewhat clasping, not decurrent, spinulose-margined, entire, lobed or pinnatifid into triangular-lanceolate lobes, the lower sometimes 2 dm . long and 5 cm . wide, narrowed into margined petioles, all pubescent or glabrate above, and densely white-tomentose beneath; heads long-peduncled; outer bracts of the involucre not coriaceous, lanceólate or ovate-lanceolate, tipped with weak short bristles; flowers purple. In dry woods and thickets, Va. to Ky., Ohio, Fla. and Tex. April-Sept.
6. Carduus Pítcheri (Torr.) Porter. Pitcher's Thistle. (I. F. f. 4062.) Biennial, persistently white-tomentose throughout; stem stout, leafy up to the heads, usually branched, 3-6 dm. high. Leaves sessile, partly clasping, or slightly decurrent, with sparingly prickly segments $4-6 \mathrm{~mm}$. wide, with revolute margins; basal leaves often 3 dm . long; heads solitary or several and racemose-spicate at the ends of the branches, about 4 cm . broad; outer bracts of the involucre ovatelanceolate, sparingly pubescent and tomentose-ciliate, glutinous on the back, tipped with short spreading bristles, the inner narrowly lanceolate, acuminate or sometimes tipped with weak prickles; flowers cream color. Shores of Lakes Michigan, Huron and Superior. June-Aug.
7. Carduus undulàtus Nutt. Wavy-leaved Thistle. (I. F. f. 4063.) Biennial, persistently and densely white-tomentose throughout, or the upper surfaces of the leaves at length green and glabrous; stem stout, leafy, usually branched, 3-10 dm. high. Leaves lanceolate or oblong-lanceolate in outline, acute, sessile or decurrent, or the lowest petioled, undulate, lobed or pinnatifid; heads about 5 cm . broad, and nearly as high, solitary at the ends of the branches; outer bracts of the involucre ovate or ovate-lanceolate, firm, glutinous on the back, tipped with short spreading prickles, the inner ones lanceolate, acuminate. On plains and prairies, Lake Huron to the N. W. Terr. and Br. Col., south to Kans., N. Mex. and Ore. June-Sept.

Carduus undulatus megacéphalus (A. Gray) Porter. Heads larger than in the type, 5-7 dm. broad. Minn. to Idaho and Ariz.
8. Carduus Platténsis Rydb. Prairie Thistle. (I. F. f. 4064.) Perennial or biennial, the root thick and deep. Stem stout, simple, or little branched, 4-7 dm. tall, densely white-felted. Leaves deeply pinnatifid, whitetomentose beneath, green, loosely tomentose, or glabrate above, the lower 12-17 cm . long, the lobes lanceolate to oblong, acute, prickly tipped and margined; heads few, about 5 cm . high and broad; outer bracts of the involucre lanceolate to ovate-lanceolate, firm, dark, tipped with short weak spreading prickles, the inser linear-lanceolate, unarmed, tipped with scarious reflexed erose appendages; pappus of outer flowers merely barbellate. Sand hills, Neb. and S. Dak. May-July.
9. Carduus ochrocéntrus (A. Gray) Greene. Yellow-spined Thistle. (I. F. f. 4065.) Similar to Carduus undulatus, but commonly taller and more leafy, often 2 m . high, equally white-tomentose. Leaves oblong-lanceolate in outline, usually very deeply pinnatifid into triangular-lanceolate, serrate or entire segments, armed with numerous long yellow prickles; lower leaves often 15-20 cm . long; heads about 5 cm . broad, $4-5 \mathrm{~cm}$. high, solitary at the ends of the branches; outer bracts of the involucre lanceolate, tipped with stout yellow prickles of nearly or quite their own length, the inner narrowly lanceolate, long-acuminate; flowers purple (rarely white ?). On plains, Neb. to Tex., Nev. and Ariz. May-Sept.
10. Carduus Nebraskénsis Britton. Nebraska Thistle. (I. F. f. 4066.) Stem densely white-woolly, apparently over 3 dm . high. Leaves linear-oblong to lanceolate, white-woolly beneath, green and sparingly loosely woolly above, irregularly slightly toothed or entire, the upper $7-15 \mathrm{~cm}$. long, $5-25 \mathrm{~mm}$. wide, the margins prickly; heads solitary, or few, short-peduncled, about 4 cm . high; outer bracts of the involucre lanceolate, prickle-tipped, the inner narrower, with reflexed acute scarious appendages; pappus-bristles of inner flowers plumose, of the outer barbellate. Scott's Bluff, western Neb. and Wyo. July-Aug.
if. Carduus odoratus (Muhl.) Porter. Pasture Thistle. Fragrant Thistle. (I. F. f. 4067.) Biennial, more or less villous-pubescent; stem stout, simple or branched, leafy, 3-10 dm. high. Roots thick, branched, solid; stemleaves sessile and clasping, oblong or oblong-lanceolate in outline, acute, $7-17 \mathrm{~cm}$.
long, $3-5 \mathrm{~cm}$. wide, pinnatifid into triangular acute dentate prickly lobes; basal leaves petioled; heads solitary, terminal, $5-7 \mathrm{~cm}$. broad, about 5 cm . high, often involucrate by the upper leaves; outer bracts lanceolate or ovate-lanceolate, with a slight glutinous strip on the back, glabrous or sparingly tomentose, tipped with slender prickles, the inner narrow, long-acuminate; flowers purple, rarely white, fragrant. In fields, Me. to Penn. and Del. July-Sept.
12. Carduus Híllii (Canby) Porter. Hill's Thistle. (I. F. f. 4068.) Biennial (?), low, villous-pubescent or somewhat woolly; stem leafy, simple or branched, 3-6 dm. high. Root perpendicular, fusiform, slender and hollow atove, enlarged below, 2.3 dm . long; leaf-lobes dentate, spinulose or with some rather stout prickles, upper leaves oblong, sessile and clasping, the lower spatulate-oblong, narrowed at the base or the lower petioled and 5 cm . long; heads $\mathrm{I} .5-2 \mathrm{dm}$. broad, $5-7 \mathrm{~cm}$. high; outer bracts of the involucre ovate-lanceolate, tipped with short bristles, the inner narrowly lanceolate, long-acuminate; flowers purple. In fields, western Ont. to Minn., south to Penn., Ill. and Iowa. June-July.
13. Carduus spinosíssimus Walt. Yellow Thistle. (I. F. f. 4069.) Biennial or perennial, somewhat woolly when young, but becoming glabrate; stem branched, leafy, 6-10 dm. high. Leaves green both sides, lanceolate or oblong in outline, sessile and clasping or the basal ones short-petioled and somewhat spatulate, pinnatifid into triangular or broader spinulose-margined and prickle-tipped, entire or dentate lobes; heads $5-10 \mathrm{~cm}$. broad, $4-6 \mathrm{~cm}$. high; bracts of the involucre narrowly lanceolate, roughish and ciliate. long-acuminate; flowers yellowish, or occasionally purple. In moist or dry sandy soil, Me. to Penn., Fla. and Tex. May-Aug., or earlier in the South.
14. Carduus mùticus (Michx.) Pers. Swamp Thistle. (I. F. f. 4070.) Biennial; stem woolly or villous when young, becoming glabrate, slender, striate, leafy, paniculately branched above, $\mathbf{I}-2.5 \mathrm{~m}$. high. Leaves densely white-tomentose beneath when young, sometimes becoming glabrous on both sides, deeply pinnatifid into lanceolate or oblong, entire, lobed or dentate, spiny segments usually tipped with slender prickles; basal leaves petioled, $\mathbf{I}-2 \mathrm{dm}$. long, those of the stem sessile and smaller; heads about 4 cm . broad and high; outer bracts viscid, appressed, more or less cottony, ovate or ovate-lanceolate, the inner linear-lanceolate, acute, all unarmed. In swamps and moist soil, Newf. to Fla., N. W. Terr. and Tex. July-Oct.

Carduus mùticus subpinnatifidus Britton. Leaves lobed, not deeply pinnatifid, green, and nearly glabrous on both sides. N. J. to W. Va.
15. Carduus arvénsis (L.) Robs. Canada Thistle. Creeping Thistle. (I. F. f. 4071.) Perennial by horizontal rootstocks, forming patches, nearly glabrous; stems striate, $3-10 \mathrm{dm}$. high, branched above. Leaves sessile and slightly clasping, lanceolate or oblong-lanceolate, deeply pinnatifid into very prickly, lobed or dentate segments; basal leaves sometimes petioled, $12-20 \mathrm{~cm}$. long; heads numerous, corymbose, purple or white; staminate heads globose, corollas projecting; pistillate heads oblong-campanulate, corollas shorter, the long pappus conspicuous; outer bracts ovate or ovate-lanceolate, appressed, tipped with short prickly points; imner bracts of the pistillate heads linear, elongated. In fields and waste places, Newf. to Va., S. Dak., Mont. and Kans. In many places a pernicious weed. Nat. from Europe. June-Sep.
16. Carduus nù̀tans L. Musk Thistle. Plumeless Thistle. (I. F. f. 4072.) Biennial, branched, sparingly tomentose, 6-9 dm. high. Leaves lancenlate in outline, deeply pimnatifid, acuminate, $7-15 \mathrm{dm}$. long, the lobes triangular. very prickly; heads long-peduncled, $4-6 \mathrm{~cm}$. broad, purple, rarely white, fragrant; bracts of the involucre in many series, long-acuminate, the prominent midnerve prolonged into a prickle, or the inner nerveless and awned; pappus-bristles 20-25 mm . long. In waste places, Penn. and N. J. to N. B., and in ballast about the seaports. Nat. or adventive from Europe. Native also of Asia. July-Oct.
17. Carduus críspus L. Curled Thistle. Welted Thistie. (I. F. f. 4073.) Biennial, somewhat tomentose; stem much branched, densely prickly. $6-12 \mathrm{dm}$. high. Leaves lanceolate in outline, with undulate and ciliate-spiny margins, all sinuate-pinnatifid into broad, 3 lobed, toothed segments, the teeth pricklepointed; heads several, usually crowded at the ends of the winged branches, 25 mm .
broad or less, purple or white, sessile or short-peduncled, or some of them rarely solitary and slender-peduncled: bracts of the involucre very numerous, linear, the outer prickle-tipped and rigid, the inner thinner and merely acuminate. In waste places, N. B. and N. S., and in baliast about the seaports. Adventive from Europe. Native also of Asia. July-Sept.

## 99. MARIANA Hill.

Annual or biennial, simple or branched, nearly glabrous herbs, with large alternate clasping, sinuate-lobed or pinnatifid, white-blotched leaves, and large discoid heads of purple tubular flowers, solitary at the end of the stem or branches. Involucre broad, subglobose, its bracts rigid, imbricated in many series, the lower ones fimbriate-spinulose at the broad triangular summit, the middle ones similar but armed with huge spreading or recurved spines. the inner lanceolate, acuminate. Receptacle flat, densely bristly. Corolla-tube slender, the limb expanded and deeply 5-cleft. Filaments monadelphous below, glabrous. Anthers sagittate at the base. Style nearly entire. Achenes ubovate-oblong, compressed, glabrous, surmounted by a papillose ring. Pappus-bristles in several series, flattish, barbellate or scabrous. A monotypic genus of the Mediterranean region.
i. Mariana Mariàna (L.) Hill. Milk Thistle. (I. F. f. 4074.) Stem striate, glabrous or slightly woolly, little branched, 6-12 dm. high. Leaves oblonglanceolate, prickly, strongly clasping, the lower often 3 dm . long and 15 cm . wide, the upper much smaller, scarcely lobed, acute; heads about 6 cm . broad; spines of the middle involucral bracts often 4 cm . long; pappus-bristles white, barbellate. Escaped from gardens near Kingston, Ontario; in ballast about the eastern seaports, and on the Pacific Coast from Br. Col. to southern Cal., where it is naturalized. June-Aug.

## 100. ONOPÓRDON L.

Coarse, branching, or rarely acaulescent, tomentose herbs, with stout stems winged by the decurrent bases of the alternate dentate or pinnatifid, prickly leaves, and large discoid heads of purple, violet or white flowers, mostly solitary at the ends of the branches. Involucre nearly globular, its bracts imbricated in many series, all tipped with long spines in our species, the inner narrower than the outer. Receptacle flat, fleshy, honeycombed, not bristly. Corolla-tube slender, the limb expanded and deeply 5 -cleft. Filaments pilose. Anthers sagittate at the base. Achenes obovate or oblong, 4 -angled or compressed, smooth or corrugated. Pappusbristles in several series, filiform, barbellate or plumose, united at the base. [Greek, Asses' Thistle, the ancient name.] About 12 species, natives of the Old World.
I. Onopordon Acánthium L. Сotton Thistle. Scotch Thistle. (I. F. f. 4075.) Biennial, white-tomentose all over; stem usually much branched, leafy, $1-3 \mathrm{~m}$. high. Leaves oblong, lobed and dentate, acute, very spiny, the lower often 3 dm . long; heads $4-5 \mathrm{~cm}$. broad, about 4 cm . high, solitary at the ends of the branches; outer bracts of the involucre ovate or oblong, minutely serrulate, tipped with long, stout, spreading spines; flowers pale purple; achenes slightly corrugated; pappus-bristles brownish, longer than the achene. In waste places, N. S. and Ont. to N. J. and Mich. Nat. from Europe. Native also of Asia. JulySept.

## ror. CENTAUREA L.

Perennial or annual herbs, with alternate entire, dentate, incised or pinnatifid leaves, and large or middle-sized heads of tubular purple-violet, white or rarely yellow flowers. Involucre ovoid or globose, its bracts imbricated in many series, appressed, fimbrillate, or dentate. Receptacle flat, densely bristly. Marginal flowers usually neutral and larger than the central ones, which are perfect and fertile, or flowers all perfect and fertile in some species. Corolla-tube slender, the limb regular or oblique, 5 -cleft or 5 -lobed, the segments sometimes appearing like rays. Anthers sagittate at the base. Style-branches short, somewhat connate, obtuse. Achenes oblong or obovoid, compressed or obtusely 4 -angled, usually smooth and shining, obliquely or laterally attached to the receptacle, surmounted by a disk with an elevated margin. Pappus of several series of bristles or scales, rarely
none. [Greek, of the Centaurs, who were said to use it in healing.] About 350 species, mostly natives of the Old World. Besides the following, 2 others, introduced species, occur on the Pacific Coast, and are rarely found in ballast about the eastern seaports.

Bracts of the involucre lacerate or fimbriate, not spiny.
Heads 4 cm . broad or less; achenes laterally attached; introduced species. Annual; pappus about the length of the achene.

1. C. Cyanus. Perennials; pappus obsolete, or short.

Flowers all perfect; marginal ones scarcely enlarged. Marginal flowers neutral, with palmately cleft corollas.
2. C. nigra.

Heads $5-10 \mathrm{~cm}$. broad; achenes obliquely attached; native western species.
3. C. Jacea.
4. C. Americana.

Bracts of the involucre tipped with stout, nearly simple spines.
5. C. Calcitrapa.
i. Centaurea Cyanus L. Blue-bottle. Corn Blue-bottle. CornFlower. (II. F. f. 4076.) Annual, woolly or tomentose, at least when young; stem leafy, slender, branched, $3-7 \mathrm{dm}$. high, the branches ascending. Leaves linear or linear-lanceokate, mucronate, $7-15 \mathrm{~cm}$. long, the basal and lower ones mostly dentate or pinnatifid, the upper or sometimes all of them, entire; heads on long naked peduncles; involucre campanulate, its bracts greenish-yellow or with darker tips and margins, appressed; flowers blue or purplish, varying to white, the marginal ones neutral with large radiant corolla-limbs; achenes slightly compressed, or 4angled; pappus-bristles unequal, nearly as long as the achene. In waste places, escaped from gardens, and in ballast, Quebec to N. Y., Va., S. Dak. and Kans. July-Sept.
2. Centaurea nigra L. Black Knapweed. Horse-knops. Hardheads. Centaury. (I. F. f. 4077.) Perennial, scabrous or pubescent; stem stiff, branched, $3-6 \mathrm{dm}$. high. Lower and basal leaves spatulate or oblong, acutish, entire denticulate, dentate or lobed, not pinnatifid, $7-15 \mathrm{~cm}$. long, narrowed into long petioles; upper leaves oblong or lanceolate, sessile, or partly clasping, entire or nearly so; heads rarely 2.5 cm . broad, bracted by the small, uppermost leaves; involucre globose, its bracts lanceolate, or ovate-lanceolate, closely imbricated, tipped with brown fimbriate appendages, or the uppermost merely lacerate; flowers rose-purple; achenes slightly 4 -sided; pappus none, or a ring of minute scales. In waste places and fields, Newf. to Ont. and N. J. Nat. from Europe. July-Sept.
3. Centaurea Jàcea L. Brown or Rayed Knapweed. (I. F. f. 4078 .) Perennial, similar to the preceding species. Leaves entire or denticulate, rarely lobed; heads $2.5-4 \mathrm{~cm}$. broad; involucre globular to ovoid, its bracts closely imbricated, brown or with brown bracts, the outer oncs with fimbriate appendages, the middle ones lacerate, the inner entire or nearly so; achenes obscurely 4 -sided; pappus none, or a minute crown. In waste places, N. Y. to Conn. and Vt. and in ballast about eastern seaports. Also in Br. Col. Fugitive from Europe. JuneSept.
4. Centaurea Americàna Nutt. American Star Thistle. (I. F. f. 4079.) Annual, roughish; stem stout, simple, or little branched, 6-18 dm. high. Leaves entire or denticulate, the lower and basal ones spatulate or oblong, 5-12 cm. long, narrowed into petioles, the upper oblong-lanceolate, sessile, mucronate; heads solitary at the ends of the leafy stem or branches; involucre nearly hemispheric, its bracts ovate or lanceolate with conspicuously pectinate appendages; flowers pink or purple, the marginal ones with enlarged and radiant corolla-limbs; achenes somewhat compressed; pappus of copious unequal bristles longer than the achene. Dry plains, Mo. and Ark. to La., Mex. and Ariz. May-Aug.
5. Centaurea Calcítrapa L. Star Thistle. (I. F. f. 408o.) Annual, pubescent or glabrous, green; stem much branched, 3-4 dm. high. Leaves 1-2pinnatifid into oblong-lanceolate to linear, serrulate-pinulose, dentate or entire mostly acute lobes, the upper sessile and slightly clasping, the lower and basal short-petioled, 1-2 dm. long, the uppermost somewhat involucrate at the bases of the sessile heads, which are about 25 mm . broad; involucre ovoid, its outer bracts ovate-oblong, spiny; flowers purple, none of them radiant; achenes compressed or obscurely 4 -sided; pappus none. In waste places and ballast, Mass. to N. Y., N. J. and Va. Also in Br . Cul. Adventive or nat. from Europe. Tuse-Oct.

## 102. CNİCUS L.

An annual herb, with alternate pinnatifid or sinuate-dentate leaves, the lobes or teeth spiny, and large sessile heads of yellow tubular flowers, solitary at the ends of the branches, subtended by the upper leaves. Bracts of the involucre imbricated in several series, the outer ovate, the inner lanceolate, tipped by long pinnately branched spines. Receptacle flat, bristly. Achenes terete, striate, laterally attached, the horny margin ro-toothed at the summit; pappus of 2 series of awns, the inner fimbriate, the outer longer, naked; anther-appendages elongated, united to their tips. [Latin name of Safflower, early applied to thistles.] A monotypic genus of the Old World.

1. Cnicus benedíctus L. Blessed Thistle. Our Lady's Thistle. (I. F. f. 408r.) Hirsute or pubescent, much branched, seldom over 7 dm . high. Leaves oblong-lanceolate in outline, rather thin, reticulate-veined, $7-15 \mathrm{~cm}$. long, the upper clasping, the basal and lower ones narrowed at the base and petioled; heads about 25 mm . broad, subtended by several large lanceolate to ovate-lanceolate leaves: bristles of the receptacle soft, long; outer awns of the pappus alternating with the inner. In waste places, N. S. to Md., Penn. and Ala. and on the Pacific Coast. Adventive from southern Europe. May-Aug.

## APPENDIX.

THE following appendix contains descriptions of additional species found within the area covered by this Manual, and of species made known from investigation, during the two years that the book has been in press. Several species proposed by various students have not been admitted, as they appear to require further investigation before their status can be satisfactorily established. A few corrections are also noted.
P. 3, for "Botrychium matricariaefòlium A. Br." read "Botrychium neglectum A. Wood ", and strike cut " also in Europe." Our plant proves to be distinct from the Old World B. matricariaefolium.
P. 24, add:
ıa. Lycopodium porophìlum Lloyd \& Underw. Rock Club-moss. Prostrate portion of stems short, abundantly rooting, curving upward, then dichotomously branching $\mathrm{I}-3$ times to form a rather dense tuft ( $4-10 \mathrm{~cm}$. high) of vertical stems, densely clothed with spreading or reflexed leaves; leaves ( $7-9 \mathrm{~mm} . \times 1 \mathrm{~mm}$.) very slightly broadened above the middle and similarly contracted toward the base, those between the strobilar regions shorter ( $6-7 \mathrm{~mm}$.) , broadest at the base but very gradually tapering, entire or very minutely denticulate; sporangia compressed-reniform; sporophylls minutely denticulate above the middle or entire, acuminate ( $4-5 \mathrm{~mm} . \times$ I mm . wide at base) ; plant often gemmiparous. Differs from L. lucidulum in its nearly linear entire leaves and smaller size, and from L. Selago in the bases of its leaves, which are flattened. On sandstone rocks, Wis., Ind. and Ala.
P. 25, add:

3a. Lycopodium Chapmànii Underw. Chapman's Club-moss. Stems prostrate and frequently rooting or slightly arching and rooting toward the end, $18-40 \mathrm{~cm}$. long, simple or occasionally pinnately branching, thick (about 3 mm . in diameter); leaves $6-7 \mathrm{~mm}$. long by 2 mm . broad, thick, rigid, lanceolate-acuminate, upwardly curving, the margin irregularly toothed, the teeth often compound below the middle of the leaf; peduncles $10-25 \mathrm{~cm}$. long, slender, leafy with more or less appressed subulatetoothed leaves below and similar entire leaves above: strobiles about 3 mm . in diameter and $1.8-7 \mathrm{~cm}$. long; sporophylls $1 \mathrm{~mm} . \times 5-6 \mathrm{~mm}$. with a broad base, suddenly contracted above into a narrow subulate apex. usually more or less toothed near the base: sporangia subglobose. Differs from $L$. inundatum by its much thicker stems, toothed leares, tall peduncles, and long narrow strobiles. Mass. to Fla. and La., mostly near the coast.
P. 26, at end of description of Lycopodium complanàtum, strike out the last sentence commencing with "Forms with", and add:
12. Lycopodium tristáchyum Pursh. Creeping Curistmas-grern. Rhizomes extensively creeping $2-4 \mathrm{~cm}$. below the surface of the ground. white, terete, their whorled or loosely spirally arranged leaves lanceolate
or ovate to broadly ovate; the terminal branchlets regularly producing innovations the second and sometimes the third season, the older foliage branches ultimately spreading and becoming lax; leaves of the primary axis in 6-8 rows, from ovate through lanceolate-acute to acuminate, those of the subterminal and terminal branchlets in four rows, glaucous, bluish green, acuminate, appressed, those of the under row differing scarcely at all from those of the other three rows, the leaves of the lateral rows somewhat incurved underneath; peduncles terete, glaucous, $50-60 \mathrm{~mm}$. long to the first forking, usually twice forked, the second $8-18 \mathrm{~mm}$. distant from the first, spreading and curving upward; strobiles two, three or usually four, $20-28 \mathrm{~mm}$. long, the sporophylls broadly depressed-ovate, truncate at the base, the lateral margins variously toothed, suddenly contracted into a subulate scarious tip; sporangium reniform, opening by a transverse slit along the top; spores ripening early in August. (L. Chamaecyparissus A. Br.) Differs from L. complanatum, with which it has been confused, in its subterranean habit, its uniform leaves, its method of branching, and in its distant clusters of strobiles. Me. to Ga. and Minn.
P. 29. Additional species and subspecies of Isoetes have been described by A. A. Eaton in "Fern-studies" and in "Proceedings of the Biological Society of Washington."

## P. 40, before description of Sparganium símplex, insert:

2a. Sparganium Americànum Nutt. Simple-Stemmed Bur-reed. Similar to S. androcladum, but the stem simple, the lower heads of the inflorescence merely peduncled. Leaves drying green, the upper with more or less sac-like bases and broad hyaline-scarious margins; nutlets slightly angled, each gradually narrowed into a stout conspicuous style. In low grounds or ponds, Ont. to Br. Col., Penn. and the Ind. Terr. Summer.
P. 40, after Sparganium mínimum, add:
5. Sparganium hyperbòreum Laest. Northern Bur-reed. Stem 2-3 dm . high; leaves shorter and narrower than those of S. minimum, I-3 mm . wide; inflorescence $1.5-2.5 \mathrm{~cm}$. long; pistillate heads I or 2 , sessile, or the lower one short-peduncled; ripe fruiting heads $5-10 \mathrm{~mm}$. in diameter; nutlets oblong, obscurely triangular at the summit; stipe very short, stigma oval, oblique, minute, sessile, or nearly so. Lab. and Hudson Bay. Also in northern Europe. Summer.
P. 49. Additional species and subspecies of Potamogeton have been described by Arthur Bennett in recent papers published in the "Journal of Botany."
P. 68, after Erianthus brevibàrbis Michx., insert:

4a. Erianthus contórtus Ell. Twisted-awned Plume-grass. Culms I-2 m. tall, the summit and panicle-axis glabrous, or nearly so; leaves I. $5-8 \mathrm{dm}$. long, $5-20 \mathrm{~mm}$. wide; panicle $1.5-3 \mathrm{dm}$. long, $3-5 \mathrm{~cm}$. wide; spikelets crowded, exceeding the basal hairs and about one-half again as long as the internodes, the outer scales $7-7.5 \mathrm{~mm}$. long, the fourth scale 2-toothed at the apex, the awn $1.5-2 \mathrm{~cm}$. long, the included portion often a little spiral at the base, the remainder loosely spiral. In pine woods, Del. to Fla. and Miss. Sept. and Oct. Differs from E. brevibarbis in having the spikelets smaller and the exserted portion of the awn loosely spiral.

## P. 70, after Andropogon Virgínicus L., insert:

4a. Andropogon tetrastáchyus Ell. Four-spiked Beard-grass. Culms tufted, $8-\mathrm{I} 5 \mathrm{dm}$. tall; sheaths, at least the lower ones, densely villous, with dark hairs; leaves 4 dm . long or less, $2-4 \mathrm{~mm}$. wide, the lower ones villous on both surfaces toward the base; spathes usually $3-4 \mathrm{~cm}$. long, extending beyond the racemes; racemes usually in fours, $3-4 \mathrm{~cm}$. long; sessile spike-
let $3-4 \mathrm{~mm}$. long, the awn straight, $1.5-2 \mathrm{~cm}$. long. In dry or moist soil, Va. (according to T. H. Kearney, Jr.) to Fla. and Ala. Sept. and Oct. Differs from A. Virginicus in having the sheaths, at least the lower ones, densely villous all over, and the racemes usually in fours.

## P. 73, after Paspalum laève Michx., insert:

5a. Paspalum angustifòlium Le Conte. Narrow-Leaved Paspalum. Culms tufted, 6-12 dm. tall; sheaths compressed, glabrous; leaves long, the larger $2-4 \mathrm{dm}$. long, less than I cm. wide, glabrous, or the upper surface sometimes sparingly hairy near the base; racemes $3-5$, spreading, usually $6-10 \mathrm{~cm}$. long; spikelets singly disposed, $3-3.5 \mathrm{~mm}$. long and about 2.5 mm . wide, glabrous. In fields, D. C. to Fla., La., Kans. and Mo. June-Sept. Differs from $P$. laeve in having the leaves elongated and in the more numerous racemes.

5b. Paspalum austràle Nash, n. sp. Southern Paspalum. Culms tufted, 4-7 dm. tall; sheaths usually hirsute only on the margins; leaves erect, short, commonly 1.5 dm . long or less, $5-10 \mathrm{~mm}$. wide, strongly ribbed, rather thick, firm, glabrous beneath or nearly so, hirsute above; racemes $2-5$, finally spreading, usually 5 cm . long or less; spikelets singly disposed, oval, $2.7-3 \mathrm{~mm}$. long and about 2 mm . wide, glabrous. On grassy flats and banks, Va. to Fla. and Ala. Aug. and Sept. Differs from $P$. laeve and $P$. angustifolium by its hairy sheaths, and from the latter also by its short leaves. Type collected by Dr. J. K. Small, at Stone Mt., Ga., Aug. I-6, 1895.

After Paspalum circulàre Nash, insert:
6a. Paspalum Bosciànum Fluegge. Bosc's Paspalum. Culms 5-I2 dm. long, compressed, finally branched, often decumbent at the base and rooting at the lower nodes; sheaths compressed, glabrous, or the basal ones papillose-hirsute; leaves $4-30 \mathrm{~cm}$. long, $3-10 \mathrm{~mm}$. wide, hairy above near the base; racemes $2-13$, spreading or ascending, $4-9 \mathrm{~cm}$. long, the rachis broadly winged; spikelets in pairs, and often so crowded as to appear in 4 rows, frequently reddish brown, broadly obovate, $2-2.3 \mathrm{~mm}$. long, $1.5-\mathrm{I} .8 \mathrm{~mm}$. broad, the flowering scale deep brown at maturity. In meadows and moist places, Va. (according to T. H. Kearney, Jr.) to Fla. and Miss. Aug.-Oct. Differs from $P$. laeve and its relatives in having the spikelets in pairs and the flowering scale a deep seal-brown at maturity.

## P. 74, after Paspalum longipedunculàtum Le Conte, insert:

ira. Paspalum Kentuckiénse Nash, n. sp. Kentucky Paspalum. Culms tufted, $2-5 \mathrm{dm}$. tall, slender; sheaths ciliate on the overlapping margin, otherwise glabrous; leaves erect, lanceolate, 6 cm . long or less, 4-10 mm. wide, glabrous on both surfaces, ciliate on the margin with hairs less than I mm . long; racemes single or in pairs, $2-5 \mathrm{~cm}$. long; spikelets about i. 6 mm . long and about 1.3 mm . wide, glabrous. In dry soil, Ky. and Tenn. June-Aug. The upper surfaces of the leaves in this species are glabrous. while in $P$. longipedunculatum they are pubescent: the marginal leaf-hairs in this are but I mm . long, about one-half the length of those in $P$. longipcdunculatum. Type collected near Poor Fork P. O., Ky., by T. H. Kearney, Jr., Aug. 1893.
P. 82, No. 4, read " Philadélphicum Bernlh." instead of " mìnus (Mtuhl.) Nash", and refer the latter to synonymy, there being an earlicr Panicum pubescens minus Poir.
P. 83, No. 16, read "linearifòlium Scribn." instcad of "Enslini Trin." and omit synonym at the end.
P. 84, before No. 17, insert:
iбa. Panicum perióngum Nash. Elongated Panic-Grass. A tufted pubescent perennial. Culms $2-4 \mathrm{dm}$. tall, simple; sheaths hirsute with long ascending hairs; leares elongated, linear, erect. papillose-hispid beneath, $2-3 \mathrm{~mm}$. wide, the upper one commonly $8-\mathrm{It} \mathrm{cm}$. long: panicle much exserted, generally extending beyond the apex of the upper leaf, $4-6 \mathrm{~cm}$. long, its branches erect or nearly so; spikelets about 3.25 mm . long and $1.5-1.75 \mathrm{~mm}$. wide. pubescent with a few scattered long hairs. On prairies and in dry soil. Ill. to S. Dak. and the Ind. Terr. May-Aug. Differs irom $P$. lincarifolium Scribn. in having larger spikelets which are nearly glabrous.

## After Panicum Bicknéllii Nash, insert:

I8a. Panicum ciliàtum Ell. Ciliate Panic-grass. Culms tufted. I-2.5 dm. tall, simple. glabrous, the axis of the panicle and its branches hirsute; sheaths glabrous: leaves spreading or ascending. glabrous on both surfaces, conspicuously ciliate on the margin, usually $2-6 \mathrm{~cm}$. long and $5-10$ mm . wide: panicle $3-5 \mathrm{~cm}$. long, its branches ascending; spikelets $1.8-2$ mm . long and about I mm . wide, elliptic. pubescent with short spreading hairs. In sandy soil. Va. (according to T. H. Kearney: Jr.) to Fla. and Miss. May-July. The short and broad strongly ciliate leaves distinguish this from P. Bicknellii Nash, and the glabrous sheaths separate it readily from $P$. laxiflorum Lam.
P. 85, before No. 24, insert:

23a. Panicum Yadkinénse Ashe. Yadkin Panic-Grass. A glabrous perennial. Culms single. 8-io dm. tall. finally somewhat branched; sheaths white-spotted: leaves ascending. lanceolate. acuminate. the primary ones 8-12 cm. long. 8-12 mm. wide: panicle $8-12 \mathrm{~cm}$. long, its branches long, ascending: spikelets about 2.3 mm . long and I mm . wide, elliptic, acute, glabrous. In dry or sandy soil, Md. to Ga. June-Sept. Differs from Panicum dichotomum L. in its taller culms, and larger leaves and spikelets.

No. 24, read "lùcidum Ashe" instead of "sphagnícola Nash "; length of spikelets should be $1.5-2 \mathrm{~mm}$. : omit in line 7 the words "or sparsely pubescent",

After Panicum Eatoni Nash, insert:
27a. Panicum octonòdum J. G. Smith. Eight-fointed Panic-grass. Glabrous. Culms erect. 7-II dm. tall. finally branched: leaves erect. firm, f-II cm. long, 4-8 mm. wide. lanceolate; panicle $9-13 \mathrm{~cm}$. long, oblong, dense. $2-4 \mathrm{~cm}$. Wide, its branches erect or nearly so: spikelets 1.3 mm . long and about 0.8 mm . wide. glabrous, oral or nearly globular. In wet places. N. J. to Ala. and Tex. May-Aug. Differs from Panicum Eatoni in its smaller, nearly globular glabrous spikelets.
P. 86, Ño. 35, read "unciphýllum Trin." instead of "pubéscens Lam.", and as a synonym add " $P$. pubescens $A$. Gray, not Lam.'

After No. 35, insert:
35a. Panicum Tennesseénse - - she. Tennessee Panic-grass. Culms tufted, 4-6 dm. tall, rather weak and ascending, papillose-hirsute with long spreading hairs: leaves ascending. lanceolate, the lower surface softly and densely pubescent with short hairs. the upper surface with scattered long hairs, the primary leaves $f-10 \mathrm{~cm}$. long, $5-10 \mathrm{~mm}$. Wide, those on the branches much shorter and spreading and with the upper surface nearly glabrous: panicle $7-10 \mathrm{~cm}$. long, its branches ascending: spikelets $1.7-2$ mm . long. $0.8-0.9 \mathrm{~mm}$. wide. elliptic or oboroid, strongly pubescent with long spreading hairs. In woods. . . Y. and Ill. to Tenn. and Fla. JulySept. Differs from P. unciphyllum Trin. in its lighter color, usually weak culms, and the glabrous upper surface of the leaves.
P. 87, No. 38, read " scopàrium Lam." instead of " víscidum Ell.", and refer the latter to synonymy, to which add also " $P$. pubescens Lam."

After No. 38, insert:
38a. Panicum scabriúsculum Ell. Roughish Panic-grass. Culms glabrous or pubescent, $8-\mathrm{I} 4 \mathrm{dm}$. long, erect, finally branched; sheaths glabrous or pubescent; leaves erect or ascending, linear-lanceolate, glabrous, I-2 dm. long, $8-\mathrm{I} 2 \mathrm{~mm}$. wide; panicle $\mathrm{I}-2 \mathrm{dm}$. long, its branches spreading or ascending; spikelets lanceolate, glabrous, $2-2.3 \mathrm{~mm}$. long and 1 mm . broad, ovate to ovate-lanceolate, acute, the nerves of the flowering scale very prominent. In swampy places and ponds, Va. to Fla. and Tex. May-Aug. Differs from P. scoparium Lam. in its longer and narrower glabrous leaves and glabrous spikelets.

After Panicum Scribneriànum Nash, insert:
43a. Panicum oligosánthes Schult. Culms tufted, erect, 3-8 dm. tall, villous, finally fasciculately branched; sheaths, at least the lower ones and those of the branches, papillose-hispid, ciliate on the margin; leaves erect or ascending, $5-10 \mathrm{~cm}$. long, $5-10 \mathrm{~mm}$. wide, lanceolate, softly and densely pubescent on the lower surface, the upper surface glabrous or nearly so; primary panicle $6-8 \mathrm{~cm}$. long, its branches ascending; spikelets about 3.5 mm . long and 1.7 mm . wide, oval, pubescent. In dry soil, Va. to Ga. and Miss. June-Sept. Differs from P. Scribnerianum Nash by its usually fewer spikelets and the softly pubescent lower surface of the leaves.

43b. Panicum Ravenélii Scribn. \& Mer. Ravenel's Panic-grass. Culms tufted, erect, 4-6 dm. tall, finally branched, papillose-hirsute below with ascending hairs, the pubescence above softer; sheaths densely papillosehirsute with ascending hairs; leaves erect or ascending, glabrous above, densely and softly pubescent beneath, broadly lanceolate, $8-12 \mathrm{~cm}$. long, I-2 cm . wide, cordate at the clasping base; panicle $8-10 \mathrm{~cm}$. long, its branches ascending; spikelets about 4 mm . long and 1.8 mm . wide, obovoid, pubescent with rather weak hairs. In woods, D. C. to Fla. and La. July-Sept. ( $P$. scoparium Ell., not Lam.) Differs from $P$. Scribnerianum in its broader leaves with the lower surface softly pubescent, and from $P$. oligosanthes in its larger leaves and more numerous spikelets.
P. 88, after Panicum Porteriànum Nash, insert:

5ra. Panicum pubifòlium Nash. Hairy-leaved Panic-grass. A tufted softly pubescent perennial. Culms 3-7 dm. tall, the nodes densely barbed; sheaths densely pubescent and ciliate on the margins; leaves spreading or ascending, ovate-lanceolate to ovate, cordate at the rounded clasping base, pubescent on both surfaces with short spreading hairs, the upper primary leaves $7-\mathrm{II} \mathrm{cm}$. long and $2-3 \mathrm{~cm}$. broad, the lower smaller; primary panicle usually but little exserted, $7-$ II cm . long, its axis, as well as the branches, densely pubescent with short soft spreading hairs; spikelets $4-5 \mathrm{~mm}$. long and about 1.6 mm . broad, narrowly obovoid, the scales distant, strongly pubescent with long spreading hairs. In rocky woods, N. Y. to Fla., Mo. and Miss. June-Sept. Differs from Panicum Porterianum Nash in having the whole plant softly pubescent, especially the lower surface of the leaves and the panicle.
P. 90, before Chaetochloa occidentàlis Nash, insert:

2a. Chaetochloa imbérbis (Poir.) Scribn. Perennial Foxtail-grass. Perennial. Culms tufted, $3-7 \mathrm{dm}$. tall, from rootstocks, slender, compressed, rough below the raceme; sheaths glabrous, compressed; leares Ir 3 dm . long, $3-7 \mathrm{~mm}$. wide, the upper surface often with a few long hairs at the base; racemes dense, spikelike, $2-5 \mathrm{~cm}$. long, nearly I cm. in diameter, exclusive of the bristles, the rachis pubescent; bristles $5-10 \mathrm{~mm}$. long: spikelets ovoid, acute, $2-2.5 \mathrm{~mm}$. long, the flowering scale acute, striate, finely transverse-rugose. In moist soil, N. J. to Fla. and Tex.; and in Kans. and Mo. Also in Tropical America. June-Aug. Differs from C. glauca in having the bristles green or purplish instead of tawny yellow, and in being
perennial instead of annual. From C. versicolor Bicknell it is distinguished by the $5-7$-nerved second scale of the spikelet.

After Cenchrus tribuloìdes L., insert:
ra. Cenchrus macrocèphalus (Doell) Scribn. Large Bur-grass. Culms at first erect or ascending, finally falling prostrate, becoming branched and forming mats, $3^{-6} \mathrm{dm}$. long; sheaths very loose, glabrous, compressed; leaves flat or complanate, smooth and glabrous, I dm. long or less, $4-8 \mathrm{~mm}$. wide; spikes stout, $3-5 \mathrm{~cm}$. long; involucres $5-12,6-8 \mathrm{~mm}$. broad, enclosing 2 spikelets, pubescent, the spines usually $5-8 \mathrm{~mm}$. long, the spikelets not exserted beyond the involucre. Along the seashore, N. J. to Miss. July-Sept. Differs from C. tribuloides L. in having the involucres much larger; in that species they are usually less than 5 mm . broad.

## P. 95, after Aristida grácilis Ell., insert:

ioa. Aristida intermèdia Scribn. \& Ball. Intermediate Aristida. Culms slender, finally branching, $3-8 \mathrm{dm}$. tall; sheaths glabrous or sparsely hirsute; leaves $5-15 \mathrm{~cm}$. long, 2 mm . wide or less, erect, involute; panicle 2-4 dm. long, slender, its branches appressed; spikelets $8-10 \mathrm{~mm}$. long, the empty scales manifestly awned, about equal, the flowering scale strongly hispidulous above the middle, equalling or exceeding the empty scales, the awns spreading, the middle one $15-25 \mathrm{~mm}$. long, the lateral ones shorter. In sandy soil, Ia. to Miss. and Tex. July-Sept. Intermediate between $A$. gracilis and $A$. purpurascens, having the large spikelets of the latter, and more the habit of the former.

## P. io5, before Sporobolus longifòlius (Torr.) Wood, insert:

ra. Sporobolus canóvirens Nash. Southern Rush-grass. Culms erect, 3 -10 dm. tall; leaves 2.5 dm . long, or less, $\mathrm{I}-3 \mathrm{~mm}$. wide, attenuate and filiform above; panicle $5-13 \mathrm{~cm}$. long: spikelets $5-6 \mathrm{~mm}$. long, the scales acuminate, the empty ones unequal, the flowering scale appressed-pubescent below with long hairs, about equalling or a little exceeded by the acute palet. In dry sandy soil, Tenn. to Mo., Kans., Miss. and Tex. July-Sept. Resembles S. asper, but the spikelets are smaller, and the palet much shorter relatively, equalling or but little exceeding the flowering scale.
P. I30, after Eragrostis capillàris (L.) Nees, insert:
ra. Eragrostis hirsùta (Michx.) Nash. Hairy Eragrostis. Culms densely tufted, rather stout, 7 -I3 dm. tall; sheaths, at least the lower ones, strongly papillose-hispid, each with a tuft of hairs at the apex; leaves flat, the lower ones $4-6 \mathrm{dm}$. long, less than I cm. wide; panicle $5-8 \mathrm{dm}$. long, diffuse, its branches finally widely spreading; spikelets $3-5$-flowered, 3-4 mm . long, the flowering scales $2-2.5 \mathrm{~mm}$. long. In dry fields, thickets and woodlands, Va. (according to T. H. Kearney, Jr.) to Fla., the Ind. Terr. and Tex. Aug. and Sept. Differs from E. capillaris in its stouter and taller culms, strongly papillose-hispid sheaths, and elongated leaves.
P. 13I, after Eragrostis secundiflòra Presl, insert:

12a. Eragrostis capitàta (Nutt.) Nash. Culms branching and creeping, rooting at the nodes, which send up branches $6-10 \mathrm{~cm}$. long; sheaths, at least those on the branches, pubescent; leaves spreading or ascending, $1-3 \mathrm{~cm}$. long, $\mathrm{I} .5-3 \mathrm{~mm}$. wide, flat, lanceolate, pubescent; panicle $2-3 \mathrm{~cm}$. long, nearly or quite as broad, oval; spikelets crowded. clustered, 12-30flowered, $6-14 \mathrm{~mm}$. long. (Poa capitata Nutt.) In sandy, usually wet soil, Ark. and La. to Neb., N. Mex. and Tex. Also in Mexico. June-Aug. Differs most prominently from E. hypnoides (Lam.) B.S.P. by its longer pubescent flowering scales.
P. I32, in Eatonia obtusàta (Michx.) A. Gray, third line, omit the words "sometimes pubescent"; add:
ia. Eatonia pubéscens Scribn. \& Mer. Hairy Eatonia. A tufted perennial, with the sheaths, back of the ligule and lower part of the culm softly and densely pubescent. Culms $3-8 \mathrm{dm}$. tall; leaves $5-18 \mathrm{~cm}$. long, $3-6 \mathrm{~mm}$. wide, glabrous, or often softly pubescent; panicle $5-20 \mathrm{~cm}$. long; spikelets $2.5-3.5 \mathrm{~mm}$. long. In dry soil, Penn. to Ga. and Tex. May-Aug. Differs from E. obtusata in having the sheaths, and often also the leaves and culms, softly pubescent.

After Eatonia nítida (Spreng.) Nash, insert:
3a. Eatonia glàbra Nash, n. sp. Smooth Eatonia. Culms densely tufted, slender, $3-7 \mathrm{dm}$. tall; sheaths glabrous; leaves rough, flat, $2-7 \mathrm{~cm}$. long, I. $5-3 \mathrm{~mm}$. wide; panicle $7-15 \mathrm{~cm}$. long, slender, nodding at the summit; spikelets $3-4 \mathrm{~mm}$. long. In woods, southern N. Y. to Tenn. MayJuly. The glabrous sheaths and leaves separate this from E. nitida. Type collected in Madison Co., Tenn., by S. M. Bain, Apr. 1893, No. 507.
P. I35, after Uniola láxa (L.) B.S.P., insert:
ia. Uniola longifòlia Scribn. Hairy-Sheathed Uniola. Culms tufted, 8-12 dm. tall; sheaths, at least the lower ones, densely hirsute; leaves flat, 3 dm . long or less, narrowed at both ends, $6-12 \mathrm{~mm}$. wide; panicle $2-4.5$ dm . long, its branches short and appressed, or the lower ones sometimes long and ascending; spikelets 3-4-flowered, usually about 6 mm . long, the flowering scales about 5 mm . long. In dry, usually sandy soil, Tenn. to Fla. and La. Aug. and Sept. Distinguished by its larger size and strongly hirsute sheaths.
P. I56, in Elymus striàtus Willd., sixth line, omit the words "rough, hispid or"; add:
ia. Elymus Arkansànus Scribn. \& Ball. Arkansas Wild Rye. Culms slender, erect, 6-9 dm. tall ; sheaths ciliate on the margin; leaves $1-2 \mathrm{dm}$. long, $4^{-8} \mathrm{~mm}$. wide, erect or ascending, auricled at the base, rough on the lower surface, the upper surface finely and densely pubescent; spike longexserted, nodding, $6-9 \mathrm{~cm}$. long; spikelets 2 at each node, 2 -flowered; empty scales linear-subulate, hispidulous and 2-3-nerved above, 8 -10 mm . long and bearing a straight awn $\mathrm{I}-2 \mathrm{~cm}$. long; flowering scales minutely hispidulous, about 7 mm . long, ending in a straight awn $2-4 \mathrm{~cm}$. long. In woods, Ia. to Ark. and Mo. July. Differs from E. striatus in having the empty and flowering scales merely hispidulous.

## P. I57, after Elymus hirsutiglùmis Scribn. \& Sm., insert:

3a. Elymus austràlis Scribn. \& Ball. Southern Wild Rye. Culms stout, erect, 9-15 dm. tall; sheaths rough-hairy; leaves ascending, 2-3 dm. long, $\mathrm{I}-\mathrm{I} .5 \mathrm{~cm}$. wide, very rough on the lower surface, rough or roughhairy above; spike I-I. 5 dm . long; spikelets 2 at each node, $4-5$-flowered; empty scales diverging, thickened, coriaceous and somewhat curved at the base, usually rough-hairy, about 1.5 cm . long, bearing an awn of about the same length; flowering scales $8-10 \mathrm{~mm}$. long, hirsute, terminated by a straight awn $2.5-3 \mathrm{~cm}$. long. In moist woods and thickets, N. C. to Fla., west to Ark. and Mo. July and Aug. Intermediate between E. hirsutiglumis and E. Canadensis; separated from the former by its stouter spike and longer scales and awns, and from the latter by the thickened and hirsute empty scales.

3b. Elymus glabriflòrus (Vasey) Scribn. \& Ball. Smooth-flowered Wild Rye. Culms erect, stout, 5-10 dm. tall; sheaths loose, smooth or rough-hairy; leaves numerous, $1.5-3 \mathrm{dm}$. long, 6 -Io mm . wide, erect or ascending, somewhat roughened on the lower surface, rough and sometimes a little hairy on the upper surface: spike stout, erect or nodding. $r-1.5$ dm. long, sometimes glaucous; spikelets 2 or 3 at each node. 3 - 5 -flowered: empty scales thickened, strongly $3-5$-nerved, hispidulous on the nerves. II-I 5 mm . long, bearing an awn about 2 cm . long: flowering seales $0-12$ mm . long, minutely hispidulous, terminated by a straight slender awn 2-3
cm . long. In low rich woods or thickets, Penn. to Tenn. and Ga., west to N. Mex. July and Aug. Related to E. hirsutiglumis, but distinguished by its merely hispidulous, not hirsute, flowering scales.

In Elymus Canadénsis L., line 6, omit the words " nearly smooth to "; add:

4a. Elymus brachystáchys Scribn. \& Ball. Short-spiked Wild Rye. Culms stout, 3-10 dm. tall, erect; sheaths glabrous; leaves I-2 dm. long, 6-10 mm . wide, ascending, smooth or a little rough below, finely hispidulous above; spike rather dense, $8-16 \mathrm{~cm}$. long, much exserted; spikelets 2 at each node, 3 -5-flowered; empty scales hispidulous, $8-10 \mathrm{~mm}$. long, bearing a straight awn $1.5-2.5 \mathrm{~cm}$. long; flowering scales smooth or minutely hispidulous, II-I3 mm . long, 5 -nerved, the nerves next the midnerve often shortly excurrent, terminated by a straight or sometimes diverging awn $2-4 \mathrm{~cm}$. long. In moist open or shaded places, Mich. and S. Dak. to N. Mex. and Tex. Also in Mexico. June-Aug. Distinguished from $E$. Canadensis by its smaller size and merely hispidulous, not hirsute, flowering scales.
P. 16i, Cyperus microdóntus, read for range, Va. and N. C., and add:

5a. Cyperus Gátesii Torr. Gates's Cyperus. Annual; bright green. Leaves $0.5-4 \mathrm{~mm}$. wide; scapes tufted, I-4 dm. high, often longer than the leaves; bracts of the involucre surpassing the $3-8$-rayed umbel; rays of the umbel I-5 cm. long; spikelets linear to linear-lanceolate, $6-15 \mathrm{~mm}$. long, acute; scales oblong-lanceolate, shining, striate; achene oblong, abruptly apiculate. In moist soil, Va. to Fla. and Tex. May-Sept. Differs from C. microdontus in the oblong, not ovate, scales, the 3-8-rayed, not capitate, umbel, and the abruptly apiculate achene.
P. 162. Cyperus Schweinítzii, strike Kans. from range and add:

9a. Cyperus Búshii Britton, n. sp. Bush's Cyperus. Perennial by tuber-like corms. Leaves $3-4 \mathrm{~mm}$. wide, smooth; scapes smooth, $3-6 \mathrm{dm}$. high, longer than the leaves; longer involucral bracts much exceeding the umbel; umbel capitate, or with I-5 rays; spikelets loosely capitate, flat, linear, acute, $8-16 \mathrm{~mm}$. long; scales firm, shining, oblong, mucronate, strongly about II-nerved; achene oblong, 3 -angled, nearly twice as long as thick, apiculate, two-thirds as long as the scale. In sandy soil, Minn. to Wis., Neb. and the Ind. Terr. July-Sept. Type collected by B. F. Bush at Arkansas, Ind. Terr.
P. I69, Eleocharis ovàta, ranges southward only to Mass. and Mich.; add:

8a. Eleocharis obtúsa Schultes. Blunt Spike-rush. Differs from Elcocharis ovata in the pale scales of the spike and in the tubercle, which is nearly or quite as broad and about one-third as high as the achene. In wet soil, N. S. to Fla., Br. Col., Kans. and Texas.
P. I70, for "Eleocharis microcàrpa Torr." read "Eleocharis Torreyàna Boeckl." E. microcarpa Torr. proves to be different and to occur only in the Gulf States and the West Indies.

## P. 171, after Eleocharis intermèdia, insert:

21a. Eleocharis Macoùnii Fernald. Macoun's Spike-rush. Annual, similar to E. intermedia, but with stouter culms, longer, narrower, ellipticlanceolate, densely flowered spikelets about I cm. long. Scales dark brown; achene compressed-trigonous, obovate, light brown, shining; tubercle deltoid-conic, about half as long as the achene; bristles downwardly barbed, about as long as the achene and tubercle. Borders of marshes, North Wakefield, Quebec.
P. 179, after Scirpus robústus, insert:
rga. Scirpus Fêrnaldi Bicknell. Fernald's Bulrush. Slender, rather pale green, the sharply three-angled culms 4-8 dm. high; leaves $2-6$ mm . wide, slenderly attenuate, the longer ones often surpassing the culms; primary involucral leaf erect, mostly 1.5-2 dm. long; spikes rather pale, short-ovate or finally broadly ovate, $\mathrm{I}-\mathrm{I} .5 \mathrm{~cm}$. long, I-3 in a sessile cluster or stipitate, and I-5 borne on slender, stiffly flexuous or crinkled, wiry, diverging peduncles $2-7 \mathrm{~cm}$. long; scales finely close-puberulent, the lower ones often somewhat spreading, becoming bifid and finally lacerate, the midvein excurrent in a recurved awn $3-12 \mathrm{~mm}$. long; achene yellowish brown and shining, broadly truncated, obovoid-cuneate, $2.5-3 \mathrm{~mm}$. long and broad, almost equally trigonous or slightly depressed-trigonous with rounded angles or the dorsal swelling more or less umbonate, shortmucronulate; bristles fugacious, shorter than or equal to the achene. Mt. Desert, Me., shore of Somes Sound with S. paludosus, Aug. 20, 1898.

19b. Scirpus paludòsus A. Nelson. Low Marsh Bulrush. Similar to S. robustus Pursh, but lower and more slender, with shorter, narrower leaves and more densely clustered, sessile, mostly ovate or ovate-oblong, dark brown spikes; culms 1.5-6 dm. high, stiff and often very slender, usually growing in close colonies, the leaves $\mathrm{I}^{-4} \mathrm{~mm}$. wide. Kesembles S. campestris Britton, of the prairie region, but the spikes are much darker, the achenes more truncate-obovate and more bluntly angled. From Can. and New Eng. to N. J. and at alkaline inland stations, flowering from 2-4 weeks earlier than $S$. robustus.

No. 24, for "Scirpus microcàrpus Presl", read "Scirpus rubrotìnctus Fernald." S. microcarpus occurs only on the Pacific slope.

## P. i8o, at end of Scirpus, add:

30. Scirpus atrocinctus Fernald. Blackish Wool-grass. Similar to $S$. cyperinus L., S. Eriophorum Michx., but the culm slender, about I.5 mm. thick at the top, the bases of the involucral leaves black or nearly so; inflorescence loose and ample with the spikelets pedicelled, or these in a subcapitate cluster; scales greenish black; bristles light brown or olivebrown. In wet places, Newf. to Manitoba, Saskatchewan, Conn., Penn. and Iowa.

For ", Scirpus cypérinus Erióphorum" read "Scirpus Erióphorum Michx." The plant proves to be specifically distinct from S. cyperiwus and from the foregoing.
P. 188, after Scleria pauciflòra, insert:

Scleria ciliàta Michx. Hairy Nut-rush. Resembles Scleria paucifora, but is usually stouter, $3^{-6} \mathrm{dm}$. high, pubescent; bracts of the flower-clusters ciliate; achenes subglobose to globose-ovoid, 3 mm . long, acute, roughened by short ridges or projections; hypogynium a narrow obtusely 3 -angled border supporting 3 tubercles, these often 2 -lobed. In pine lands, Va. to Fla., Mo. and Tex. Also in the W. I. June-Sept.

## P. 229, after Arisaema triphyllum, insert:

ia. Arisaema Stewardsònii Britton, n.sp. Stewardson Brown's Indian Turnip. Dark green, $3-6 \mathrm{dm}$. high. Leaf-segments 3, lanceolate, acuminate, thin, narrowed at the base, shining on both sides, $4-20 \mathrm{~cm}$. long. spathe about as long as its peduncle. strongly fluted, green witl white stripes, the dilated part acuminate; spadix slender, blunt: fruits 8-10 mm. in diameter. In wet woods, growing among Sphagnum, eastern Penn. Differs from related species by its fluted spathe and shining leaves Type from Tannersville, Penn., collected by Stewardson Brown, E. P. Bicknell and N. L. Britton, July 4th, 1901 .

## P. 248, after Juncus tênuis, insert:

ira. Juncus intèrior Wicgand. Inland Rush. Plants 5-to dm. tall, light green. Leaves basal; blades about one-third the length of the scape.

I-I. 25 mm . wide, sometımes involute; scapes grooved; inflorescence $3-10$ cm . long, many-flowered, the branches ascending; flowers scattered, rather distant; perianth straw-colored, 3-4 mm. long; sepals and petals nearly equal, lanceolate-subulate, slenderly acute or acuminate, appressed or erect; stamens 6, one-half as long as the perianth; anthers much shorter than the filaments; capsule oblong or rarely ovoid-oblong, about as long as the perianth, obtuse or barely apiculate; seeds oblong, $0.35-0.50 \mathrm{~mm}$. long. In dry woods or on prairies, Ill. to Wyo., Tenn., Miss. and Ark. Spring and early summer. Differs from $J$. secundus in the longer bracts of the inflorescence, the larger perianth, the flowers scarcely or not at all secund.
irb. Juncus Dúdleyi Wiegand. Dudley's Rush. Plants 3-10 dm. tall, pale green. Leaves basal; blades about one-half the length of the scape, or less, very narrowly linear, flat, frequently somewhat involute; scapes tufted, often relatively stout, but wiry, striate-grooved; inflorescence 2-5 cm . high, or rarely slightly larger, usually rather congested, considerably exceeded by its bract, few-flowered; perianth green or pale straw-colored, 4-5 mm. long; sepals and petals firm, nearly equal, lanceolate-subulate, acute, more or less spreading, scarious-margined; anthers slightly shorter than the filaments; capsules ovoid-oval, shorter than the perianth, somewhat apiculate; seeds oblong, $0.37-0.45 \mathrm{~mm}$. long, apiculate at each end. In damp soil and open places, Me. to Ont., Saskatchewan, Wash., Penn., Tenn. and Mex. Spring and summer. Differs from J. tenuis by the yel-low-brown cartilaginous margins of the leaf-sheaths.

## P. 254, after Juncoides campéstre, add:

8. Juncoides bulbòsum (Wood) Small. Bulbous Wood-Rush. Base of the plant accompanied by bulblets. Foliage almost glabrous or somewhat webby on the leaf-margins and at the tops of the sheaths; stems I-4 dm. tall; inflorescence umbel-like, the peduncles very unequal at maturity; sepals and petals ovate-lanceolate or lanceolate, $2-2.5 \mathrm{~mm}$. long, brownish, acuminate, neither manifestly soft nor hyaline at the apex; capsule broadly obovoid, or globose-obovoid, often nearly as thick as long, surpassing the sepals or sometimes about equalling them. [Luzula campestris var. bulbosa Wood.] In woods, thickets and open sandy places, Va. to Kans., Ga. and Tex. Spring.

## P. 263 , after Allìum vineàle, add:

6a. Allìum carinàtum L. Keeled Garlic. Similar to A. vineale. Bulb ovoid, its coats membranous; stem terete, leafy to about the middle, 2.5 dm . tall or less; leaves linear, channeled below, flat toward the apex, 2-3 mm . wide, prominently 3 - 5 -nerved; bracts of the umbel 2 , narrowly linear, one much longer than the other; umbel erect, bearing either bulbs or capsules; pedicels filiform, $2-4 \mathrm{~cm}$. long, filaments simple, not toothed. Bucks Co., Penn., N. E. Arnold. Fugitive from Europe.

## P. 266, insert:

## 7a. TÙLIPA L.

Bulbous herbs with erect leaf-bearing stems and large solitary (rarely 2) erect flowers. Perianth campanulate, the segments distinct, erect or erect-spreading, deciduous, usually with a spot at the base, but without a nectar-gland; stamens 6, hypogynous, shorter than the perianth; anthers erect, basifixed; ovary nearly or quite sessile, 3 -celled; ovules numerous; capsule oblong or globose; seeds numerous, flat. [Ancient name.]. Fifty species or more, natives of Europe and Asia.
r. Tulipa sylvéstris L. Wild Tulip. Bulb ovoid, 2.5 cm . long or less; stem about 3 dm . high, with I-3 linear-lanceolate acuminate leaves; flower yellow, 7-9 cm. broad; inner perianth-segments rather broader than the outer, acute; filaments pubescent at the base. In meadows, Bucks Co., Penn. Adventive from Europe.
P. 274, after Trillium víride, insert:

Trillium viridéscens Nutt. Stem 4-6 dm. tall, slender, usually pubescent at the top; leaves ovate, orbicular-ovate or broadly elliptic, $10-15 \mathrm{~cm}$. long, acuminate, sometimes abruptly so, 5-nerved, sessile; flower sessile; sepals linear-lanceolate or almost linear, $4-5 \mathrm{~cm}$. long, acute, green; petals conspicuously narrow, the claw-like base linear, $1.5-2 \mathrm{~cm}$. long, greenish, the blade narrowly linear-lanceolate or nearly linear, fully twice as long as the claw-like base, pale purple; filaments $2.5-5 \mathrm{~mm}$. long; anthers $12-15 \mathrm{~mm}$. long; stigmas $6-8 \mathrm{~mm}$. long, straight, or recurved only near the tip. On hillsides and rich woods, Kans. and Ark. Spring. Differs from $T$. viride in its acuminate leaves and pale purple narrower petals.

## P. 339, after Celtis crassifòlia, insert:

2a. Celtis Georgiàna Small. Georgia Hackberry. A shrub or small tree, with pinnately arranged branches, the young twigs puberulent. Leaves small, mostly less than 5 cm . long, short-petioled, obliquely ovate, subcordate, acute or short-acuminate, sharply few-toothed or some of them entire, firm, rough or roughish above, prominently reticulateveined beneath; peduncles short, $2-8 \mathrm{~mm}$. long, mostly not longer than the diameter of the globose fruit. In rocky places, D. C. to Fla., Mo. and Ala. April.

## P. 34r, after Humulus Lùpulus, add:

ıa. Humulus Japònicus Sieb. \& Zucc. Japanese Hop. A twining vine, similar to the Common Hop, the leaves deeply pedately $5-7$-cleft. Pistillate aments few-flowered, their bracts and bractlets deltoid, acuminate, hispid-pubescent at least on the margins, not glandular. In waste ground, D. C. Introduced from Japan. Aug.-Sept.

## P. 369, after Chenopodium glaùcum, insert:

2a. Chenopodium vulvària L. Stinking Goosefoot. Annual, muchbranched, white-mealy, the branches procumbent, 3 dm . long, or more; leaves ovate, entire, 2.5 cm . long, or less, the slender petioles about as long as the blades; flowers in dense short axillary and terminal branched or simple spikes mostly shorter than the leaves; sepals ovate-lanceolate, obtusish. In waste places and ballast, Ont. to Del. July-Sept.
P. 384, after Sesuvium marítimum, add:
ia. Sesuvium séssile Pers. Western Sea Purslane. Much-branched, glabrous, similar to S. maritimum, the stems often copiously verrucose; pedicels $\mathrm{I}-3 \mathrm{~mm}$. long, or none; stamens numerous; flowers and capsules slightly larger than in S. maritimum. On beaches, shores and in saline soil, W. Kans. and Colo. to Tex., Cal. and Mex. Also in S. Am. MayNov.
P. 385, strike " Minn." from range of Talinum teretifolium and insert:
ra. Talinum rugospèrmum Holzinger. Rough-seeded Talinuri. Similar to $T$. teretifolium and confused with that species. Stamens 12-25: filaments very slender, red; anthers nearly circular in outline, yellow: style 3 -cleft nearly one-third its length into linear stigmatic lobes: seeds pale, roughened. T. terctifolium differs in having short, blunt style-lobes. oblong anthers, and smooth black seeds. In dry soil. Ind. to Wis. and Minn.

## P. 417, after Delphinium albéscens, insert:

4a. Delphinium Treleàsei Bush. Trelease's Larkspur. Roots fascicled; stem erect, 6-12 dm. tall, glabrous, slightly glatucous, few-leaved: basal leaves long-petioled, deeply palmatifid into linear segments 1.5-3 mm . wide: raceme often 3 dm . long or more, loose, the lower pedicels sometimes branched; pedicels very slender, ascending, the lower 5-10 cm.
long, the upper suorter; flowers blue; sepals anu spur about equal in length, puberulent; spur straight, nearly 2 cm . long; sepals narrowly ovate; bractlets borne somewhat below the calyx; lower petal yellowbearded; follicles 3 , erect, slightly pubescent. In barrens, Mo. MayJune.

## P. 43I, after Thalictrum dioìcum, insert:

3a. Thalictrum occidentàle A. Gray. Western Meadow-rue. Rootstock slender. Stem glabrous, I m. high, or less, bearing 3-6 leaves; leaves glaucous beneath and sometimes minutely glandular, the upper short-petioled; leaflets thin, reniform to obovate, their lobes few, rounded; flowers diœecious or polygamo-diœcious, in panicles 1.5-3 dm. high; achenes $6-7 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. wide, flattened, 2 -edged, strongly 3 -ribbed on each side, the ribs somewhat branching; persistent style filiform, half as long as the achene, or more; filaments yellowish-green to purplish, slightly clavate. Me. and New Brunswick; Manitoba and Mont. to the Pacific Coast. May-July.
P. 482, after Heuchera villòsa, insert:

Heuchera macrorhiza Small. Big-rooted Heuchera. Similar to $H$. villosa, but stouter, the rootstock thicker and woody; pubescence of the stem and petioles denser; leaf-lobes shorter and broader, their margins copiously villous-ciliate; pedicels more villous than the turbinate calyx; capsule longer, twice as long as the calyx. River-banks, Tenn. and Ky.
P. 518. Additional species of Crataegus have been described by Mr . W. W. Ashe in "Journal of the Elisha Mitchell Scientific Society", and in "Bulletin of the North Carolina Agricultural Experiment Station," and by Mr. C. D. Beadle and Prof. C. S. Sargent in the "Botanical Gazette."

## P. 553, after Astragalus Robbínsii, insart:

22a. Astragalus Jésupi (Eggleston \& Sheldon) Britton. Jesup's Milk Vetch. Similar to $A$. Robbinsii, but with larger, darker purple flowers, the pod longer, acuminate, somewhat triangular in section, with a dorsal groove, and a stipe equalling or longer than the calyx. In rocky places, Me., N. H., Vt. (A. Robbinsii Jesupi Egg. and Sheld!)

## P. 563, after Lespedeza Nuttàllii, insert:

3a. Lespedeza Brittònii Bicknell. Britton's Bush-clover. Light green and densely cinereous-pubescent, especially above, the upper surface of the leaves glabrate; stems ascending, o.5-1 m . long, wand-like, bearing short flowering branches and reduced leaves above, often longer branched about the middle; leaves short-petioled; petioles $2-10 \mathrm{~mm}$. long; leaflets oblong, rounded or contracted at base and apex, $20-45 \mathrm{~mm}$. long, $8-20 \mathrm{~mm}$. wide; terminal flower-clusters short-spicate on slender peduncles $2-5 \mathrm{~cm}$. long; lower peduncles short and few-flowered, or bearing clustered cleistogamous flowers; coralla pinkish-purple, much surpassing the attenuate calyx-lobes, $6-8 \mathrm{~mm}$. long; pod ovate or ovate-oblong, 4.56.5 mm . long, acute, canescent or short-pubescent, twice the length of the calyx-lobes or less. Dry soil, Bronxville, N. Y. City. Also eastern Mass. and N. J. Aug.-Sept.

## P. 564, before Lespedeza angustifòlia, insert:

ga. Lespedeza velutìna Bicknell. Velvety Bush-clover. With the habit and appearance of $L$. capitata, but densely soft-velvety all over, with somewhat cinereous pubescence, the younger parts velvety-canescent, $0.5-$ 1.2 mm . high, often bushy-branched above; leaves crowded, ascending, the petioles $3-7 \mathrm{~mm}$. long; leaflets oblong, narrowed to the base, rounded at the apex, $25-40 \mathrm{~mm}$. long, $8-18 \mathrm{~mm}$. wide, velvety on both surfaces, tomentose-ciliate; inflorescence very dense, of crowded short clusters;
corolla $7-8.5 \mathrm{~mm}$. long, about equalling the calyx-lobes, the standard pure white, with purplish-streaked centre; pod narrowly rhomboid-oblong, narrowed to each end, $5-6 \mathrm{~mm}$. long, 2.5 mm . wide, canescently pubescent, much shorter than the calyx-lobes. Low thicket near Woodlawn, N. Y. City. Also in eastern Mass. Sept.
P. 638, for "Viola alsophìla Greene" read "Viola LeConteàna Don", the older name.
P. 640. Additional species of Viola have been described by Prof. E. L. Greene in " Pittonia."
P. 668, at bottom, add:

## 3. ECHINOPANAX Dec. \& Pl.

A densely prickly shrub, with palmately lobed leaves and racemed or panicled umbels of small greenish-white flowers. Calyx-teeth obsolete; petals 5, valvate; stamens 5; filaments filiform; anthers oblong or ovate; ovary 2 -3-celled; styles 2 ; stigma terminal; fruit laterally compressed. (Greek, prickly Panax.) A monotypic genus of northwestern North America and northeastern Asia.
r. Echinopanax hórridum (J. E. Smith) Dec. \& Pl. Devil's Club. Stems erect from a decumbent base, I-4 m. high, densely prickly, leafy above; leaves nearly orbicular in outline, $1.5-6 \mathrm{dm}$. broad, cordate at the base with a rather narrow sinus, $3-7$-lobed, with scattered prickles on both sides and puberulent beneath, the lobes acute, sharply irregularly serrate; inflorescence wooly, terminal, I-3 dm. long; peduncles subtended by a narrow laciniate bract; pedicels filiform; stamens about twice as long as the ovate petals; fruit $4-5 \mathrm{~mm}$. long, scarlet. In rocky places, Isle Royale, Lake Superior (according to W. A. Wheeler) ; Mont. to Ore. and Alaska. June.

## P. 671, after Hydrocotyle verticillàta, add:

3a. Hydrocotyle austràlis C. \& R. Southern Marsh-Pennywort. Like $H$. verticillata, the inflorescence proliferous; pedicels $2-4 \mathrm{~mm}$. long; fruit about 2 mm . long and 3 mm . broad, rounded at the base. In wet soil, Va. to Fla. and Tex., near the coast. Differs from $H$. verticillata in the longer pedicels, and from $H$. Canbyi in the unnotched fruit.

## P. 673, before Sanicula Canadénsis, insert:

2a. Sanicula Smàllii Bicknell. Small's Snakeroot. Stem 25-40 cm. tall, usually simple, widely 2 -forked above; leaves slender-petioled, subcoriaceous, dull green, paler beneath, 3-divided, the lateral segments cleft or parted; divisions obovate or broadly rhomboid, mostly obtuse, dentateserrate with aculeate teeth, often incised, $4-8 \mathrm{~cm}$. long; stem-leaves $3^{-4}$, the opposite upper pair subsessile and 3 -cleft; rays of umbel $2-6$, spreading; pedicels $2-3 \mathrm{~mm}$. long; sepals finally spreading, linear, cuspidate; anthers little exserted; petals yellowish or greenish, obovate, shorter than the sepals; fruits $3-6$, closely sessile, subglobose, $5^{-6} \mathrm{~mm}$. long, the bristles slender; styles slender, spreading, about the length of the calyxsegments; oil-tubes 5. Rich or rocky woods, Fla. and Ga. to Mo. MayJune.
P. 678, for "Apium leptophýllum" read "Apium Ammi (L.) Urban", the older name.
P. 679, after Cicuta maculàta, insert:
ra. Cicuta Curtíssii C. \& R. Curtiss' Water-hemeock. Similar to Cicuta maculata, but with thicker ovate-lanceolate leaf-segments, the reins
prominent beneath; fruit orbicular, about 2 mm . long, constricted at the commissure. In wet soil, Va. and Ky. to Fla. and La. June-Aug.
ib. Cicuta occidentàlis Greene. Western Water-hemlock. Similar to Cicuta maculata, the oval to oblong fruit constricted at the commissure, the ribs all projecting about equally, while in C. maculata the fruit is not constricted at the commissure, and the lateral ribs are much the largest; veins prominent on the lower surface of the leaflets. In wet soil, S. Dak. and Neb. to Idaho and N. Mex. June-Sept.
P. 685, for "Cymopterus montànus T. \& G." read " Phellopterus montànus Nutt." The genus Phellopterus Nutt. differs from Cymopterus Nutt., as shown by Coulter and Rose.
P. 687. Substitute for genus 44. PEUCEDANUM L., the name LOMÀTIUM Raf. As shown by Coulter and Rose, the Old World Peucedanums are generically distinct from the North American plants which have been so called. Our species, according to these authors, are as follows:

1. Peucedanum nudicaule $=$ Lomatium orientàle C. \& R.
2. Peucedanum foeniculàceum $=$ Lomatium foeniculàceum (Nutt.) C. \& R.
3. Peucedanum Kingii is referred to Cynomarathrum Kíngii (A. Gray) C. \& R.
4. Peucedanum villosum $=$ Lomatium daucifòlium (Nutt.) C. \& R.

## P. 749, at end of Asclepiadàceae, add:

## 7. PERIPLOCA L.

Woody twining plants with entire opposite leaves and middle-sized flowers in umbels. Calyx 5 -parted, glandular within; corolla deeply 5 parted, the segments obtuse, dextrorsely rotate, villous on the inner surface; corona adnate to the base of the corolla, with io broad or 5 slender elongated, entire or lobed scales or appendages; filaments short, free, conniving at the short appendiculate apex; pollen granulose, loosely aggregated in two masses in each anther-cell; follicles slender, glabrous, generally united at the apex; seeds comose. (Greek, twining.)
r. Periploca Graèca L. Glabrous; leaves ovate-oblong, acute, paler beneath; umbels cymose; peduncles shorter than the leaves; corolla-segments dull brownish or greenish, with a darker line down the middle and a whitish spot at the base within; appendages of the corona slender, ligulate, 2 -toothed at the apex. A handsome woody climber of the Old World, escaped from cultivation, Mass. to Kans. Native of Syria and the Grecian Islands. Called Silk Vine.

## P. 782 , after Teucrium occidentàle, insert:

2a. Teucrium littoràle Bicknell. Coast Germander. Pale and canescent, 3-5 dm. high, erect or assurgent, often with ascending branches; leaves thickish and rugose-veiny, narrowly oblong or sometimes broader, narrowed into the petiole, closely fine-serrate or becoming unequally dentate-serrate, $6-\mathrm{II} \mathrm{cm}$. long, $\mathrm{I} .5-4 \mathrm{~cm}$. wide; petioles $5-10 \mathrm{~mm}$. long; spikes narrow, often interrupted; bracts about the length of the calyx; calyx small, $4-5 \mathrm{~mm}$. high, becoming somewhat gibbous-urceolate, the teeth short, the upper ones obtuse; corolla pale pink, about 15 mm . long, loosely pilose without. On or near the coast, Me. to Fla. July-Aug.

2b. Teucrium róseum Bicknell. Maine Germander. Rather stout and deep green, 3-7 dm. high, the stem soft-pubescent or downwardly villous; leaves broadly oblong or oblong-ovate, cuneate at base, acute or acuminate at apex, irregularly dentate-serrate or somewhat cut-serrate, hoarytomentose beneath, softly pilose-pubescent above, $6-9 \mathrm{~cm}$. long, 2.5-4.5 cm . wide, the slender petioles hoary-pubescent, io- 15 mm . long; inflores-
cence hoary-villous; calyx often purplish, 5-7 mm. long, the upper tooth acute, the lateral ones obtuse, the lower pair but little longer, triangularsubulate; pedicels very short; bracts usually longer than the calyx, ciliatefringed; corolla rose-purple, somewhat smaller than in T. littorale and less exserted, more or less pilose-bearded. Coast of Me. and Mass. Aug.Sept.

2c. Teucrium boreàle Bicknell. Northern Germander. Erect or ascending, rather slender, often widely branched from the base, $3-8 \mathrm{dm}$. tall, or more; stem loosely pubescent with recurved hairs to glabrate; inflorescence somewhat villous-pubescent, scarcely if at all glandular; spikes short, or the terminal one elongated and somewhat flexuous; leaves thin or membranous, ovate-oblong to oblong-lanceolate, $5-10 \mathrm{~cm}$. long, 2-3.5 cm . wide, acute, serrate to dentate-serrate, above minutely hispidulouspuberulent, beneath thinly tomentulose, or sometimes glabrate throughout; petioles of the main leaves becoming $\mathrm{I}-2 \mathrm{~cm}$. long; bracts mostly shorter than the calyx, ciliate; calyx thin, campanulate, $4-5 \mathrm{~mm}$. long, the subequal teeth short and broad, the lateral pair very obtuse; corolla pur-plish-pink, $12-15 \mathrm{~mm}$. long, about three times the length of the calyx, loosely short-pubescent and dotted with minute glands, the terminal lobe broad. N. H. to northern N. Y. Aug.

2d. Teucrium menthifòlium Bicknell. Mint-leaved Germander. Hir-sute-pubescent with recurved hairs to nearly glabrous except the inflorescence, smaller and less branched than $T$. occidentale, the denser spikes shorter, with the bracts often elongated and foliaceous, the pubescence not viscid nor glandular; leaves firm, pale green, minutely pubescent to glabrate above, white-veiny and thinly tomentulose beneath, lanceolate or narrowly oblong, narrowed at the base, $5-9 \mathrm{~cm}$. long, $2-3 \mathrm{~cm}$. wide, acute or acuminate, sharply serrate; calyx $5-6 \mathrm{~mm}$. long, narrowly campanulate, the teeth shorter and less rigid than in T. occidentale, the lateral obtuse, the lower pair only slightly longer; corolla pink, short, sometimes not twice the length of the calyx, thinly pubescent and glandular, the terminal lobe small, often not broader than the lateral ones. Central Mich.

## P. 796, after Monarda scàbra, insert:

5a. Monarda móllis L. Canescent Wild Bergamot. Similar to M. fistulosa and $M$. scabra, differing from the former in its canescent, not spreading pubescence, and from the latter in its longer-petioled leaves mostly narrowed at the base. In dry soil, N. E. to Ga., S. Dak., Kans. and Tex. Summer.

## P. 781, after Ajuga réptans, add:

2. Ajuga Genevènsis L. Erect Bugle. Similar to the Creeping Bugle, but devoid of runners, and the whole plant pubescent with long hairs. Basal leaves tufted; flowering stems solitary or several, I.5-3 dm. high. In a lawn, Danville, Penn. May-June. Adventive from Europe.

## P. 857, after Plantago màjor, insert:

ra. Plantago halophila Bicknell, n. sp. Salt-marsh Plantain. Very similar to $P$. major, often diminutive, but sometimes as large. More or less hirsutulous-tomentulose throughout, dull green, the spikes and scapes often bright purplish; leaves thick, undulate, often prostrate in a stif rosette or ascending, the blades usually but not always longer than the petioles; scapes stiff and slender, commonly upcurved-assurgent. the naked lower part mostly longer than the leaves and often $2-4$ times the length of the narrow spikes; bracts thinner and less concave than in P. major, mostly rather shorter and more ovate and acute: pyxis relatively narrower than in P. major. circumscissile mostly within the tips of the sepals and somewhat below the middle, lid longer and less conic than in P. major. Salt marshes and shores, Me. to N. J. Type from Van Cortlandt, N. Y. City, flowering in July, about two weeks later than $l$ '. major.
P. 898. Read for range of Lactuca Scariòla, "in waste places. Ohio, Idaho and Mont., and in ballast about the eastern seaports; not common."

Before Lactuca Ludoviciàna, insert:
ra. Lactuca viròsa L. Strong-scented Lettuce. Similar to the Prickly Lettuce (Lactuca Scariola) and confused with it. Leaves oblong to oblanceolate, finely irregularly denticulate, rarely slightly sinuate; achenes dark-colored. L. Scariola has sinuate-pinnatifid leaves and pale achenes. A common weed in waste and cultivated grounds, Me. to N. Dak., Ga., Kans.

## GLOSSARY OF SPECIAL TERMS

Acaulescent. With stem subterranean, or nearly so.
Accumbent. Cotyledons with margins folded against the hypocotyl.
Achene. A dry one-seeded indehiscent fruit with the pericarp tightly fitting around the seed.
Acicular. Needle-shaped.
Acuminate. Gradually tapering to the apex.
Acute. Sharp pointed.
Adnate. An organ adhering to a contiguous differing one; an anther attached longitudinally to the end of the filament.
Adventive. Not indigenous, but apparently becoming naturalized.
Albumen. See Endosperm.
Alliaceous. Onion-like, in aspect or odor.
Alternate. Not opposite; with a single leaf at each node.
Alveolate. Like honeycomb; closely pitted.
Ament. A spike of imperfect flowers subtended by scarious bracts, as in the willows.
Amphibious. At times inhabiting the water.
Amphitropous. Term applied to the partly inverted ovule.
Amplexicaul. Clasping the stem, or other axis.
Anastomosing. Connecting so as to form a well-defined network.
Anatropous. Applied to an inverted ovule with the micropyle very near the hilum.
Androgynous. Flower-clusters having staminate and pistillate flowers.
Angiospermous. Pertaining to the Angiospermae; bearing seeds within a pericarp.
Anther. The part of the stamen which contains the pollen.
Antherid. The male organ of reproduction in Pteridophyta and Bryophyta.
Anthesis. Period of flowering.

Apetalous. Without a corolla.
Apical. At the top, or referring to the top.
Apiculate. With a minute pointed tip.
Appressed. Lying against another organ.
Arborescent. Tree-like, in size or shape.
Archegone. The female reproductive organ in Pteridophyta and Bryophyta.
Areolate. Reticulated.
Areolation. The system of meshes in a network of veins.
Areole. A mesh in a network of veins.
Aril. A fleshy organ growing about the hilum.
Arillate. Provided with an aril.
Aristate. Tipped by an awn or bristle.
Aristulate. Diminutive of aristate.
Ascending. Growing obliquely upward, or upcurved.
Asexual. Without sex.
Assurgent. See Ascending.
Auricled. (Auriculate). With basal, ear-like lobes.
Awn. A slender bristle-like organ.
Axil, The point on a stem immediately above the base of a leaf.
Axile. In the axis of an organ.
Axillary. Borne at, or pertaining to, an axil.
Baccate. Berry-like.
Barbellate. Furnished with minute barbs.
Basifixed. Attached by the base.
Berry. A fruit with pericarp wholly pulpy.
Bilabiate. With two lips.
Bipinnate. Twice pinnate.
Bipinnatifid. Twice pinnatifid.
Blade. The flat expanded part of a leaf.
Bract. A leaf, usually small, subtending a flower or flower-cluster, or a sporange.
Bracteate. With bracts.
Bracteolate. Having bractlets.
Bractlet. A secondary bract, borne on a pedicel, or immediately beneath a flower; sometimes applied to minute bracts.

Bulb. A bud with fleshy scales, usually subterranean.
Bulblet. A small bulb, especially those borne on leaves, or in their axils.
Bulbous. Similar to a bulb; bearing bulbs.
Caducous. Falling away very soon after development.
Caespitose. Growing in tufts.
Callosity. A small, hard protuberance.
Callus. An extension of the inner scale of a grass spikelet; a protuberance.
Calyx. The outer of two series of floral leaves.
Campanulate. Bell-shaped.
Campylotropous. Term applied to the curved ovule.
Cancellate. Reticulated, with the meshes sunken.
Canescent. With gray or hoary fine pubescence.
Canaliculate. Channelled; longitudinally grooved.
Capitate. Arranged in a head; knoblike.
Capsular. Pertaining to or like a capsule.
Capsule. A dry fruit of two carpels or more, usually dehiscent by valves or teeth.
Carinate. Keeled; with a longitudinal ridge.
Carpel. The modified leaf forming the ovary, or a part of a compound ovary.
Caruncle. An appendagge to a seęd at the hilum.
Carunculate. With a caruncle.
Caryopsis. The grain; fruit of grasses, with a thin pericarp adherent to the seed.
Caudate. With a slender tail-like appendage.
Caudex. The persistent base of perennial herbs, usually only the part above ground.
Caudicle. Stalk of a pollen-mass in the Orchid and Milkweed families.
Cauline. Pertaining to the stem.
Cell. A cavity, of an anther or ovary.
Chaff. Thin dry scales.
Chalaza. The base of the ovule.
Chartaceous. Papery in texture.
Chlorophyll. Green coloring matter of plants.
Chlorophyllous. Containing chlorophyll.
Ciliate. Provided with marginal hairs. Ciliolate. Minutely ciliate.
Cilium. A hair.
Cinereous. Ashy; ashy-colored.

Circinnate. Coiled downward from the apex.
Circumscissile. Transversely dehiscent, the top falling away as a lid.
Clavate. Club-shaped.
Cleistogamous. Flowers which do not open, but are pollinated from their own anthers.
Cleft. Cut about halfway to the midvein.
Clinandrium. Cavity between the an-ther-sacs in orchids.
Cochleate. Like a snail shell. •
Coma. Tuft of hairs at the ends of some seeds.
Commissure. The contiguous surfaces of two carpels.
Conduplicate. Folded lengthwise.
Confluent. Blended together.
Connate. Similar organs more or less united.
Connective. The end of the filament, between the anther-sacs.
Connivent. Converging.
Convolute. Rolled around or rolled up longitudinally.
Coralloid. Resembling coral.
Cordate. Heart-shaped.
Coriaceous. Leathery in texture.
Corm. A swollen, fleshy base of a stem.
Corolla. The inner of two series of floral leaves.
Corona; Crown. An appendage of the corolla; a crown-like margin at the top of an organ.
Coroniform. Crown-like.
Corymb. A convex or flat-topped flowercluster of the racemose type, with pedicels of rays arising from different points on the axis.
Corymbose. Borne in corymbs; corymblike.
Costate. Ribbed.
Cotyledon. A rudimentary leaf of the embryo.
Crenate. Scalloped; with rounded teeth.
Crenulate. Diminutive of crenate.
Crustaceous. Hard and brittle.
Cucullate. Hooded, or resembling a hood.
Culm. The stem of grasses and sedges. Cuneate. Wedge-shaped.
Cusp. A sharp stiff point.
Cuspidate. Sharp-pointed; ending in a cusp.
Cymp. A convex or flat flower-cluster of the dewrminate type, the central flowers first unfolding.
Cymose. Arrange1 in cymes; cymelike.

Deciduous. Falling away at the close of the growing period.
Decompound. More than once divided.
Decumbent. Stems or branches in an inclined position, but the end ascending.
Decurrent. Applied to the prolongation of an organ, or part of an organ running along the sides of another.
Deflexed. Turned abruptly downward.
Dehiscence. The opening of an ovary, anther-sac or sporange to emit the contents.
Dehiscent. Opening to emit the contents.
Deltoid. Broadly triangular, like the Greek letter delta.
Dentate. Toothed, especially with outwardly projecting teeth.
Denticulate. Diminutive of dentate.
Depauperate. Impoverished, small.
Depressed. Vertically flattened.
Dextrorse. Spirally ascending to the right.
Diadelphous. Stamens united into two sets.
Diandrous. Having two stamens.
Dichotomous. Forking regularly into two nearly equal branches or segments.
Dicotyledonous. With two cotyledons.
Didymous. Twin-like; of two nearly equal segments.
Diffuse. Loosely spreading.
Digitate. Diverging, like the fingers spread.
Dimorphous. Of two forms.
Dicecious. Bearing staminate flowers or antherids on one plant, and pistillate flowers or archegones on another of the same species.
Discoid. Heads of Compositae composed only of tubular flowers; rayless; like a disk.
Disk. An enlargement or prolongation of the receptacle of a flower around the base of the pistil; the head of tubular flowers in Compositae.
Dissected. Divided into many segments or lobes.
Dissepiment. A partition-wall of an ovary or fruit.
Distichous. Arranged in two rows.
Distinct. Separate from each other ; evident.
Divaricate. Diverging at a wide angle.
Divided. Cleft to the base or to the mid-nerve.
Dorsal. On the back, pertaining to the back.
Drupaceous. Drupe-like.

Drupe. A simple fruit, ușually indehiscent, with fleshy exocarp and bony endocarp.
Drupelet. Diminutive of drupe.
Echinate. Prickly.
Ellipsoid. A solid body, elliptic in section.
Elliptic. With the outline of an ellipse; oval.
Emarginate. Notched at the apex.
Embryo. A rudimentary plant in the seed.
Embryo-sac. The macrospore of the flowering plants, contained in the ovule.
Endocarp. The inner layer of the pericarp.
Endogenous. Forming new tissue within.
Endosperm. The substance surrounding the embryo of a seed; albumen.
Ensiform. Shaped like a broadsword.
Entire. Without divisions, lobes, or teeth.
Ephemeral. Continuing for only a day or less.
Epigynous. Adnate to or borne on the upper part of the ovary.
Epiphytic. Growing on other plants, but not parasitic.
Equitant. Folded around each other; straddling.
Erose. Irregularly margined, as if gnawed.
Evanescent. Early disappearing.
Evergreen. Bearing green leaves throughout the year.
Excurrent. With a tip projecting beyond the main part of the organ.
Exfoliating. Peeling off in layers.
Exocarp. The outer layer of the pericarp.
Exogenous. Forming new tissue outside the older.
Exserted. Prolonged past surrounding organs.
Exstipulate. Without stipules.
Extrorse. Facing upward.
Falcate. Scythe-shaped.
Farinaceous. Starchy, or containing starch.
Fascicle. A dense cluster.
Fascicled. Borne in dense clusters.
Fastigiate. Stems or branches which are nearly erect and close together.
Fenestrate. With window-like markings.
Fertile. Bearing spores, or bearing seed.
Fertilization. The mingling of the contents of a male and fenale cell.

Ferruginous. Color of iron-rust.
Fetid. Ill-smelling.
Fibrillose. With fibres or fibre-like organs.
Filament. The stalk of an anther; the two forming the stamen.
Filamentous. Composed of thread-like structures; thread-like.
Filiform. Thread-like.
Fimbriate. With fringed edges.
Fimbrillate. Minutely fringed.
Fistular. Hollow and cylindric.
Flabellate. Fan-shaped, or arranged like the sticks of a fan.
Flaccid. Lax; weak.
Flexuous. Alternately bent in different directions.
Floccose. With loose tufts of wool-like hairs.
Fcliaceous. Similar to leaves.
Foliolate. With separate leaflets.
Follicle. A simple fruit dehiscent along one suture.
Follicular. Similar to a follicle.
Foveate. Foveolate. More or less pitted.
Free. Separate from other organs; not adnate.
Frond. The leaves of ferns.
Frutescent. Fruticose. More or less shrub-like.
Fugacious. Falling soon after development.
Fugitive. Plants not native, but occurring here and there, without direct evidence of becoming established.
Funiculus. The stalk of an ovule or seed.
Fusiform. Spindle-shaped.
Galea. A hood-like part of a perianth or corolla.
Galeate. With a galea.
Gametophyte. The sexual generation of plants.
Gamopetalous. With petals more or less united.
Gemma. A bud-like propagative organ.
Gibbous. Enlarged or swollen on one side.
Glabrate. Nearly without hairs.
Glabrous. Devoid of hairs.
Gladiate. Like a sword-blade.
Gland. A secreting cell, or group of cells.
Glandular. With glands, or glandlike.
Glaucous. Covered with a fine bluish or white bloom; bluish-hoary.
Globose. Spherical or nearly so.
Glomerate. In a compact cluster,

Glomerule. A dense capitate cyme.
Ghumaceous. Resembling glumes.
Glume. The scaly bracts of the spikelet: of grasses and sedges.
Granulose. Composed of grains.
Gregarious. Growing in groups or colonies.
Gynobase. A prolongation or enlargement of the receptacle supporting the ovary.
Habit. General aspect.
Habitat. A plant's natural place of growth.
Hastate. Halberd-shaped; like sagittate; but with the basal lobes diverying.
Haustoria. The specialized roots of parasites.
Head. A dense round cluster of sessile of nearly sessile flowers.
Herbaceous. Leaf-like in texture and color, pertaining to an herb.
Hilum. The scar or area of attachment of a seed or ovule.
Hirsute. With rather coarse stiff hairs.
Hispid. With bristly stiff hairs.
Hispidulous. Diminutive of hispid.
Hyaline. Thin and translucent.
Hypocotyl. The rudimentary stem of the embryo; also termed radicle.
Hypogynium. Organ supporting the ovary in some sedges.
Hypogynous. Borne at the base of the ovary, or below.
Imbricated. Overlapping.
Inperfect. Flowers with either stamens or pistils, not with both.
Incised. Cut into sharp lobes.
Included. Not projecting beyond surrounding parts.
Incumbent. With the back against the hypocotyl.
Indehiscent. Not opening.
Indusium. The membrane covering a sorus.
Inequilateral. Unequal sided.
Inferior. Relating to an organ which arises or is situated below another.
Inflexed. Abruptly bent inward.
inflorescence. The flowering part of plants; its mode of arrangement.
Integument. A coat or protecting layer.
Internode. Portion of a stem or branch between two successive nodes.
Introrse. Facing inward.
Involucal. A secondary involucre.
Involucrate. With an involucre, or like one.
Involucre. A whorl of bracts subtending a flower or flower-cluster.
Involute, Rolled inwardly.

Irregular. A flower in which one or more of the organs of the same series are unlike.
Labiate. Provided with a lip-like organ; belonging to the family Labiatae.
Laciniate. Cut into narrow lobes or segments.
Lanceolate. Considerably longer than broad, tapering upward from the middle or below; lance-shaped.
Latex. The milky sap of certain plants.
Leaflet. One of the divisions of a compound leaf.
Legume. A simple dry fruit dehiscent along both sutures.
Lenticular. Lens-shaped.
Ligulate. Provided with or resembling a ligule.
Ligule. A strap-shaped organ, as the rays in Compositae.
Limb. The expanded part of a petal, sepal, or gamopetalous corolla.
Linear. Elongated and narrow with sides nearly parallel.
Lineolate. With fine or obscure lines.
Lobed. Divided to about the middle.
Loment. A jointed legume, usually constricted between the seeds.
Loculicidal. Applied to capsules which split longitudinally.
Lodicules. Minute hyaline scales subtending the flower in grasses.
Lunate. Crescent-shaped.
Lyrate. Pinnatifid, with the terminal lobe or segment considerably larger than the others.
Macrosporange. Sporange containing macrospores.
Macrospore. The larger of two kinds of spores borne by a plant, usually giving rise to a female prothallium.
Marcescent. Withering but remaining attached.
Medullary. Pertaining to the pith or medulla.
Mericarp. One of the carpels of the Umbelliferae.
Mesocarp. The middle layer of a pericarp.
Micropyle. Orifice of the ovule, and corresponding point on the seed.
Microsporange. Sporange containing microspores.
Microspore. The smaller of two kinds of spores borne by a plant, usually giving rise to a male prothallium; pollen-grain.
Midvein (Midrib). The central vein or rib of a lf $f$ or other organ.
Monadelpho s. Stamens united by their filaments.

Moniliform. Like a string of beads.
Monecious. Bearing stamens and pistils on the same plant, but in different flowers.
Monstrous. Unusual or deformed.
Mucronate. With a short sharp abrupt tip.
Mucronulate. Diminutive of mucronate.
Muricate. Roughened with short hard processes.
Muticous. Pointless, or blunt.
Naked. Lacking organs or parts which are normally present in related species or genera.
Naturalized. Plants not indigenous to the region, but so firmly established as to have become part of the flora.
Nectary. A sugar-secreting organ.
Node. The junction of two internodes of a stem or branch, often hard or swollen, at which a leaf or leaves are usually borne.
Nodose. Similar to nodes or joints; knotty.
Nodulose. Diminutive of nodose.
Nut. An indehiscent one-seeded fruit with a hard or bony pericarp.
Nutlet. Diminutive of nut.
Obcordate. Inversely heart-shaped.
Oblanceolate. Inverse of lanceolate.
Oblong. Longer than broad, with the sides nearly parallel, or somewhat curving.
Obovate. Inversely ovate.
Obovoid. Inversely ovoid.
Obsolete. Not evident; gone, rudimentary, or vestigial.
Obtuse. Blunt, or rounded.
Ochreae. The sheathing united stipules of Polygonaceae.
Ochreolae. The ochreae subtending flowers in the Polygonaceae.
Ochroleucous. Yellowish white.
Oösphere. The cell of the archegone which is fertilized by spermatozoids.
Operculate. With an operculum.
Operculum. A lid.
Orbicular. Approximately circular in outline.
Orthotropoos. Term applied to the straight ovule, having the hilum at one end and the micropyle at the other.
Ovary. The ovule-bearing part of the pistil.
Ovate. In outline like a longitudinal section of a hen's egg.
Oroid. Shaped like a hen's egg.
Ovule. The macrosporange of flowering plants, becoming the seed on maturing.

Palate. The projection from the luwer lip of two-lipped personate corollas.
Palet. A bract-like organ enclosing or subtending the flower in grasses.
Palmate. Diverging radiately like the fingers.
Panicle. A compound flower-cluster of the racemose type, or cluster of sporanges.
Paniculate. Borne in panichs or resembling a panicle.
Papilionaceous. Term applied to the irregular flower of the Pea Family.
Papillose. With minute blunt projections.
Pappus. The bristles, awns, teeth, etc., surmounting the achene in the Chicory and Thistle Families.
Parasitic. Growing upon other plants and absorbing their juices.
Parietal. Borne along the wall of the ovary, or pertaining to it.
Parted. Deeply cleft.
Pectinate. Comb like.
Pedicel. The stalk of a flower in a flowercluster, or of a sporange.
Peduncle. Stalk of a flower, or a flowercluster, or a sporocarp.
Pedunculate. With a peduncle.
Peltate. Shield shaped; a flat organ with a stalk on its lower surface.
Penicillate. With a tuft of hairs or hairlike branches.
Perfect. Flowers with both stamens and pistils.
Perfoliate. Leaves so clasping the stem as to appear as if pierced by it.
Perianth. The modified floral leaves (sepals or petals), regarded collectively.
Pericarp. The wall of the fruit, or seedvessel.
Perigynium. The utricle enclosing the ovary or achene in the genus Carex.
Perigynous. Borne on the perianth, around the ovary.
Peripheral. Pertaining to the periphery.
Persistent. Organs remaining attached to those bearing them after the grow ing period.
Petal. One of the leaves of the corolla.
Petaloid. Similar to petals; petal-like.
Petiolate. With a petiole.
Petiolule. The stalk of a leaflet.
Petiole. The stalk of the leaf.
Phyllode. A bladeless petiole or rachis.
Pilose. With long soft hairs.
Pinna. A primary division of a pinnately compound leaf.

Pinnate. Leaves divided into leaflets or segments along a common axis.
Pinnatifid. Pinnately cleft to the middle or beyond.
Pinnule. A division of a pinna.
Pistil. The central organ of a flower containing the macrosporanges (ovules).
Pistillate. With pistils; and usually employed in the sense of without stamens.
Placenta. An ovule-bearing surface.
Plicate. Folded into plaits, like a fan.
Plumose. Resembling a plume or feather.
Plumule. The rudimentary terminal bud of the embryo.
Pollen. Pollen grain. See Microspore.
Follinia. The pollen-masses of the Orchid and Milkweed Families.
Polvgamous. Bearing both perfect and imperfect flowers.
Folypetalous. With separate petals.
Pome. The fleshy fruit of the Apple Family.
Procumbent. Trailing or lying on the ground.
Prophylla. Bractlets.
Prothallium. The sexual generation of Pteridophyta.
Puberulent. With very short hairs.
Pubescent. With hairs.
Punctate. With translucent dots or pits.
Pungent. With a sharp stiff tip.
Pyriform. Pear-shaped.
Raceme. An elongated determinate flower cluster with each flower pedicelled.
Racemose. In racemes, or resembling a raceme.
Rachilla. The axis of the spikelet in grasses.
Rachis. The axis of a compound leaf. or of a spike or raceme.
Radiant. With the marginal flowers enlarged and ray-like.
Radiate. With ray-flowers; radiating.
Radicle. The rudimentary stem of the embryo; hypocotyl.
Radicular. Pertaining to the radicle or hypocotyl.
Raphe (Rhaphe). The ridge connecting the hilum and chalaza of an anatropous or amphitropous ovule; the ridge on the sporocarp of Marsilea.
Ray. One of the peduncles or branches of an umbel; the flat marginal flowers in Compositae.
Receptacle. The end of the flower stall, bearing the floral organs; or, in Com-
positae, bearing the flowers; also, in some ferns, an axis bearing sporanges. Recurved. Curved backward.
Reflexed. Bent backward abruptly.
Regular. Having the members of each part a like in size and shape.
Reniform. Kidney-shaped.
Repand. With a somewhat wavy margin. Reticulate. Arranged as a network.
Retrose. Turned backward or downward.
Retuse. With a shallow notch at the end.
Revolute. Rolled backward.
Rhachis. See Rachis.
Rhizome. See Rootstock.
Rootstock. A subterranean stem, or part of one.
Ringent. The gaping mouth of a twolipped corolla.
Rostellum. Beak of the style in Orchids.
Rostrate. With a beak.
Rosulate. Like a rosette.
Rotate. With a flat round corollalimb. Rugose. Wrinkled.
Runcinate. Sharply pinnatifid, or in cised, the lobes or segments turned backward.
Sac. A pouch, especially the cavities of anthers.
Saccate. With a pouch or sac.
Sagittate. Like an arrow-head, with the lobes turned downward.
Samara. A simple indehiscent winged fruit.
Saprophyte. A plant which grows on dead organic matter.
Scabrous. Rough.
Scale. A minute, rudimentary or vestigial leaf.
Scape. A leafless or nearly leafless stem or peduncle, arising from a subterranean part of a plant, bearing a flower or flower-cluster.
Scapose. Having scapes, or resembling a scape.
Scarious. Thin, dry, and translucent, not green.
Scorpioid. Coiled up in the bud, or in the beginning of growth, unrolling in expanding.
Secund. Borne along one side of an axis. Segment. A division of a leaf or fruit.
Sepal. One of the leaves of a calyx.
Septate. Provided with partitions.
Septicidal. A capsule which splits longitudinally into and through its dissepiments.
Serrate. With teeth projecting forward:
Serrulate. Diminutive of serrate; serrate with small teeth.
Sessile. Without a stalk.

Setaceous. Bristle-like.
Setose. Bristly.
Silicle. A silique much longer than wide.
Silique. An elongated two valved capsular fruit, with two parietal placentae, usually dehiscent.
Sinuate. With strongly wavy margins.
Sinuous. In form like the path of a snake.
Sinus. The space between the lobes of a leaf.
Sorus (Sori). A group or cluster of sporanges.
Spadiceous. Like or pertaining to a spadix.
Spadix. A fleshy spike of flowers.
Spathaceous. Resembling a spathe.
Spathe. A bract, usually more or less concave, subtending a spadix.
Spatulate. Shaped like a spatula; spoonshaped.
Spermatozoids. Cells developed in the antherid, for the fertilization of the oösphere.
Spicate. Arranged in a spike; like a spike.
Spike. An elongated flower-cluster or cluster of sporanges, with sessile or nearly sessile flowers or sporanges.
Spikelet. Diminutive of spike; especially applied to flower-clusters of grasses and sedges.
Spinose. With spines, or similar to spines.
Spinule. A small sharp projection.
Spinulose. With small sharp processes or spines.
Sporange. A sac containing spores.
Spore. An asexual vegetative cell.
Sporocarp. Organ containing sporanges or sori.
Sporophyte. The asexual generation of plants.
Spreading. Diverging nearly at right angles; nearly prostrate.
Spur. A hollow projection from a floral organ.
Squarrose. With spreading or projecting parts.
Stamen. The organ of a flower which bears the microspores (pollen-grains).
Staminodium. A sterile stamen, or other organ in the position of a stamen.
Standard. The upper, usually broad, petal of a papilionaceous corolla.
Stellate. Star-like.
Sterigmata. The projections from twigs,
bearing the leaves, in some genera of Pinaceae.
Serile. Without spores, or without seed.
Stigma. The summit or side of the
pistil to which poiien-grans become attached.
Stipe. The stalk of an organ.
Stipitate. Provided with a stipe.
Stipules. Appendages to the base of a petiole, often adnate to it.
Stipulate. With stipules.
Stolon. A basal branch rooting at the nodes.
Stoloniferous. Producing or bearing stolons.
Stoma (Stomata). The transpiring orifices in the epidermis of plants.
Strict. Straight and erect.
Strigose. With appressed or ascending stiff hairs.
Strophiole. An appendage to a seed at the hilum.
Strophiolate. With a strophiole.
Style. The narrow top of the ovary.
Stylopodium. The expanded base of a style.
Subacute. Somewhat acute.
Subcordate. Somewhat heart-shaped.
Subcoriaceous. Approaching leathery in texture.
Subfalcate. Somewhat scythe-shaped.
Subligneous. Somewhat woody in texture.
Subterete. Nearly terete.
Subulate. Awl-shaped.
Subversatile. Partly or imperfectly versatile.
Succulent. Soft and juicy.
Sulcate. Grooved longitudinally.
Superior. Applied to the ovary when free from the calyx; or to a calyx adnate to an ovary.
Suture. A line of splitting or opening.
Symmetrical. Applied to a flower with its parts of equal numbers.
Syncarp. A fleshy multiple or aggregate fruit.
Tendril. A slender coiling organ.
Terete. Circular in cross section.
Ternate. Divided into three segments, or arranged in threes.
Tetradynamous. With four long stamens and two shorter ones.
Thallus. A usually flat vegetative organ.
Thyrsoid. Like a thyrsus.
Thyrsus. A compact panicle.
Tomentose. Covered with tomentum.
Tomentulose. Diminutive of tomentose.
Tomentum. Dense matted wool-like hairs.
Torsion. Twisting of an organ.
Tortuous. Twisted or bent.
Tracheae. The canals or ducts in woody tissue.
Tracheids. Wood-cells.

Triandrous. With three stamens.
Tricarpous. Composed of three carpels.
Trimorphous. Flowers with stamens oi three different lengths or kinds; in three forms.
Triquetrous. Three-sided, the sides channeled.
Truncate. Terminated by a nearly straight edge or surface.
Tuber. A thick short underground branch or part of a branch.
Tubercle. The persistent base of the style in some Cyperaceae; a small tuber.
Tuberculate. With rounded projections.
Turbinate. Top-shaped.
Uliginous. Inhabiting mud.
Umbel. A determinate, usually convex flower-cluster, with all the pedicels arising from the same point.
Umbellate. Borne in umbels; resembling an umbel.
Umbellet. A secondary umbel.
Umbelloid. Similar to an umbel.
Uncinate. Hooked, or in form like a hook.
Undulate. With wavy margins.
Urceolate. Urn-shaped.
Utricle. A bladder-like organ; a oneseeded fruit with a loose pericarp.
Valvate. Meeting by the margins in the bud, not overlapping; dehiscent by valves.
Vascular. Relating to ducts or vessels.
Vein. One of the branches of the woody portion of leaves or other organs.
Veinlet. A branch of a vein.
Velum. A fold of the inner side of the leaf-base in Isoetes.
Velutinous. Velvety; with dense fine pubescence.
Venation. The arrangement of veins.
Vernation. The arrangement of leaves in the bud.
Versatile. An anther attached at or near its middle to the filament.
Verticil. See Whorl.
Verticillate. With three or more leaves or branches at a node; whorled.
Vestigial. In the nature of a vestige or remnant.
Villous. With long soft hairs, not matted together.
Virgate. Wand-like.
Whorl. A group of three similar organs or more, radiating from a node. Verticil.
Whorled. See Verticillate.
Winged. With a thin expansion or expansions.

## ABBREVIATIONS OF THE NAMES OF AUTHORS.

A. Benn. Bennett, Arthur.
A. Br. Braun, Alexander.

Adans. Adanson, Michel.
Ait. Aiton, William.
Ait.f. Aiton, William Townsend.
All. Allioni, Carlo.
Anders. Andersson, Nils Johan.
Andr. Andrews, Henry C.
Andrz. Andrzejowski, Anton Lukianowicz.
Angs. Angström, Johan.
Ard. Arduino, Luigi.
Arn. Arnott, George Arnold Walker.
Aschers. Ascherson, Paul Friedrich August.
Aubl. Aublet, Jean Baptiste Christophore Fusée.
Aust. Austin, Coe Finch,
Bab. Babington, Charles Cardale.
Bald. Baldwin, William.
Baill. Baillon, Henri.
Bartl. Bartling, Friedrich Gottlieb.
Bart. Barton, William P. C.
Bartr. Bartram, John.
Beaur. Palisot de Beauvois, A. M. F. J.

Benth. Bentham, George.
Benth. \&o Hook. Bentham, George, and Hooker, Joseph Dalton.
Berch. Berchtold, Friedrich von.
Bernh. Bernhardi, Johann Jacob.
Bess. Besser, Wilhelm S. J. G. von.
Bieb. Beiberstein, F. A. M. von.
Bigel. Bigelow, Jacob.
Bisch. Bischoff, Gottlieb Wilhelm.
Biv. Bivona-Bernardi, Antonio.
Boeckl. Boeckeler, Otto.
Boehm. Boehmer, Georg Rudolf.
Boiss. Boissier, Edmond.
Borck. Borckhausen, Moritz Balthazar.
Brack. Brackinridge, William D.
Breze. Brewer, William Henry.
B. S. P. Britton, N. L.; Sterns, Emerson Alexander; Poggenburg, Justus.
Brot. Brotero, Felix de Avellar.
Buch. Buchenau, Franz.
Buckl. Buckley, Samuel Botsford.

Burgsd. Burgsdorff, Friedrich August Ludwig von.
Carr. Carriere, Élie Abel.
Casp. Caspary, Robert.
Cass. Cassini, Henri.
Cav. Cavanilles, Antonio José.
Celak. Celakowsky, Ladislav.
Cerv. Cervantes, Vicente.
Cham. Chamisso, Adalbert von.
C. \&o S., Cham. \& Sch. Chamisso and Schlechtendahl.
Chapm. Chapman, Alvan Wentworth.
Chois. Choisy, Jacques Denis.
Clairv. Clairville, Joseph Philippe de.
Clayt. Clayton, John.
Cogn. Cogniaux, Alfred.
Coult. (Dips.) Coulter, Thomas.
Coult. Coulter, John Merle.
$C$. \& $R$. Coulter, J. M. and Rose, Joseph Nelson.
Darl. Darlington, William.
Davenp. Davenport, George Edward.
DC. De Candolle, Augustin Pyramus.
A. DC. De Candolle, Alphonse.

Dec. Decaisne, Joseph.
Desf. Desfontaine, René Louiche.
Desr. Desroussoux,
Pesv. Desvaux, Nicaise Augustin.
Dicks. Dickson, James.
Dietr. Dietrich, David Nathanael Friedrich.
Dill. Dillen, John Jacob.
Dougl. Douglas, David.
Drej. Drejer, Saloman Thomas Nicolai.
Dryand. Dryander, Jonas.
Dufr. Dufresne, Pierre.
Dumort. Dumortier, Barthélemy Charles.
Eat. Eaton, Amos.
Eat. \& Wr. Eaton, Amos, and Wright, John.
Eberm. Ebermaier, Karl Heinrich.
Ehrh. Ehrhart, Friedrich.
Ell. Elliott, Stephen.
Endl. Endlicher, Stephen Ladislaus.
Engelm. Engelmann, George.
Esch. Escholtz, Johann Friedrich.
Fabr. Fabricius. Philipp Konrad.

Fisch. Fischer, Friedrich Ernst Ludwig von.
F. \& M. Fischer and Meyer, C. A.

Foug. Fougeroux, Auguste Denis.
Forsk. Forskal, Pehr.
Forst. Forster, Johann Reinhold and George.
Fresen. Fresenius, Johann Baptist Georg Wolfgang.
Froel. Froelich, Joseph Aloys.
Gaert. Gaertner, Joseph.
Gaertn. f. Gaertner, Carl Friedrich.
Gal. Galeotti, Henri.
Gaud. Gaudichaud-Beaupré, Charles.
Gey. Geyer, Carl Andreas.
Gill. Gillies, John.
Ging. Gingins de Lassaraz, Frédéric Charles Jean.
Glox. Gloxin, Benjamin Peter.
Gmel. Gmelin, Samuel Gottlieb.
Gmel. F. F. Gmelin, Johann Friedrich.
Gooden. Goodenough, Samuel.
Gren. \&o Godr. Grenier, Charles, and Godron, D. A.
Grev. Greville, Robert Kaye.
Griseb. Grisebach, Heinrich Rudolf August.
Gronov. Gronovius, Jan Frederik.
Guss. Gussone, Giovanni.
Hack. Hackel, Eduard.
Hall. Haller, Albert von.
Hamilt. Hamilton, William.
Hartm. Hartman, Carl Johann.
Hassk. Hasskarl, Justus Carl.
Hausskn. Haussknecht, Carl.
Hazv. Haworth, Adrian Hardy.
$H B K$. Humboldt, Friedrich Alexander von; Bonpland, Aimé and Kunth, Carl Siegesmund.
Hegelm. Hegelmaier, Friedrich.
Hell. Hellenius, Carl Niclas.
Heist. Heister, Lorenz.
Herb, Herbert, William.
Hitch. Hitchcock, Albert Spear.
Hochst. Hochstetter, Christian Friedrich.
Hoffm. Hoffman, Georg Franz.
Hoffmg. Hoffmansegg, Johann Centurius.
Holl. Hollick, Arthur.
Hook. Hooker, William Jackson.
H. \& A: Hooker, W. J., and Arnott, George A. Walker.
Hook. f. Hooker, Joseph Dalton.
Hornem. Hornemann, Jens Wilken.
Huds. Hudson, William.
Irm. Irmisch, Thilo.
Facq. Jacquin, Nicholas Joseph.
Fuss. Jussieu, Antoine Laurent.
A. Fuss. Jussieu, Adrien de.

Karst. Karsten, H.
K7. Klotsch, Johann Friedrich.
Kuehl. Kühlwein.
L. Linnaeus, Carolus, or Carl von Linné.
L. f. Linné, Carl von (the son).

L'Her. L'Heritier de Brutelle, Charles Louis.
Laest. Laestadius, Lars Levi.
Lag. Lagasca, Mariano.
Lam. Lamarck, Jean Baptiste Antoine Pierre Monnet.
Lamb. Lambert, Aylmer Bourke.
Leavenzw. Leavenworth, Melines C.
Ledeb. Ledebour, Carl Friederich von.
Lehm. Lehmann, Johann Georg Christian.
Le Peyr. Le Peyrouse, Philippe.
Lepeh. Lepechin, Iwan.
Lesp. \&o Thev. Lespinasse, G., and Theveneau, A.
Less. Lessing, Christian Friedrich.
Lestib. Lestiboudois, François Joseph.
Lightf. Lightfoot, John.
Lilj. Liljeblad, Samuel.
Lindl. Lindley, John.
Lodd. Loddiges, Conrad.
Loefl. Loefling, Pehr.
Lois. Loiseleur-Deslongchamps, Jean
Louis Auguste.
Loud. Loudon, John Claudius.
Lour. Loureiro, Juan.
MacM. MacMillan, Conway.
Marsh. Marshall, Humphrey.
Mars. Marsson, Theodor.
Mart, Martens, Martin.
Mart. \&o Gal. Martens, Martin, and Galeotti, Henri.
Maxim. Maximowicz, Carl Johann.
Med. Medicus, Friedrich Cassimir.
Meisn. Meisner, Carl Friedrich.
Mer. Merat, François Victor.
Mert. Eo Koch. or M. \& K. Mertens,
Franz Karl, and Koch, Wilhelm
Daniel Joseph.
Mett. Mettenius, George "Heinrich.
Mey. Meyer, Ernst Heinrich Friedrich.
Michx. Michaux, Andre.
Michx. f. Michaux, François André.
Mill. Miller, Philip.
Millsp. Millspaugh, Charles Frederic.
Mitch. Mitchell, John.
Mont. Montagne, Jean François Camille.
Moric. Moricand, Moise etienne.
Moq. Moquin-Tandon, Alfred.
Muell. Arg. Muiller, Jean, of Aargau.
Muench. Muenchhausen, Otto von.
Muhl. Mühlenberg, Heinrich Ludwig.
Murr. Murray, Johann Andreas.

Neck. Necker, Noel Joseph de.
Nestl. Nestler, Christian Gottfried.
Nutt. Nuttall, Thomas.
Ort. Ortega, Casimiro Gomez.
Pall. Pallas, Peter Simon.
Parl. Parlatore, Filippo.
P. Br. Browne, Patrick.

Pers. Persoon, Christian Hendrik.
Planch. Planchon, Jules Emile.
Poir. Poiret, Jean Louis Marie.
Poll. Pollich, Johann Adam.
Pourr. Pourret, Pierre André.
R. Br. Brown, Robert.

Raf. Rafinesque-Schmaltz, Constantino Samuel.
Redf. \&o Rand. Redfield, John H., and Rand, Edward S.
Reichenb. Reichenbach, Heinrich Gottlieb Ludwig.
Retz. Retzius, Anders Johan.
Richards. Richardson, John.
Roem. Roemer, Johann Jacob.
R. \&S. Roemer, J. J., and Schultes, Joseph August.
Roem. \& Ust. Roemer, J. J., and Usteri, Paulus.
Rostk. Rostkovius, Friedrich Wilhelm Gottlieb.
Rottb. Rottboell, Christen Fries.
Roxb. Roxburgh, William.
R. \&o $P$. Ruiz, Lopez Hipolito, and Pavon, Josef.
Rupr. Ruprecht, Franz J.
Kydb. Rydberg, Per Axel.
St. Hil. St. Hilaire, August de.
Salisb. Salisbury, Richard Anthony.
Sarg. Sargent, Charles Sprague.
Sartz. Sartwell, Henry P.
Sav. Savi, Gaetano.
Schk. Schkuhr, Christian.
Schlecht. Schlechtendal, Diedrich Franz Leonhard von.
Schleich. Schleicher, J. C.
Schleid. Schleiden, Matthias Jacob.
Schrad. Schrader, Heinrich Adolph.
Schreb. Schreber, Johann Christian Daniel von.
Schult. Schultes, Joseph August.
Sch. Bip. Schultz Bipontinus, Karl Heinrich.
Schum. Schumacher, Christian Friedrich.
Schrvein. Schweinitz,Lewis David von.
Scop. Scopoli, Johann Anton.
Scribn. Scribner, Frank Lamson.
Scribn. \&o Ryd. Scribner, F. L., and Rydberg, P. A.
Ser. Seringe, Nicolas Charles.
Seub. Seubert, Moritz.
Sheld. Sheldon, Edmund P.
Shisttlw. Shuttleworth, Robert.

Sibth. Sibthorp, John.
Sieb. Go Zucc. Siebold, Philipp Franz von, and Zuccarini, Joseph Gerhard.
Soland. Solander, Daniel.
Spreng. Sprengel, Kurt.
Steud. Steudel, Ernest Gottlieb.
Stev. Steven, Christian.
Sudw. Sudworth, George B.
Sw. Swartz, Olof.
S. Wats. Watson, Sereno.

Thuill. Thuillier, Jean Louis.
T'hunb. Thunberg, Carl Peter.
Thurb. Thurber, George.
Torr. Torrey, John.
Torr. \&o Schw. Torrey, J., and Schweinitz, L. D.
Torr. \& Hook. Torrey, John, and Hooker, William Jackson.
Tourn. Tournefort, Joseph Pitton de. Tratt. Trattinnick, Leopold.
Trel. Trelease, William.
Traut. Trautvetter, Ernest Rudolph.
Trin. Trinius, Karl Bernhard.
Trin \&o Rupr. Trinius, Karl, and Ruprecht, F. J.
Tuckerm. Tuckerman, Edward.
Turcz. Turczaninow, Nicolaus.
Underw. Underwood, Lucien Marcus.
Vaill. Vaillant, Sébastien.
Vell. Velloso, José Marianno de Conceiçao.
Vent. Ventenat, Étienne Pierre.
Vill. Villars, Dominique.
Wahl. Wahlenberg, Georg.
Wahlb. Wahlenberg, Pehr Friedrich.
$W$. \&o $K$. Waldstein, Franz Adam
von, and Kitalbal, Paul.
Wallr. Wallroth, Karl Friedrich Wilhelm.
Walp. Walpers, Wilhelm Gerhard.
Walt. Walter, Thomas.
Wang. Wangenheim, Friedrich Adam Julius von.
Wats. \&o Coult. Watson, Sereno, and
Coulter, John Merle.
Web. Weber, Friedrich.
Wedd. Weddell, H. A.
Weinm. Weinmann.
Wender. Wenderoth, George Wilhelm
Franz.
Wettst. Wettstein, R. von.
Wigg. Wiggers, Friedrich Heinrich.
Willd. Willdenow, Carl Ludwig.
Wimm. Wimmer, Friedrich.
Wisliz. Wislizenus, A.
With. Withering, William.
Wolfg. Wolfgang.
Woodv. Woodville, William.
Wormsk. Wormskiold, M. von.
Wr. Wright, John.
Wulf. Wulfen, Franz Xavier.

## INDEX OF LATIN NAMES.

[Classes, Orders, Families and Tribes in Small Capitals; genera in roman; synonyms in italics.]

Abama, 255
Abies, 34
Abronia, 383
Abutilon, 621
Acacia, 527
Acalypha, 588
Acanthaceae, 853
Acer, 607
Aceraceae, 607
Acerates, 745
Achillea, 1013
Achroanthes, 303
Acnida, 379
Aconitum, 417
Acorus, 231
Actaea, 414
Actinospermum, 1004
Acuan, 527
Adelia, 725
Adenocaulon, 979
Adiantum, 7
Adicea, 343
Adlumia, 44I
Adonis, 43 I
Adopogon, 891
Adoxa, 877
Adoxaceae, 877
AEgopodium, 680
AEschynomene, 558
AEsculus, 609
AEthusa, 682
Afzelia, 835
Agastache, 785
Agave, 280
Agoseris, 900
Agrimonia, ${ }^{1 I}$
Agropyron, 153
Agrostemma, 388
Agrostideae, 63
Agrostis, 109
Ailanthtus, 582
Aira, 115
Aizoaceae, 383
Ajuga, 781, 1051
Alchemilla, 510
Aletris, 268
Alisma, 54
Alismaceae, 53
Alliaria, 447
Allionia, 382
Allium, 262, 1046
Allocarya, 769
Alnus, 329
Alopecurus, 102
Alsine, 394
Althaea, 618
Alyssum, 466

Amaranthaceae, 377
Amaranthus, 377
Amaryllidaceae, 278
Ambrosia, 910
Ambrosiaceae, 908
Amelanchier, 517
Ammannia, 648
Ammodenia, 402
Ammophila, 114
Ammoselinum, 678
Amorpha, 545
Ampelanus, 746
Ampelopsis, 615
Amphiachyris, 928
Amphicarpon, 75
Amphilophis, 71
Amsonia, 737
Amygdalus, 526
Anacardiaceae, 599
Anagallis, 718
Anaphalis, 976
Anastrophus, 75
Andrachne, 586
Andromeda, 703
Andropogon, 68, 1038
Andropogon, 71
Andropogoneae, 62
Androsace, 714
Androstephium, 264
Anemone, 418
Anethum, 683
Angelica, 684
Angiospermae, 38
Anogra, 658
Anonaceae, 410
Antennaria, 973
Anthemideae, 917
Anthemis, 1014
Anthoxanthum, 92
Anthriscus, 674
Antirrhinum, 822
Anychia, 404
Apera, 115
Aphanostephus, 943
Apiastrum, 676
Apios, 569
Apium, 677, 1049
Apium, 678
Aplectrum, 304
Apocynaceae, 737
Apocynum, 738
Aquilegia, 415
Arabis, 463
Araceae, 229
Aragallus, 555
Arales, 228
Aralia, 667

Araliaceae, 667
Archichlamideae, 306
Arctagrostis, 108
Arctium, 1029
Arctostaphylos, 706
Arenaria, 400
Arethusa, 298
Argemone, 439
Argentina, 502
Arisaema, 229, 1045
Aristida, 93, 1042
Aristolochia, 349
Aristolochiaceae, 347
Aristolochiales, 346
Arnica, 1022
Arnoseris, 892
Aronia, 516
Arrhenatherum, 118
Artemisia, 1017
Aruncus, 492
Arundinaria, 158
Asarum, 348
Asclepiadaceae, 740
Asclepias, 740
Asclepiodora, 745
Ascyrum, 625
Asimina, 410
Asparagus, 270
Asperugo, 772
Asperula, 868
Asplenium, $\boldsymbol{\text { I }}$
Aster, 946
Astereae, 914
Astilbe, 477
Astragalus, 550, 1048
Atamasco, 279
Atheropogon, 123
Atragene, 422
Atriplex, 372
Avena, 117
Aveneae, 64
Azalea, 698
Azolla, 21
Baccharis, 971
Balia, 1008

[^0]:    New York Botanical Garden, August 24, 190 I.

[^1]:    * Contributed by Professor Lucien M. Underwood.

[^2]:    * Contributed by the late Rev. Thomas Morong.

[^3]:    * Contributed by the late Rev. Thomas Morong.

[^4]:    * Contributed by the late Rev. Thomas Morong.

[^5]:    Carpels in a ring upon a small flat receptacle.

    1. Alisma.

    Carpels crowded in many series upon a large convex receptacle.
    Flowers perfect, staminate or polygamous.
    Pedicels not recurved; calyx spreading.
    Pedicels recurved in fruit ; calyx appressed to the carpels.
    2. Echinodorus.
    3. Lophotocarpus.

    Flowers monœcious or diœcious.
    4. Sagittaria.

[^6]:    Stem branched; leaves whorled or opposite.
    Acaulescent; stoloniferous; leaves grass-like, elongated.
    Stem stoloniferous; leaves broad, rounded, cordate, petioled.

    1. Philotria.
    2. Vallisnervia.
    3. Limnobium.
[^7]:    A. Spikelets 1 or 2 -flowered, when 2 -flowered the upper fertile, lower staminate: rachilla articulated below the scales or the subtending involucre, and not extemting beyond the flowers.
    Spikelets not flattened laterally.
    Flowering scale and palet hyaline; none of the scales spiny.
    Spikelets monœecious ; staminate and pistillate in the same panicle.
    I. Maydeae.

    Spikelets in pairs, perfect, or the pedicellate one staminate, cmply, rulimentary or wanting.
    II. Andropogroneae.

[^8]:    * Contributed by Mr. Geo. V. Nash.

[^9]:    Spikelets ovate, acute, about 2.5 mm . long.
    Spikelets oval or obovoid, obtuse, turgid, about 3 mm . long.

    1. B. digitarioides, 2. B. obtusa.
[^10]:    I. Staminate flowers numerous, in one or more terminal spikes, which are sometimes pistillate at the base or summit; or the spike solitary and the staminate flowers uppermost or basal, rarely diœcious; stigmas mostly 3 and the achene 3 -angled or swollen (stigmas 2 and the achene lenticular or compressed in nos. 12-16: 49-59; 67-72); pistillate spikes stalked or sessile, the lower commonly stalked. Nos. $1-142$. EUCAREX.
    A. Perigynia mostly long-beaked, $3^{-20} \mathrm{~mm}$. long, often inflated, the beak usually as long as the body or longer (short-benked in Nos. $11-16,34$ and 35 ); pistillate spikes mostly large (small in nos. 1, 13 and 14), globose, ovoid, oblong or cylindric. Nos. 1-35.

    Perigynia membranous or papery. Nos. 1-3r.
    Spike solitary, few-flowered, staminate above; perigynia strongly reflexed, subulate. PAUCIFLORAE. [p. 190.]

    1. C. pauciflora.

    Spikes normally several, the staminate uppermost ; if solitary, staminate at the base. (See no. 30.) Nos. 2-3I,

    Perigynia ovoid, conic with a narrowed base, or subulate, tapering into the beak. Nos. 2-28.
    Teeth of the perigynium-beak slender, short or none, not stiff nor awned. Nos. 2-24.
    Teeth of the perigynium-beak lanceolate or subulate. Nos. 2-10. LUPULINAE. [p. 19I.]
    Teeth of the perigynium-beak short or almost wanting (long in No. 17) nos. ili-24. Vesicariae. [p. 192.]
    Teeth of the perigynium-beak stiff, setaceous or awned. Nos, 25-28. Pseudocyperae. [p. 195.]
    Perigynia obovoid, very abruptly contracted into the beak; spikes exceedingly dense. Nos. 29-3I. Squarrosae. [p. 196.]
    Perigynia firm, hard or leathery. Nos. 32-35. Paludosae. [p. 196.]

[^11]:    * Contributed by the late Rev. Thomas Morong.

[^12]:    * Contributed by Mr. E. P. Bicknell.

[^13]:    Anthers 2; lip a large inflated sac.

    1. Cypripedium.

    Anther solitary.
    Pollinia with a caudicle, which is attached at the base to a viscid disk or gland. Glands enclosed in a pouch.

    Sepals free; lip 3-lobed. 2, Orchis,
    Sepals united above into a hood; lip entire.
    3. Galeorchis.

[^14]:    * Revised by Dr. P. A. Rynberg.

[^15]:    Corallorhiza multiflora flávida Peck. Whole plant light yellow; lip white, unspotted. Perhaps distinct. N. Y. and Neb.

[^16]:    * Revised by Dr. P. A. Rynberg.

[^17]:    Husk indehiscent; nut rugose or sculptured.

    1. Juglans.

    Husk at length splitting into segments; nut smooth or angled.
    2. Hicoria.

[^18]:    Hicoria glabra hirsùta Ashe. Similar to type, but leaves larger, pubescent beneath, thinner, generally destitute of resinous globules on the lower surface; fruit larger. Va. to Ga .
    12. Hicoria villòsa (Sarg.) Ashe. Scurfy Hickory. Woolly Pig-nut. (I. F. f. II56a.) A small or medium sized tree, with deeply furrowed dark gray bark. Buds of 6-8 imbricated scales, the outer usually thickly dotted with resinous globules; lateral buds mostly short-stiped; staminate aments pubescent, and gland and scurf covered; twigs usually glabrous, bright purple-brown; petiole pubescent; leaflets 5-9, at first thickly covered beneath with silvery peltate glands. mixed with resinous globules, generally pubescent; fruit about 2.5 cm . long, obowoid, the husk partly splitting; nut brown, thick-shelled, angled; seed small, but sweet. Mo.

[^19]:    * Leaves or their lobes bristle-tipped, deciduous; acorns maturing in autumn of second year.

[^20]:    Trees or shrubs; stipules fugacious.

    Staminate and pistillate flowers spiked; leaves dentate or lobed.
    Staminate flowers racemose or spiked; pistillate capitate.
    Pistillate perianth deeply 4 -cleft ; leaves entire.
    Pistillate perianth 3-4-toothed; leaves various.
    Erect or twining herbs; stipules persistent.
    Twining vines ; pistillate flowers in ament-like clusters.
    Erect herb; pistillate flowers spicate.

[^21]:    * Contributed by Dr. John K. Small.

[^22]:    Annual; inner sepals not winged in fruit ; pedicels reflexed.

    1. P. articulata. Perennial; inner sepals winged in fruit; pedicels divergent.
    2. P. Americana.
[^23]:    Calyx-teeth not twisted; plants pubescent, glandular or glabrate.
    Flowers cymose or panicled; calyx enlarged by the ripening pod.
    Fruiting calyx much enlarged, ovoid, obovoid or globose.
    Plants viscid-pubescent; flowers usually diœecious.
    Flowers white or pink, opening in the evening.
    Flowers red, opening in the morning.
    Plant roughish-pubescent; flowers perfect, scarlet.
    Fruiting calyx campanulate or tubular.
    Petals deeply laciniate; introduced species.
    Petals entire or emarginate; native western species.
    Flowers solitary; calyx inflated; plants arctic-alpine.
    Flower nodding; pod erect.
    Flower and pod erect or nearly so.
    Calyx-teeth twisted ; plant densely white-woolly all over.

    1. L. alba.
    2. L. dioica.
    3. L. Chalcedonica
    4. L. Flos-cuculi.
    5. L. Drummondi.
    6. L. apetala.
    7. L. affinis.
    S. L. C̈ronaria.
[^24]:    * Leaves pinnately divided, or some of them of but a single terminal segment. Flowers I-2 cm. broad, white or purplish.

    1. C. pratensis. Flowers $2-8 \mathrm{~mm}$. broad, white.

    Leaf-segments numerous, small, the terminal one $4-20 \mathrm{~mm}$. wide, narrowed, rounded or subcordate at the base.

    Leaves nearly all basal, pubescent.
    2. C. hirsuta.

    Stem leafy; leaves glabrous or very nearly so.

[^25]:    Ovary 3-5-celled; leaves hollow.
    Ovary 1 -celled ; leaves circinate in unfolding, the blade flat.

[^26]:    * Small aquatic fleshy herbs, with a spathe-like involucre, and a 2-3-celled capsule ; perianth none.

    Fam. I. Podostemaceae.

    *     * Land or rarely swamp plants without an involucre.
    $\dagger$ Endosperm present, usually copious and fleshy; leaves mostly zuithout stifules. Herbs.

    Carpels as many as the calyx-segments; stamens as many or twice as many.
    Plants succulent ; carpels distinct or united at the base, in ours dehiscent lengthwise.

    Fam. 2. Crassulaceae.
    Plants not succulent; carpels united to the middle, circumscissile.
    Fam. 3. Penthoraceae.

[^27]:    * Revised by Dr. P. A. Rydberg.

[^28]:    * Revised by Dr。 P. A. Rydberg.

[^29]:    1. A. arbutifolia.
    2. A. atropurpurea.
    3. A. nigra.
[^30]:    * Flowers in corymbed spike-like racemes at the summit of the stem, yellow.

    Basal leaves long, narrow, acuminate.

    1. $P$. cymosa.

    Basal leaves spatulate or obovate.
    2. P. ramosa.

    *     * Flowers in solitary spikes or spike-like racemes, terminating the stem and branches.

    Basal leaves spatulate or obovate; flowers orange-yellow.
    3. $P$. lutea.

    Basal leaves inconspicuous or wanting; flowers not yellow.
    Leaves, at least the lower, verticillate; spikes $8-18 \mathrm{~mm}$. thick, blunt; flowers purple to greenish white.

    Spikes sessile, or nearly so ; wings deltoid. 4. P. cruciata. Spikes peduncled; wings lanceolate-ovate.
    5. P. brevifolia.

[^31]:    * Contributed by Dr. John K. Small.

[^32]:    * Contributed by the late Rev. Thomas Morong,

[^33]:    Petals oblong or obovate, slightly united.

    1. Ilex.

    Petals linear, distinct.
    2. Ilicioides.

[^34]:    x. Berchemia.
    2. Rhamnus.
    3. Ceanothus.

[^35]:    * Contributed by Mr. Charles L. Pollard.

[^36]:    Land or marsh plants, or, if aquatic, submerged leaves not dissected.
    Calyx-tube merely enclosing the ovary, but free from it, except at the base.

    Anthers longitudinally dehiscent.
    Anthers opening by terminal pores.
    Calyx-tube almost wholly adnate to the ovary.
    Fam. 1. Lythraceae.
    Fam. 2. Melastomaceae.
    Fam. 3. Onagraceae.
    Aquatic or amphibious herbs, the submerged leaves dissected (except in Hipf $u$ is, which has whorled narrow leaves and only i stamen).

[^37]:    * Revised by Dr. John K. Small.

[^38]:    Ovary ro-celled; fruit a berry-like drupe with I-seeded io nutlets.

    1. Gaylussacia.

    Ovary 4-5-celled; fruit a many-seeded berry.

[^39]:    * Revised by Miss Anna Murray Vail.

[^40]:    Corolla-lobes entire.
    Corolla manifestly appendaged within, between the stamens. Leaves entire. Leaves crenate-dentate. Leaves pinnately divided, or pinnatifid, the segments incised. Racemes loose; pedicels slender; ovules 2 on each placenta.

    Lo

[^41]:    Leaves dentate or serrate; flowers in terminal spikes.
    Calyx canescent, it upper teeth obtuse.

    1. T. Canaderse.

    Calyx villous, its upper teeth acutish.
    2. T. occidentale.

    Leaves pinnately parted; flowers axillary, solitary.
    3. T. laciniatum.

[^42]:    * Fruit a berry ; corolla plicate, its lobes generally induplicate.

    Anthers unconnected, destitute of terminal pores, dihiscent.
    Fruiting calyx bladdery-inflated.
    Fruiting calyx 5 -angled and deeply 5 -parted; ovary 3 - 5 -celled.
    r. Physalodes.

    Fruiting calyx 5 -lobed, not parted, ro-ribbed, often 5-10-angled, reticulated, wholly enclosing the berry; ovary 2 -celled.
    Corolla open-campanulate, yellow or whitish, often with a dark center; seeds with a thin margin, finely pitted. 2. Physalis.
    Corolla flat-rotate, violet or purple; seeds thick, rugose-tuberculate.
    3. Quincula.

    Fruiting calyx somewhat enlarged, but closely fitted to the fruit, thin, obscurely veiny, open at the snouth.
    Corolla rotate, whitish; lobes of fruiting calyx much exceeding the berry.
    4. Leucophysalis.

    Corolla rotate, whitish, sometimes tinged with purple; fruiting calyx not exceeding the berry.
    5. Chamaesaracha.

    Anthers connivent or slightly connate ; fruiting calyx not enlarged.
    Anthers short or oblong, opening by terminal pores or short slits in our species.
    6. Solanum.

    Anthers long, tapering from base to summit, longitudinally dehiscent.
    7. Lycopersicon.
    ** Fruit a nearly dry berry ; corolla campanulate, little or not at all plicate, its lobes imbricated.
    8. Lycium.

[^43]:    * Contributed by Dr. P. A. Rydberg

[^44]:    * Contributed by the late Rev. Thomas Morong.

[^45]:    * Scapes rooting in the mud; leaves entire; bladders usually few or none. Scapes stout, strict, I -Io-flowered; flowers yellow, $8-20 \mathrm{~mm}$. broad.

    Flowers $16-20 \mathrm{~mm}$. broad; spur 12 mm . long.
    Flowers 8 -10 mm . broad; spur 6 mm . long. Scape filiform, 2-bracted above; flower solitary, purple. Scape filiform, the raceme zig-zag; flowers I-IO, yellow.
    . cornuta.
    2. $U$. juncea. Scape filiform; flowers minute, cleistogamous.
    3. U. resupinata.
    4. U. subulata.
    5. U. cleistogama.

[^46]:    * Prepared with the assistance of Mr. E. L. Morris.

[^47]:    * Anthers not tailed at the base; stigmatic lines of the style-branches only at the base, or not extending beyond the middle ; flowers all tubular and perfect, never yellow ; rays none.
    Style-branches filiform or subulate, hispidulous; receptacle naked.
    Tribe x. Vernonieae.
    Style branches thickened upward, obtuse, papillose.
    Tribe 2. Kupatokieam.
    ** Anthers tailed at the base, unappendaged at the tip; heads small; rays none (except in Inula, where they are large and yellow).

    Tribe 4. Invleae,

[^48]:    * Leaves alternate, pinnatifid into filiform segments. I. E. capillifolium.
    ** Leaves petioled, verticillate in 3 's-6's, or the upper opposite.
